There is a simple solution. It is the giving of the circulation privilege to every government obligation on terms that will indemnify the government in the matter of interest, stopping the issue of currency on commercial paper, and permit every bank to issue money as needed on deposit of the bonds. Then the local bank will be free from dictation from any source save the Federal Government, can handle its own customers, and can face competition if it enters any pool inimical to the interests of its community.

Mr. Ford's Page

THE world seems running over with knowledge, yet when you take it all and reduce it to its essence which is Wisdom, you discover that there is a great deal of refuse. As tons of roses produce but little attar, so oceans of fact and centuries of experience seem to produce only a few simple principles. To be born with power to see these principles, or to achieve a sight for them, is to have become wise.

The world is much wiser than it knows, for although it is keenly alive to its lack of knowledge in many things, it does possess certain principles by which every kind of fact it may discover, can be interpreted. How much of the essence of principle is distilled from experience, and how much of the essence of principle we innately possess to enable us to distill at all, forms an interesting subject for speculation. But it is always forced upon us that we are not quite new beginners where we seem visibly to begin, nor do we end where all trace of us seems to be lost. The chain of principle which binds us fast to Reality seems to span with one link the period of human experience, and stretch either way into distances that no one has measured.

At the end of a recent biography the subject tried to sum up what he had learned from life, and he was able to say it all in a half-dozen simple sentences. There was nothing startling in it. Nothing that would evoke a thrill. But anyone who knows the experience of *knowing* a simple truth, and *seeing* how the apparently simple thing runs regnantly through all the planes of life—anyone having this experience will know how thrillingly real such knowledge can be. It is not that the intellectual conception is new, but the realization is new and vivid. It is like old familiar things seen under a light that penetrates and glorifies them.

The purpose of life seems to be the accumulation of experience, and the greatest experience of all is to get vividly and realistically inside a principle.

Perhaps this explains why people, as a rule, are impatient of the things they are merely told. It may explain the half-contempt of the boy for his father's counsel. It is happening in the world every day that full-grown men are suddenly exclaiming: "My father used to tell me that! By George, the old man was right!" But the discovery is not made until the grown son has entered the serviceable temple of truth through the homely door of experience. And he will try in turn to tell his son, but his son may be stubborn, too, and have to learn in the same belated way.

Of course, some people do learn by merely being told. The instant they hear the principle proclaimed, they have no need of proof or any kind of confirmation, they just instantly *know* it is true. It is as if they had known it before, but had forgotten, and the spoken word called to life again an element that was already there.

This experience, too, has led men on many quests. How did we learn to know that was true which we only heard once with the ears? Whence came that inner recognition and full-fledged understanding on the instant of the message? Why were we able to "see" at once what others see with difficulty, and some seem never to see at all? Where did we originally learn that which we now suddenly recall? Such questions cannot be avoided. And once these are admitted, others thrust themselves up. Can a man receive the results of experience as a gift? Does the natively gifted mind realize without intermediary experience, what the other mind must receive through the sweat of grime of a lifetime of experience? Or have we a prenatal past?

However these problems may be regarded, it is certain that the world goes forward in proportion to the number of minds that "see." There is a constant urge that the people "think." Thinking becomes a grind unless there are facts to grind upon, or unless there is this background of principle through the medium of which all the elements of a problem can be related. "Thinking" may become a most desperate labor without the materials upon which thought can work. To "think" strenuously and never be able to "see" is but a process that wears down the resiliency of the mind. Until thought gets the wings of vision, it does treadmill work.

Progress, especially that kind of progress which depends on the agreement of the people on some forward-looking idea, does not come by the efforts of men but by the unfolding of that which seems to be dormant in the public mind. All of the arguments against slavery existed during the height of slavery, but the enlistment of the logical faculties was not enough, is never enough, to bring about a great change. "A man convinced against his will is of the same opinion still." No man is convinced against his will—the old saying is in error that far—but many a man is convinced in his logical or rational nature, in his thinking apparatus, without being greatly affected as a whole. He will say "yes" and go on acting "no." His logical retreat has been cut off, but his moral or spiritual advance has not begun. That is the reason. Intellectual conviction need not enlist the whole life. Indeed, the highest motive power for progress has been known to come when a man "sees" first, and afterward puts logical foundations under that which he sees.

Now, in dealing with great masses of people, the logical framework of an idea of public advance is often very slight, just enough to satisfy the vigilant logical faculties that no fallacy is being introduced. But the tremendous support which is won for justice or progress comes, not because the people are laboriously convinced by argument, but because with swift and accurate insight they "see."

That is the danger in which systems of injustice stand in this land. They think they are securely defended behind the technical ignorance of the masses. They think they can work forever the sleight-of-hand trick by which a few mysterious words are shouted to the people to stupefy them again or make them timid. Systems of injustice are due to discover very soon that these defenses are insecure. For the people do not work to their conclusions by the pick-and-shovel method, wearily thinking out each step by itself; they arrive by the airplane route, going at once to their objective on the wings of clear "seeing." And when once the people "see," the game is over. Thereafter no argument, no pressure, no force can turn them back. The program of progress, in any special matter, is won the moment the people "see."

The systems of injustice, whose term is now very short in this country, are just bethinking themselves what they can say in their own defense, what arguments they can invent to turn the popular mind as a horse is turned by the bit in his mouth. But it is too late. The day of judgment is not a day of orations to the jury. The day of judgment is like the sorting of apples in harvest. The good ones go here, the bad ones go there. Argument has no place. What a thing *is* determines the case, and nothing else does. No argument can remove the character of injustice from the unjust system. Its fruits condemn it. And its fruits are such as people can "see."

That orchard figure explains it. Harvest is coming and harvest is revelation of the nature of the seed that has been planted. Moreover, harvest is inevitable. The ripening of the multitude of facts and experiences which the people have had is as inevitable as the dawn. And not only inevitable but irresistible.

THERE is harvest because all the crops ripen at the same season. There are great forward steps in the affairs of men because thought ripens into "seeing" at the same time. Little is immediately accomplished by the sowing of facts—facts at the best are only seeds, and only as they are facts can they grow as seeds. Little is immediately accomplished by argument—argument is but watering the sown seed. But there comes a time when the seed becomes something else, when knowledge becomes principle, when intellectual conviction becomes that deeper thing which we call "clear seeing," and upon the arrival at "seeing" by the people, old things pass away and better things are born. "Seeing" is the end of a process, and once it is attained, nothing can turn it back. We are nearing the time of a new harvest of "seeing."

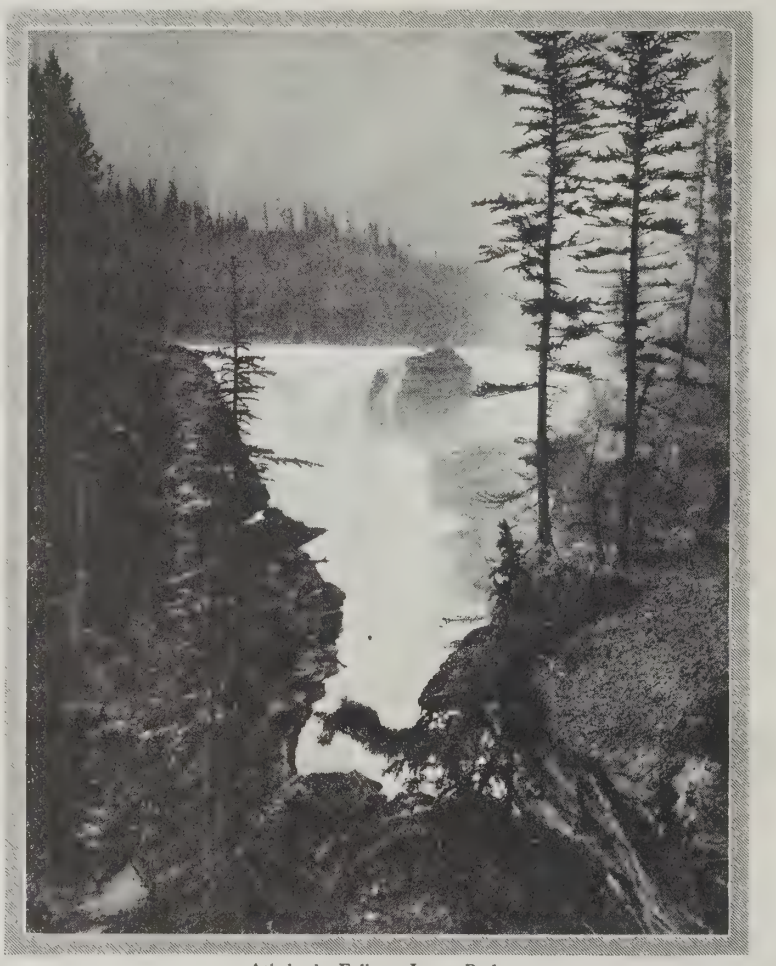
A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Beauties of Canada's National Playgrounds

Large Tracts in Dominion Reserved for Parks and Preserves

By D. M. LE BOURDAIS

AS THE city park is to the urban dweller so is the national park to the people of a country. The one provides partial breathing spaces by means of which the individual may keep up that contact with nature which is so very essential until such time as it may be more effectually renewed by a sojourn in the other.



In these strenuous days there is a continual contest between the utilitarian and the esthetic. And, more often than not, what is termed the esthetic is found in the end to be much more utilitarian than a great deal that bears the latter stamp more obviously impressed upon it. There is, therefore, always a tendency—strenuously opposed by the relatively few of vision—to restrict the areas set aside or proposed for purposes of recreation and to devote them to more "productive" ends. But in Canada it is possible to combine this most utilitarian function with the pursuit of pleasure and health.

The great continental watershed is the Rocky Mountains. A number of the largest rivers in the Dominion flowing into the Pacific, the Arctic and Hudson Bay have their rise within a short distance of each other in the Rockies or the parallel Selkirk Range lying to the westward.

Owing to Canada's great territorial extent, its immense natural resources and its relatively sparse population there has been practically no opposition to the reservation of large tracts of territory for national parks and game preserves. Moreover, Canada's mountain area is so ruggedly beautiful and so obviously suited not only to provide a natural playground for many millions more than Canada is likely to possess for a long time to come but to supply the deficiency for the millions whose homes lie in lands not so fortunately circumstanced, that her failure to do so would be no less than a crime. Canada has been fortunate in having men at the head of her affairs, who, in this respect, at least, have not been lacking in vision. Hence, as a result, the Dominion today possesses a total of 9,384 square miles of national parks—an area somewhat in excess of the total extent of the national parks in the United States, exclusive of Alaska.

As long ago as 1885—before the Dominion of Canada, as such, had been 20 years in existence—the desirability of providing for the millions yet to come was recognized and a small area surrounding the since famous hot springs at Banff, in the Rocky Mountains, was set aside. The extent of this park has been increased from time to time until at the present moment it comprises 2,751 square miles. This is officially known as Rocky Mountains Park, but is popularly known as the Banff Park, because the town of that name forms its principal center. It lies on the eastern slope of the Rockies, with the continental divide as its western boundary, and is roughly wedge-shaped, being about 90 miles long by about 50 miles wide. The main line of the Canadian Pacific Railway cuts through it diagonally. Banff and Lake Louise, the latter farther west and at a greater altitude, are the two principal tourist resorts and contain probably the best and most extensive accommodation for travelers to be found in the Canadian parks.

Each year the Canadian Rockies are attracting a greater number of persons who love and appreciate the glories of mountain climbing. At Banff is the headquarters of the Canadian Alpine Club whose beautifully situated clubhouse is visited each summer by alpinists from far and near, including famous mountaineers who have served their apprenticeship in the Alps, Andes or Himalayas and amateurs who believe with Professor Coleman (professor of geology at Toronto University and an enthusiastic mountaineer) that mountains can only be seen from a mountain and cannot really be seen from the valley. For in the Canadian Rockies there are mountains to suit the taste and degree of dexterity of all classes of climbers from Mount Rundle right near Banff, which, although 9,665 feet in height, presents no difficulties to the amateur, to Mount Assiniboine (11,860), farther south, which has been termed the "Canadian Matterhorn," or to Mount Robson (13,700), in Jasper Park, neither of which is to be despised by the most expert climber. And there are dozens of other peaks still unclimbed and unnamed to tempt those who relish the opportunity to set foot where none but the eagle and the wild goat have trod. Occasionally, such aspirations end in disaster, as in the case of Dr. W. E. Stone, late president of Purdue University, Lafayette, Indiana, who fell to his death after having scaled the virgin peak of Mount Eon in July, 1921. Newspaper readers will probably remember how Mrs. Stone, after seeing her husband go tumbling down the precipice, was forced to remain for six days and nights on a narrow ledge of rock high up on the mountain side whence she could neither advance nor retreat, during which time she was without food, her only sustenance being a faint trickle of water providing not more than a mouthful every four hours. But these contingencies only lend zest to the real mountaineer; and those who knew Dr. Stone well feel certain that had he been given his choice he would doubtless have preferred, with John Muir, death on some noble mountain or in the heart of a glacier to disease or some shabby lowland accident.

Athabaska Falls, at Jasper Park.

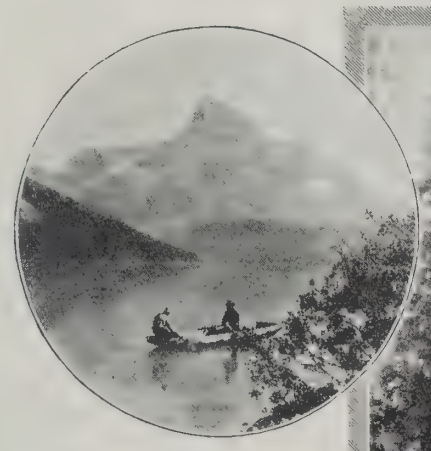
In addition to the joys of mountain climbing, the visitor to Banff may see quite an extensive area of mountain territory by motor, for nearly 200 miles of excellent motor roads have been constructed with Banff as the hub. In this manner beautiful lakes may be visited, splendid valleys traversed, and even elevations may be reached that in most regions would be considered mountains—all while bathed in the brilliant sunshine and breathing the invigorating air of the mountains rich with the odors of the pine and the spruce. Bathers may take their choice of hot or cold water, the former in the commodious baths provided by the government or by certain of the hotels, the latter in the waters of the Bow River fresh from the melting glaciers. Boating, fishing, horseback riding, golfing, and, in fact, practically all forms of recreation, except the killing of birds or animals, are possible at Banff under ideal conditions.

Crossing the Great Divide, one comes to Yoho National Park containing an area of 476 square miles lying along the western slope of the main chain of the Rockies. It, too, is cut by the line of the Canadian Pacific Railway, Field Station, its chief distributing point. Yoho Park has not yet accommodations to handle such crowds as visit Banff and Lake Louise each year, but the person who wishes to see exceptionally beautiful mountain scenery and who does not expect to view it merely from the seat of an observation car may find lakes, glaciers, waterfalls, canyons and mountain peaks probably not duplicated.

It is not that the mountains in the Canadian Rockies are extremely high as mountains go, for they are not so high as some of the peaks farther south in the United States, but they rise generally above comparatively low surrounding valleys, and thus appear higher to the person in the valley than do mountain peaks that rise from a high foundation of tableland. Moreover, the heavy precipitation and the lower snow-line of the more northerly latitude provide many peaks with a perpetual cap of snow, and consequently glaciers, that would in a more southerly latitude be bare of snow excepting in winter. These circumstances also result in a heavy growth of timber on the lower slopes with very dense vegetation in the valleys. The glaciers feed innumerable streams that tumble over precipices in dazzling cascades, or form wonderful jewels of lakes whose waters reflect in their depths the outlines of their mountain lords and which range in color from the deepest blue to the brightest emerald, hues peculiar to glacial waters that must be seen before their absolute beauty can be even faintly appreciated.

The Columbia River, which reaches the Pacific in the state of Oregon, rises in the western foothills of the Rockies near the southern boundary of British Columbia, flows northeast for about 150 miles, and, after making an abrupt bend, flows southward into the United States. Within this great elbow lies the massive Selkirk Range. Geologically, the Selkirks are older than the Rockies and consequently not quite so high, their highest peak, Mount Sir Sandford, being but 11,634 feet, and their average somewhat lower. From the standpoint of alpine scenery, however, they are in no way inferior. The warm humid breezes from the Pacific deposit most of their moisture in the Selkirks and as a result the latter lie under vast fields of snow and ice at altitudes and at seasons when corresponding peaks in the Rockies are bare. The effect of this greater precipitation is seen in the density and size of the timber that clothes their lower slopes and also in the almost tropical profusion of the undergrowth and vegetation in the valleys.

Forming an irregular rectangle containing 468 square miles, Glacier National Park lies atop the broad bulk of the Selkirks, having Rogers Pass, through which runs the main line of the Canadian Pacific Railway, as its center, and cut on the western slope by the Illicilliwaet Valley. In addition to innumerable glaciers and snowfields, stupendous mountains, fairy waterfalls and gem-like lakes, the Nakimu Caves are perhaps most worthy of mention. This series of subterranean galleries and grottoes is to be found in the Cougar Valley about seven miles northwest of Glacier Station. Up to the present time these underground passages have been explored for about 2,000 feet. They are from 100 to 120 feet beneath the surface and have evidently been eroded by the Cougar River which can be heard reverberating in their dark recesses, still gouging them out to greater depths. Evidently, some convulsion of nature has caused the river to follow this subterranean course and in the ensuing ages it has, where the rock was softer, hollowed out these great caves, some of which are from 100 to 200 feet in length and from 20 to 50 feet high and from 10 to 30 feet in width. These larger chambers are connected by passages of varying heights and widths.



Continuing to the west, near Revelstoke, British Columbia, one comes to Revelstoke Park, which occupies the broad undulating summit of Mount Revelstoke, aggregating 95 square miles. This park is all above the 7,000-foot mark and affords a unique opportunity to secure a splendid view of alpine scenery, including the Columbia and Illicilliwaet valleys, from the clouds without any of the discomforts of climbing, as an excellent switchback motor road has been constructed from Revelstoke.

Canada's largest—and, until recently, least known—national park is Jasper, comprising 4,-

Why You Have Lost Faith in Your Newspaper

Dependency on Advertising Receipts Costs Its Loyalty to Readers

By LEWIS HARPER

ARE the newspapers "controlled" by the department stores? It is time that this question should be frankly discussed, for it seems that nearly everybody believes it. There are just two classes, newspapermen and department store executives, who do not believe it, if the discussions that I have heard are any criterion, and I have heard it talked from coast to coast, bellowed from the soap box, and enunciated most nicely in Chautauqua and classroom. It is assumed as a social and political axiom by those laboring under the psychosis of "economic determinism."

And now the charge is a matter of official record. In discussing the tariff bill recently, Senator Porter J. McCumber, of North Dakota, said: "The policies of practically all the great metropolitan papers of the country are governed by the counting room. If the great department stores do not own stock in those papers, they are their customers, and through the advertising medium control the policy of these papers.

"From the time of the introduction of the great department stores of the country until the present, these papers have gradually become their mouthpieces in favor of practically free trade, or, at least, a very low tariff."

Now this quotation is not from the *Congressional Record* but from a dispatch printed in a Chicago newspaper—crowded from stem to stern with department store advertising.

To the average newspaperman that fact alone is sufficient answer to the charge of department store control. In truth, the charge of department store control has appeared so absurd to most newspaper executives that they have not usually deemed it worth refuting. So sure have they been of their position that they have allowed the charge to go practically unanswered for something like 20 years. From their silence, the inference seems to have been generally drawn that they either admit the charge or fear to discuss it.

There Have Been "Kept" Papers

ONE platitude of present-day radical propaganda is, "Why don't the newspapers sue Upton Sinclair for libel, if what he says in 'The Brass Check' isn't true?" It has never occurred to those who ask that Mr. Sinclair's long list of special instances of newspaper depravity as compiled and presented by himself does not make out a general case, even ex parte. Few such questioners have probably thought of the fact that newspaper publishers rarely resort to libel suits for the simple reason that they do not wish to encourage libel suits in any way. Most of them play down all news about libel suits to minimize the importance of the legal doctrine of libel and to avoid encouraging libel actions through the suggestive power of news. The newspapers have never thought it good policy, good business or good sense to give millions of dollars' worth of publicity to publications attacking them—such as the Sinclair "Brass Check." They have reasoned that to print editorial refutations of such charges would bring them to the attention of their 25,000,000 daily circulation. Otherwise, the charges would not reach over a few hundred thousand readers at the most—the bulk of these, with their minds already made up as to the iniquities of the "capitalist press."

The daily newspapers are, as a rule, self-supporting and profitable. Their circulation is voluntary. No one is compelled to pay for them, or to advertise in them. But it is precisely the self-supporting papers that are called the "kept press," by radical publications which live by frantic passing of the hat, or subscription to which is made compulsory on members of labor unions which have guaranteed the support of such papers. In the eyes of regular newspapermen it is only the "kept press" that denounces others as "kept."

However, there *have been* "kept" daily newspapers. In fact, it was only recently that two prominent Texas daily newspapers were caught taking money from the packers; so it is a question whether the newspapers have been wise in assuming that everyone else is as sure as they are themselves of their own honesty. Perhaps it would have been better to take the public into their confidence rather than to have assumed that everyone is aware of their honesty and economic independence.

Not Controlled by Stores

IT IS with this idea that I undertake this analysis of the charge of department store control, and if my conclusions do not agree either with the current newspaper conception or what I believe to be the incorrect popular view, it is hoped that at least the discussion will tend to clarify a situation that certainly needs more light.

I have never yet met a newspaper editor who ever received an order from a department store, directly or through the business office.

In seven years of editorial management I do not recall ever having received an "order" from a department store, and precious few requests, of any nature—certainly only one to color news, and that met with a refusal. The refusal resulted in an advertising boycott by the department stores, one of the very few ever attempted in America. It ended in increased advertising rates for repentant department stores.

In that case—one of perhaps two dozen in the history of American journalism—the department stores were under political and police pressure—not acting of their own volition. Incidentally, the newspaper was a small one, but that proved a source of strength instead of weakness, for our overhead was small, it was easy to cut our operating costs, and we went through the storm on the black side of the ledger, but with little profit.

Of course, newspapermen will admit that here and there a weak newspaper may allow itself to be coerced by big advertisers, usually department stores, but they say—and I believe justly—that such an instance would merely demonstrate the moral weakness of the newspaper owner, not a necessary result of the relation between the two institutions.

Against the instances that could be cited of weak newspapers submitting to department store dictation, there are probably just as many instances of strong and unscrupulous newspapers dealing ruthlessly with weak department stores—especially those whose owners have been socially indiscreet in cities where publishers are not overly nice about using the blackjack, and there are such cities and such publishers—not many but a few.

The public knows that the bulk of newspaper revenues comes from advertising, and that department stores are the biggest advertisers. After several decades of political mud slinging and journalistic muckraking, in which the debates of our democracy have degenerated into mutual recrimination based on charges of sinister motives and influence—it is perhaps not surprising that the people leap to the conclusion that the department stores run the newspapers. But with equal justice they might conclude that the Typographical Union dictates the policy of the papers its members print, for it is a fact that scarcely a dozen newspapers from Maine to California today could go to press if the printers said no.

The theory of department store "control" or "dictation" is one of those obvious guesses based on a half truth, with which our generation abounds. It is true that department stores influence the newspapers—in fact, all advertising influences them, but *not directly*. Advertising influences the newspapers because the newspapers' need for advertising has made *quantity* circulation the *be all and end all of newspaper policies.* The advertiser buys space on the basis of so much "per inch per thousand" newspaper readers. Thus the advertiser and the publisher have a common objective, to reach as many readers as possible.

The people have mistaken a *community of interest* between the newspapers and the department stores for the control of the one by the other. They have guessed correctly that there is something wrong with the newspapers but have failed to understand what it is. In this respect I believe that the majority of newspapermen are equally in the dark. There is today much searching of hearts in their ranks. The loss of public confidence which followed the censorship of wartime has been keenly felt by the newspapers. In politics it has been evidenced unmistakably by defeat after defeat administered to policies or candidates enjoying the bulk of newspaper support. In many cities "newspaper favor" is a death warrant for a political candidate. Nearly every recent proposed national policy which the *Literary Digest* has accredited with the majority newspaper support has been defeated.

The Public Is Dissatisfied

THE public is dissatisfied with the newspapers. It feels that it is not getting a genuine article, certainly not getting what it thinks it wants.

As usual, it will be found upon investigation that the reason the public is not getting what it thinks it is entitled to, is because it is not paying for it. It apparently was not, and is not willing to pay for it, so it is getting an inferior substitute. The newspaper buyer pays only two or three cents for his paper. It is safe to say that the production cost of few American newspapers is less than 10 cents a copy, most of them average higher, some a great deal higher. The newspaper receives only about 50 per cent of the purchase price, the rest goes to the distributor. So the newspaper reader is paying directly for only 10 per cent of the cost of the article he buys—often less than that.

Right here we come to the economic fallacy which is at once the cause of the newspaper's failure to function properly and the public's lack of faith in the newspaper's independence. Indirectly, as a member of the consuming public, the reader is paying for the newspaper's *by-product*—advertising. And, unlike nearly every other manufacturing industry, the newspaper business is living *mainly* on its *by-product.* This is the source of its weakness—the cause of its readers' uneasy distrust. The tax levied upon the public by the newspapers is deceptive like all other forms of indirect taxation.

Without realizing it, the public is paying an increased price for nearly everything it consumes because of advertising costs. Advertising constitutes from 75 to 90 per cent of newspaper earnings. The newspaper no longer owes its readers for its principal means of support. It is no longer under special obligations of loyalty to any reader clientele. It does not need loyal friends and believers in its veracity or its policies, as much as it needs advertising revenues. Advertising rates and revenues are based primarily on the *quantity* of circulation a newspaper has to sell. Hence, the main objective of the newspaper publisher is *mass circulation.* If that can be obtained by honesty, truth-telling and public service—well and good. But if there are any easier ways or short cuts, then the temptation to adopt them is great indeed.

On analysis, most of the complaints heard about the newspapers—sensationalism, sex psychosis, demagogy and the like—will be found to trace back to the quest for mass circulation, which is the basis of advertising sales value. This will also explain why the number of newspapers has so greatly diminished, and why there are no longer small groups of newspaper readers in every city or state who "swear by" this or that newspaper, or this or that editor. The quest for mass circulation also has resulted in the loss of that intimate touch between the editor and the reader which still remains the strength of small-town journalism. It has forced the newspapers to deal in generalities, to treat only of "big" events, "far-away stuff" or to descend to topics such as sex, which are capable of being understood by the largest numbers of people, without regard to their cultural status.

If readers were able to segregate themselves into classes and buy newspapers to meet their special wants, they could get quite excellent specialized journals for 10 cents and upward, but when they are compelled to buy in the mass, because advertising revenue is dependent on mass circulation, they are forced to pay for a whole lot of stuff they don't want, because the other fellow demands it.

The public demanded *cheap* newspapers and *good* newspapers. To supply them the publishers were compelled to develop their by-product of advertising, and to obtain advertising revenue they were forced to seek mass circulation. No more perfect illustration than the economic spiral can be found than this basic fact of publishing economics.

The quest for mass circulation, forced by the public demand for cheap papers of high quality, has finally reacted to produce cheap newspapers both in price and quality—using the word cheap not in its money sense—for it is a fact that some of the most expensive stuff published is the least intelligent, both in execution and in appeal.

Lives Upon Its By-Product

THE newspaper reader is now forced to buy a product appealing to every element of the community irrespective of what *he* wants to read. To obtain and hold a volume of circulation sufficient to command the advertising revenues, the newspaper has had to expand into fields formerly occupied by special publications.

Professional baseball, under suspicion, but supposed to hold the interest of at least 50 per cent of male readers, commands one or two pages in every newspaper. *The cost of this publicity probably far exceeds the total gate receipts at all the League Parks.* The lovelorn and frequently lachrymose ladies who write to Beatrice Fairfax or Cynthia Grey for advice and consolation must have a column or column and a half a day. The handbook suckers must read the racing entries and that calls for expensive special-wire service. The man who reads the pseudo science on the editorial feature page thus helps keep the breath of life in the tottering form of race-track gambling. Probably 20 per cent of the people read the editorials, and probably five per cent know that many of them are now canned products manufactured back East, and shipped out to the "provinces."

A small per cent of readers play the stock market. The 95 per cent who do not, pay for the special wires, special writers and white paper devoted to this daily form chart of the Wall Street gaming house.

There is an outstanding article of faith in newspaper shops that women read women's page features—probably 25 per cent of them do—but this means from one to four pages in the afternoon papers. Most of us enjoy the Gumps, Jiggs, and some still stand for Mutt and Jeff. To the esthetics they are outrages, but they help pay for them.

The quest for mass circulation made necessary by the fact that the newspapers must live upon their by-product—a fundamentally false basis both in morals and economics, and fraught with ultimate consequences of evil that are becoming more evident as the process goes on—leads to actual distortion of the news. It necessitates covering a wide extent of territory, multiplication of editions, and the moving up of press times until the date line of many newspapers is a falsehood.

What You Get for "News"

THERE are widely sold editions of "afternoon" newspapers in New York, the usual news "deadline" of which is midnight of the day before. Afternoon newspapers are compelled to print their main editions so early that what straight news they contain is rewritten from the morning papers. Naturally they do not like to play up the other fellow's news so they give it as scant treatment as possible. They are seldom able to handle anything that happens after noon on their day of publication, and as the great bulk of human transactions are completed after the midday meal, a great deal of important news never appears in the principal or home-delivered editions of the afternoon papers, or if it does appear, is not adequately treated.

The afternoon papers for a long time have been growing in comparison to the morning press, because advertisers prefer them, believing that women read them more than the morning papers. The result of these two tendencies is to impair the news service to a large and growing class of readers, who do not get either the late afternoon editions, or the morning papers.

The race against time to cover as much territory as possible has militated against accuracy in handling the news. It has made it necessary for the reporter in contact with actual happenings to telephone the news

A Helping Hand for the Lonely Wayfarer

Travelers' Aid Society Does Much for Those Bewildered by Trips

By H. W. PATTON

TWO little children, a boy and girl, who appeared no more than six or seven years old, were traveling alone across the country in a railroad train. That they were not poor little rich youngsters was evident from their garments, which were clean, but cheap and obviously homemade. Besides they were in a day coach—further evidence that their parents were not oversupplied with this world's goods. Rich children do not ride in day coaches, especially at night. These more fortunate youngsters ride in Pullmans and are put to sleep in a comfortable berth. Children of the better class do not often travel alone, but they do sometimes, as will be shown.

To return to the type of youthful travelers with which this article begins, there are thousands of such travelers now, and no harm befalls them on their journeys, and they never fail to reach their destination, thanks to that little-known, but very useful organization, the Travelers' Aid Society, whose representatives look after their welfare along the way.

(C) Underwood & Underwood
A little girl and her dolly, just arrived from Europe alone, and she at once came under the protecting wing of the Travelers' Aid.

These children travel because some emergency has made it necessary. Perhaps their mother has died and the father is sending them to relatives in some other section of the country. He is unable to accompany them because of financial or other reasons, so the Travelers' Aid performs the service for him without cost.

In former days the Travelers' Aid tagged these youthful wayfarers, the tags bearing the names of the children and their destination. The tags made the little ones conspicuous, and they were the recipients of much attention from adult passengers on the trains. The passengers used to stuff the children with all sorts of goodies and actually made it so pleasant for them that they were loath to leave the trains when they reached their destinations. An official of the Travelers' Aid said that in most cases the adult passengers had no interest whatever in the children—they used to feed them good things just to amuse themselves or to relieve the monotony of traveling. Anyhow, children traveling alone under the protection of the Travelers' Aid no longer are tagged, and the only attention they receive on the road is from the conductors, who see that they are comfortable, for conductors heartily co-operate with the society in its work.

The children are put aboard trains in charge of conductors and the conductors see that they stay aboard until they reach their destination, or until their arrival at a point of change. In the latter cases, the conductors turn the children over to a Travelers' Aid at the changing point, and she puts them on the proper train. Many of these children are met by the aids by appointment; that is, a telegram precedes them, and if the children are too young to tell their names, a description of them is contained in the wire, so that the aid at their destination or point of change will know whom to look out for and protect. Many children of the rich now are in-

An immigrant mother and her baby, cared for by the Travelers' Aid on arrival at Ellis Island.

trusted to the care of the Travelers' Aid, too, but they ride in Pullmans and have comforts others cannot enjoy. These children are sent hundreds of miles to schools in different parts of the country. They are unaccompanied by parents or nurse, but no harm ever befalls them. They go back and forth between school and home at vacation time under the watchful eyes of the aids.

The work of the society is international in scope, and young children not only travel in safety and comfort all over the United States, but journey from one end of the world to the other and always reach their destinations.

Not long ago a Hungarian girl 11 years old, and speaking no English, started from Budapest alone for America. She was nearly three months making her way out of her native land and across the Atlantic. She was discharged to a Travelers' Aid at Ellis Island. Her passport stated that she was on her way to Monarch, New York. There is no such place, and after diligent effort, the society located her parents in Monarch, Wyoming, and the child was sent there, being looked after at points along the way by Travelers' Aid people.

(C) Underwood & Underwood
Five years old, and he came from Europe to America alone, where the Travelers' Aid saw to it that he reached his destination, a small inland town.

Sixteen-year-old Italian immigrant protected by Travelers' Aid. She was bound for a small Michigan town, but she had the wrong address. The Travelers' Aid finally straightened her out.

Two children, a boy and girl, both four years old, were discharged to the society at Ellis Island a month ago. One was an alien and the other had acquired citizenship through his mother marrying an American soldier. These toddlers had crossed the ocean alone, and were bound for North Carolina. They made the entire trip from New York to their destination alone, being met at all points of change by Travelers' Aid workers.

These are only examples of the helpful service performed by the society. It must not be taken for granted, however, that the work of the society is all in behalf of child travelers. On the other hand, this work is only a small part, though it perhaps is the most appealing.

Immigration inspectors at Ellis Island discharge to the society all women, girls and children who are eligible to be admitted to the United States, but who, in the opinion of the inspectors, need further care or assistance to their destination. These include all young women and girls coming to the United States to marry.

And there were 3,700 young women and girls entering Ellis Island last year who stated that their purpose in coming to America was to marry and who were discharged to the Travelers' Aid. Every one of these cases was investigated by the society, and the workers discovered that in many

Ohio—A Paradise of the Money Lenders

Taxes for Interest Are Higher Than Taxes for City Expenses; Usurers' Joker Costs Citizens of the Buckeye State Dearly

By EMERSON ROBINSON

EXCITEMENT arose in Ohio a few months ago. "Only 25 per cent of the people think," a prominent state official was quoted as saying.

Ensued an immediate stampede of adults and near adults into the preferred class and just as they were resting happily in their intellectuality, the statement was denied.

It may be true that in other states only 25 per cent of the people think; it may even have been true in Ohio a few years ago, but it most assuredly is too low an estimate now.

Residents of the cities *are* thinking—thinking of the mountainous debts which have been pyramided upon them in the last eight years, and they are crying out aloud for relief from the over-burden of "interest" taxes and maturing obligations.

And the bond buyers and money lenders are enjoying these "interest" dollars wrung through a law from a legislature in which the Bill Smiths and the Sam Joneses had implicit confidence.

In 1910, Judson Harmon, lawyer, and former attorney-general of the United States, was elected governor. Sentiment for a taxation system to replace the archaic one then in force was almost universal. At that time it was customary to return property at a low value; the tax rate was very high.

Governor Harmon evolved a plan which he believed and which others believed and still believe, would have resulted in a solution; but it was only partially adopted —its teeth were left out.

The so-called Smith law was the result. It provided for a 100 per cent valuation of all property and a maximum tax rate of 10 mills, exclusive of a levy to take care of bonds voted by the people. Fine on the face of it but—

The Money Lenders' Joker

IT DID not contain any drastic provision to compel listing of all property at its true value! That was the money lenders' joker.

That it was engineered and forced through the legislature by the money lenders has been repeatedly charged throughout the state.

Idle money was plentiful in the state at that time. A number of representative money lenders got together. They argued that it was as essential to create a market for money as to create a market for anything else. A careful study of the finances of the cities and the school districts was made and the conclusion reached that one per cent would be about the right maximum tax rate for these districts for the reason that one per cent *would not bring in sufficient revenues to finance their affairs and they would have to borrow money, or issue bonds!*

The public, as is customary in such deals, was not taken into the confidence of the usurers but was led to believe that the appraisal of all property at its true value would result in a tax rate of less than one per cent, and that all intangible property voluntarily would be returned.

C. A. Dyer, overseer of the Ohio State Grange, has made these charges openly on the platform in all the large cities of the state, before bankers and others who should have known the truth or falsity of the statements. They have never to this date been challenged!

And the condition of the state is mute evidence of the success of the law and of the scheme of its inventors.

The bonded indebtedness of all the cities, schools, counties and townships in 1911 was about $187,000,000. On July 1, 1921, it was $607,899,000; today (the official figures will not be ready for several months) it is conservatively estimated at $700,000,000 on which the people are paying $36,000,000 in interest!

An increase of $513,000,000 indebtedness in 10 years!

A tribute of more than $100,000 a day interest charges on the people of Ohio!

What Interest Bill Would Do

THE interest bill alone would have paid all the expenses of the state and its various subdivisions 30 years ago! It would more than pay for the gigantic engineering project which is designed to prevent future floods in the Miami Valley! It would keep 30,000 families in comfort for a year!

Ohioans expected a taxpayers' millennium; instead they got a money lenders' paradise, made to order.

Within a year after the Smith law became effective, bonds began to be issued in greater sums than ever before and with the succeeding years they began to pile up at an alarming rate.

They were issued for the very smallest of improvements which ordinarily would have been taken care of by the current expense fund. Then they were issued to meet operating expenses—the full harvest of the money lenders was on.

And with the coming of the year 1922 you have this situation:

> In the 94 cities in the state (of 5,000 population and upward) *more than 52 per cent of all taxes and other revenues raised for city purposes is being paid out in interest and to retire bonds.* **Four of the cities are paying between 83 and 85 per cent for these purposes.** Many others are paying from 70 to 80 per cent; others 60 to 70 per cent; others, 50 to 60 per cent, and so on. A number of the smaller cities, however, are able to get along with a normal percentage for their sinking funds.

An Ohio legislator, recently seeking information on the debt situation, wrote to an official in New Jersey and asked what, in his opinion, was a fair proportion of income to be paid for interest and bonds. He got the answer that in that state if these requirements exceed 20 per cent, it's considered time to call out the riot squad, armed with machine guns and assisted by the fire department.

"Sinking Fund" is a correct phrase, as the people of Ohio are learning to their sorrow!

Bankruptcy Is Faced

JOSEPH B. TRACY, in his report for the year ending June 30, 1921, just issued, sounds this warning: That unless the political subdivisions of the state desire to escape bankruptcy, there will have to be a reduction of the ratio of debt to wealth. He shows the public debts increased $16.95 for every man, woman and child, while the wealth, as represented on the grand tax duplicate, increased only 10.6 per cent or $1,025,078,248.

The per capita debt a year ago was $142.06; now it is about $155.

Add to this the per capita debt of the nation, approximately $248, and you will see that Ohioans are up against a pretty stiff liability!

Further, for the year ending June 30, 1921, the city debt increased by more than $50,000,000 to $342,112,636 and the school debt by $40,000,000 to $133,029,406. Ohio is burning both ends of the candle against the middle with a tax increase of 35 per cent, a debt increase of more than 20 per cent and tax duplicate increase of only 10 per cent.

Did the money lenders figure well in 1910? Ask any taxpayer!

The original Smith law provided that the amount collected in 1911 should only exceed the amount collected in 1910 by six per cent, plus three per cent in 1912, plus three per cent in 1913. This schedule was repealed in 1913 and it was generally admitted at the time of its adoption that it was only temporary.

It became effective June 2, 1911, and in the first year of its operation, it failed, as the money lenders knew it would, to accomplish its publicly avowed purpose—to force personal property to bear an equitable share of the tax burden.

Various manipulations of the law followed, and members of the legislature evidently knew this would cripple activities in the cities and gave them, as a sop, permission to issue deficiency bonds for current expenses.

So deficiency bonds became popular in Ohio. They were issued in practically every one of the more important cities, millions and millions of them, and the people of 1930 and 1945 will be paying the wages and salaries and the current expenses of the cities in 1920 and 1921.

The people are paying interest on these bonds and will continue to pay interest on them, and on other bonds which were issued and the asset still unpaid for.

What Interest Did for Bellaire!

FOR instance, in Bellaire, Ohio, bonds were issued in 1879 for the construction of a waterworks plant. The cost was fixed at $100,000 and the issue was for that amount. The citizens there have paid out $249,000 in interest charges, but with all that effort they have been able to pay only $15,000 on the original bond issue. If the debt could be wiped off for cash today that plant would have cost Bellaire a total of $334,000. That is what interest does.

In 1878, Toledo got ambitious and bonded itself for $432,000 to buy a railroad. This road was sold years ago *but the people will not finish paying for the bonds until 1930.* Then again, the same city got more ambitious in 1889 and started in the oil and gas business. This did not meet with the approval of Mr. Rockefeller's company and competition started. The wells were pumped dry in a few years. The last bond was paid in 1919.

Portsmouth wanted a new bridge across the Sciota River in the days of long ago—too long to recall. Bonds, of course, were issued but they were not paid until 1920 or 40 years after the bridge had disappeared, probably washed out by a flood.

Butler County built a fine suspension bridge across the Miami River at Hamilton a good many years ago. The last of the bonds mature in 1924 but the bridge was removed from the bed of the river a couple of years ago when work was started to prevent a recurrence of the flood which took it away in 1913.

There are untold instances such as this throughout the state, according to the Ohio Institute for Public Efficiency, a private organization which was organized in 1914 with the view of helping to bring about efficiency and economy in public work.

Toledo, the third largest city in the state, has adopted a novel plan in handling its finances this year. All of the money derived from taxation was placed in one fund and the policy of first come, first served was put into execution. So officials face what they term an overdraft of $1,316,000 which includes appropriations for which there is no money, excess expenditures by departments over allowances, and bond issues whose funds have been spent but the improvements for which they were authorized never carried out. Sinking fund requirements this year total $1,387,560 and $400,000 more in 1923. *The interest charge alone this year is $709,746.*

In Cincinnati, about $6,000,000 has been issued in *deficiency bonds* and the city has been forced to levy an occupational tax to increase its current expense fund.

In 1915, Cincinnati received $3,070,091 for current expenses; this year it received from taxation $1,866,800, but if it had no interest charge, it could meet all of its expenses very nicely.

At the election last fall, the people refused to vote a special levy and when the first of the year came, George P. Carrel, who was elected mayor, faced the necessity of cutting down the city expenses. He used the pruning knife ruthlessly, policemen were laid off, fire houses closed, and much street cleaning stopped. And he took the vote of the people as a mandate that no more bonds should be issued. This had been his policy since his inauguration, but he's having a fight now. The majority in council has voted to issue bonds for $2,000,000 for various improvements. If they are issued, it will mean a further cutting of the city's current expense fund next year. Southern Ohio is watching this fight of the mayor.

Business Mayor in Hamilton

IN HAMILTON, Harry J. Koehler, Jr., who was elected mayor, has put every department on a business basis, forced economies and expects to operate the city for $100,000 less this year than last. No bonds are being issued for extensive improvements. He has notified property owners that if they want a street paved they will have to pay the entire cost. Heretofore, the intersections have been paid for by city bond issues.

Dayton has issued $1,500,000 in *deficiency bonds* which in the words of the director of finance was undoubtedly bad financial practice. Dayton, too, is paying in interest this year $247,400 and for bonds maturing only $12,100 more.

In Youngstown, they elected an unusual mayor last autumn, George E. Oles, a rather brusque and picturesque official, and he has been having one continual round of battle since his inauguration. He has forced certain economies and his latest was to force council to drop 25 policemen from the payroll. Under threat of a further curtailment, council issued bonds for money to meet the payroll of others. This is due to the fact *that 62 per cent of the city's income goes for interest and bonds,* helped along by the heydey of deficiency bonds when Youngstown needed cash to pay her bills and $1,755,577 of these bonds was put on the market.

The debt of Cuyahoga County, including cities, schools, and so on, is $154,532,785 and the debt of the cities alone, $97,134,472. All but a small percentage of this is against *Cleveland which is paying this year 38 per cent of her income for bonds and interest.*

What will the cities do next year and the next? What will many of them do the latter part of this year after they have used up all of their funds? They cannot issue deficiency bonds; it's now against the law. The officials, or many of them, are like the grasshopper which chirps happily along the summer without a thought of the winter.

Some of them may take advantage of an old law which permits issuing of bonds to pay policemen and firemen only after the service has been rendered and the salary made a lien against the city.

Some of the schools will reduce their school terms; some will ask for a special levy from the people.

"Pay-as-you-go" Law Passed

BUT none of these will effect a cure. They will only postpone the day of reckoning and give more tribute to the bondholders.

Taxing districts must be put on a business basis. And to aid in this the last legislature passed a "pay-as-you-go" law.

This provides that taxing districts cannot borrow money for current expenses and defines current expenses as any improvement the life of which is five years or less. It restricts the life of bonds to the probable life of the improvement. It makes compulsory retirement of bonds and forces the serial issue of these bonds. To give these taxing districts sufficient time to go on this new basis, a companion law gives the people power to lift all tax limitations by direct vote up to September, 1923.

The money lenders have had their inning in Ohio. It may last for a little while longer but it has passed its zenith.

And the official who was credited with saying that only 25 per cent of the people think, was wrong. Every taxpayer is thinking and kicking when he goes to the county treasurer's office twice a year to pay his taxes; and every tenant is thinking when he pays this tax, plus interest, to his landlord.

In the Populous Realm of Four-Flushing

Poseurs Make a Fine Art of the Masquerade of Wealth and Place

By EDWARD J. BECK

"EVEN lying fluctuates according to the season of the year; the imagination yields its rarest fruits of fancy in the summer," said an eminent psychologist in a lecture to a class of his summer students.

"In vacation time the inhibitions of the everyday environment are broken down. For several weeks the paltry details and limiting realities of daily life are cast aside. The ribbon clerk and stenographer pose in rôles that come nearest to expressing their secret aspirations. We must not judge the pretensions of the seashore too harshly, because the pretenders are merely succumbing to their daydreaming propensity. Because of the time and the place they dream out loud. Many an O. Henry story is re-enacted when the pseudo-broker discovers the pseudo-heiress to be a shop girl on leave and she finds her hastily netted catch to be an aspiring shipping clerk."

We toil and sweat and scheme for money because the size of our stack of chips is ocular proof of our superior playing ability in the game of life. Whatever our aim in life may be on the surface, when expressed in terms of its least common denominator, it is gratification of our self-esteem by winning the esteem or exciting the envy of our fellows.

We can attain the satisfaction of self-realization in three different ways. We can create and produce; we can "kid" ourselves; or we can four-flush.

We all harbor certain more or less grandiose illusions about ourselves. They give us a subjective satisfaction equivalent to that derived from having "the real goods" just as a miser might gloat over a hoard of money, part of which is counterfeit.

But, after all, our self-respect depends on the respect others have for us. Unless we are insane, our self-approbation must rest on at least a foundation of genuine social approval. The crazy man is happy in imagining he is Napoleon, J. P. Morgan or Henry Ward Beecher, but the normal person cannot satisfy his vanity by cherishing such extreme delusions. His nature demands applause from the galleries of the crowd instead of merely from the back-stage of his own mind.

Achievement is the royal road to eminence, but the four-flusher tries to reach that objective by a side-alley. The "have-nots" can go A. W. O. L. from the Coxey's army or nobodies and sneak over to the camp of the "Who's Who" crowd by the back-road of pretense.

The habitat of the four-flusher is the modern city. You will find him most numerous in the lobby of the large hotel. He is the product of our pecuniary standards of living. A *good* bluffer is entitled to some respect. He plays his game with finesse and skill. The four-flusher is merely an example of the vulgarization of our social ideals.

If there were a Nobel prize for four-flushing, I think I should nominate for the honor a drug clerk who dispenses pills and sodas in a pharmacy near Columbia University in New York. To his acquaintances the debonair clerk is known as "Count." There is no doubt of his aristocratic birth, because he can show envelopes addressed to him from Hungary which bear his title.

This is only one of his many exploits. Count had a park-bench acquaintance who was caretaker for a rich man's pleasure boat, which was anchored in the Hudson River, near Grant's Tomb. The owner was absent for some weeks and left orders that under no circumstances was the boat to be run while he was away. Count bribed the caretaker to let him bring an occasional friend aboard. Count was a lady killer par excellence. Whenever he scraped up an acquaintance with a typical Manhattan flapper he would begin by telling of his noble lineage, allude to his wealth and wind up with a mention of his yacht.

"Wouldn't you like to take a trip to Tarrytown in my yacht this afternoon?" was his supreme stroke. The maiden, finding the dreams founded on years of Sunday newspaper reading at last realized, of course, jumped at the chance.

They went down to the dock and first inspected the luxurious craft fore and aft. "George," the count would say to the caretaker, "I want you to run us up to Tarrytown this afternoon."

George would then shamefacedly reply: "Sir, I regret that the engine has not yet been repaired," just as he had been instructed in the rehearsal.

And then the count would express his disappointment at "his" menial's dilatoriness with a dramatic cussing-out.

He couldn't sail up the river, but he had by his dramatic stroke aviated to the loftiest pinnacle of the young lady's estimation. For every four-flusher there is a four-flushee—a person whose ratings of others are based on as vulgar and false standards as those of the perpetrator of the pretense.

In New York there are firms which specialize in lavishly furnishing a house for an evening party at so much per. Liveried servants are supplied, and all the appurtenances of affluence are rentable for the occasion.

Merchants are imposed on by the four-flusher out seeking distinction by spurious means. Two women walked into a store and one of them excited the envy of her companion by inspecting all the elaborate silver coffee urns in the department and then buying the most expensive one. She did not pay cash, but asked to have it sent out C. O. D. She never expected to accept or pay for the goods, but she could not resist the opportunity to impress her friend. It is a common trick to order merchandise from very expensive and exclusive stores so that the neighbors will be impressed when they see a truck and a liveried chauffeur from the high-class shop stop next door. Later, the goods are returned as unsatisfactory, or if the package is small and the customer has no charge account, they are refused at the door.

That there are various and devious ways of flattering one's self-importance is exemplified by the man who goes into an exclusive hotel and tips a bell hop to page himself. To hear the sound of his name reverberating through the gilded arches thrills him. Furthermore, it impresses anyone who may know him and who hears it. The clerks in some of the best hotels for a gratuity permit the four-flusher to receive his mail at that address. One fellow used to awe the clerk by registering and then pulling several packages of "money" out of a grip and asking him to put them in the safe. The packages were labeled "$3,000" on the outside; the inside was filled with newspaper. The four-flusher who regularly writes his letters on the stationery of an expensive hotel is a common pest whom the managers are trying to suppress.

A common trick is for a company which occupies a small office in a large building to put a picture of the structure on its letterhead with a large faked sign bearing its name emblazoned somewhere on it. Or a fellow by the name of Jones will move into the Skinner Building; find a poor fellow by the name of Skinner; give him a small sum for the use of his name and thus acquire the right to have the concern's mail addressed to the Skinner Company, Skinner Building, Chicago.

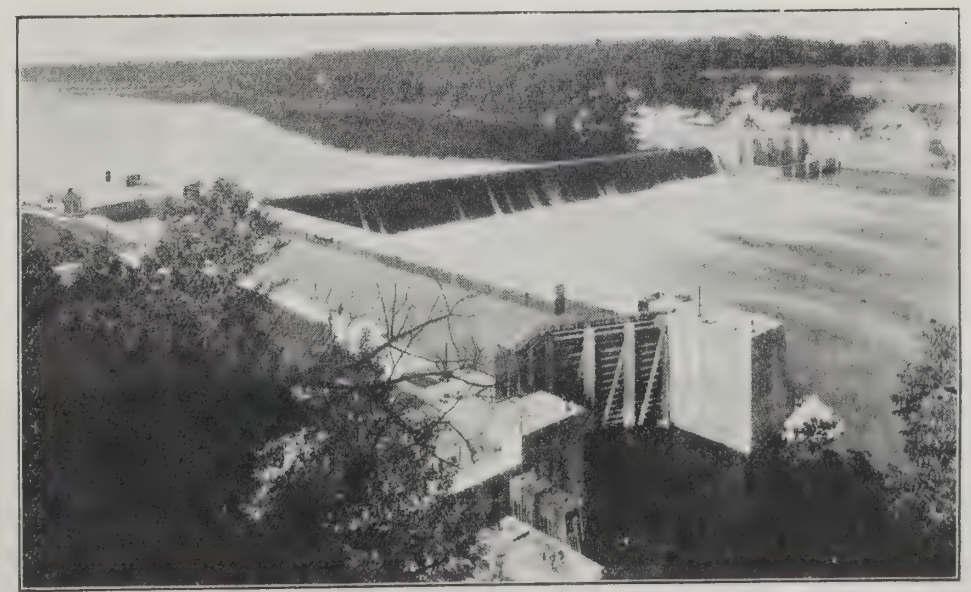
According to the accounts in the papers, some residences which have been burglarized must have been veritable treasure houses. According to the report given to the police, thousands of dollars' worth of diamonds and jewels have been taken. The victim who may have lost only a set of silverware couldn't resist the temptation to create a splurge by exaggerating his losses.

If you or I intended to make a splash, we'd try to do it in front of our friends so that our achievement would have permanence and follow-up results by being engraved on the tablets of memory of our associates. But the thirty-third degree four-flusher makes his grandest splurge in an alien environment. He likes to impress a strange crowd in a strange restaurant by his spendthrift performances. He wants subjective satisfaction from ostentatiously spending his money and seems to be able to get it even by playing before a strange audience.

The possession of a large and showy library is a favorite method of showing non-existent erudition. The president of a national trade association has for three years made a finely composed speech to the annual convention of the organization. I know the man who wrote them for him. This writer also wrote a pageant for the celebration of a missionary society which drew visitors from all over the country. A lumberman's wife was credited with the authorship in the program, and she beamed with pride when her friends showered her with congratulations for her hitherto undiscovered literary talent. Publishers get out books of happy phrases "to embellish conversation and correspondence," thus enabling a low brow to display a classic style. There are bureaus which prepare orations, college debates and essays at modest rates.

Harnessing Waters of the Upper Mississippi

By EARL CHRISTMAS



THE Upper Mississippi, fitting origin of the mighty Father of Waters, is to be harnessed by man. For more than four years, a big dam built across the river at the head of navigation at St. Paul has held undeveloped possibilities of an extensive water power project. For four years, great quantities of water have gone over the 700-foot apron of the high dam, wasted, unused.

Now, however, the water is to be turned to the use of man. The city of St. Paul already has asked formally for permission to use the power from the dam. The city of Minneapolis also plans to ask for a permit for the power. The dam, known locally as the government high dam, is located between St. Paul and Minneapolis. One private corporation also has asked for permit to use the power. Plans for utilization of the power are being prepared by engineers, and a formal hearing is to be held by the water power commission.

How the power is to be used has not been determined. One plan suggested is to lease the power to an industry. Another plan is for the city—provided St. Paul is given permit to use the power—to build a municipal plant at the dam. Engineers estimate that with an expenditure of $600,000, the city could develop 15,000 horse power.

In other words, 15,000 horse power, now going to waste over the dam, at the very door of the city, could be harnessed to generate 33,000,000 kilowatt hours of electricity a year.

One plan under consideration is to lease the power, once the right is obtained by the city, to existing companies with equipment for distribution of the electricity. One company, engaged in the development and distribution of power, already has made application for the power. Officials of this company placed the amount of power that may be depended on from the dam at 4,000. Rather, this was the estimate of engineers of the company of the amount that may be counted on with certainty every day, allowing for periods of low water.

The $1,000,000 dam over the Mississippi at St. Paul, destined to furnish vast quantities of electricity for the city on its banks.

Other engineers, however, have held out greater possibilities in the power now being wasted at the dam. The dam was built primarily for navigation purposes, but apparently it soon will be performing another important function, the provision of electricity or power for one of the cities on the banks of the river. Originally, plans were made for utilization of the power by the cities of St. Paul and Minneapolis and the University of Minnesota. A corporation was formed for this purpose, but difficulties in financing the project under the state laws necessitated the abandonment of that project. Now, both St. Paul and Minneapolis are applicants for the coveted power, to say nothing of a private corporation. Wasted for four years, the power suddenly becomes much sought.

Judge Kenesaw Mountain Landis, visiting the dam not long ago, was moved to strong words at official delay and red tape that had prevented development of the project.

"It's a crime," he said. "Indeed, it is an outrage. Here is all this water. Think of its vast power as it sweeps over that dam. Yet, there it is going over the dam unused, wasted, gone to the sea forever without being used."

But the wasted water of the dam soon will be utilized, it appears. When the Water Power Commission can decide to whom it will grant a permit, the Upper Mississippi will be turning its power into the wheels of industry or providing light and power for a city.

Turn to the Left in Rome, to the Right Outside

In Which an American Traveler Jots Down What Interests Him

By WILLIAM ATHERTON DU PUY

I SAW in Paris a taxicab in which hung brazenly a placard which read: "English spoken, American understood."

It is little trouble, I found, to get along with the one language in Paris. There is always somebody about who speaks English. And many Americans have high school French.

But Italy is largely a one-language country. Possession of a smattering of French does not help one much. Oddly, a bit of Spanish one may have picked up on the Mexican border is of great service. An Italian can "sabe Espanol." I was using a bit of this sort of Spanish on one of those gorgeous policemen with hats just like Napoleon, and how do you suppose he came back at me?

"Why don't you talk United States?" he said. He had grown up in Providence, Rhode Island.

Rome gives the impression of being much farther from the United States than is Paris or Geneva. In both of the latter cities, for instance, one sees American movies more than any other, and derives a good deal of amusement from trying to follow them with the interscripts in a language he cannot read. "Charlot," as Charlie Chaplin is billed, is very popular, as is Bill Hart, the two-gun man. But when one gets into Italy the American film disappears. One still gets American shoes, soap, talcum powders, but not much else.

In Rome, the vehicles all turn to the left; outside the city limits they turn to the right.

A guide at St. Peter's told me this—a guide with an instinct for the dramatic:

He had just shown me the bronze St. Peter of heroic proportions which stands at one side of the nave and which has received the worshipful caresses of devout pilgrims for 1,700 years. Two and one-half inches had been worn off the protruding bronze toe by those centuries of caresses. Think of the number of kisses necessary to wear away two and one-half inches of bronze!

The Low-Necked Hacks of Rome

THEY turn to the left in the streets of Rome—usually. It is the rule but there are no traffic regulations. Sometimes they turn to the right. They pass on the left or right. They wind in and out. They dodge about. They dash madly past street cars, trams I should say, that are disgorging passengers. They disport themselves in such a way as would get one arrested four times in a block in America.

All the time you are riding in a low-necked hack. Remember the low-necked hacks they used to have in America? Once in a long while in Washington you see an old couple drive out in one of them yet—a sentimental survival of a past generation. Well, do you know what became of those low-necked hacks? They have all been sent to Rome and are today being used to transport the gladiators' descendants and the tourists from one place to another about the Eternal City.

Three *lire* will take you a dozen blocks in one of these carriages, low and open and comfortable. Taxis, on the contrary, while they are to be had, cost twice as much as in America.

While there are taxicabs in the cities the absence of automobiles for other uses is one of the striking differences in Europe. One might ride on the train for an hour through the country and never see an automobile. And one never sees the black and friendly face of a Negro in Italy. And one rarely sees the face of a Jew.

"Jews seek out the country where money is plentiful," an Italian told me, "and congregate there. Italy is poor and has few Jews."

A *lire,* to be sure, is, to be exact, nearly six cents. In Paris there is the *franc,* similarly designated in Switzerland, the *mark* in Germany, but in Italy called the *lire,* pronounced "leree," with the *e* long. Before the war they all used to be worth about 20 cents. Now, however, the French franc is worth nine cents, the Italian lire six cents, the German mark almost nothing, while the Swiss franc still maintains par at 20. Currencies have been much mussed up since the war.

Where the exchange is most upset, there the tourist can tour cheapest and the buyer procure his greatest bargains. So it happens that the nation which has maintained its currency on the soundest basis is losing the trade and the travelers. The schools of Switzerland are without students and the hotels are empty and for the cruel reason that her currency is sound!

"America has never done Italy justice," a cultured lady of that country told me. "They regard us as a race of fruit peddlers. Look upon this city and conceive the character that a people must have had to build it."

"The people who built it did have character," an American friend afterward said to me, "but that people, the ancient Romans, is passed and gone. The Italians of today are different."

Which is a conclusion not at all just if one examines the facts. The Rome of the Caesars is gone, as a matter of fact. The ancient Forum is a pile of rubbish from which protrudes an occasional classic pillar. I hunted out the very spot where Mark Anthony stood when he requested his countrymen to lend him their ears. "Here mighty Caesar fell." Only the cement core of the ancient structure remains to mark the spot. A patch of corrugated roofing protects it from further decay. The ragged, circular walls of the Colosseum are in the background and the Palatine Hill, where the emperors dwelt, is just to the right, a mass of fallen walls. The Forum of ancient Rome lies buried in its narrow valley which Christian Rome made the dumping place for rubbish for a thousand years and has but of late been exhumed. The new Rome is more modern.

And wherever one goes about this Rome he finds evidences of the handiwork of a superior people. If he looks down from his hotel windows into a palace garden across the street he sees a formal arrangement of shrubs tucking away the classic marble figures that adorn it. If he looks out his back window the cornice of the adjoining building presents to him the stone-preserved figures of the classic muses. The ceiling of the bookstore he visits may be handpainted. Any vista down a narrow street may present a harmonized scheme of buildings, each so designed as to fit into the whole picture and make it worthy of the canvas of a master. There are no streets in Rome so bad as to approach the unattractiveness of the average side street in the business section of an American city. After some weeks in the presence of European streets that have grown like parkways in the hands of landscape gardeners, one shudders at the thought of ragged, chaotic Broadway. Surely, he says, America can be awakened to the fact that a street needs as much watching and direction in its growing as does a hedge.

But what I started out to say was that the magnificence of modern Rome is due to the character of the modern Roman, descendant from the time of Caesar and inheriting the instincts of his fathers. St. Peter's, greatest structure of the western world, is comparatively modern. The stupendous monument of Victor Emmanuel II, standing at the end of the Corso, Rome's main street, is not yet completed, although it has now been under way for 30 years. They have spent 100,000,000 lire on it, despite Italian poverty, which would have been $20,000,000 on the post-war basis. In America we have recently completed the Lincoln Memorial in Washington, at a cost of $4,000,000, and I have often heard it said that it is the greatest monument ever erected to any man. It would be lost, however, in a corner of the Victor Emmanuel monument. All of which does not prove that the latter is great art, it probably being too early for the verdict.

So these Italians must be pretty good people with something quite stern back of their pleasing exteriors. Italy as a nation was but lately formed by modern Italians out of a group of chaotic states.

"Roma," they call their Eternal City and I am entirely unable to follow the logic of outsiders who insist on calling it "Rome." This sort of thing is done quite regularly in Europe. When I went down to Genoa to the conference, for instance, I found that the dwellers in the home town of Christopher Columbus called it Genova, and the French, next-door neighbors, designated it as Genes. Now I think folks ought to know what the names of their own cities are and that we should accept them as authority.

Gets "Breaks" on an Omelet

MY WIFE went to Genoa with me. Why should one not take his wife to an economic conference?

The first morning we quite upset the ménage by insisting on an omelet for breakfast. Now, the continental breakfast is coffee, rolls and jam and there is consternation if one attempts to change it. But the best part of our insistence on omelet was this: When the waiter brought it he very painstakingly divided it, one portion, as nearly as I could make out, being two-fifths of the whole and the other being three-fifths. Then he gave the larger portion to me. It happens all the time here. Men are regarded as the more important element in the matrimonial couplet and are rationed accordingly.

We had eaten many Italian *table de hote* dinners in New York and I may say without fear of successful contradiction that they are the safest buy in that city for one with a good appetite and a limited purse. So in Genoa we began to look around for Italian *table de hotes* but in vain. Everything was short order. To be sure the waiter expected you to eat along certain conventional lines. You must have a large plate of either macaroni or rice with grated cheese over it for lunch, or a stupendous helping of soup with the whole vegetable garden in it for dinner. Then fish, then chicken, if you took the waiter's suggestion, for chickens grow freely, then cheese; then fruit. All the portions were much larger than those you got in America and you began to worry about your wife growing stout. The fruit course, for instance, consisted of nuts, dates, figs, pears and oranges, all heaped together, and eat all you want.

And wine, of course. The simplest of these was the "wine of the country" which New York used to call "red ink." It cost you two lire a bottle. If you failed to take wine the waiter was completely dazed. He did not understand. He groped back into his waiting past to 1903 and remembered a customer who had failed to take wine. I do not believe that "Pussyfoot" Johnson himself could long withstand the surprised pain that is inflicted on an Italian waiter when you decline wine. Though a prohibitionist for 20 years I have now drunk wine with my meals for weeks.

Well, in Genoa one goes around to see where Christopher Columbus was born and an odd and picturesque nook it is. Here is the financial section of the town with the new Bank of Italy standing out in modern magnificence. The ancient prison of Genoa was torn down to make a place for it. Two of the prison towers, however, more than a thousand years old, and a block of stone which represented two ancient rooms in the prison building, were left standing. It was in one of these towers that the father of Christopher Columbus spent his life as a watchman. It was in the two preserved rooms that he dwelt and that the son was born. The flagstones hereabout knew well the boyhood bare feet of him who was to discover America. How differently the history of a hemisphere might have shaped itself, one may wonder as he stands here, if the watchman's child had been a girl!

And back of the prison down Bricabrac street, or its equivalent in Italian, is the old town. There is a square mile of this old town running down to the harbor and St. George's Palace where Lloyd George tried heroically to jolly his unsympathetic associates into an attitude of harmony and accomplishment on that opening day of the conference. It occupies about all the level ground there is hereabouts. To me it is one of the most fascinating communities I ever saw. It is built solidly of large, thick-walled buildings of the tenement type, eight stories high. They have been there a thousand years and more, but are unaffected by time. They teem with a busy mass of humanity—the reservoir of this seafaring commercial people which has meant much to the world, a people of whose blood was not only Columbus but Napoleon, born on Corsica near by, and Garibaldi.

But the oddest part of this old town and its 200,000 people is the fact that a wagon never enters it. A wagon cannot. There are no streets wide enough to accommodate it. In many of its thoroughfares you can stand in the middle and touch both sides with your fingers. They are streets for foot passengers only. There are shops in here—baker shops, butcher shops, clothing shops, wine shops, goldsmith shops, all crowded little shops, for space is precious. All their stocks in trade come in on human backs or, sometimes in the broader streets, in pushcarts.

Genoa Climbs Up the Hills

AND up and down these narrow passageways, slits between high buildings with but slender strips of sky visible and with a ray of sunshine almost unknown, surge the modern-day descendants of the race of Columbus, little changed in a surrounding that is not changed at all—a pleasing, sturdy, half-blond race of North Italians, quite happy and prosperous.

But modern Genoa climbs up the hills. Precipitous as they are they have been terraced, and winding roadways have been cut into their sides. All over them have been built apartment houses. There are almost no individual residences in Genoa. You look across the valley at hillsides studded with these modern structures,—a patchwork of pink and yellow and brown, for these Latins have no Anglo-Saxon fear of the use of colors. And here again a whole hillside will present a harmony as an artistic whole that is without a jar. The instinct of a people working through building regulations has made every vista a picture.

One goes down to Piazza Deferrari in the middle of the town and here views a most remarkable accomplishment, the *Via Venti Settembre* or, in Americanese, Twentieth of September street. That is the name of a thoroughfare. And what I want to say right here is that the Twentieth of September street is the finest, completest and in every way most satisfactory thing by way of a street that I have ever seen in all the world.

This street again is evidence that this is a people of those fine sensibilities which are the proper measure of civilization and at the same time that they are the possessors of a practical competence to make their dreams come true.

Thirty or forty years ago Genoa decided to cut a new street out of Piazza Deferrari to relieve congestion. Since this street was to be laid down where none already existed, said the Genevese, why not make it all a street should be?

So a wide, noble thoroughfare was laid out. Then the building regulations were prescribed. The buildings all along should be of harmonious and imposing proportions, 10 stories high. But here was a difference. The builders might utilize the space to the very edge of the street and 10 stories above it. But beneath the portion of their buildings coming to the street line they should provide arcades in lieu of sidewalks. These arcades were to be constructed under prescribed regulations. They should be high-arched, splendidly columned, magnificently ornamented. Thus would they provide for this street wide sidewalks that were protected from rain and sun, that were a succession of vaulted domes, that looked out on the street through a series of classic arches, that made a superb setting for magnificent shop windows. Block after block these arcades span even the intervening streets so shoppers can pass dry shod however inclement the weather may be and untouched by the sun in the heated months. The whole scheme has been completed and is in every way gratifying. The Twentieth of September street beats them all.

Genoa abounds in the palaces of the merchant princes of her past. The hilltops of Italy are crowned by ancient castles surrounded by grim-fronted walls where robber barons used to dwell. Great battle-marked ramparts fallen into decay still girdle her modern cities. Here marched Hannibal, you are told. Caesar passed this way. Yonder building felt the touch of Michaelangelo. Here came the Byzantine artists to build their cathedrals, striped black and white in contrasting marbles. One such still stands across the way. And Milan, Florence, Venice! They are incomparable. There is nothing in all the world quite up to them.

"Hokum": the Tarnish on the Silver Screen

Concluded from page 2

"yellow" journals. The layman calls it "trash." In a field where so much serious matter could be written there is produced for publication in these weeklies and monthlies the back-fence gossip. Praise is always of the gushing, sloppy and nauseating variety. No intelligence is exercised in the policy of these publications, no attempt made to enlighten or inform, no effort to present any discussion that will tend to make better pictures or improve the performers or the audiences.

Charles Chaplin is the leading actor of the screen. He is the best-known screen performer in the world today. Chaplin is a genius. He is a student of economics and is a constant reader of economic subjects, also other subjects. He is a keen student of the drama and one of the most serious-minded men in the country. Chaplin, who makes the world laugh and cry, can play an organ, a piano or a violin. He paints pictures. He engages in sculpting and in esthetic dancing. There are few serious subjects that he cannot discuss with a surprising knowledge.

Chaplin does not grant interviews. The reason is that, after devoting more than an hour of his time, as a rule, discussing some serious topic and giving his views with an idea of helping some of the readers, Chaplin discovered that, instead of printing what he had said, the interviewers devoted the allotted space to silly dribble upon nothing in particular and credited the remarks to Chaplin. If Chaplin gave his views upon the future of Russia and his idea of solving the Russian problem, the interviewer was certain to print an article telling what Chaplin "said" about Russian "flappers" and attributing to him a series of remarks supposed to be funny, at least intended to be.

The intelligent people engaged in the making of pictures, admit that much of the harm that has come to the industry, has been the result of stupid publicity, the kind with which the weeklies and monthlies are filled. When the industry was younger (and it is really not more than 10 years old) the publicity agents decided that the one thing that would attract public attention quicker than anything else was the dollar mark. This is not new nor original with them. The dollar mark, long before the day of the motion picture press agent, was regarded as the one "sure fire hit." So the press agents began working on the dollar mark. They wrote long stories telling what this star and that star received. An actor probably would be drawing $200 a week, when he or she worked. The press agent by a simple tap of the typewriter added another "o" to the actual figure for the sake of publicity.

The method had a boomerang. The public finally tired of the publicity. The public became angry at the motion picture actors. Reading about the million dollar salaries, the million dollar mansions in which they lived, the $50,000 cars they drove, the $5,000 dogs that sat about them, the $10,000 overcoats they wore, the $2,500 gowns, the $100,000 garages, the imported food they ate, the imported wines they drank and the $2,000,000 productions they appeared in, the public grew jealous.

Consider the case frankly: Myrtle, youngest daughter of the Atkinson family, works in a factory. Her salary is $12 a week. Of this she spends 75 cents each week at a neighborhood motion picture house. Myrtle works eight hours a day for her $12 a week. Her brothers and her sisters work. They work as hard as Myrtle. They, too, spend part of their weekly earnings to see the motion pictures. They enjoy them. Then they read about the people they see upon the screen. They discover that all they do, according to the press agent, is to stroll before the camera a few afternoons each week and for this they get $1,000,000 a year. Why? Myrtle and her brothers and her sisters make that possible by paying their quarters. Myrtle rebels. Myrtle's brothers and sisters rebel and they are weaned away from the theater by this publicity instead of being attracted to it.

Now, as a matter of fact, there are a great many more persons in the motion picture business who get less than $100 a week than there are getting more than that. One of the best-known actresses of the screen, a girl who is a headliner and whose pictures are in great demand, gets $300 a week and the most popular male actor of the screen draws $1,500 a week, when he works. Those are actual salary figures.

Not alone in the matter of salary did the publicity departments err but in other departments of their work. The romance and glamour with which certain well-known screen performers were surrounded has soured the public on the industry to a certain extent.

Just a few instances can be set down here to illustrate this angle of motion picture publicity.

There was a popular screen actress of the vampire type. She acquired an enormous vogue. Much publicity was called forth in her behalf. She became a "character."

The press agent busied himself. He decided upon mystery. He sent out stories of how this "remarkable artist" was the most mysterious of women. She always arrived at the studio in a closed cab, curtains drawn. She departed in the same cab, curtains drawn. She denied herself to all interviewers. Her idle moments were spent studying the mystic arts.

Fine idea, so the press agent developed it. He finally found a reason for the mystery in his subject's make-up. He discovered that she was born in the shadow of the Sphinx while her father and mother, wealthy Europeans, were making a tour of the Far East. They pitched their tent hard by the well-known Sphinx and here, in the shadow of this famous and ancient masterpiece, the "great artist" first saw the light of the Far East sky.

So well, so good, but not for long. An enterprising reporter discovered that this "daughter of the Sphinx" was the daughter of a bartender, born over a saloon, where the owner of the place gave the father lodgings as part of his pay for serving drinks beneath the birth spot of this idol of the screen. From a room above a side-street saloon to a tent in the shadow of the Sphinx is a long, long cry.

And there was Roscoe Arbuckle, the Falstaff of the silver screen. Countless stories were printed about Arbuckle. He was graduated from one of the leading universities in the West. During his college days he was the idol of the campus, one of the greatest football players the West ever produced, a marvelous track and field athlete and what not.

Last September Arbuckle was arrested after a party in a hotel in San Francisco, a party that had a fatal ending. Reporters began delving into Arbuckle's past and they discovered that this hero of the campus was formerly a bar boy in a saloon that was not listed among "the best bars in town." Arbuckle spent his days manicuring the barroom floor during the time the press agent said he knocked the college athletic world all hollow with his feats.

Another instance is furnished by Miss Mabel Normand, one of the best-known screen actresses. Miss Normand was pictured as a student of psychology, as a philosopher and an ardent reader of philosophic literature.

One of the motion picture directors was mysteriously slain. It happened that Miss Normand was the last person to see him alive on the night before his death. In giving her testimony, Miss Normand said that she stopped her car at a corner, on her way to the director's home, to buy a bag of peanuts and the latest copy of the *Police Gazette*.

One of the male idols of the screen was a man who, according to the press agent, left his favorite hobby of studying Shakespeare and writing plays and painting pictures, to act upon the silent stage. He was a learned man, the press agent proclaimed to the world, and he proceeded to prepare for this man an astounding ancestry and endow him with a vast heritage.

One day the screen idol's wife sued him for divorce and in giving her evidence went into the unpleasant details of this actor's past. It seems he clerked in a store where imitation jewelry was the article carried and then he decided to develop himself physically, so he quit the clerk's job and took dumbbell exercise to develop his body. He exercised so much that he became sick and his wife had to take in washing to support herself, the ambitious husband and their several children.

These are but a few instances. Many others could be cited. The efforts of the publicity agents to create their subjects into supermen and superwomen have plenty of limitations and drawbacks. Exposes such as the few set down here, have created a situation difficult to handle. The wrong kind of publicity is responsible.

But publicity, as this article is meant to show, is not all that ails the motion picture industry at the present time. It is a many-sided ailment.

Beauties of Canada's National Playgrounds

Concluded from page 6

400 square miles on the eastern watershed of the Rockies in Northern Alberta and constituting the largest big-game sanctuary in the world. Entrance to Jasper Park is through the Athabaska Valley, the principal route of the fur-traders in the days before the railway was dreamed of. Here on the shores of a small tarn on the continental divide, the traders from Hudson Bay met the brigades from the Pacific Coast and exchanged their burdens. They gave to this lakelet the name, "Committee's Punchbowl," which it still retains. Before the builders of the Canadian Pacific Railway definitely chose the Kicking Horse Pass farther south, the line of the transcontinental had been located through Athabaska Pass, but after that location was abandoned the pass became deserted by all but the mountain goat, the grizzly and the mountain sheep—excepting for an occasional band of Indians attracted thither by the presence of game. When, however, Athabaska Pass was chosen by both the Grand Trunk Pacific and the Canadian Northern railways (both of which are now merged in the Canadian National System) as their main route through the mountains, the Canadian Government decided to reserve the territory adjacent to the railways on each side for the benefit of the people of Canada. But the railways had not long been completed before the war came on and consequently funds have not been available for the construction of roads, bridges, trails and hotels for tourist accommodation such as are provided in the older parks. Therefore, the person who prefers to breathe the mountain air from the balcony of a luxurious hotel or to view the scenery from the tonneau of a comfortable motor car had better wait awhile; but those who like to live in a tent for a change or in a log cabin, who like to tramp among the mountains—even though under the handicap of a pack—or those who wish to go for longer jaunts with saddle and pack horse, will find in Jasper Park natural beauty of every kind that will make a vacation spent within its borders a memorable event.

Tai Shan, or "Great Sacred Mount," is the highest peak in a range of mountains extending east and west through the Shantung promontory. It was a sacred spot more than 2,000 years B. C., and it remains today a national place of worship by followers of Buddha, although the temple itself has almost fallen into ruins.

Lake Louise in Rocky Mountains Park is said to be among the first seven most perfect natural landscapes in the world, but there are those who stoutly maintain that Maligne Lake in Jasper Park is its superior. At any rate, it has a beauty all its own, set as it is at the foot of great mountains that pierce the skies on all sides, their peaks and glaciers reflected on its placid surface. It is about 40 miles from the nearest railway point and is somewhat difficult of access, but as it is the culminating point of 40 miles of unsurpassed scenery the trip will repay in full measure the necessary difficulty and inconvenience.

Maligne Lake is drained by the river of the same name, but it is the river, not the lake, that has earned the rather sinister appellation. This is because of its rapid and treacherous current. A short distance above its discharge into the Athabaska River, the Maligne passes for about half a mile through a narrow and tortuous gorge, in places not more than 10 feet in width and more than 180 feet in depth.

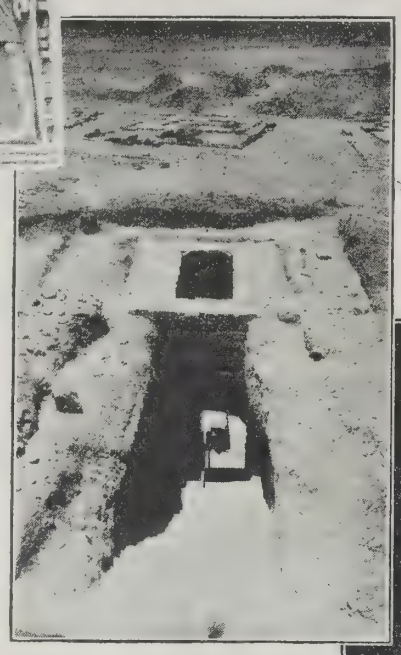
About 20 miles above Jasper Station, the principal railway point within the park, the Athabaska River itself drops over a precipice and flows through a narrow canyon which is described by Stanley Washburn, in his book, "Trails, Trappers and Tenderfeet," as follows: "The river, peaceful and quiet as some great inland waterway, comes flowing around a curve at a width well on to 200 yards, and then suddenly the banks close in and the whole volume of water seems to leap suddenly forward over a ledge less than one-third that width, and fall into a chasm some 80 feet deep. The walls close in abruptly from both sides and the vast tumult of water goes surging through a gorge so narrow that a man could easily leap across from wall to wall. Far down in the depths is the white froth and resonant roaring of this vast stream, which is congested into such meager space that it seems as though the walls of stone could not withstand the fury with which it lashes at the rocky barriers that inclose it. A hundred feet above it, the noise and thunder created down in the depths are so great that only by shouting can one make his voice heard a foot away."

All the parks that have been referred to are in the mountains. And as they are bird and game sanctuaries as well there has been a material increase in the wild life in all of them, but there were animals more greatly in need of protection from the destructive hand of man than those that inhabit the high mountains, for the comparative inaccessibility of the retreat of the latter is in some measure a protection. But the former denizens of the plains, the buffalo and the antelope, or the moose and elk of the wooded valleys, were in much greater need of preservation. With the purchase by the Canadian Government in 1907 and 1909 of the herd of 709 head of buffaloes belonging to Michel Don Pablo, of Montana, practically the entire remnant of those vast bands of buffaloes which but a few years previously roamed the prairies came into the possession of the people of Canada. That they should live and multiply under conditions as nearly similar to their wild state as possible, a reservation of approximately 160 square miles was set aside at Wainwright, Alberta, and inclosed in a special wire fence 75 miles in length. The land here is light and not particularly suited to agriculture. Numerous old buffalo trails and wallows show that it was a favored spot in days gone by.

In addition to the sentimental value arising from the protection of the animals their rapid increase promises a considerable economic gain. At the present moment the buffalo increase is such that the parks department is finding it necessary to slaughter about 1,000 males, the meat of which will be placed on the market; and the same thing will probably be done later on with regard to some of the other game animals. Thus it is seen that in this respect also the policy of setting aside ample reservations for parks purposes has a solid utilitarian foundation.

Ethiopian Pyramids Give Up Ancient History

Records of Conquerors of Egypt Uncovered



By F. N. HOLLINGSWORTH

Hand-carved amulet plaque of blue faience from tomb of a queen of Piankhy one of twenty-fifth dynasty of Egyptian rulers.

A STORY of excavation and exploration covering a period of 10 years under the blazing sun in the midst of the desert of the Upper Nile, in the Sudan, is revealed in the Harvard report of Professor George A. Reisner regarding his expedition under the joint auspices of Harvard University and the Boston Museum of Fine Arts. Dr. Reisner recently returned to America with priceless treasures, and data enough to keep Egyptologists busy for another 10 years.

The discovery of the tombs of 26 generations of Ethiopian kings, and the recovery from beneath the deeply drifted sands of material buried and forgotten for more than 2,000 years, makes it possible to write for the first time the history of Ethiopia and its lost civilization. These discoveries were made at Napata, the ancient capital of Ethiopia, but now called by the Arabs, Gebel Barkal. Napata lies in the Anglo-Egyptian Sudan, at the southern end of Dongola province, at the foot of the fourth cataract of the Nile, and the royal cemeteries were found outside of the ancient city, one on the north at the modern village of El Kur'uw and the other on the south at Nuri.

Stairway to the vaulted burial chamber of King Piankhy.

At the latter village the Egyptologists examined a group of pyramids which proved to be the tombs of the 26 kings and 55 queens of Ethiopia from 660 to 250 B. C., most of whose names had been lost to human knowledge. A few years earlier Professor Reisner's party had discovered in Ethiopia the pyramids of four kings of Egypt, Piankhy, or Pianchi, Shabaka, Shabataka and Tanutaman. They formed the Twenty-fifth Dynasty of Egypt, called Ethiopian by the ancient historians, because their home was at Napata, in Ethiopia. They were the ancestors of the kings buried at Nuri. This surprising discovery, the precursor of greater ones, was made in a field of small pyramids so ruined and so inconspicuous that Professor Reisner regarded them as the very last resort in the search for the tombs of the First Dynasty of Ethiopia.

Excavations gradually uncovered the burial chamber of Tirhaqua, the king of Ethiopia mentioned in the Book of Isaiah of the Bible, one of the five Ethiopian monarchs who ruled over Egypt. Then one by one were uncovered the tombs of other kings, queens, princes and princesses of Ethiopia for a period of more than four centuries, an interval as long as that between the discovery of America by Columbus and the present day.

After the excavations and discoveries at Nuri, four of the greatest kings of Ethiopia were still unaccounted for—kings who, like Tirhaqua, had ruled Egypt as well as Ethiopia. In the third year of search, tombs of these four kings with their queens, and indeed of six generations of their ancestors, were found at the second royal cemetery at El Kur'uw, north of Napata.

It was then learned that the royal family of Ethiopia had sprung from a tribe of Libyan nomads who had entered the province, then a part of Egypt, about 900 B. C., become Egyptianized, revolted from Egypt, and finally, under Piankhy, conquered the older country. From this sun-scorched place, five of the kings of Ethiopia had ruled Egypt and 2,000 miles of the Nile Valley, and had sent their ambassadors to the courts of Assyria and western Asia.

Above is shown the burial chamber of King Shabataka with a broken coffin bench in the center. Prof. GEORGE A. REISNER, of Harvard, whose expedition revealed a lost civilization.

Careful study of the objects and inscriptions found in these tombs has given the archeologists a full chronological list of the kings of Ethiopia during this period and a knowledge of the remarkable arts and crafts of the time. It is stated that the material discovered at Nuri and at El Kur'uw can never be duplicated.

The manner in which archeologists excavate a royal tomb is in itself interesting, and a lesson in the art of taking pains and looking carefully after details.

A gang of trained workmen was put to work to clear the stairway leading down into the tomb. This had been filled in after the funeral with the clean debris left from the excavation of the rock-cut chambers and the building of the pyramid. Looters at some time or other had dug holes in the clean filling of each stairway, which afterward was filled up again, partly with things the thieves threw away and partly with drift sand. The robbers, naturally, had been seeking gold and jewels.

It is easy to distinguish between the original filling and the debris of the thieves' tunnel. The objects found in the thieves' debris usually came from the royal burial chamber, and in the records of the expedition are distinguished carefully from other objects. When the doorway at the foot of the stairs was reached, the gang of workmen was then withdrawn and put to clearing the pyramid above or another stairway until the record of the door blocking and measurements of the stairs were made.

After that the sand which had washed into the burial chamber was removed, leaving only about eight inches of the floor debris intact. With the sand gone, then the serious and difficult work of examining and removing bit by bit the floor debris came and for this only the most skillful of the Egyptian workmen were used. This floor dirt is to the Egyptologist what pay dirt is to the gold miner.

Thus at El Kur'uw, the preliminary work was begun by attacking the stairway of a ruined pyramid which Professor Reisner numbered *Ku XV*. "To my surprise," reports Professor Reisner, "the stairway proved unusually large for the size of the pyramid, which was only 12 meters square. But our men had long practice. After three days, close to the doorway, a fragment of a blue faience figure was found on which, written in ink, I read: 'The king of Upper and Lower Egypt, Shabaka.'

"In amazement I suddenly realized that these poor ruined pyramids at El Kur'uw must be the tombs of the Twenty-fifth Dynasty of Egypt, the First Dynasty of Ethiopia. Seven days later *Ku XVIII* was identified, again by a broken shawwabti-figure, found in the thieves' tunnel, as the tomb of Shabataka, the son of Shabaka. Later another tomb was proved to be that of the long-sought Piankhy, and *Ku 16*, the tomb of Tanutaman. But the eighth was never identified by an inscription, and it was not until the end of the season that I realized it must be the burial place of King Kashta, the father of Piankhy.

"The identification of the tombs of four kings of Egypt in 15 days was one of the most amazing series of discoveries that has ever fallen to the lot of any expedition, and it gave us the distinction of having recovered the tombs of all the kings of Ethiopia from the founding of the monarchy until its power passed to the kingdom of Meroë, from 750 B. C. to about 250 B. C., a period of 500 years.

"All the works of the royal craftsmen which were placed in these tombs, in so far as preserved, have passed into the records of the expedition, and although

A Helping Hand for the Lonely Wayfarer

Concluded from page 9

cases the men they had come to marry already had wives.

Some of the girls, on their arrival, refused to marry the men to whom they had plighted their troth. Frequently, it was established, the girls knew the men only through correspondence or photograph, and one can well fancy the disillusionments that occur when meeting actually takes place. Most of the girls coming to America to marry are non-English speaking and have to be assimilated in a new community, as changing one's mind about marriage is not sufficient reason for deportation. How many of these young women and girls were saved through the Travelers' Aid can only be conjectured.

Another important work of the society in New York has to do with all manner of immigrants, and their exploitation is usually frustrated by the aids.

In the railroad stations throughout the country, the work of the Travelers' Aid is exceedingly varied. There all problems that can confront any human being are met. Much of the service performed by the aids in the stations is of a more or less minor character, but is not so minor when the need is emergent. Some of the problems met are destitution, desertion, delinquency, illness, blindness, old age, insanity, and so on, all of which come under the protection of the society's workers.

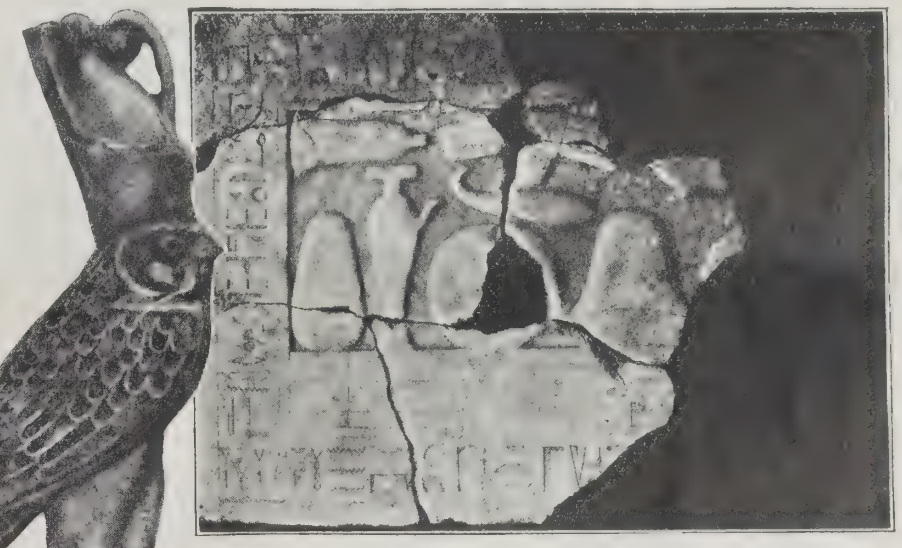
In the New York railroad stations alone, the society officials discover on an average of 90 runaway girls each month, and they never get beyond the stations. Of course, this applies to all railroad stations throughout the country, except to a smaller degree.

Miss Virginia M. Murray, general secretary of the New York Travelers' Aid Society, is authority for the statement that more old persons have been traveling around alone this year than ever before. These aged persons with which the society's workers have come in contact are helpless and unfitted to travel alone, she says, and that they are going from some one who did not want them at all to somebody else who wanted them less. In a single day the Travelers' Aid in New York stations cared for three such travelers who were all more than 80 years of age.

The services of the Travelers' Aid is extended only to travelers and does not invade any other field, thus avoiding all duplication of efforts. There perhaps is no other organization with the distinctly varied opportunities for human service. Most societies are organized to meet some special need, such as relief, child welfare, social hygiene, delinquency, and so on, while to an effectively functioning Travelers' Aid Society, at some time or other, there come all these problems, says Miss Murray.

Two hundred cities now have Travelers' Aid work. But an official of the society says that the very persons who should know the society—persons unaccustomed to travel and children—haven't heard much about it and the help it offers.

some pieces of sculpture may yet be found in Ethiopian temples, but very few of the fine products of the other crafts may be expected, those of the goldsmiths, the coppersmiths, the ivory-carvers, the makers of stone vessels, the faience workers and the amulet cutters. In other words, the expedition has established a practical monopoly of the royal works of Ethiopia."



Egypto-Ethiopian antiquities and the historical material have opened up a new chapter in the history of the ancient world and revealed the story of a great family which began as a wandering tribe in the Libyan desert, established a kingdom in Ethiopia, conquered an empire in Egypt, and lost its empire but not its kingdom, to the greatest conquerors of antiquity, the Assyrians.

When one walks through the straggling modern village of El Kur'uw, stretching along the desert edge only 100 yards from the Nile, the rock-desert rises gently. On the highest knoll is the late pyramid halfway up the slope. The other pyramids are hardly visible from the village. But the summit of the knoll is crowned with a low heap of rubble, in which trained eyes see a tumulus-grave of the Nubian type. On each side of this tumulus and down the slope, stand five other tumuli-graves and then about halfway between the summit of the slope and the late-period pyramid, a row of eight square stone tombs, mastabas, or little pyramids. In front lie the remains of the pyramids of Piankhy, Shabaka, and Tanutaman, and behind the pyramid of Shabataka. To the north extends a row of five queens' tombs. Curiously enough this group is called at the present day, "Tombs of the daughters of the Sheikh," by the people of the village. On top of the pyramid of the late king stands a little rubble shrine with fluttering flags to which the native women make vows and bring small gifts, usually nickel coins, which they throw among the stones of the shrine.

"All the graves had suffered grievously at the hands of the spoilers," said Professor Reisner. "Not a name was found of any of the ancestors. But archeology is not helpless. The spoilers always dropped or overlooked something, and in the debris of the plundered grave of the first ancestor, we found a number of very fine flint and chalcedony arrow points and a number of heavy gold beads, equal to 38 English sovereigns in weight, besides fragments of pottery, alabaster and faience. These arrowheads were characteristic Libyan form, inconceivable in the tomb of an Egyptian. The first ancestor, therefore, came from a more primitive form of life than prevailed in Egypt, and from an area under Libyan influence. These and similar discoveries in tumuli of the first and second generations proved that the family was not far advanced from the primitive state.

The mastaba of King Shabataka is shown above. To the left is an alabaster Canopic head from the tomb of King Tanutaman.

The fragment above is from the alabaster altar of Queen Nenpery, discovered during the Reisner expedition. The amulet to the left, from the tomb of Queen Kashtaneferuwka, is a silver hawk with details in gold inlay.

"The original weight of gold found in these early tumuli must have been astonishingly large. Fragments of fine vessels of alabaster and decorated faience of Egyptian manufacture indicate access to Egyptian exports. The importance of Ethiopia in the Middle and New Empires of Egypt lay in the geographical situation of this barren land, which gave the ruling power the control over the exploitation of the gold fields of the eastern desert and over the trade routes between Egypt and Central Africa. It is the old story of a fresh and vigorous tribe gaining ascendancy over the resources of an ancient empire, softened by centuries of prosperity. Long before the Northern Libyans had pressed into lower Egypt and about 945 B. C., one of them had finally gained the Egyptian throne as Shesonq I. From the facts discovered at El Kur'uw, it was probably in the reign of this monarch that the Southern Libyans, the Temehuw, began to press into Ethiopia as their brethren had done in the north. While the northern Libyans were ruling Egypt as the kings of the twenty-second and twenty-third dynasties, the Southern Libyans, led by the chief first buried at El Kur'uw were consolidating their positions in Ethiopia and their control of the golf fields and the southern trade routes."

After two centuries, for reasons yet obscure, the Northern Libyans, the rulers of Egypt, declined in vigor and in unity. Egypt split into a number of small, practically independent, kingdoms, and in this time Kashta, or his immediate predecessor, also made himself practically independent. Certain it is that before he died Kashta had won the southern provinces of Egypt from his Libyan cousin and possessed enough power to force the adoption of his daughter Amenirdis by Shepenwepet I, as her heir and successor in the office of High Priestess of Amon at Karnak. Piankhy, the son of Kashta, claimed the sovereignty of Egypt, and enforced his claim by a military conquest, of which he has left a full account on a stela found 50 years ago at Barkal.

Thus it came about that Egypt passed from the hands of the Libyan Twenty-third Dynasty into those of the Libyan Twenty-fifth Dynasty, which was called Ethiopian by the ancients simply because it seized Egypt after having first established a monarchy in Ethiopia.

To one who has lived in the sun-baked district of Napata, with its hot spring winds, it is a continual source of wonder that a family bred in this desolation should have reached such a height of power, and still greater wonder that they preferred to inhabit this remote spot while governing the rich and pleasant land of Egypt. As the king of Egypt through a preceding age had administered Ethiopia through his viceroy, so now the king of Ethiopia ruled Egypt through his officers. The king's messengers went from Napata and traversed a thousand miles of the river valley before they reached the old capital at Memphis. The king of Ethiopia was known throughout the ancient world and his ambassadors passed safely under its protection to the powers of Western Asia.

The imperial period of the Ethiopian Libyans was short, only about 50 years in length, but the character of that great family was more clearly developed by adversity than by prosperity. For they held their Ethiopian kingdom for many generations after their defeat by the Assyrians, and passed their royal power to a line of kings who ruled Ethiopia and Meroë for eight centuries or more.

Why You Have Lost Faith in Your Newspaper

Concluded from page 8

into the rewrite man instead of coming in and writing his own story, as under the old régime. This has resulted probably in an improvement in the form and "dress" of news stories, but has lessened their reliability.

In addition to the unfavorable effect on news-content caused by the economic fallacy of living on their by-product, the newspapers are suffering from "entangling alliances"—largely with industries of a parasitic character—which results from their dependence on advertising.

The cost of overhead has leaped tremendously—probably far outstripping the advances in labor and paper cost and these have been terrific. The increased volume of circulation has led to enormous distribution charges and more overhead for that department. This has necessitated higher prices for advertising space and limited the possible number of advertisers. Newspaper men admit that this is an evil. A lawyer with few clients is naturally more closely affiliated with them than an attorney enjoying a general practice. So a newspaper with only a few advertising clients is more entangled with them than a paper with a wide variety of space buyers.

The game has become so fierce that hundreds of newspapers have perished or have been "consolidated" in the last five years. But this process means more expense. The surviving paper must make the effort to hold the circulation of the deceased or absorbed contemporary. This means an appeal to a different class of readers, the addition of new features and departments, employment of more special correspondents, and subscription to more special wire services, the number of which has increased recently despite the decrease in the number of newspapers.

Of the entangling alliances of the newspapers, their mutual interest with the department stores is, of course, the most conspicuous. Most publishers and department store managements understand that it would be possible after a fashion to print and publish a daily newspaper without department store advertising. In fact, the trick has been turned here and there, although, of course, such newspapers suffered a great curtailment in size and quality. But far-sighted merchants also understand that few department stores would be able to keep their stores open if it were not for advertising—and newspaper advertising at that. Their experiences years ago when printers' strikes suspended publication of the newspapers for a time in some cities have never been forgotten. The decrease in their sales was immediate. It grew steadily worse and soon reached the proportions of a menace to their whole system of merchandising.

The department store is no more the master of the newspaper than the newspaper is the master of the department store. As at present constituted, probably neither could exist without the other. The real evil of the relations between the department store and the newspaper is that they are partners in an economic abuse—beneficiaries of a frightful industrial waste. There is a third party to the partnership—the traction interest.

Every week day millions of buyers are hauled into the congested shopping centers of American cities and then hauled home. They are seeking the bargains which they have read about in the newspapers. Despite all the vaunted economies of department store distribution it is becoming apparent that their economies, if they exist, are offset by their overhead, high rentals and advertising expense, to say nothing of the cost of car fare to the buyer, and the boosting of rentals to other businesses forced to remain in the congested centers.

As the public becomes better informed, the neighborhood stores are bound to increase their business. There are signs here and there that the bargain day mania is playing out. The department stores are killing the goose that lays the golden eggs by their failure to reduce retail prices in accordance with the wholesale trend. To the credit of the newspapers, be it noted that they have printed without fear or favor the facts about the fall in wholesale prices, right along with the blatant advertising of the department stores which have betrayed to the really intelligent buyer the failure to disgorge war profits.

So much for the most conspicuous, but not the only, entangling alliance with which the newspapers are fettered because of their dependence on the sale of their by-product, advertising, rather than of their basic product, news, the product their readers are seeking.

It is unnecessary to speak of the other handicaps under which they labor because of their necessity of holding mass circulation. *The American people are now fully aware of the fact that there are some things about which they cannot always expect to get a full presentation of the news—they know that because of the polyglot racial character of the average newspaper's circulation it does not often tell the whole story about international relationships. They are aware that in discussing crime waves, or the flood of sexual delinquency they cannot find in the newspapers any reference to racial factors, which every police reporter knows—but no newspaper prints.*

All this does not mean that newspapers suppress news. It means that they do not borrow trouble by interpreting it fully, unless some great national emergency calls for the whole truth. In crises the newspapers tell it all, but in more normal times they soft-pedal. Yet it is precisely the silent currents of events that make history and really affect national destiny, rather than the spectacular flashes and flurries which make the front page.

Why You Pay What You Pay for Coal!

Wipe Out Mud Road Tax on the Farm

CHRONICLER OF THE NEGLECTED TRUTH

Why You Pay What You Pay for Winter's Heat

Propaganda Bureaus Maintained by Operators Show Lack of Good Faith

By WILLIAM A. MCGARRY

This is the first of four articles on the anthracite situation.

AMERICAN householders are spending three-quarters of a billion dollars every year for anthracite coal. That sum is nearly three times the cost to the ultimate consumer of the same amount of coal 10 to 15 years ago. Prices are so high that last winter thousands of poor families dependent on anthracite for fuel were unable to buy enough to keep them warm. In the so-called "stove flats" of New York, children were compelled to huddle together for warmth. In New England, relatively well-to-do citizens closed the upper floors of their homes so that they would have less area to heat. Even in some districts of the anthracite fields dwellings located literally over the mines were only partially heated because their occupants could not afford to pay the prices fixed and exacted by the groups of interests controlling the production, the transportation and the distribution of anthracite.

The foregoing is important to every American citizen, whether he lives in one of the 25 states in which hard coal is used, or in those states supplied by the bituminous fields. It is important in Florida and Southern California as well as in New England, for even the southern states are depending more and more on the industries for their prosperity. Those industries are now supplied by the great soft coal fields, and in many respects soft coal mining bears no relation to anthracite. But the citizen is affected in two ways: first, by the extent to which he must buy products of New England, New York and Pennsylvania where hard coal is in general use; and second, by the growing danger that the methods of anthracite may be applied to the soft coal industry, with consequent increase in price.

When those methods are thoroughly understood by citizens of all the states, and when the menace to prosperity which they constitute is generally recognized, it may be possible to halt the upward trend of prices and perhaps to force reductions that will bring the price to the consumer within reach of his pocketbook. The purpose of the series of articles of which this is the first is to assist toward that understanding by a revelation of how the control of anthracite is maintained. That can be shown by the official statements of the operators. From the same source it can be shown that while the large coal companies cry their poverty from the housetops, they are in reality making huge profits, the extent of which is only partially hidden by the familiar practice of pyramiding—the issuance of stock dividends.

Coal, meaning both the hard and soft varieties, might be likened to the oil industry. Hard coal or anthracite is to a large extent comparable to the huge profit makers of the Standard Oil groups. It is thoroughly organized and strongly held. About 80 per cent of the total output is from the groups known as the "railroad mines." Of the remaining "independent" production a large and constantly growing percentage is sold through the coal sales companies established by the railroad coal mining companies. In the past, various means were used to prevent the real independents cutting prices, in the few instances where that was attempted. As a rule it has not been attempted because the whole trend has been in the other direction. Until last winter the production of anthracite was never quite sufficient to meet the demand. Therefore, the independent was in a position to sell his coal often at a premium over the railroad list price, which is published every month by the Philadelphia and Reading Coal and Iron Company.

Insist There's No Price-fixing

THE coal barons insist in all their propaganda that there is no price-fixing. But year after year in monotonous succession the records show that approximately 80 per cent of the production is sold at the price named on the first of every month by the Philadelphia and Reading Company. That has enabled officials of the Reading to claim from time to time that their most valuable function is to keep down prices and to stabilize the industry. The flaw in their argument is that prices have not been kept down. By admission of the operators they are far too high. In former years it was the custom, after crowding on "all the traffic would bear," to attempt justification of the ultimate price by comparison with prices of other commodities. Now, however, even the operators admit that the cost of a ton of anthracite is above the economic buying power of the average householder.

It is not the intention here to go into the problems of soft coal. But to complete the comparison of the industry as a whole with the oils, it might be said that bituminous is comparable to the independent fields. In some instances the profits are just as high as when a good well is struck. In others, losses are sustained. There is much speculation. The field is overproduced, according to all authorities. Whereas the total production of anthracite is only approximately 80,000,000 tons a year, that of bituminous can be run above 600,000,000 tons. If all the mines now opened were worked anywhere near capacity with the 600,000 miners in the fields, the total could be vastly increased. When William G. McAdoo was Secretary of the Treasury, he asserted that some soft coal producers earn 2,000 per cent on their invested capital. Soft coal operators are forced to keep their prices down because of the competition, particularly that of the "snow birds" or wagon mines, the outcroppings in back yards and on farms, worked spasmodically by the farmers during the winter when there is enough demand to make it profitable.

In the hard coal fields it is estimated that there are now about 155,000 miners. That figure should be kept in mind in connection with some of the statements made by the operators, particularly the statement made originally last February by Samuel D. Warriner, president of the Lehigh Coal and Navigation Company, and repeated since then at frequent intervals whenever it has been deemed expedient. The Lehigh Coal and Navigation Company is one of the largest owners and operators of hard coal mines. But apart from the tonnage he controls directly by reason of his presidency of that company, Mr. Warriner looms large in the industry as chairman of the General Policies Committee, and as chairman of the General Committee of Anthracite Operators. The General Policies Committee represents the "companies" as they are known in the industry; otherwise, the railroad coal companies. There is also an Anthracite Operators' Association consisting of all the independents. The General Committee of Anthracite Operators is the group representing both railroad mines and independents, with which union leaders have been in conference off and on since March 15 over the question of a new wage scale. Mr. Warriner also is the chairman of that committee.

Late in February last, a meeting of operators was held in Atlantic City. After two days of closed sessions the meeting adjourned. Back in his Philadelphia office Mr. Warriner, as spokesman, announced for the first time that the operators considered the price of anthracite too high. He said it was too high in relation to the purchasing power of the people, and also in comparison with the prevailing prices of other commodities. As the first step toward reduction of prices, Mr. Warriner said the operators intended to meet with the mine union officials in New York on March 15, and insist on a reduction of wages. At that time he did not say how much of a reduction would be demanded. The Shamokin convention of the miners had gone on record earlier for an increase of 20 per cent for contract miners and $1 a day for day men. According to Mr. Warriner the $1 demand would affect about 100,000 men, whom he said were being paid $4.20 a day under the existing scale.

Want to Force Down Labor

NATURALLY, some questions were asked by the newspapermen. It was the first time in anthracite history that operators had made such an admission concerning the price of their commodity, and the reporters sought to find the reason. Mr. Warriner was asked concerning the amount of anthracite in storage—the surplus of production over demand. He said he could not give figures but admitted that it was large. He was asked also concerning other economies which he said the operators were making in their efforts to reduce the price of coal to the ultimate consumer. In answer he said that the cost of materials and equipment used in the mines was being reduced in line with the whole trend of deflation. But he was quick to point out that these total reductions amount to very little in comparison with the labor cost. He said that the operators could not reduce the price without a reduction in wages.

Again on March 15, when the opening session of the conference with the unions was held, Mr. Warriner repeated verbally the substance of the first part of his February statement. But when he came to the point of discussing reductions in the cost of timber, metal and other equipment, he took a new tack. Some of the newspapers had shown a marked desire to know why these reductions spoken of in February had not been passed along to the customer. So, in March, Mr. Warriner announced that the reductions had not yet reached the mines. Again he emphasized that all those items represent but a small percentage of the total cost of producing a ton of coal.

A few days later the position of the operators was set forth again, this time in answer to the 19 demands made by the miners. Operators were quite familiar with those demands. They were publicly announced early in the year after they had been formulated at the Shamokin convention. But, nevertheless, a week was consumed to prepare the answer. And when that answer came it proved to be in reality nothing more than the statement made by the operators following the Atlantic City conference in February. It was more specific in some particulars, but even then it did not contain the final demand of the operators for a wage cut of 20 per cent for contract miners, and $1 a day for day men. That demand was reserved for a later date, thus consuming more time, although everybody knew what it would be. For when the miners were in convention in Shamokin a publicity representative of the operators had made the announcement of the reduction his employers would demand. The operators decided that his statement was "premature" at that time.

Those who followed the slow pace of the conference in New York were forced to wonder if the operators really desired a settlement. That suspicion was fed by reports from the anthracite regions, where, according to general information, from 10,000,000 to 12,000,000 tons of hard coal in prepared sizes was in storage when the miners quit work on April 1. Reports of the Federal Reserve banks and from other sources since then indicate very little demand. It is asserted by the miners that the operators are not anxious to reopen the mines until they have disposed of the huge surplus stocks, if possible at a premium. But so far, in spite of all their propaganda, in spite of the fact that the Warriner statement has been given to the public in various forms from three to five times, there has been no stampede to buy coal. The truth is that the apparently impossible happened. The public balked.

"The deflated pocketbook of the buyer cannot continue to pay the present prices," says the statement issued by the operators in New York on March 17. "Economy is being practiced by the consumer and various substitutes for anthracite are being used. But for the fear on the part of the public of a suspension April 1, the recent movement of anthracite would have been even less than it was, with the result of short-time employment throughout the region. The economic situation today not only forbids any increase in costs and prices, but compels a reduction.

But while repeating their demand for a reduction of wages as the only possible way to cut the cost of coal to the ultimate consumer, the operators have consistently ignored the demand of the miners that a commission be created to inquire into the costs of producing coal. Operators put forth their own figures of these costs. But they do not show what the costs contain. The miners say the price of coal could be reduced $5 a ton without taking a cent from wages, by the reduction of freight rates, the charges of coal sales companies, the profits of operators, jobbers and retailers, and the elimination of unnecessary expenses.

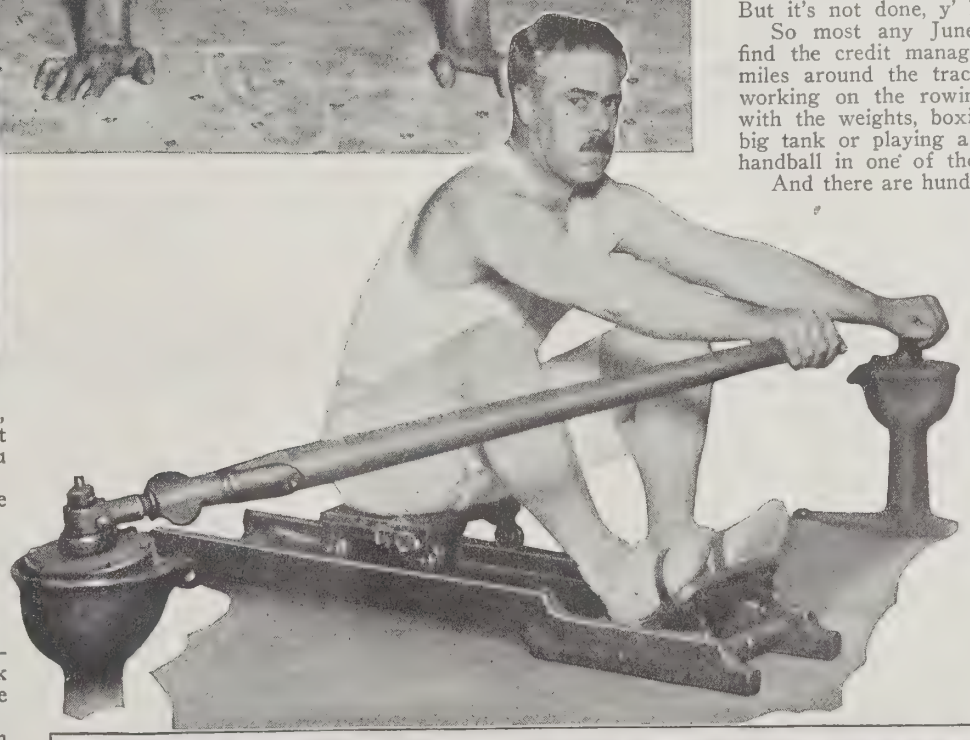
A lack of good faith is apparent in nearly everything put out by the propaganda bureaus maintained by the operators. The miners charge that the purpose of the publicity bureau is to "throw coal dust into the eyes of the public." Let the public judge. Within the last few months the publicity bureau put out a statement beginning, "A miner's annual earnings of $8,793.65 have been revealed by an inquiry into mine payrolls." The statement added that the 28-year-old Austrian miner referred to had not earned less than $7,000 a year in three years. But at the tail end of the statement it was pointed out that the man's work was driving tunnels through the rock, to connect gangways and veins of coal; also that earnings as large as $7,000 a year are not uncommon in that kind of work. In other words, he was not really a miner of coal, but an expert.

The same bureau put out a statement showing alleged costs of a large operating company for the first seven months of 1919. It claimed an average cost of $4.94 per ton against an average selling price of $4.69 per ton, and added, "there was consequently in the seven months a loss which averaged 24 cents a ton for each ton mined." The figures by months show the loss was 43 cents a ton in January, but there was a progressive decrease of loss until finally by July the company was making a profit of 19 cents a ton. There the statement stopped. Any reader would be naturally curious to know what profit was made in the remaining five months of the year. It is a fact that the company to which the figures referred did make a profit in that year, large enough to pay an eight per cent dividend and have a half million dollar surplus.

More Sold, Price Higher

IT HAS become almost a rule of American business that as volume of output reduces overhead, prices to the consumer should be reduced. Many huge industries have been built on the principle of reducing the price first to command the volume. In all such cases, the men back of those industries and the workers in the shops and factories are taking raw materials and turning them into finished products. Coal, on the other hand, is a natural resource. It is not to be overlooked that it must be cleaned and sized, and that those processes are expensive. But the same laws of multiple production applying to other industries should apply to coal, and the records of profits made out of the hard coal mines would seem to indicate that they do.

The ultimate consumer may well wonder what the end will be if instead of getting cheaper coal, the results of savings in operation are to be translated into an added burden to him. In the next article it will be shown that that is exactly and specifically what has happened over a period of the last 20 years in the mining of anthracite. To put it even more plainly, the reason why anthracite costs up to $16 a ton today within a day or two of the mines is because huge profits have been made in the past. The consumer who buys a ton of coal is paying not only an exorbitant return on the actual capital invested, but he is paying an equally exorbitant rate of interest on the past profits. If those profits had not been made in the past it is conceivable that it would be more difficult today for the operators to contend that they cannot afford to make reductions.



In succeeding articles it will be shown how six profits are paid by the ultimate consumer, including the wages of the miners. Profits of the big operating companies revealed in their annual reports will be set forth that the public may judge for itself what truth there is in the argument of the operators that they cannot reduce the price. It will be shown how the effort of the government, begun in 1902, to break up the so-called "coal trust" has resulted only in cementing the power of the group of bankers dominating anthracite from coal mine to coal bin, and has brought about a pyramiding of interest in distribution, each of which exacts its profit until the operators themselves are forced to admit that the final price is unbearable.

The Business Man Somersaults Into Health

Eternal Quest for Fountain of Youth Finds Way to Gymnasium

By GEORGE C. HENDERSON

"MARRY you? Why, you poor, bald-headed, flat-footed, rheumatic tin can. I wouldn't marry a wheezy old walrus like you if you were the last man on earth."

So spake the first stone-age stenographer to the stone-age business man as she hopped onto her dinosaur and headed for home and mama.

Thus began the initial search for the fountain of youth.

Impelled by the scorn of the forest maiden, the slightly shop-worn financier tightened the girth of his tunic, rubbed sheep-dip on the bald spots, discarded his comfortable sandals for tighter ones, took to deep breathing, regulated his diet to include more calories, and read up extensively on vitamines.

The search for the fountain of youth dates from when King Solomon installed massage baths and runs down through Ponce de Leon's famous hunt for the mystic waters on the American continent to the modern period of gland operations, serum injections and treatment at the hands of white Swamis.

The same fakir who flim-flammed Ponce de Leon by telling him that the Fountain of Youth bubbled ecstatically in the Florida swamps, is now at work on the gullible with his post-hypnotic suggestion, internal breathing, predigested diet, muscle-making, unconscious evolution and planetary influences on the epiglottis.

The wise man of old, who tried to rout poor hopeful Diogenes out of his tub by telling him that he was suffering from neurasthenia, is at work on Mr. Jones, the bookkeeper at the Bon Ton cutlery store, insisting that his salvation lies in horoscopic readings at $4 each.

About the time that Mr. Raleigh was laying down his cloak in the mud for Queen Elizabeth, most of the people on the globe believed that plagues and afflictions were brought by evil spirits, and witches were burned for practicing the "black art." The pest who, in ancient times, would have treated Demosthenes for contraction of the thorax, then appeared in the shape of a holy man or witch dispeller.

A little later we encounter what is known as the patent medicine era, when the land was flooded with sugar-and-water concoctions and pills. People bought these medicines, some of which contained narcotics and poisons, and consumed great quantities of the rot.

Today the "Fountain of Youth" purveyors do not give even a quart bottle and a cork to their patients. They have improved upon the system of the Middle Ages and the Cast-Iron Age of American development.

A small pamphlet, entitled "Life's Secrets Unfolded," brings the vigor of a giant to you, adds two feet to your height, removes a front porch or grows hair on a billiard ball.

Mr. Gulick, the well-known bootlegger, learns through occult manifestations that his stomach trouble is due to a short circuit of his invisible astral body with the earth stratum instead of the inordinate consumption of fusel oil and wood alcohol.

Pretty Miss Bennett pays $45 for 50 lessons in beauty culture and finds that the 50 cents' worth of mimeographed paper tells her to drink a lot of water, avoid sugars, fats and starches, quit eating the things she likes and take a run around the block every morning at six. She tries the running stunt once, bringing out the fire department, three policemen, a wagon from the emergency hospital and a guard from the insane asylum, all of whom have been called by the mystified neighbors.

We have with us the Science of Eating, the Science of Breathing, the Science of Mastication and innumerable other sciences dealing with the wiggling of the toes, simonizing the teeth and changing the aspect of the epidermis.

There are in the United States 1,299,377 persons who have the "master key" to health and are willing to make you a duplicate for anything from 25 cents to $500.

City life plays hob with a man's vitality, unless the said man keeps fit by muscular recreation. The late Colonel Theodore Roosevelt built himself up from a puny, myopic youth into a virile, dynamic superman through hunting, racing, walking, riding and prowling about the woods and open places. President Harding is a strong advocate of outdoor recreation and no week passes that he does not take a horseback ride or play a game of golf. Thomas A. Edison is an enthusiastic pedestrian.

What makes the tired business man tired is generally all work and no play. The lounger gets tired from all play and no work.

Take the credit manager for a big department store. Credit managing is not what one might term the strenuous life. If one could combine the credit job with that of a truckman, the balance between physical and mental exertion might be adjusted. But it's not done, y' know.

So most any June afternoon you can find the credit manager tearing off a few miles around the track at the gymnasium, working on the rowing machine, tinkering with the weights, boxing, swimming in the big tank or playing a momentous game of handball in one of the courts.

And there are hundreds of thousands like the chap just mentioned. The gymnasium idea has taken hold of the American business man in every city. A man who has made a success in life knows in his heart that there is no real cure for physical ills in nostrums and drugs. So he seeks in the athletic club that development which the outdoor man gets at his work.

When a Russian scientist announced recently that "long hair gives long life" and declared that the vital vibrations are absorbed through the hirsute growth, you might expect to find the bald heads making a path to the door of the hair tonic man. But not so. In fact, you are more likely to glimpse a glistening dome in a calisthenics class, doing flipflops over an iron bar, presenting a remarkable symphony of ripping biceps.

"As you think, so are you," says the modern

Loose Them and Let Them Go

OVER and over again, in hope that the shame of it might burn, the insistent statement is made that the United States lags behind the whole world in giving amnesty to political prisoners. The enemy agents who blew up our factories and docks have been released. Military spies of the enemy, taken in the very act of espionage, have been released. Suspect aliens of every degree have been released. *But Americans whose chief fault was that they held a certain economic theory are still in jail.* Of all the nations joined in the war on either side, only Russia and the United States continue to use prisons for the punishment of differences of political opinion.

Since the facts have forced a public hearing it is no longer possible to quiet the conscience with the notion that our political prisoners are "reds" and are, therefore, just as well in jail as out. The facts are that the majority of these men are Americans, supposedly possessing the guaranties of American citizenship, and that in very many cases their arrest had nothing to do with the war at all, not even with the passions incident to war, but were victims of a plan, *proceeding under cover of the war excitement,* to terrorize certain labor movements.

Men were arrested, thrown into jail, railroaded to prison under long sentences, because they had ideas about industry with which others did not agree. Men were arrested because they had ideas about wages which were inconvenient at the moment, and the easiest way to suppress the idea was to have the man hauled off to jail. In no case was disloyalty proved; in many cases it was not even charged. Some of the men had not even expressed their distaste for war, a distaste shared by millions of us whom no government would dare touch.

But, aside from that, as political prisoners, they are entitled to the enlightened treatment which all the enlightened nations have meted out to their political prisoners, namely, release and liberty. Most of these men are actually entitled to governmental apology and reparation—but to suggest it would be millennial.

The friends of these men and the believers of liberty everywhere are making one last effort to get American decency into action. Their fear is that a few of the more favored men may be released as a sop to public opinion and the rest forgotten. The very possibility of such an occurrence, the very possibility of such a fear under any system of Justice, is significant in the extreme. If Justice has become subject to mass movements of opinion, it is because of the extreme possibilities for injustice in the hands of everybody, from town marshals upward, during the war. What the friends of the prisoners want is their liberty, but what we as citizens should also desire is an exposure of the methods by which these men lost their liberty.

We know of the great lawlessness which today characterizes official departments of the government. There is robbery of the United States mails; there is thievery among private papers; there is actual kidnaping of people by the agents of the Government—even now, in these post-armistice days! But even so, the official lawlessness of war days was greater in extent. Worst of all was the deliberate and diabolical use of the war-passion and the war-time power to satisfy private grudges. There is no doubt now that under cover of the war it was deliberately planned to use the confusion to strike down certain attempts at industrial independence; there is no doubt now that the program which began in wholesale arrests of certain classes of American workers, ended in the deflation of the currency which threw wages down and then brought unemployment.

Make no mistake, the powers of darkness have had their innings among us Americans, and the best we can now do is to do justice and release the political prisoners. Even where, as "political" prisoners their restraint may have seemed justified, as "political" prisoners they are now entitled to be free. This is granted in England, France, Italy, Belgium, Germany, Austria—everywhere; everywhere except the United States and Russia.

A giant petition is about to be presented to President Harding. Some of the most conservative men of the nation will assist at the presentation. The delay in action has been too long for Americans to take any pride or do any boasting should the petition be granted, but to delay action any longer would be a permanent stain.

Let the political prisoners go free.

Cut Down the Delays

THERE will be many new members in the next United States Senate. The personnel of the House of Representatives will also show changes. The results of the primary elections make these prophecies certain, although the extent of the revolt against the present Congress cannot be determined until the general election.

The early indications of changes are sufficient to make a discussion of the next Congress in order. And the policy which calls for the most radical change in the next Congress has to do with the methods by which that body conducts its business.

Legislative delays are the most fruitful subjects of criticism. The rules of the House and Senate are such that delay rather than dispatch is the ideal sought. In the present Congress, the length of time required for affirmative or negative action upon the soldiers' bonus, the tariff, and other important measures has been apparent to the entire country.

There are arguments in favor of deliberate judgment, and debate on important bills sufficient to enlighten the country on all controversial subjects. But there is no argument for the interminable dragging out of committee consideration and repetitious debate on the floors of the houses. The inauguration of the budget system should relieve members of Congress from much of the detail in connection with appropriation bills; the country will not be inclined to excuse such delay as grows from the logrolling in behalf of pork-barrel appropriations.

In the Senate, there is abundant opportunity for reform in the elaborate institution known as senatorial courtesy, and in the iron-clad insistence upon seniority rule.

Courtesy is a splendid thing. But it is puzzling to read of parliamentary debates in which partisan privilege permits the exchange of bitter insult, while senatorial courtesy requires the most profound obedience to peccadillo rules. Senatorial courtesy is often most discourteous to the country.

Respect for elders and regard for experience are attributes of virtue, but the Congressional seniority rules tend toward placing the country's most vital business in the hands of those whom age has enfeebled and made hesitant. The country is entitled to the leadership of its men of most alert mind and most unalloyed energy. Changes in senatorial rules may easily be formulated giving places of honor to aging statesmen, while permitting actual leadership to go to those whose abilities cast them for the part.

Congress has suffered much criticism during recent years. It lies with the next Congress to allay that criticism by speeding up its business to the highest pitch, commensurate with wise consideration of the measures before it.

Working While Waiting

THE miners of Boulder, Colorado, who are victims of a general strike, do not choose to remain idle simply because their chosen vocation is closed.

The foothills, the mountain streams and the dumps of abandoned mines are dotted with the tents of striking miners, busily panning gold and silver from the gravel or chipping tungsten from the broken boulders.

In many cases, the miners have taken their families, giving the adventure the semblance of a vacation outing. Others leave their dependents in the coal camps and return with their gains at the week-end.

What do they earn? That is immaterial, perhaps, but it is sufficient to carry them through the strike without calling for outside help, and to afford some assistance to those not so fortunate.

The example of these men should help others where gold and silver do not abound, for there are other means of tiding over bad times, even in localities where opportunities are few. Idleness is the worst enemy to citizenship; independence and self-reliance its characteristic.

A Drive to End "Drives"

COMMENDABLE progress has been made toward national deflation. Business enterprises have cut operating costs, and written off useless appendages. The government, under the praiseworthy impetus of General Charles A. Dawes' budget activities, has accomplished much. In both business and the government, of course, there is still a great deal to be done.

But there is one field of American money-spending, whose burden upon the general public has not been lessened appreciably.

That is the field occupied by the hosts of organizations, devoted to the noble purposes of uplifting, inspiring, directing, and otherwise saving mankind.

It is a wonderful field. There is scarcely a single organization encamped within its limits, which does not seek to confer some beatific gift upon our fellow men. Whether it be the Society for International Famine Prevention, the Association Opposed to Red Neckties or the Ladies Auxiliary Circle in favor of Artistic Igloos, there is doubtless something commendable about the object desired by each. And each, too, has as its inspiring genius some enthusiastic person of the utmost sincerity.

But the whole trouble is, we cannot afford them all. In the wake of the war, with its "drives," thousands upon thousands of organizations grew up, eager to alleviate human suffering, advance human government, elevate the human intellect. Each of these organizations had its officers, its offices, its committees, and its costly efficiency methods. And the public paid.

The feverish period which gave rise to them has passed, but the organizations remain. Although the deflation period was severe enough to compel the loosening of even such tight grips as politicians are able to fasten upon government jobs, it has not yet been strong enough to break the hold of uplift organizations. No such organization ever dissolves because it believes that it has ended its usefulness. None of the smiling, agreeable, platitudinous secretaries (office hours 9:30 to 3, lunch from 11:30 to 2) ever voluntarily relinquishes his glass-topped desk. The result is that the burden on the public, which, in the last analysis, must support them, is not lightened.

There must be a reduction in the number of these organizations, and a reduction in the cost of the overhead of those that remain. Otherwise, the really necessary campaigns for funds—and they are few—will suffer because of sheer public exhaustion from subscription drives and contribution drains.

When each individual returns to the realization that his important business is minding his own business, rather than that of the rest of the human race, perhaps the whole race will be found able to get along without the help these associations feel called upon to bestow.

Perhaps we shall be driven to organize the Society to Prevent the Extraction of Huge Sums for Unnecessary Purposes. A "drive," no doubt, would prove the popularity of such a movement.

Honesty and Their Policy

OH, FOR a man, whom the germ of politics has bitten, and who still will dare give expression to his real beliefs!

Look them all over from coast to coast. Congressmen, mayors, aldermen, governors, candidates, hopeful aspirants—and then try to name one whose utterance measures up to the standard of courage the country has the right to expect.

"I must not offend any man."

Such must be the motto, common to all who seek the favor of democratic government. A few there are, whose names have been linked with certain radical proposals, who attract the reasoning opposition of persons of contrary faith. And a few there are who, on original entrance into the field of political aspiration, come as clear-cut crusaders for the particular group whence their candidacy sprang.

But once started down the political track—how quickly radicalism feels the oil of tolerance! How soon are all men beloved! How rapidly do words and phrases melt unctuously into platitudes which can offend none and which roll mellifluously off the tongue!

The outspoken man, whom the world admires for the freedom of his statement—how soon does his outspokenness get edited by his editors, his personalities get sheered of their personal references by his secretaries, his wild radicalisms become tame under the suave ministrations of his managers!

Nominate the wildest tiger of Bengal for Congress, and we are willing to wager he will be making speeches in a month, in which he is expressing his high regard for the English, the Irish, the Italian, the German, the Swede, the Hottentot; shouting his strong conservative progressivism; and winding up with a peroration in which he pays tribute to Washington and Lincoln.

Mr. Ford's Page

THE country has learned to expect strikes and rumors of strikes whenever business picks up enough to give men confidence. For years past the strike disease has been chronic in certain industries. The strike, which a few years ago was a local shop matter, later developed into a wider trade movement, until now it has attained national dimensions and has attempted an offensive and defensive alliance among related trades.

This development of the strike would be awarded the unbiased verdict of being good strategy, if all the other elements were equal. That is to say, if you grant that the "class war" is here, it is excellent strategy to organize your whole class against the opposite class. Or, if it be true as some of the labor leaders teach, that in the hands of the employers are all the keys of prosperity and all the desirable gifts of life, if it is true that employers hold the fate of the world in their decision, then it is nothing but good strategy to compel them to release their grip and distribute these good gifts to all.

The "if" is a very big one and it is upon the consideration of it that the whole estimation of strike strategy must turn.

The strike itself has never won anything. It has been total loss to all concerned. At most it can be defended, if at all, only as an educational accessory. There have been benefits in the adjustment of working conditions following upon strikes, but close examination does not credit the strike with being the beneficial cause. Always there was the moral compulsion of Public Opinion which has said, "this demand is right!" and that has been the winner. Without this, nothing was attained. Even with it, there was staggering loss.

The two most significant developments in the strike situation have come within recent years: one has been the public apathy with regard to them. The people who can best be depended upon to catch the moral inwardness of a situation have ceased to be as sympathetic toward strikes as they once were. This cannot mean that they have ceased to feel with the worker, because *the Public is the Worker.* It means something which perhaps the Public would find it hard to put into words. The Public seems to get a sense of changing base before it gets the principles on which the change is based. Some have interpreted Public apathy to mean that the people are thinking that it is not wise to make things harder while everything remains hard enough for the people. But there is probably something deeper than that, though as yet inarticulate. There is probably a growing sense of the futility of fighting straw men, or of seeking benefits within a system which is constitutionally unsound.

OUR annual strike bill would feed the starving world for which we are now collecting millions of dollars. It represents far less than one-half of what we should gain if we were to go on a just economic basis. Some people oppose the implications of "economic justice" because they think it will mean a decrease in wealth, a diminishing return, everybody doing with less in order that the poor may have a little more. That is most absurd. Economic justice would bring such an increase of wealth that the economic problem would practically disappear as a sore and change into an avenue of greater progress. Our strike bill represents our fines and penalties before the Court of the Eternal Justice for not being fair and just. The measure of our economic injustice is the measure of our net loss.

The second development—a sinister one, but probably in the line of progress—has been the strategic use of the strike by unscrupulous employers to create conditions that serve them. Just as European monarchs once caused war to divert their people's minds from home problems, so have employers been known to throw out incitements to strikes for purposes of their own. Sometimes it was to ruin a competitor whose business would be involved in the strike. Sometimes it was to mislead their workmen so badly as to discredit them in the public estimation. Sometimes it was for the purpose of rousing the fear of hunger by bringing on battles marked by every brutality of which the lower forms of labor and the still lower forms of capital were capable.

In a hundred years it will be clearly seen that the strike was Justice—not the justice of employer or employe—but the Justice of natural law. The just due that you refuse to give one way, you will be compelled to give another way. That law is over all men and movements. It operates upon the man who stints at the job and it operates upon the man who stints at the pay envelope. Somehow both will pay up. What they gained by shaving the law of Justice they will lose to that very Law. Enough money is lost every year in strikes in the United States to feed the world. *More money is lost than would have to be given up to put our whole economic system on a just basis!*

The protest against all talk about a just economic order is rooted in the misconception of some that it will require them to sacrifice some of their wealth, that it will diminish their returns. The absurdity of this cannot easily be put into words. Why, the fact is that it is the present system which sacrifices wealth and lowers returns! Take the sum lost in strikes, lassitude, shop dissension, sabotage, "soldiering," cheating, a sum staggering to contemplate; a sum reaching billions!—well, that is the sum that would be added to wealth under a better system. Yes, and double: for we should then keep what we now lose, and the time we now spend in losing it would be used to create as much again.

There will be more wealth under a system of justice than there is now. Justice always pays better than injustice: we can see that even when our very best justice is rather pale: even then it is better than injustice. Beyond all its vagaries the chief fallacy of Socialism was that it encouraged the idea that social justice would mean a scaling down of wealth. It would mean nothing of the kind. As economic injustice has been steadily pushed back in this world—and it has been pushed a considerable distance in the last one hundred years—wealth has increased by leaps and bounds. What is lacking is the certainty of outlook which would allow men to get the best out of the material increase; and that certainty of mind must come through a deliberate effort on the part of men of all classes to get this national housekeeping system of ours into some kind of decent order.

As long as the employer withholds from his men, so long will he pay up to the Law, and he will pay a penalty along with what he withheld. As long as employes work along in the idea that their work is merely to get something out of the front office, something which must necessarily be in antagonism to the front office, so long they also will pay to the Law. And as long as the Public looks on, never sensing the moral issue involved, never considering the great challenge involved, that long will the Public go on bearing its large share of the cost.

Here we have been hearing the quarrels of two great services, railroads and mining. But more than strikes are involved. The worst thing is not the strike. The worst thing is the assumption by employers and employes that railroading as it is now will continue, and that mining as it is now will continue, and that the fight must be waged on the basis of present things. The most colossal piece of railroad mismanagement in a long history of mismanagement was the cut of the railroad men's wages. That is indefensible. The management that manages by taking operating expenses out of wage envelopes is already doomed. Mining is in the same case—most amazing, most stupid mismanagement, joined sometimes to a human callousness that is startling. But, have the only railroaders there are—the workers on the railroads; have the only miners there are—the delvers in the mines, ever come forward with more than a demand that the financial managers give up more? Must mining forever be the hard thing it now is? Must railroading always be the wasteful thing it now is? Has nobody thought further than the fight between factions in systems which progress has already doomed?

Some time sheer weariness of the recurring menaces and interruptions will rouse the Public to put its finger upon the real seat of the trouble, and when it does so, the great surgeon will operate quickly.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

With Country Banks on Strike, Could Wall St. Live?

By CHARLES ALBERT COLLMAN

LATE one November evening, chill, dark and unforgettable, I left the financial district of New York. In the skyscrapers looming upward, the windows seemed black and gaping holes. From the bay, a shuddering wind swept up Manhattan Island, that struck one to the bone. It was the kind of night when men raise the collars of their ulsters well above their ears and hurry homeward, grateful at the thought of warmth and comfort.

Attempting to cross Wall Street, I was stopped by a long line of men in single file. They stood there shivering, their haggard faces nipped with cold. Some sat on camp stools. A few were drinking coffee from bottles and munching sandwiches. They were about two hundred in number, some old and gray-haired, many young in years, down to the age of boyhood.

This file of humanity stretched from Broadway, opposite Trinity churchyard, along Wall Street to a point between the offices of J. P. Morgan & Company and the National City Bank. It ended before the doors of a large white building on the south side of the historic street.

It was then nearing eight o'clock. The people had been posted there since the close of banking hours that afternoon. With sullen determination, they were going to remain stationed on the sidewalks for the next 14 hours, sleepless in the terrible cold of that November night, so they could be the first in line when the doors of the Trust Company of America would open at 10 o'clock the following morning.

It was a night that had succeeded one of the grim days of the Rich Men's Panic. For weeks, dense crowds had filled Wall and Broad streets, nervous, curious and questioning. They had packed the high steps of the Sub-Treasury Building in their anxiety. The district had, in fact, been black with people eager to witness one of the most remarkable demonstrations of modern times—the greatest and longest bank run that has yet occurred in financial history.

Stretching patience and endurance to the breaking point, these night watchers were hoping to get back the money they had placed in a Wall Street institution.

They little knew that they were only the pawns of great financiers who had foreseen an emergency.

Few of them dreamed that the extraordinary scene in which they played their parts, had been staged within the walls of powerful banking houses.

For more than a year, a furious gamble had been in progress. Now the greatest of all the gamblers, the men who controlled Wall Street, were making the country pay the costs of all the dreadful hazards that had been taken.

The financial catastrophe had been precipitated by wealthy speculators. A crowd of copper men had attempted a disastrous corner in United Copper shares. As fast as they garnered the stock, they put it up as collateral for call loans in a chain of banks and trust companies identified with their operations. Another coterie of brokers had cornered the stock of the Tennessee Coal, Iron & Railroad Company, in order to get control of this corporation, which was an iron, coal and steel property extending through Alabama, Tennessee and Georgia.

Speculation Ties People's Money

THE brokers succeeded in their corner in T. C. & I. But, instead of success, it spelt their ruin. In buying up all the stock in the market, they had run the price up to $166 a share. On this stock they had obtained from complaisant bankers loans of *public money* deposited in Wall Street institutions, aggregating $25,000,000. This immense loan was now a frozen credit. The brokers were unable to sell the Tennessee Company as they had planned. Neither could they pay back their loans. Nor could the banks get back their money. They did not dare to liquidate the collateral of Tennessee stock, for had they tried it, the price of T. C. & I. would have dropped to almost nothing, and dragged the stock market down with it. A deadlock now ensued in Wall Street—a period of uneasy waiting, punctuated by dismal forebodings.

In the process of building up corners in copper, coal, steel and steamship stocks, there had been a period of wild speculation. In the nine months since the beginning of the year, 156,791,047 shares of stock had been traded in on the New York Stock Exchange, which represented an actual outlay of $12,233,942,317. Most of these transactions had been carried on margins. In order to facilitate them, banks in the financial district had advanced 80 per cent of the money in the shape of call loans. *Country banks in every part of the Union had hundreds of millions in the shape of demand deposits in Wall Street institutions. And now Wall Street bankers had tied up the bulk of the country's money in stock gambling ventures.*

A money stringency asserted itself as demands arose for capital needed in legitimate business. The rates for call money jumped to eight and one-half per cent, to 10 per cent, and finally one day they advanced to the stupendous figure of 125 per cent. That meant that the broker was asked to pay an interest rate of $1.25 on every $1.00 that he was borrowing from his bank. This was more than the traffic could bear. The brokers could not pay off their loans. The banks began to throw the stock collateral upon the market for any price it might bring, and the Stock Exchange suddenly staggered under the greatest break in prices it had sustained for many years.

Desperate scenes now took place in the private offices of great banking houses. White-haired brokers wept and pleaded with bankers not to sell out their loans. For in the demoralized Street, the first blow fell upon the commission men who had been gambling in copper shares. Their firms went down like houses of cards. The Mercantile Trust Company, which had financed them, became embarrassed.

The public, calmed by reassuring statements, was as yet unsuspecting. The heads of the great National banks alone knew the danger of the situation. They held a secret meeting, at which they determined upon a plan to save their institutions at the cost of others, and sustain the corner in Tennessee Coal & Iron stock, from which the banking leaders hoped to profit.

In great cities, when a fire gets beyond control, it is the custom of firemen to bomb the intervening buildings with dynamite to stop the progress of the flames. The National banks that controlled the destinies of Wall Street, decided upon a similar step. They planned that the force of the panic should be directed against the trust companies, which in those days were not members of the New York Clearing House.

After banking hours that day, one of the largest National banks announced that it would refuse to clear for the Knickerbocker Trust Company. On the following morning there ensued a run on the Knickerbocker Trust, which, after paying out $8,000,000, closed its doors. The day before, its stock had been selling at $1,200 a share. This day its shares were not worth a dollar. Its president, Charles T. Barney, at once resigned. This immense failure shocked the world. It even became a feature of ribaldry in London music halls.

Punish Another, Save Selves

MR. BARNEY was a Sybarite. He had loved the beautiful things in life. He was never accused of wrongdoing, but he had made the mistake of having associated himself with one of the speculative groups. Only a short time before this, Mr. Barney had shown me some of the treasures which he had gathered in his splendid home. In his foyer was an antique Venetian ceiling. A green stone mantel, which he had imported from Italy, filled nearly the entire length of his great dining room. Two weeks after the bombing of his trust company, the banker was found lying dead beside this marvel of Italian Renaissance of the thirteenth century, a revolver in his hand and a bullet in his brain.

On the day when the Knickerbocker Trust closed its doors, Wall Street was filled with direful rumors. That night, the leaders of the Street held a meeting uptown in a private banker's library. The panic was still out of hand. They feared that there would be runs on all their banks next morning. All this while the newspapers had been true to the best traditions. They still reassured the public, and refrained from mentioning the name of a single institution against which a run might be precipitated.

But the suave and polished gentlemen who rule Wall Street can show themselves to be as hard and cruel as the scaly monsters of the Saurian age. *To safeguard their own banks, they decided to single out another trust company, and hurl upon it the full weight of the financial storm.* They adjourned that night from the banker's library to Sherry's, where, at one o'clock that morning, the leading partner in the foremost banking house called in the financial reporters and to them spoke the deadly words. He said that the subject of that night's conference had been the affairs of *the Trust Company of America.*

Even then, the New York press refused to name the ill-fated institution, with one exception—a Jewish-owned newspaper which enjoys the favor of the Street.

Early the next morning, Wall Street was packed with the desperate depositors of the Trust Company of America, an institution which boasted resources of $76,000,000. The company paid out $12,000,000 the first day, $9,000,000 the second day, and so continued paying daily for a period of some 45 days. As shown before, the depositors camped all night in the financial district, so as not to lose their places in line. The trust company was slowly bled white. Then the dictators of the Street compelled the associated trust companies to advance the unfortunate institution $25,000,000 of their own funds. The order was that the Trust Company of America *must not close down.* In all, $34,000,000 was withdrawn by depositors during a run unprecedented in the history of banking.

The president of the Trust Company of America was Oakleigh Thorne. He stuck to his post without a word, and paid out his millions until the run was ended. Then he continued the company, and paid off the $25,000,000 loan of the associated trust companies. He even brought his concern back to a point where it once more paid dividends upon its stock. But the harsh emperors of the Street's arena had turned down their thumbs. Their dictum was that Oakleigh Thorne must depart forever from Wall Street, with all who had been associated with him.

I did not see Mr. Thorne again until the day of his departure. When I called at his narrow office on the mezzanine floor of the Trust Company of America building, he was seated, smiling, before his desk, above which hung a sign: "Don't Worry." *His hair had turned absolutely white.*

New York Banks Were Saved by Withholding the People's Money. What If the Interior Banks Withheld Money From New York?

Thorne said to me: "When the storm broke, to my utter amazement, its chief force was directed against the Trust Company of America. It is idle now to discuss the reason why. I am going across the river. I have bought the Corporation Trust Company of New Jersey, to provide jobs for the boys who stood by me."

The National banks of Wall Street had saved themselves, and protected the great pool in Tennessee Coal & Iron stock. Now they exchanged $30,000,000 in United States Steel sinking fund five per cent bonds for the stock ownership of the T. C. & I., held as collateral under the $25,000,000 loans, and thus, without the expenditure of one dollar, the great Tennessee Coal & Iron property, whose corner had been the mainspring of the panic, fell into the possession of the United States Steel Corporation.

While these tragic events were transpiring in Wall Street, how fared it with the country? The banks of the interior—in other words, the country banks—had not been identified in any way with the "stock pools" and "stock corners" of Wall Street. The great bulk of the American people had not been gambling in the stock market, and, in fact, knew nothing of its speculative ventures. And when the approaching catastrophe engulfed them, it came like a bolt from the blue unknown.

Toward the end of October of that year, the country was in need of funds to move its crops. It owned an ample surplus of many hundreds of millions. Unfortunately, this money had been intrusted by its local banks to the New York National banks, in the shape of demand deposits.

Turn Down Country Banks

NOW the country banks called on Wall Street for the return of a certain amount of their funds. They little suspected that their millions had already been loaned out to stock gamblers and tied up in the form of frozen credits. *Their consternation may be imagined when the New York banks coolly replied that they were refusing to ship coin or currency against the deposit balances of their country correspondents.*

But it was true. The New York National banks, totally disregarding the country's rights and interests, closed their money vaults, refused to pay out funds, and kept business going between themselves by the interchange of Clearing House certificates. They bluntly refused to pay the cost of their mismanagement. They let the country pay.

Immediately, the panic, born in Wall Street, extended its ravages to the Middle West, the South and the West. Business men desperately offered high premiums for currency. Manufacturing concerns either closed down or reduced their pay rolls by discharging operatives and laborers. This was still in the month of October. Throughout the country, banks, finding that their demands for the return of their New York deposits fell on deaf ears, were forced to close their doors. They had no appeal from Wall Street's decision. First of all, the Bath Trust Company, of Bath, Maine, suspended; on the same day the Bankers Trust Company, of Kansas City, shut its doors, that day also witnessing the closing of the Dollar Savings Bank, of Akron, Ohio.

The action of New York caused bankers in Minneapolis, St. Paul, Duluth, Chicago, Boston, Philadelphia, Baltimore, Louisville, Columbus, Cincinnati, Des Moines, Detroit and other cities to suspend temporarily the payment of money on checks, certificates of deposit or drafts, and to furnish no money to bank correspondents.

No more vivid lesson was ever read to the country on the evils of margin gambling in Wall Street, the speculation by pools and the cornering of stocks, than the panic of 1907. The corner in T. C. & I., which made a great corporation richer without its having to expend a dollar, was atoned for by the unemployed western miner, the factory workman who lost his job, the small merchant whose business was sold under the hammer.

Long afterward, Alexander Gilbert, then president of the New York Clearing House, acknowledged the culpability of the New York banks in the Rich Men's Panic, in an address to the Denver Bankers' Convention. Mr. Gilbert freely admitted that the financial collapse was seriously aggravated by the extravagant speculation which had prevailed on the Stock Exchange

VILHJALMUR STEFANSSON

New Vistas in Exploration of Arctic Region

Stefansson Upset Theories of Scientists

By D. M. LE BOURDAIS

"TODAY we add another to the long list of polar explorers, both north and south, whom our society has welcomed and to whom our members have listened with absorbing interest."

The speaker was Admiral Peary, the man whose name probably will be associated with polar exploration for as long as history endures. The occasion was the presentation of the Hubbard Gold Medal, the highest honor in the gift of the National Geographic Society, to another renowned polar explorer—Vilhjalmur Stefansson.

Among other things Admiral Peary said:

"What Stefansson stands for is this: he has grasped the meaning of polar work and has pursued his task in the Arctic regions section by section. He has profited by experience piled upon experience until he knows how to face and overcome every problem of the North. His method is to take the white man's brains and intelligence and the white man's persistence and will power into the Arctic and supplement these forces with the woodcraft, or, I should say, polarcraft, of the Eskimo—the ability to live off the land itself, the ability to use every one of the few possibilities of those frozen regions—and concentrate on his work."

Perhaps it is because Stefansson is an anthropologist, and first approached the Arctic through the study of its people, that he has come to understand the ways of the polar regions so well. After a postgraduate course at Harvard, and two summers spent in archeological research in Iceland, Stefansson's first visit to the Eskimos was in 1906, when he went north to act as ethnologist with the Leffingwell-Mikkelsen Arctic expedition. While ostensibly attached to that expedition, he never actually became a member of it.

The Lesson He Learned

AS STEFANSSON doubted that the party would reach its destination because he believed its ship, the Duchess of Bedford, to be not properly equipped to cope successfully with ice conditions along the Arctic coast, it was arranged that he should proceed overland by way of Edmonton and down the Mackenzie River to meet the expedition at Herschel Island—if the Duchess of Bedford should eventually reach there. He felt that should his predictions prove correct he need not lose any time, but could devote his intention immediately to a study of the little-known, scientifically, Mackenzie delta Eskimos. His surmise proved correct. The Duchess of Bedford met adverse ice conditions and was overtaken by winter at Flaxman Island, on the north coast of Alaska, some distance west of Herschel Island.

In the meantime, Stefansson had reached Herschel Island. His equipment was on board ship, so he found himself as he says, "set down 200 miles north of the polar circle, with a summer suit of clothing, a camera, some notebooks, a rifle and about 200 rounds of ammunition, facing an Arctic winter, where my only shelter would have to be the roof of some hospitable Eskimo house." But this was just what he wanted. He wished to study the Eskimos at first hand and wisely concluded that there was no better way to do so than by living with them as a member of the native community. This Stefansson did. He found "the people were agreeable."

It was really this winter's experience that laid the foundations of his later procedure in the North. He realized that these people were born, lived as little children and grew to manhood and old age under climatic conditions which were popularly believed by the world that he had recently left as particularly hostile to human life; and that they obtained fuel for heat and light, as well as food, from the resources of the country.

If with primitive weapons the Eskimos were able to obtain sufficient food (principally seals and caribou) to maintain themselves, why should not white men equipped with rifles do equally well at least? He could see no reason why they could not. Previous observers had approached the North with fixed preconceptions concerning the fundamental hostility of climatic conditions in the Arctic—and they generally found there that which they went to seek. Stefansson sought to understand the North; and, succeeding, discovered many of the "terrors" of the Arctic regions to be myths.

Much difference of opinion existed up to that time between various polar explorers as to whether certain parts of the mainland of North America east of the Mackenzie delta and west of Hudson Bay, and the islands lying directly north of that coast, were inhabited. Stefansson believed they were. He succeeded in interesting the American Museum of Natural History in his plans after returning from his first year's work among the Eskimos of the Mackenzie River delta. But funds were low and no expedition requiring the usual paraphernalia of Arctic exploration was possible. This was just what Stefansson did not require. Here was a chance to prove his theory regarding the ability of white men to live on the resources of the country. His plan was to start from a point known to be inhabited and work eastward into the territory believed by others to be uninhabited. Wherever Eskimos were living, Stefansson felt certain he could maintain himself.

He at first intended going alone, but finally arranged with Dr. R. M. Anderson, a former classmate in the University of Iowa, a naturalist, to accompany him. They set out for the Arctic by way of the Mackenzie River with probably the smallest outfit ever carried by explorers in polar regions.

How the Party Lived

THEY left for the North in April, 1908, and returned in the autumn of 1912, the four intervening years having been devoted to a study of the Eskimos on the northern coast of Canada eastward from the Mackenzie delta and on Victoria Island. Eskimos were found in practically all localities they visited.

The most momentous achievement of the four years, however, was the actual demonstration of the soundness of Stefansson's theory of "living off the country."

The expedition of 1908-12 was confined principally to the mainland. Stefansson and his parties had subsisted mainly on caribou killed inland and seals obtained on the sea ice. But Stefansson believed that what they had done on and near the mainland also could be done on the islands hundreds of miles north of the mainland and even out hundreds of miles from any land on the frozen surface of the sea.

In this respect it was conceded by explorers who had first differed with Stefansson in regard to the possibility of "living off the country" that if such a possibility existed on the mainland, where caribou are to be obtained, the same thing might be done to a limited extent on such of the islands as were known to contain caribou or polar cattle, commonly called "musk oxen." But when it came to the maintenance of life on the floes of Beaufort Sea, for instance, all polar opinion was against him. The authorities long considered the best on polar exploration were unanimous in the belief that the sea surrounding the Pole was devoid of life.

Peary had always provided himself with sufficient fuel and food to supply his party until it returned to its base.

Stefansson is persistent, if anything, and was not to be turned aside by a little thing such as the unanimous opinion of all the authorities. He was convinced that his theory was more sound than the opposing belief. He was successful again in interesting the American Museum of Natural History in his plans. Together with the National Geographic Society, that institution agreed to find funds for the financing of another expedition which should put Stefansson's theories to the test and complete also the studies commenced by Anderson and himself on their previous trip.

The amount of money at the disposal of these two institutions, however, proved to be inadequate; and as the territory to be explored was in Northern Canada, and the adjacent islands claimed also by Canada, Stefansson thought that perhaps the Canadian Government might be induced to join in the expense of the expedition. He accordingly approached Sir Robert Borden, then prime minister of Canada, with that end in view. Sir Robert appreciated the value to Canada of the undertaking. He accordingly suggested that the Canadian Government would be willing to finance the project in full if it could be arranged to have the expedition conducted entirely under the auspices of the government. This proposal appealed to Stefansson, as he is of Canadian birth, having been born in Southern Manitoba in 1879, of Icelandic parents, who subsequently moved across the line into North Dakota when he was a child. Thus it became known as the Canadian Arctic Expedition.

The Karluk, a 250-ton whaling vessel, which had been used for a number of years in the Arctic, had been purchased previous to the transfer of the expedition to the government and it also was transferred. On board was gathered a large staff of scientists drawn from several European countries, the United States and Canada and even as far away as Australia. Among them was Dr. Anderson, Stefansson's former companion, who was appointed second in command of the expedition. The Karluk sailed to Nome, Alaska, to take on final supplies and equipment. Here two smaller boats, the Alaska and the Mary Sachs, both of 30 tons, were purchased, as it was the intention to divide the expedition into two sections, one under Dr. Anderson in the Alaska to work in the vicinity of Coronation Gulf along the mainland; and the other under the direct command of Stefansson himself to proceed as far north as possible in the Karluk and carry out geographical exploration and the collection of scientific data in the great Arctic archipelago, and on the ice of Beaufort Sea. The Mary Sachs was to act as tender for both sections, but on leaving Nome late in July, 1913, both the smaller craft were used to transport the equipment belonging to the southern division, under the command of Dr. Anderson. This section proceeded in accordance with the program; but the Karluk was caught in the ice off Point Barrow, Alaska, the most northerly point of the North American continent, and finally carried by the current westward almost to Wrangel Island, off the north coast of Siberia, where she was finally crushed by the ice and sunk. The crew and members of the scientific staff who were on board succeeded in leaving the ship in safety, but more than half of them lost their lives crossing the ice to Wrangel Island, or died after their arrival there. Stefansson was not on the Karluk when she was carried offshore by the storm that set adrift the floes in which she was frozen. He had gone ashore with two companions to obtain fresh meat for the ship. The fate of the Karluk was not known for more than a year.

Such an untoward incident as the loss of the main ship of the enterprise, and particularly valuable and necessary equipment, at almost the outset, was a serious handicap to the success of the expedition. But Stefansson was not daunted. He decided that now was a good opportunity to put into execution his project for proving conclusively that life could be maintained by "living off the country" on the ice of Beaufort Sea. He had landed from the Karluk on the coast not far west of where Dr. Anderson's party was expected to winter. His plan was to take what equipment he required, consisting of dogs, sledges and scientific equipment, from Dr. Anderson's party which, with the addition of some supplies and equipment purchased from traders along the coast, would be sufficient for the trip he had in mind. It consisted of a sledge journey in the early spring, following, northward over the sea ice. If new land were discovered it would be roughly charted and the party would return to its starting point. If the land were extensive the party might remain on it for a year. If no land were discovered and ice travel continued good the party would, after having proceeded northward as far as considered practicable, turn eastward and attempt to land on the west coast of Banks Island or Prince Patrick Island.

Covers 100,000 Square Miles

BUT when Stefansson discussed his plans with Anderson, the latter declined to become a party to them, insisting that the scheme was foolhardy, and refused to give up the equipment under his charge. Besides Anderson's insubordination, another difficulty presented itself: the men also were thoroughly convinced of the foolhardiness of the undertaking and refused to go. Stefansson finally succeeded in winning over a number of them and hired two more men whom he had known on previous trips to the Arctic.

After experiencing considerable difficulty in obtaining suitable equipment, the ice party set out on a journey which most of those left behind expected would end in disaster if persisted in. After support parties had been sent back, the ice party consisted of two men besides Stefansson, with one sled pulled by six dogs. They had food for themselves and their dogs sufficient to last about 30 days. They found no new land, but arrived on the west coast of Banks Island on June 25, having been 93 days on the ice, and having traveled more than 500 miles, as shown on the map, but when counter-drift is considered, probably nearer 700 miles. They had not gone without a meal in all that time, but had been able to kill enough seals to supply them with food and fuel. Stefansson had demonstrated the truth of his theory!

During that summer they remained on Banks Island, killing sufficient caribou and seals to carry them through the dark period of the winter. The following spring they carried out another ice trip, farther north, on which new land was discovered. In all, more than 100,000 square miles of land and sea were withdrawn from the area previously marked "unknown" on the maps by Stefansson's explorations in these and succeeding years.

Stefansson has demonstrated beyond all possibility of doubt the absolute feasibility of the theories which he had the courage to hold against all sorts of opposition and the faith to put to the test with his life as a forfeit in case of failure.

Across the Border to Intoxicating Liquors

American Unjustly Views Canada as Bar; Canadian Sees U. S. as Sponge

By A. R. PINCI

"YOU don't realize how lucky you are," said a Tulsa citizen to a Troy citizen in the smoking compartment of a Canada-bound limited train that had left Grand Central Station in New York at 7:45—12 hours from the nearest lawful drink.

"You fellows can satisfy your appetite over the week-end. Just cross the border and there you are. You may do it by motor or by train, but right next door—all you want!"

"Yes," said the New Yorker, "if money is no object."

"Is money any object in buying drinks nowadays?" retorted the Oklahoman. "I grant that railroad fares or tires and gas come high, but think, man, think! In the end it costs less than the stuff we buy in our part of the country. Men don't hesitate to peel off a ten-spot for a bottle of the-devil-knows-what, and you fellows kick because you can have the right drinks, no danger of prosecution, no fear of death, and a vacation on the side. You don't deserve the good luck."

It was a casual conversation carried on humorously, half comically, to kill time by discussing comparative geographical nearness to the intoxicating liquor border.

The chat was interesting and typical not for its immediate subject of discussion, but for its implication. It identified a suspicion, or a belief, or a persuasion, of those American localities that in actual miles are farthest from the nearest "wet" territory. On the other hand, even wet territory is considered from its standpoint of accessibility, and for this sole reason the bibulous inhabitant of Key West considers himself less fortunate than his fellow-citizen of Bisbee or San Diego, while the latter feels discriminated against because Mexico does not offer the same liquor stores that Eastern Canada offers to the inhabitants of Plattsburg, New York; St. Albans, Vermont, and Skinner, Maine.

Quebec Not a Storehouse

THAT Quebec is much of a storehouse for thirsty residents along or adjacent to the Canadian border is really a fiction. Except the skilled liquor-hunter, the average American might traverse a Quebec city or town and fail utterly to discover the envied emporiums. The visitor's eye might feast upon billboard advertisements of "Frontenac Ale," but a keen glance would be needed to detect signs announcing the sale of this or that drink within.

I walked a mile along St. Jean street before I could discover a place where I might have something to drink. That was in the city of Quebec, the heart of French Canada, in May, 1922. It was not much easier in Montreal, with its nearness to the American border, and consequent more Anglified (but not necessarily Americanized) atmosphere. St. Catherine street is the principal business and theater center, but hunting on it for a place to drink was no easy job.

The most conspicuous indication of these oases are those plate glass windows upon which in gilt letters are these words: *Commission des Liqueurs de Quebec.* They are the official stores, where one may lawfully buy one bottle at a time, to be consumed elsewhere. But externally these official stores—because they are managed by the province's authorities—offer no attractive effects. They look more like the average undertaker's windows than anything else I have ever seen. When the shades are drawn after 6 p. m., they look bare and unattractive; during the business day, windows at partitions remind one of an emergency post office. No high polish, no brass trimmings, no seats, no inviting surroundings. Just a few official notices hanging upon the walls. Everything is nicely calculated to speed the parting purchaser with his one bottle, although there is nothing to prevent him, if so inclined, from repeating the operation as often as his time and endurance permit, and his rotations remain undiscovered by the salesman.

Trying Government Control

THE picture of children flattening their noses against the windows of toyshops and candy stores as they contemplate the tempting stock on show is familiar, but in Quebec it seems necessary for the drink-hunter to flatten his nose against the windows of restaurants to find whether they are licensed to sell wines and ales. In certain places, the announcement is set forth in such small letters that hypermetropic individuals who left their glasses at home would be unable to read them.

The residents of Quebec are calm about the entire liquor question. Just now they are experimenting with governmental control of the sale of intoxicating liquors as well as light wines and beers. How they will vote at the next election is problematical.

The fact is that the Quebecans are not drinkers, as drinkers are understood in the United States. I have dined at public restaurants, at clubs, and in private, but during an entire week in the province, and in big cities at that, only one table was adorned with a huge glass of beer—and half of it was left untouched. Well-to-do as well as persons not especially prosperous seemed entirely satisfied to do without any of the probably 50 items on the wine list—from sparkling wine down to ale.

This attitude in public is the index of their attitude at home. Not being users of alcoholic beverages, regardless of intoxicating degree, they are necessarily not handlers of the stuff. Although the sale is not restricted, but only regulated, there seems to be little incentive for trafficking. It is not only unjust, but essentially uncomplimentary, and decidedly offensive, to regard our northern neighbors as the drink hosts of Americans, facetiously or otherwise.

Quebec just now is trying out a policy with regard to temperance that may or may not be continued. Quebec's present system is that province's medium between unlimited sale and absolute prohibition. To the American, Canada is the embodiment of a free country—that is, until he finds that while the drink is there, he is unable to indulge as freely as he likes. When it comes to quantity, his restrictions are no less severe than those in "dry" United States. The visitor (or even the citizen) looking for quantity, must have recourse to dark and devious methods. No sooner does drink become a sport rather than an article for the table than the bibulously inclined become outlaws.

Unfortunately, both for Canada and the United States, the bootleggers and other illegal traffickers in liquor have given a reputation to Canada that is undeserved. It is not the sort of feeling that should be permitted to continue between two congenial neighbors. The single act of a liquor contrabandist, with its trail of publicity and prosecution under the law and the resultant irritation of hasty prohibition critics, has far-reaching effects. It is these effects that lead the people in the United States to divide, roughly speaking, into two classes; those who want to go to Canada to drink and those who believe that Canada is conspiring to injure the United States by purveying intoxicating beverages.

But there is another side to this question. If the average American thinks of Canada in terms of a barroom, the average Canadian thinks of the United States as a sponge. Be it understood that this statement applies to the individual who has not traveled, who has not known of the truth of conditions, and whose opinion is the cynical feeling inspired by reading much of the popular bootlegging literature.

On my first visit to Ottawa the first offer made to me, after the preliminaries of introduction, was that in case I wanted *a bottle* it would be no trouble to show me how to obtain it. As a sign of hospitality and desire to please it was amusing, but it was also serious. Ottawa, the capital of the Dominion of Canada, is just across the Ottawa River from the province of Quebec. Being in Ontario, it is dry.

As a matter of fact, bottled (or package) goods of this kind come high in Canada. A certain well-known brand of Scotch whisky retails at $4.30 a quart, and a "short quart" at that. All others are in proportion. The least expensive table wine I found was labeled Chateau Richer, "eight per cent, made from raisins." It was the sole purchase of the kind I made, because I wished to taste wine of whose pedigree I was sure. So much is said about "wine from raisins" in New York, and so much of it floats around at $5 to $8 a gallon, that I wished to compare the two.

The Wine Costs Too Much

IT WAS good wine, perhaps too sweetish for the table, but quite too dear, merely on the strength of its worth. Moreover, the wine drinker is penalized or the beer drinker is favored. One may get a bottle of beer for 20 cents—it was 15 cents before the new budget went into effect late in May—but one may not get a bottle of wine, a short pint, for less than 75 cents, which is the price I paid.

The fact is that many a gourmet does not care for even a whole short pint at one meal. It is incredible, especially these days, but it's so, nevertheless. The diner must either pay for the full bottle he does not consume or consume more than he cares to drink. The New York family hotels some years ago, recognizing this situation, and refusing to go on the principle that the unaccompanied diner is a rarity, decided to establish small bottles known as "splits," which contained about two claret glasses. This gave the advantage of unopened bottles, unspilled glasses, and the label. This arrangement was limited to California wines and Médocs.

G. A. Sinnard, president of the Quebec Liquor Commission, upon his return from France, where he purchased the best liquors for distribution in the territory over which the commission has control, said that government regulation is an excellent system. "Our way of control has greatly helped temperance. It has discouraged the drinking of whiskies and rums and encouraged the use of wines and beer."

There are certain interesting phases that bear looking into. One is especially worthy of study. It has to do with a plebiscite while I was in Quebec. It happened in the municipality of the village of Templeton, Hull County, which includes the villages of East Templeton and Ste. Rose de Lima. In 1911 when the villages and parish formed but one municipality, the East Templeton Council, acting on a petition signed by more than 80 per cent of the electors, put prohibition into effect.

On May 26, 1922, a poll was held on the question of the issuance of tavern and hotel licenses by the Quebec Liquor Commission. Of the 125 electors in the municipality, only five turned up at the poll between the hours of 9 and 10:30, each voting in favor of wine and beer licenses. The poll was declared closed by Mr. H. B. Beauchamp, secretary-treasurer of the municipality, who acted as returning officer, after half an hour elapsed without a vote being recorded. The formality was governed by the provisions in the Municipal Code.

According to the Quebec Liquor Act, the Commission may grant licenses if the majority of the voters express a demand for the same at a regularly held poll. The size of the vote has nothing to do with the question, provided that there is a majority.

In this particular instance, however, there has arisen a technicality that may affect this particular quintuple vote. It is held by certain individuals that the poll should have been kept open until the regular closing time at six o'clock in the evening, and not closed—even if legally, because 30 minutes passed without a ballot. If no formal opposition is registered, the license will be granted.

As far as Quebec in general is concerned, the liquor issue will form the best part of the future provincial elections. It is not a question between prohibition and license, but rather as to method of governing the sale. It is the question of whether the present government liquor monopoly shall be continued or abolished, in the latter case reinstituting the old licensing system, subject to certain new restrictions. At present there is a government monopoly in "hard" liquors, private parties being licensed to sell only beers and wines.

The Conservative party in convention at Montreal declared for a licensing system which would permit hotels and other duly authorized vendors to dispense alcoholic drinks of all kinds.

Moonshine Stamped in Canada

CANADIANS I have talked with have no fault to find with the governmental vending arrangement, although a few joke about the "bottle a day" restriction, since one is at liberty to buy a bottle at each window and in every shop, if he is clever enough to conceal prior purchases. In fact, the government is popularizing the system as much as possible, and now supplies may be ordered by telephone, a nominal charge being made for the delivery service.

These stores, however, are not beyond the sphere of operations of burglars. Five men attempted to rob the Commission's store at St. Johns. They sped away in an automobile when surprised at their work, but were arrested a few hours later 33 miles away. Whether money or liquor, the government of Quebec is quite serious about apprehending criminals.

I have seen California wine in French ports ready to undergo certain occult transformations that in due time would see it reposing in America in dark green bottles dusted and labeled with some attractive French name, possibly within a few miles of the spot whence the original grapes came. But that being now a dead industry, another has taken its place.

Manufacturing bootleggers along the states bordering Quebec and the Great Lakes send their moonshine to Canada to be sealed, stamped and bonded, to bring it into the United States. On the other hand, little smuggling of real Canadian liquor was indulged in. These statements are on the authority of the Federal prohibition director of Michigan, who is seeking to obtain motor boats to patrol the Detroit River.

Liquor-running between Canada and the United States is serious business. It is as objectionable to the Canadian authorities as it is to the American. That Canadians consider our side of the case is proved by the decision last spring by Magistrate Jelfs at Hamilton, Ontario, when he ruled that transportation of liquor which was consigned to an American buyer was a "breach of international law." He cited a slave-running case of 1807 as precedent, the Amedic slave case.

In that case, an American slave runner, shipping slaves to the United States, was caught on the high seas by the British. English courts ruled that because both countries had laws against slave importation, the man was guilty of breaking international laws. Magistrate Jelfs accordingly held that, because Ontario and the United States both prohibited the importation and sale of liquor, the prisoner had committed "an act likely to endanger the peace between the countries."

May Patrol the Border

JUST now there is talk of establishing something akin to an armed force on the border east of Ontario, where no soldier has ever trod for a century, all because of the bootleggers.

Plans are being discussed to patrol the frontier by means of armored cars carrying machine guns. Fifty shots were fired at Rouse's Point and Malone, New York, last April, in an attempt to smuggle 5,688 bottles of whisky. Ten men were implicated and a current valuation of $50,000 was set upon the confiscated goods.

Another and more conspicuous instance was that involving the magic change, while being transferred from railroad terminal to ship, of 6,260 bottles of bonded famous Scotch whisky into strawberry and cream soda. The shipment, valued at $110,000, consisted of 175 barrels each containing 36 bottles, and was routed by way of New York to Cuba from Canada. Latest information is that several prohibition agents had been arrested in connection with this affair.

Now that the Supreme Court of the United States has ruled that intoxicating liquors cannot be transshipped from this country or permitted to go through in bond, cases like the above are unlikely to happen again, and undoubtedly Cuba and other countries will now receive their liquor shipments directly and not by way of Canada. This in effect relieves pressure upon Canada and diminishes the grand total of Canadian importations, and accordingly restricts the field of operations of the bootlegger and liquor thief.

As far as Canada herself is concerned, there will be no worry over the consequent loss of freight rates, since the carrying of liquor has become a very expensive proposition, and the carriers desire to be relieved of their responsibility.

How Mud-Road Tax Is Being Eliminated

Improvement of Highways Is of the Greatest Benefit to Farmers

By J. H. WALTON

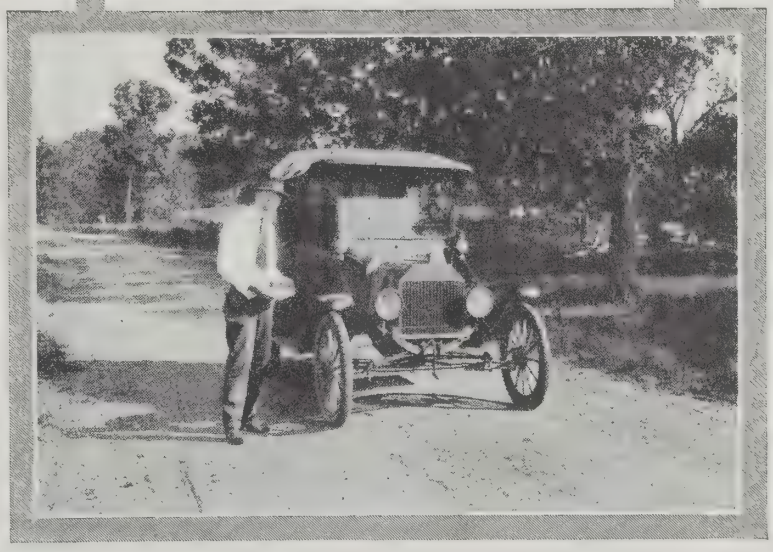
HAVE you ever considered to what extent every individual is dependent on the highway system of the country for the necessities of life? We are dependent alike on the super-highway with its smooth concrete surface that stretches between the larger cities, and the little mud road that lies back in an obscure farming section. The truth of this statement is evident in that practically everything we use at some time passes over the highways.

In working out a plan of highway improvement we must think in terms of the motor-driven vehicle. The growth of the automobile industry in the past few years has surpassed the dreams of the most visionary prognosticators of 20 years ago.

A study of the state highways of California, made by the United States Bureau of Public Roads, discloses the average week-day traffic units to be divided in the ratio of 97.3 per cent motor driven and 2.7 per cent horse drawn. In other words, of every 100 vehicles passing a given point on the road, 97 were automobiles and only three were horse drawn. There are enough automobiles in the United States for every one of the 105,000,000 inhabitants to ride in them at the same time; one motor vehicle for every 10 persons.

The National Automobile Chamber of Commerce states that the most important use to which the automobile is put is in business. This includes the thousands of motor cars used to transport workers to and from their places of employment, as well as motor trucks used in commercialized business—regular motor truck freight delivery routes between cities, and bus lines for passenger service. The use of the motor car for pleasure is already of secondary importance, and such use will become less as time goes on.

There are 4,000 passenger motor buses operating in California alone. It is possible to travel from Los Angeles to the Oregon line by motor bus, changing at San Francisco. Through tickets are sold and are interchangeable in the same way as in railroad travel. Sixty-three companies in Connecticut specialize in passenger bus service.



Regular freight motor truck routes have been established between New York, Philadelphia, Baltimore and Washington. Large trucks make daily trips between these points, carrying many tons of foodstuffs and manufactured goods. Similar reports from other states indicate that this feature of the use of motor vehicles is growing to gigantic proportions, and schools are being organized to train men for positions as highway transport engineers. It has been predicted by authorities familiar with the situation, that highway transportation will eventually supplant railroad transportation for the short-haul traffic, both freight and passenger. There is even now a keen competition in some sections, and a few of the more progressive railroads have adopted gasoline-driven engines to run over their rails for use in short-haul business.

The good-roads question, while it is of the utmost importance to all, primarily concerns the farmer. The business of farming is essentially dependent on the condition of the roads, for whatever is not produced on the farm must be hauled to the farm, and many crops of the farm must be hauled away to the railroad stations and local markets.

When the farmer can use a motor truck to deliver his produce to market he saves time, thus being able to devote more time to his farm work with a resultant increase in crops. He can live farther away from the railroad or market, as a reduction in time is equivalent to a decrease of the distance. The reduction may be largely due to increased speed of hauling, to increased load, or to both.

Jefferson Highway near De Queen's, Arkansas, before improvement. The tax paid in increased maintenance cost, excessive use of gas and oil, repairs, tires, and so on, on this mud road greatly exceeds that paid to improve it.

The same highway, improved. Would you have been willing to pay as much for the farm shown in the picture before the road was improved as you would now?

To use motor trucks with a maximum of efficiency it is necessary to have good roads. In answer to a questionnaire sent out by the United States Bureau of Public Roads, to farmers having motor trucks, 73 per cent state that the principal disadvantage of the motor truck is poor roads. Eleven per cent say cost of operation, two per cent soft ground, two per cent mechanical trouble, and only 11 per cent say first cost of the truck. As cost of operation, soft ground and mechanical trouble are largely dependent on the condition of the road, it is safe to say that poor roads are by far the greatest disadvantage to the universal use of motor trucks on the farm.

For the farmer who does not have a motor truck, and who believes the first cost would prohibit his buying one even though he had good roads, and who must use teams exclusively, improved highways are proportionately as advantageous.

"To fix one's ideas on the reduction in the cost of hauling due to the improvement of roads," says an official of the Bureau of Public Roads, "the transportation of farm produce to market should be considered. The cost of this work in the United States at present is high and is done mainly to steep grades and yielding road surfaces on unimproved roads. It must always be remembered that the worst grade on any road tends to limit the load that can pass over the *entire* road." But, "the cost of hauling farm produce to market is probably not so much increased by the presence of excessive grades as it is by the bad conditions of road surfaces. There is no question that poor road surfaces cause an economic waste, of which the total in this country is startling."

In connection with this it is well to consider a few authentic instances of actual conditions. Before the road from Ben Hur to Jonesville, in Lee County, Virginia, was improved, merchants hauling goods from Ben Hur, the nearest railroad station to Jonesville, required a two-horse team for 2,500 pounds, when the roads were in ordinary condition. Since the road has been improved, these merchants haul 30 sacks of fertilizer, weighing 200 pounds each, and use two mules. They now make two trips a day instead of one. They can haul 80 bushels of coal to the load instead of from 30 to 35, which was the load on the unimproved road.

Another instance at Crosby, Texas, is significant. There a shell road was built for one mile out of town. A farmer four miles out came to town with a team of two mules and loaded on his wagon at the railroad station two tons of wire fencing. At the end of the improved shell road, on his return, the farmer was compelled to throw off 3,000 pounds of the wire. He then hitched two additional mules to haul the 1,000 pounds on the remaining three miles of unimproved road. This man then had to make three more trips for the remaining 3,000 pounds of wire, and it required his time for the four miles from 10 o'clock one morning until 11 o'clock the next morning to finish the hauling. If the improved road had extended four miles to the farm, the original team of two mules could have hauled the two tons of wire in two and one-half hours.

Innumerable instances of this kind could be cited, and every farmer who is dependent on bad roads knows from sad experience that poor roads mean poor business, and waste of time and money. The expense of poor roads is clearly shown by the following, taken from a bulletin prepared by the Bureau of Public Roads:

"In the cotton states of the South the average haul of cotton from farm to the shipping point is 11.8 miles. The average load is about 1,700 pounds—a little more than three bales—and the average cost of hauling is 80 cents a bale. The cost of marketing the 1911 crop of 16,250,276 bales was $13,000,220, if computed on the above basis. To each bale of cotton there is about half a ton of cotton seed, which was hauled from the farm to the gin, and then a large percentage of it hauled again to the shipping point. The average cost of hauling cotton seed in the United States is $3 a ton. The 1911 crop of seed, therefore, cost $24,375,414 to haul. The total cost of hauling the cotton crop in 1911, including the seed, was, therefore, $37,375,634. Any system of road improvement throughout this zone which would reduce the annual hauling charge five per cent would effect a saving of $1,868,781 a year."

Thus you see you pay for good roads whether you get them or not, and you pay more if you don't get them. The choice lies with you. You can pay for good roads by improving them, or you can pay for them by *not* improving them, and the cost is greater, in increased cost of products, in wear and tear on trucks, tires, increased cost of gas and oil, and, if you are a farmer using teams, in increased time spent on the road and in shortened life of your horses.

If you choose the first method and improve your highway you can see the result of your expenditures. You have an improved road—one you can depend on to stand up under the wear to which it is subjected, and one on which you can depend in the spring and autumn when it is needed the most.

If you choose the second method and do not improve your highway you do *not* see the result of your expenditures—and you do *not* have the improved roads. The cost is greater but because it is paid out a few cents here, a dollar there, you do not realize the gross amount.

Another way in which you pay for not having good roads is in the debit of unproductive back-lying lands. Thousands of acres of good fertile land are idle because of lack of adequate transportation facilities. Every acre of unused land is a distinct liability to the community in which it is located.

A farmer in Sullivan County, Tennessee, a few miles from Bristol, had 100 bushels of potatoes which he intended to market during the winter of 1907-8. Owing to bad roads he was unable to haul the potatoes at all and they rotted in the cellar. Nevertheless, the price of potatoes reached the peak for that year in the meantime. A Bristol merchant stated that during the winter as many as 10 carloads of farm produce, including wheat, potatoes, and other supplies, were daily shipped in to feed not only Bristol, but the adjacent territory. This section could no doubt have been self-supporting had they had adequate highway transportation.

To show clearly the inability of the farmer situated on a poor road to compete with a farmer situated on an improved road, it is only necessary, for the sake of example, to let it be supposed that two farmers living in separate counties, but at equal distances from the cotton market, learn by telephone that cotton has advanced in price $1 a bale. The farmer living on a bad road can immediately haul *one* bale of cotton, while the other farmer can haul *four* bales because he lives on a good road. The raise in price means a profit of $4 to the one man and only $1 to his neighbor.

In 1921, highway improvement cost the people of this country $600,000,000. Of this sum $120,000,000 was paid by automobile license fees, leaving $480,000,000 paid by the state and Federal taxes, road bonds, and so on.

Apportioning this equally among the 105,000,000 inhabitants we learn that good roads cost every man, woman and child one and one-quarter cents a day last year. Can anyone say he does not get the equivalent of his one and one-quarter cents in service? Can he say he is entirely independent of the highway system?

In order to obtain the best results it is necessary to take a state-wide view. What road would be of most benefit to the greatest number of people? That is the road which should be improved first.

What we really need is a *system* of improved roads that will accommodate everybody, and it is not to be expected that it will pass everyone's door. The railroads render a wonderful service, but we cannot go out to our front gate and board a train. It is hoped that eventually *all* roads will be improved, but it is necessary to make a beginning and advance along logical lines.

We must not improve one road here, another a hundred miles away which in no way supplements the entire system. Before deciding upon improving any road we should first determine whether that road is an artery in our transportation system, or only a tributary vein. If we improve the secondary roads and allow the primary roads to deteriorate they will not be able to accommodate the traffic flowing to them from the tributary roads.

Preventable Losses From Crimson Challenge

In Five Years the Death Toll Mounts to Thousands of Lives

By COURTENAY SAVAGE

(C) Int. F. S.

DURING the past five years the United States has suffered a money loss of $1,672,722,677, approximately 75,000 men, women and children have met violent deaths, while nearly 100,000 persons have been injured- -all through one cause. War is not the only form of destruction, for these tremendous losses of life and property were caused by the crimson destroyer that battles with forked tongues—*fire!*

Did you say, "too bad"? Yes, it is too bad, it is a crying shame, for 75 per cent of that loss was absolutely preventable, and if the facts could be obtained the percentage would probably be larger, many fire insurance authorities estimate as high as 95 per cent. Even more startling is the fact that of the killed and injured 82 per cent of the victims were mothers and children, which means that the majority of the fires in the United States occur in the homes. Just what that means can be better understood by examining the monthly fire report of a fair-sized community. If there were 20 fires during the month, an investigation would show that 16 of those 20 fires took place in private homes.

Fire has always held a fascination for man, and has always been one of his greatest enemies. The olden civilizations worshiped fire, not only because it gave heat, and helped them in the preparation of their foods, but because fire held terror—it was the swift destroyer that spared nothing. With the advancing ages, however, man realized that while fire was an enemy it could be checked, and the fire departments with their strong streams of water, and their chemicals, came into being. Then modern efficiency stepped in. It was not a case of checking a fire that had been started, but of preventing the start of the flame.

Fire prevention! The words have a familiar sound because it is a subject much talked about—and yet, for some unfathomable reason, the advice of how to prevent a fire is seldom followed.

As 80 per cent of the fires occur in private homes it is well to start any research into what the individual householder can do to prevent loss by fire in the home circle.

It is early morning! The family is just getting up. The kitchen fire is not burning well, and breakfast must be ready in a few minutes. Why not hasten the fire with a little kerosene? "Hasten the fire" is the correct expression to use. Of course, there are plenty of occasions when kerosene is used that the house does not burn down—but there are also numerous occasions when the house does burn, and when the person holding the kerosene can also is burned.

Perhaps you belong to a household where kerosene is never used—but—do you use an oil mop to wipe up the floors? You do? Well, it may be news to you, but $1,000,000 worth of fire loss a year can be traced to waste rags saturated with oil, and men and women alike are to blame. The man of the house goes to his garage, uses an oil rag on the car, and then throws the rag into the cupboard of the garage. The woman of the household uses her oil rag for the floors or the furniture—and then she, too, puts her oil rag in a cupboard. What happens next? You have heard, of course, of spontaneous combustion? Linseed oil is probably the greatest cause of spontaneous combustion, but there is still danger with less inflammable oils. It is just as well to burn an oil rag after you have finished with it, or at least to fold it tightly and put it away in a tin box. In the case of oil floor-mops put them outside if possible, but if not outside put the oil-soaked mop in a metal can. Most mops come in such a can. Never poke an oil rag or mop into an infrequently used cupboard filled with rubbish, old papers, rags, and so on, and then go away to forget all about it.

All this is not a preachment against the oil mop, but it does mean—don't shut an oil mop or rag into an almost air-tight closet where it may first spontaneously set fire to itself, and then ignite any "rubbish" that may have accumulated in the closet.

In the five years just ended it is estimated that the greatest fire loss was caused by matches and smoking, the amount having been estimated at more than $90,000,000. The two instigators of this tremendous loss are men who smoke and young children of less than school age.

Most men who smoke are constantly lighting a cigar, pipe, or cigaret, as the case may be, throwing down the match, and walking away. They do it many times and nothing happens, but perhaps there will be a time when somebody must send for the fire department!

See that a match is out before it leaves your fingers, or, if you throw it down, step on the flame. One great fire danger comes through smoking while lying down, either in bed or on a divan. The man lights his "smoke" and then either drops off to sleep, or becomes so engrossed in what he is reading that, before he realizes it, the bed, divan, or his clothing, is on fire.

A large portion of the loss under this particular heading comes from children playing with matches, and, incidentally, this practice is the cause of a major portion of the death loss through fire. Fire has always held great attraction for children, and while they seem instinctively to know that they must not play with matches they will sneak them away if possible. The little boy wants to play "smoke" with a piece of paper, the little girl wants to light her toy stove. The fall of the year, with its bonfires, always carries with it tragedies of children who take matches from the house to light the dried leaves.

Just how dangerous is this last-mentioned pastime can be imagined from the remark of a coroner of a small, mid-western community that he had been called to look into the deaths of 21 children who had been burned in 16 days. And in practically every case the mother was not at fault; it was just the fascination that fire held for the child. The chief cure for the "matches" habit in children is to keep the matches where the children cannot reach them, teach them the dangers of fire, and, as far as possible, use a "safety" match, which is not so easy to ignite as the common match.

Incidentally, the same coroner called attention to the fact that it is possible to fireproof children's play clothes, and that it is not an expensive or laborious job. Also such articles as draperies, lace mats used under candles, and so on, can be fireproofed.

The directions for fireproofing are simple. Dissolve one pound of ammonium sulphate in one gallon of water. The result will be a clear solution in which the fabric to be fireproofed should be thoroughly soaked, either immersed or sprinkled, and then allowed to dry slowly. The effect of the fireproofing lasts as long as the article is kept dry, and can only be thoroughly removed by soap and water. The chemical used in this fireproofing, ammonium sulphate, is a white crystalline powder, purchasable at any drug store for about 30 cents a pound. The solution does not de-

Photo by Social Press Association, New York.

Above—A city fire, terrible because it not only endangers lives and property but means loss of work for hundreds. Most of the fires in this country are preventable.

Center—A city fire, probably preventable, as are 95 per cent of the fires in this country. Such a fire as this is a grave menace to the community, and misery follows in its wake.

Below—The ruins of F. W. Woolworth's palatial home. Carelessness perhaps played its part in the fire, and yet the Woolworth chain of 5 and 10 cent stores is built on modern efficiency.

teriorate through standing, is not poisonous, and does no damage to the clothes. If you are skeptical, tear a piece of goods in two. Soak one piece in the solution, and when it is dry apply a match. The unfireproofed material will burn at once, but it will be some time before the edges of the fireproofed goods will blacken, and the material itself will not burn under ordinary conditions.

Such a solution is highly practical for children's play clothes, especially as there is a growing fondness for overalls in the form of "cowboy" and "Indian" suits. Used for children's theatricals, Christmas parties where there is a candle-lighted tree, and similar occasions, fireproofing would eliminate much of the danger.

Of the many causes that go to make up the national fire loss the average person, for some reason, decidedly underestimates the fact that electricity is far more dangerous than the open gas jet or the chemical gas plant found in the cellars of homes situated in rural districts. In five years, faulty electric wiring caused a loss of $85,735,168 and the electric iron was directly responsible for more than 40 per cent of these fires. It was not the iron itself that did the damage, but the careless use of it. Case after case has been recorded in which the woman went away, possibly to answer the doorbell, or the telephone, and left the iron turned on. The iron burned a hole in the ironing board—and then in the house.

The installation of electric wires in your home should be considered a most important item, for faulty wiring starts a fire between the walls which may smoulder for hours, and then burst forth, possibly at night. Not only make sure that your wires are properly protected, but be satisfied that they are inspected.

A twin fire cause with the faulty electric wiring is the open gas jet, and fire after fire has been caused by thoughtless folk who open a window and allow a curtain to fly on the wings of the wind against the open flame. Don't hang flowing curtains where they can blow against an open gas jet, and don't hang ornaments on a gas jet.

The open flame brings up the subject of escaping gas. Never go hunting any smell of gas with an open light, a match, a candle or lamp. More than one family has literally "hit the roof" because there was a gas leak in the cellar, and someone went down and struck a match to find the exact place where the gas was escaping.

The cellar in every home is practically synonymous with the furnace. Don't neglect the furnace! Keep a strict watch on all chimney and heating pipes, both those of the furnace and of any stoves you may use. Have all flues cleaned. Watch the drafts. If the house is to be left alone for an hour or so see that the drafts are in a condition to be left safely.

If you are building your own home insist on an eight-inch chimney wall, standing on its own foundation, and properly lined. In any home it is a serious mistake to allow a stove, a pipe that becomes heated, or the furnace to rest against wood. Take care of the fireplace; don't let the mantle extend far into the room, causing a decided overhang for the fireplace itself. Use a fire screen with an open fire, for both coal and wood crackle and may at any moment send out a shower of sparks.

Don't use a wooden box for hot ashes! Hot ashes may smoulder for hours before setting fire to the wood. Use a metal ash can. Disregard for just such points as these caused a fire loss of about $25,000,000 last year.

Above—A fire in the shops down by the railroad. It means temporary loss of work and spells tragedy to the poor folk in town.
Left—"The fire started in the chimney." And winter is an especially bad time for fires; the water is frozen, the engines are hampered by the snow, and the blaze gets a start. Too bad they didn't have the chimney cleaned.

Right — Somebody forgot to see that the camp fire was out, and but for the quick action of the fire-ranger a forest fire might have resulted.

A growing fire menace to the country comes from a very selfish source—the family picnic. The use of automobiles, and the growing love in this country for the out-of-doors has developed a number of persons who make a habit of camping out, either for one meal, or for several days. These picnickers usually build a fire, but unfortunately they do not always put out their fire, and the result is a burned-over patch of shrubbery, and occasionally the loss of a clump of fine trees. The trouble is that city people do not understand how to put out a camp fire. There is no flame that they can see, the ashes do not glow, so they go away. Never leave a camp fire until the embers have been scattered. Use a pail of water to dampen the embers, stamp them out, and scatter them with a stick. Then they cannot be fanned into flame by the wind.

The "don'ts" that go to make up fire protection make a lengthy list, but they are worthy of great consideration for they are truly of personal value. Unfortunately, most people know them, realize their worth, but in a careless moment "forget."

Don't keep kerosene in a warm room!

Don't fill a lamp, or an oil stove, after dark, or near a fire.

Don't use an inflammable cleaning fluid near an open flame.

Don't hang clothes to dry on a chair, or rack, before an open fire, and then go away!

In burning rubbish don't choose a windy day—and it is safer to use a metal incinerator!

Keep the cook stove clean—don't let grease gather, it may take fire!

Kill rats as soon as you hear them in the walls. Many fires have been caused by rats gnawing at match boxes—not for the matches themselves, but to get the paste on the boxes.

Don't get excited—if there is a small blaze (such as a curtain afire) use a wet broom and beat out the flame!

Fire prevention should not only be a part of the daily duty in the personal home life of the individual, but it is the individual's privilege to see that the public buildings of the community are following all the possible precautions to prevent fire. In the larger communities there is an official whose business it is to see that the schools, the motion picture theaters, churches, town hall, and so on, are kept from becoming fire traps. Each week carries its toll of lives lost in public buildings, and in the small town especially it is more or less of an individual problem. Be sure that your public buildings are provided with sufficient exits to make them safe; these exits must not be bunched at one end, but should be convenient to all parts of the building.

Each day Nature sends out her crimson challenge—fire! It is up to you whether you will take up this challenge and fight it—or if you will allow the terror to continue causing a loss of millions of dollars a year, and, at the same time, sacrificing thousands of lives to what is really nothing more than carelessness.

Such is the crimson challenge! What are you going to do about it?

The Business Man Somersaults into Health

Concluded from page 3

prophet, and when the great financier gets into a boxing contest with his commercial rival he thinks he is a youngster and is one.

Perfect health does not lie in great strength. A small man with very little muscle may outlive a giant.

The vital organs, stomach, heart, lungs and liver, are the important factors. If these organs function perfectly then you are just as healthy as the most rugged plainsman.

It is safe to say that 75 per cent of all human ills are traceable to the stomach. And it is to remedy this that the business man seeks the gymnasiums to add exercise to dietetics. Obesity, emaciation, flat feet, nervousness, lung trouble, impaired circulation of the blood and many other difficulties are aired while in scanty gymnasium attire.

At one time in his career the business man was a high school or college man and he harks back to the days when the school "gym," with its adjacent football field, baseball diamond and cinder path, was the central point of his interest. He remembers how well he felt after a play in the open and a hot shower followed by a cold one.

So it is only natural that the merchant and banker and professional man should turn to the athletic clubs, Young Men's Christian Association and other gymnasiums when the keen edge of health begins to wear away.

Here he finds there is no royal road back to youthful vigor. Physical directors tell of men who have passed the physical deadline and who at 60 are trying to regain the muscle, vigor, clear eye and attractive posture of youth. After he has lost his muscle tone and his bones have stiffened it is absurd for him to expect to "come back."

The secret of success of these gymnasiums lies not in the grinding drills and calisthenics but in the fact that gray-haired business men are being taught to play again.

Frowns of nervous irritation and worry disappear before the friendly banter in a baseball, basket ball or handball game, while frequently doctors, bankers, lawyers and merchants may be heard roaring with laughter while a minister of the gospel tries to duck a stock-broker in the swimming tank.

When the timid bank president first gets into his suit he is warned not to travel too fast. Once around the track, a few minutes of calisthenics or army "setting up" exercises, a swim the length of the tank and back and a good shower and rubdown will clear the brain and stimulate the body.

Two-thirds of the votaries at this shrine of youth are battling Old Man Avoirdupois. Some men have lost their activity, their ability to respond quickly, due to overweight. Not only is there a muscular sluggishness but the brain does not work so acutely.

The average business man takes his calisthenics in homeopathic doses after he has had his play on the handball courts, on the traveling rings, at basket ball or on the track. One person may have a hobby for developing the leg muscles while another does not go near the exercise room but swims a few hundred feet and calls it quits.

Swimming is one of the finest sports for the development of the body because it brings all the muscles into play and forces the swimmer to breathe deeply.

Deep breathing exercises should be practiced by any one trying to build up his body, to give the lungs plenty of work to do.

The American business man has started to strip off his waistline. And many have become near-youngsters again as they wage their daily fight against flabbiness, staleness, flat feet, stomach trouble and gout.

Still a Boy's Town: Being a Sequence of the Famous Narrative of William Dean Howells

By EMERSON ROBINSON

"A BOY'S TOWN" is still a boy's town, old friend of youth, and from your spirit residence you are perhaps today looking down upon the scenes of your happy childhood. But it is hardly the same scene; the same site would be a better phrase, for if you had visited the town of your urchin days before you started on your great adventure, you would have been as a stranger. Here and there you might have recognized a house, but even the old canal, from the banks of which you used to envy the lordly captain, as he directed his wonderful ship, has been abandoned and the wrecked hulls of later ships are strewn along the water.

I have a suspicion that your boy and my boy were very much the same—just boy, that's all, only of a different generation. Your boy had a feeling that the world moved and that its affairs were directed for his especial benefit; my boy knows it, for in this boy's town of Hamilton, Ohio, where your boy lived and where my boy lives, deference is paid to the boy. More organized effort is being put forth for his welfare and his happiness than in any other city in the country.

I have often wondered what your boy would do, were he suddenly transported through four-score years and more and be allowed to live with my boy in the town that boys love. How would you, old friend, knowing the ways of your youth, like to come back for awhile and live with me in the days of my youth?

Oh, for a Return to Youth

'TWOULD be a rare privilege, wouldn't it, a privilege sought by man since reason first flashed through his brain. Oh, for a return to youth with its joyful unresponsibility and its great big problems!

But your life has been full of service, old friend, and your reward will be in a boyhood of 80 years ago renewed and lived again with my boy of today.

* * *

Your boy arrived late one Friday night and went immediately to my boy's home. He deposited his bundle of clothing on the back steps and knocked, and when my boy's mother opened the door your boy was given his first surprise. He was dazzled by the brilliant light! Why, in the olden days, he had to read by a dim candle light! And when he was taken into another room, he saw a big case filled with books. When he wanted a book, just one, he had to borrow it! And your boy liked to read and to study and try his brain and hand at poetry, too!

When your boy looked at my boy he was disappointed. He expected to see some superior being; instead he found his counterpart.

Pretty soon my boy's mother took both boys upstairs and to bed; in a room with a heavy rug and into a bed with a thick mattress and springy springs. This seemed foolish to your boy, who slept just as soundly and as peacefully on a "straw tickin'" and in a room without a carpet.

And then your boy was disappointed again, for my boy's mother not only kissed her son good night but kissed him as well and gave him a gentle pat on the cheek and told him to say his prayers and sleep tight.

Your boy's mother used to do this very thing and somehow he expected something different from my boy's mother. He thought about this for a long time and then his boy brain evolved this wonderful truth: that the seasons change and the styles change and ideas change, but mothers and boys remain the same always.

Day Memorable to Visitor

YOUR boy and my boy really became acquainted after my boy's mother had turned out the lights and gone downstairs. And so your boy could better enjoy his return, my boy told him of the new lights which almost hurt his eyes, and of the automobiles and the street cars and the telephone, and the airplane and—yes, of the radio. He used many new terms but your boy soon understood them and when sleep finally came on, he dreamed, as boys and grown-ups will, that he was in an airplane and that it turned over and he was falling to the ground.

The next day was a memorable one for your boy and thoroughly enjoyed by my boy. They were called early in the morning to go on a treasure hunt. It was a mysterious name. Your boy had hunted for treasure when he was here ages before. He had always heard that there was buried treasure at some of these out-of-the-way places but had never been able to find any. So when he heard the news, he was all excitement. But my boy rolled over and attempted to go to sleep again, and did, but only for a few moments when, at second call, he got up. He knew how long he could play 'possum.

Your boy, after they had washed and dressed and had their breakfast, asked my boy when he was going to do the chores and my boy looked at him in amazement. Chores! a lost word for the boy of 1922. Cut the wood, carry in the water, and do a dozen and one or two other things designed especially by mothers to keep their boys busy. My boy complained when he had to go to the grocery. But chores? He had never heard it used.

The boys then left home for the treasure hunt and my boy led the way through a labyrinth of streets to the main street, now nicely paved and lined with stores and shops and fine homes, but a street your boy knew as an unusually muddy one with perhaps a sidewalk here and there. They saw in the distance a great crowd of boys, apparently about their own age; more boys than all the town had when your boy was here before.

One of the men called out an order and the boys automatically fell into lines of four each. The march started and kept up for hours over hills and, another wonder, good roads, and then your boy saw something he recognized—a reservoir; it was a big one and he looked around for the smaller one, but found that it had been filled up and near it stood a factory.

And still the march kept on, although your boy was getting a little tired. Suddenly there came from one of the men an order to stop and it was near the river and a grove of big trees. A number of the boys went out and got some wood and soon there was a great fire going and in a few minutes your boy enjoyed his first "weiner roast." He had never eaten food so good.

After the "roast" one of the men got the crowd of boys about him and told them a story, dealing with fair play in their games, and then shot an arrow. The treasure, he told them, was within a hundred feet of the line of the arrow. He gave the order to hunt and 400 wildly excited boys started a mad scramble for whatever the treasure might be. Your boy found a small piece of paper and, curious, opened it. 'Twas an order for one dollar on a local bank. ONE DOLLAR! Your boy had never had so much money in his life before and his joy knew no bounds. My boy was not so fortunate but a number of others found valuables and the hunt was at an end and a rest of an hour was ordered.

Rest—the Time to Play

REST! What does the word mean to a boy! It meant time to play and do as they pleased. And they played. Some wanted to go swimming but were told they'd have to wait until they got back to town. Here again your boy was mystified. When he was here before, even to go swimming in town meant that the constable would be on the lookout for you. But he held his curiosity and the march back was started.

In town again all the boys went to a big building and there, in groups of 60, half an hour for each group, every one had his swim in a pool. Your boy changed his mind about my boy not having a good time, that first day.

The next day being Sunday, both boys were allowed to sleep a little late and then got up and went to Sunday school.

Your boy met a gray-haired man and found he was just a big boy. Sure he ran a bank and had a big family of big boys, but he was just a boy himself. He asked your boy all about himself and what his father did and told him to come back.

On the way home, my boy told him more about the man. He would fight for a boy any time. Every boy knew him and every boy liked him. One time he had a party of some kind to give something to the boys and there were more than a thousand there. When the boys wanted baseballs or a place to play or anything, he always saw that they got it. Then that man became a great hero in your boy's eyes as he was a great hero in my boy's eyes. He's the friend of the boy, and he'll stop his business any day in the week to help a boy because he's making men.

Your boy was very lonesome the next day because my boy was in school. He played for awhile with my boy's dog and then started out to find some of the places where he used to play.

Surely the hydraulic where he used to fish for "peelers" would be there and the shops where he used to have his tops made. Instead he found a street paved and lined with automobile repair shops. And as he strolled on down toward the river, his heart suddenly leaped and the old fear of his former youth came back to him.

For there stood the dread academy in which he used to stand in deadly fear of the teacher. The same building, yes, but its uses have changed, and there have been thousands who have entered there since he was a boy, whose dread was more than his; who looked upon it with terror and who suffered there for days and nights, too, for sins committed against the law. It's the police station now, and the hopes and ambitions of many mothers have been blasted there, as the hopes and ambitions of your boy's mother, 80 years ago, rose with reports of his growing knowledge.

Your boy gazed at this building but a moment and, recalling more pleasant pastimes, turned toward the old covered bridge which spanned the placid Miami. It was gone, but in its stead there was, and is, a gigantic structure on which your boy walked to see the river of his youth. But even the river had changed and he saw gigantic shovels scoop dirt from its bed and great levees, paved with blocks, where the old tree-covered banks used to be.

Skating in the Evening

YOUR boy recalled the days when he used to stand by the old river and secretly hope that the flood which was coming on would take away the covered bridge. And that flood which he hoped for came a few years ago and it took several bridges with it, and if it had come when your boy wished it, it would have taken away his town and "A Boy's Town" would never have been written.

In the evening both boys took roller skates and went to a small park which lay between two wide, paved streets. There were hundreds of boys and girls there and your boy had another surprise. Policemen stood about and prevented automobiles or other vehicles entering the streets for three hours, then all skaters were told to go home. Your boy was told that this happened nearly every night during a certain season of the year and that there were never any accidents or fights and that the young people could skate to their hearts' content. And during the winter there is another street which is turned over to the boys for coasting when there is snow.

When the boys got home, they were tired, but instead of going to sleep at once, they made plans for the morrow. A great day! A circus coming to town! Your boy asked my boy if he was going out to meet it and told him that in the olden days all the boys used to walk way down the road to welcome the elephants and the men and then would try to find some work to do to get in for nothing. They'd work all day for this little reward and if they failed to get work would try to "sneak in," for the boy who "sneaked in" was the hero of the hour. Both boys got up with the first peep of dawn the following morning without being called and went down to "meet the circus." They found other boys there before them lined along the railroad tracks for a mile.

The boys followed the circus to the big commons and for hours watched the men drive the stakes and pitch the tents and some, yes, quite a few, made plans to run away. There never has come a circus to this boy's town but half the boys have not planned to run away with it.

In the Boy's Town of 1922

YOUR boy in the months that he was visiting my boy became a boy in a boy's town of 1922.

He learned to play baseball and of the thousands of boys here today there are not half a dozen who do not know the game. Many, yea, hundreds, are on league teams, for there are more than half a hundred of them and to be on one of these "nines" a boy not only has to be a boy but he has to have many of the attributes of a man. And the same holds for the hundreds of basket ball teams, hiking clubs, boy scouts and kindred boys' organizations.

And in addition to the organized play life of the boy there is his private play life when he spins his tops as your boy did in 1840, plays marbles, and works on his radio set.

Your boy became a modern boy in a model boy's town and he'll be the better man for it, for those who are working for your boy and my boy, and 80 per cent of the boys in a boy's town, are not limiting his play but directing it; and directing it physically, morally, mentally and spiritually, so that in the end my boy will be a better man than my dad's boy.

A boy, truly, is a boy in any town, but in this town, a man's a boy as well, for the man is the boy's pal.

A Newspaper's Headlines, Its Inviting Ads, And an Editorial of Much Interest to You

THE DEARBORN INDEPENDENT recently published an article, "Balkanized Chicago," in which the crime wave from which that city is suffering was analyzed. The article displeased an editorial writer on the staff of the lurid *Herald Examiner* of Chicago. We are reproducing the editorial in full below, as also we are reproducing the headlines from the first pages of the *Herald Examiner* from April 25 to May 27, during which time terrorism was at its height in the country's Second City. Without comment, we also reprint advertising taken from the *Herald Examiner* during the same period. We ask that you study the headlines, read the advertising, go through the editorial—and *form your own opinion*.

HERE IS THE EDITORIAL FROM THE PAPER THAT PUBLISHED THE HEADLINES AND ADS SHOWN ABOVE:

A WRITER in Mr. Ford's weekly has devoted several pages to a feverish account of what he calls "Balkanized Chicago."

Life in our city, according to his report, is little more than a nightmare of screaming headlines. Chicago has a "crazy-quilt population" that has become "a vast potpourri of tribes, nationalities, gangs, rings, sects and cults crystallized into various alliances and combinations for purposes of defense, control or plunder."

The city's chief product, in the eyes of this writer, seems to be "lurid news of crime, banditry, murder, bombing, degeneracy, graft and official corruption."

It is a city of "nightly black powder bombs," with its days punctuated by a "crackling of gangsters' gats on the West Side."

He revels in the description of "important labor unions controlled by convicts and professional criminals." "The Chicago labor leader of this type," declares this inspired penman, "always owns a high-powered car and spends from $50 to $100 a day on drinks in the cabarets and saloons, that still remain open in privileged parts of the city; a few of them keep scattered harems in true Balkan or Levantine style."

From this it is but a step to a description of the "vilest dens ever seen on the North American continent" and "orgiastic dances in all-night cabarets."

But why go on? There are pages of these alleged descriptions, until an outsider must wonder where Chicago finds time to run its factories, its banks, its great commercial houses, or how it finds employment for its millions, and feeds and clothes them as well as a large share of the surrounding world.

And why does Mr. Ford's contributor think it worth while putting all this on paper? Here is his answer:

"It is worth while for the American people to understand it. Not that they may point out Chicago as a pariah, but that they may consider carefully this prototype of what they themselves soon may be if they cling to the cult of the Melting Pot!"

The "Cult of the Melting Pot" has no more to do with banditry in Chicago than with the slums of London or the apaches of Paris. That is sure and flat.

Chicago is a great city—that is all.

With Country Banks on Strike, Could Wall St. Live?

Concluded from page 6

before that time. "Had it not been," he added, "for Stock Exchange demands previous to and during the panic, I doubt if money rates in the country would have at any time been much more than normal."

"But," observes the Wall Street banker of the present day, "all that sort of thing was ended 12 to 14 years ago. The Street has changed its methods since 1907, and its ethics today are high."

Do the facts prove this allegation? Let us see.

Has the outbreak of excessive speculation been modified or diminished or controlled, as the former head of the New York Clearing House had hoped?

No. Today it is estimated in most conservative circles that nearly one billion and a half dollars have been loaned out on call to brokers for speculative purposes.

The amount of stocks carried on margin, the number of pools in operation, and the actual money consumed in margin trading are three times larger than the figures that prevailed in the wild days preceding the panic of 1907.

The speculative hero of the Street today is a pool operator with a shady history—he was once a partner in a Boston bucket shop—who is openly conducting an enormous syndicate speculation in a western railway issue.

Market prices are being demoralized periodically by a reckless gamble in Mexican Petroleum, in which the bulls boast that they have trimmed the bears to the extent of more than two millions.

Are Wall Street bankers more discreet today in their ventures than they were in 1907?

Evidently less so. During the early half of last year the financial district was shaken to its foundations by the discovery that one of the largest trust companies had dropped some $50,000,000 in the unwise promotion of a shipping company and a banking house, organized to promote foreign trade. Both ventures, launched in untried fields, by inexperienced men, were proved economically unsound. The sole reason that this event failed to precipitate a financial catastrophe is the fact that Wall Street's resources have quintupled since the war, and the losses were adjusted in secret by the institutions involved.

It may be taken as an axiom that Wall Street never alters—it merely develops.

It is quite probable that a panic, such as that of 1907, is impossible of repetition, at least within our generation. But this probability is not based upon any amendment of Wall Street's methods. It is due to the creation of the Federal Reserve System as a result of the panic.

But the Reserve System is conducted through human agencies, and its merits or demerits are directly traceable to the sort of management it enjoys. The panic of 1907 was a wrong inflicted by Wall Street on the rest of the country. Has the Reserve System made such discrimination impossible in the future—has it nullified the power of New York's financial district to corner the country's money and use it to the detriment of its actual owners?

To find the answer, one has only to review the great crisis of 1920 in the agricultural districts when ruin overtook large numbers of farmers and ranchmen. At the hearing last year on this subject before the Joint Congressional Committee, the former controller of the currency testified to the big and general fact that the system had failed to function as it should have done, and that its failure had caused fearful losses and great suffering.

It was shown by official figures from the Federal Reserve bulletin that, at the end of October, 1920, the 12 Federal Reserve banks held a grand total of discounted and purchased paper amounting to $3,100,000,000, of which $299,000,000 consisted of "bankers' acceptances" mainly from New York City banks. But the "agricultural paper" and "live stock paper" held by the Federal Reserve banks amounted to but $240,000,000, or less than eight per cent of the total accommodations granted by the system. This eight per cent was very small in consideration of the fact that the farmers represent about 43 per cent of our population, and when the aggregate value of farm property, according to the last census, is about $77,000,000,000.

But toward all these questions the attitude of Wall Street is defiant and uncompromising. It feels—and perhaps this feeling is quite human—that while it remains the custodian of the country's surplus wealth, it may do as it wills with the sums intrusted to it. It is out of sympathy with the country, and its interests remain local and selfish. If, unfortunately, a schism should ever arise between the East and the West, it will be due to the cynical viewpoint of the Street.

The official reports of the controller of the currency show graphically in whose hands lies the control of the country's money power, if they will only attempt to assert it. The official report for 1921 shows that the total resources of the 8,155 National banks of the country, on September 6, of that year, aggregated $19,014,102,000.

1921

Total assets of the country National banks	$ 15,586,222,000
Total assets of the New York National banks	3,427,880,000
Preponderance of country banks over Wall Street banks	$ 12,158,342,000

Percentage of resources to the total:

Country National banks	82%
New York National banks	18%

Now let us see what proportion of their surplus funds the country banks keep on deposit with the New York National banks.

Report of the controller of the currency, as of January, 1920:

Thirty-one New York National banks had on deposit to the credit of their correspondent banks in all parts of the country, $896,351,000.

Report of the controller of the currency, as of September 6, 1921:

Thirty New York National banks had on deposit to the credit of their correspondent banks in all parts of the country, $685,989,000.

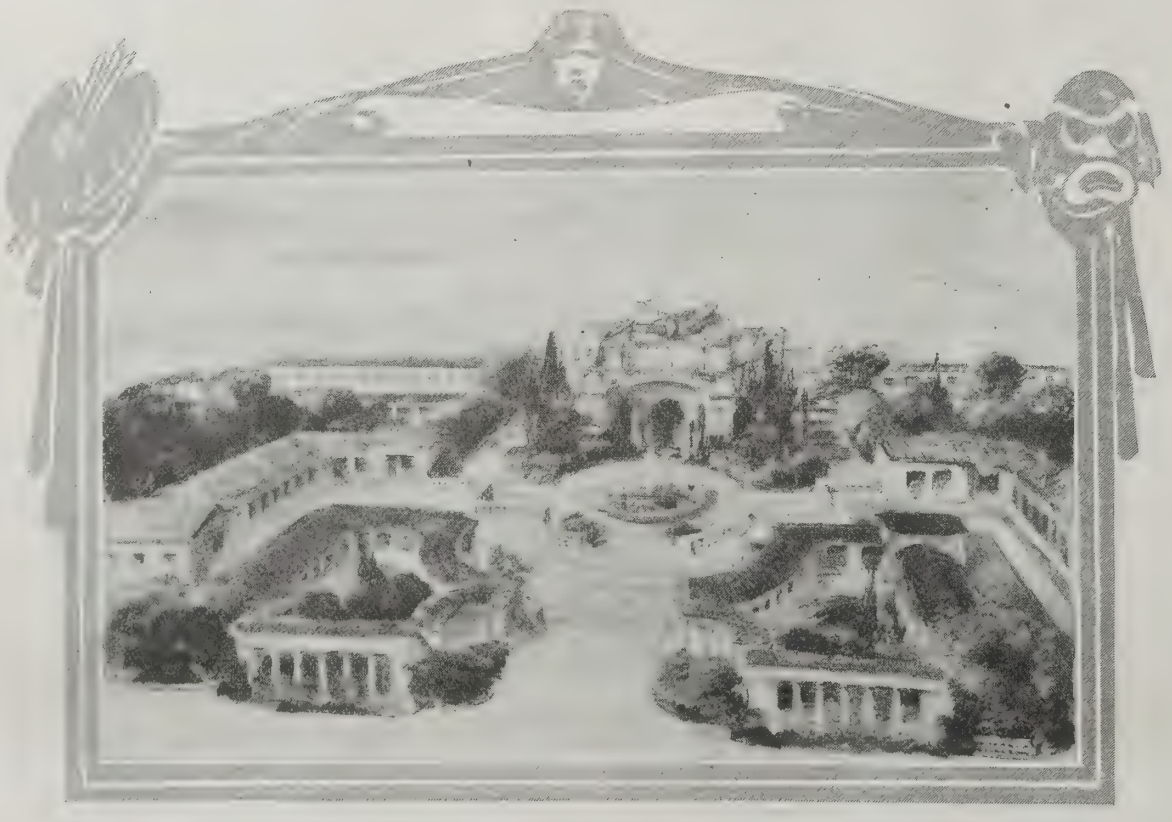
It may also be of interest to note how these hundreds of millions of demand deposits, lying in the Wall Street banks, are proportionated among the different sections of the country. In 1920, the New York National banks had on deposit to the credit of their correspondent banks in all parts of the country, the following sums:

Held for banks in

Western states	$ 36,358,000
Middle Western states	164,625,000
Southern states	159,024,000
Eastern states	299,618,000
New England states	44,400,000

If these figures teach anything, they teach the lesson that, while New York and the country are interdependent, *Wall Street needs the country more than the country needs Wall Street.* They show that *the country banks possess 82 per cent of the National banking resources of the United States,* and that they annually keep on deposit with the Wall Street banking institutions, sums ranging from $700,000,000 to $900,000,000.

The experience of 1907 has shown, as the conditions existing in Wall Street show today, that *the immense surplus funds deposited by the country in New York banks, are used almost exclusively by the latter in lending them out as call loans to members of the New York Stock Exchange.* The country could easily forego the returns it derives in interest from New York, and utilize its financial sinews in its own territory to far better advantage.



As long as Wall Street commits itself to huge gambling ventures, just that long are the wealth and well-being of the country in danger. But the country banks have it in their power any day to nip these wild speculative operations in the bud. This truth has just been graphically proved at the present writing. The call money rate in Wall Street, a day or so ago, ruled at two and three-fourths per cent. One "country institution" recalled $4,000,000, which had been on call in the Street for three or four weeks. This withdrawal was followed by several others. The absence of this western money was immediately felt in banking circles, and bankers began liberally to call brokers' loans. The call money rate jumped instantly by one-half points to five per cent.

At any time, a concerted movement of a similar nature on the part of the interior banks, could so deplete the floating supply of speculative funds in Wall Street, that they would swiftly prick the bubble of speculation, and convince the dominating powers of the Street that they must be compelled to give due consideration to the interests of those who hold in their hands the real and actual wealth of the Nation.

If the country banks went on strike, what would Wall Street do?

Planning a National Art and Music Center

AS A result of the three-day music festival given by California composers, musicians and singers, in the Greek Theater of the University of California, last autumn, the artistic, civic and commercial organizations of Berkeley have combined on a plan for a National Art and Music Center. Bernard Maybeck, one of the leading architects of California, has prepared the design, a photograph of which is shown herewith, and Charles Keeler, managing director of the Berkeley Chamber of Commerce, is at the head of the movement to place the art center there. The work is being carried on under the conditions imposed by the Fletcher Bill, creating a National Conservatory of Music and Art, now in committee of the National Congress. This measure provides for branches of the national conservatory in various states, of which California is one. Californians are ready with site and plans for immediate construction as soon as the national aid is extended.

Architect's drawing of art center proposed to be located on site adjacent to the University of California and overlooking the Golden Gate.

It is planned that the art center shall be both educational and productive; productive in that it shall furnish a permanent home and harmonious working conditions for creative artists in music, composition, painting, sculpture, the drama and literature; and educational, in that opportunity shall be given for the training, by these creative artists, of other and younger persons who show especial adaptability for any of the arts. The plans provide for from 125 to 150 studio-homes, or apartments, surrounded by spacious gardens, built in the Spanish type, so adaptable to California climatic conditions, and centering in a large plaza or central park, likewise beautified by lawns, gardens and statuary, and forming seating place for a large audience. At one side of this plaza will stand a large theater, with an auditorium capable of containing several hundred persons. This auditorium, fully equipped, would be used for the development of the dramatic art, and for lectures to students and workers in the conservatory. The back of the stage of this indoor theater is planned to open out onto the plaza, forming an outdoor stage. This would provide for constant use of the theater both in rainy and in clear weather. The studio-apartments are to be designed for the various uses of painters, sculptors, musicians, singers and writers, and rentals would be nominal, merely enough for actual expenses. For those artists who prefer to own their own homes, yet are not possessed of a great amount of money, arrangements are to be made for the establishment of a cooperative building and loan association, whereby such artists could purchase land in locations which pleased them, and have erected thereon the exact design of home they wished, paying for it in small monthly or annual payments, at a low rate of interest. Bankers and real estate men have agreed to give time and aid to it, with the view that such an opportunity will bring the leaders in art to Berkeley. They figure that it will be a good investment for them, even though they get no return from this particular project.

It should not be considered from this that all those attracted by painting, music, or the other arts, would be received as students. For every thousand aspiring, 100 would reach the final tests, and possibly only one eventually would be admitted. The plan is to make this art center to the art world what a great university is to other educational fields, so that only those of application, ability and serious thought would last. So far, no state aid has been asked, but it is understood that the state government is in a receptive mood toward the idea, and that the University of California will extend every aid in its power to its neighbor, which plans to become a veritable University of Art.

Evolution of Shipbuilding on Great Lakes

Oak Vessel of Years Gone By, Succeeded by Efficient Steel Freighter

By H. W. PATTON

IF IT were left to the railroads to transport all the freight that is carried in ships on the Great Lakes during the eight-months' navigation season they would find the task physically impossible. There is not enough railroad equipment in cars and tracks to do the business. In addition, lake vessels carry the goods cheaper than railroads could afford to do it. Therefore, the great inland bodies of water are an important factor in the economic affairs of America, or the world for that matter.

A Great Lakes freighter of the modern type carries a cargo of 10,000 tons of coal or iron ore, or 400,000 bushels of grain. The capacity of the average freight car is 50 tons, so that it would require a train of 300 cars to transport what one of the big lake ships can carry on a single trip. Railroads do not run trains of 300 cars.

Multiply this one cargo by thousands and it will be seen that millions of tons of commodities are carried by the hundreds of lake vessels. Billions of feet of lumber also are transported on the lakes each season. Most of the iron ore that is converted into steel in the United States and Canada is carried in these ships, as well as a vast amount of copper, grain from the West and Northwest, and flour in barrels and packages.

The fact that the lakes are closed to navigation during the winter months seems a handicap to commerce, but the boats make up for this in the open season. They carry enough iron ore down the lakes before navigation closes to run the furnaces all winter, and sufficient coal is transported up the lakes in these ships to carry the West and Northwest through the cold season.

In addition to the commodities mentioned, immense quantities of general merchandise are transported up and down the lakes. These goods are carried in what are known as package freighters. Ore, coal and grain are transported in bulk or coarse freighters.

Navigation on the Great Lakes is young compared to that on the oceans, but it has made wonderful strides. Something like 40 years ago there was launched on the St. Clair River the largest lake carrier up to that time. It was a tow barge, and its capacity was 1,600 tons. Marine men marveled and wondered where such a boat would ever find enough cargo to fill her hold. Now there is a steamer on the lakes with a capacity of 14,000 tons. It often has carried such a load, and could carry more if the channels of the lakes were deep enough. However, a ship with a capacity of 10,000 tons seems to be most popular with shippers and builders in this day.

The first ships on the Great Lakes were built of oak, the same material used in building ocean vessels in bygone days. But oak is scarce and has been for years. Even if it were plentiful, it is unlikely that many ships would be constructed of this material. During the war, when there was a constant cry for ships, fir trees were felled with which to build wooden ships, but the country knows that very few of these wooden ships ever turned a wheel.

Steel is the material that makes the best ships, and no other material has gone into ships built on the lakes for two decades or more.

Before oak became scarce, a few iron ships were built on the lakes, but this material, which shipbuilders call metal, did not come into popular use. Some of these early iron, or metal, ships are still in service, however. One of these is the United States gunboat, Wolverine, the only warship Uncle Sam maintains on the lakes. This craft is a venerable one, being about 70 years old.

But it is with freight vessels that this article deals. First came the old oak sailing vessel, with a capacity of a few hundred tons, which was followed by the wooden steamboat, and then there arrived the iron vessel, which was soon discarded for steel.

The first steel ships were built on the lakes in the late '80's, and some of the very first are still in service. Two early steel steamers were the Western Reserve and Gilcher. They were about 300 feet in length, with a carrying capacity of approximately 3,000 tons each. They were Leviathans in their day. These boats were lost. One disappeared with all hands and the cause of the disaster was never known. There was one survivor from the other, and he reported that the ship had broken in two. This was a lesson for builders, who began to build the ships stronger. Now one seldom hears of a Great Lakes steel ship breaking in two, except in striking a rock.

The Great Lakes whaleback must not be overlooked in the transition in lake ships. In the early '90's, Captain Alex. McDougall, of Duluth, dreamed of revolutionizing ship construction, and the whaleback was a child of that dream. McDougall was certain he could build a boat that couldn't be "drowned"; that is, lost by foundering, for less than the standard type of ship. The boat was cigar-shaped, and McDougall's idea was that the waves would wash completely over them without causing any damage to ship or cargo. In this he was right, but otherwise the boats were not glittering successes. It was difficult to unload them, and they were not huge carriers. However, perhaps 30 or 40 vessels of this type, including a big excursion steamer, were built. But none were built after the first batch. A few still ply the lakes. Some years ago a fleet of a dozen or more of the whalebacks were taken to the Atlantic for coast service, and whether they were "drowned" or not, nearly all are now out of service. Some were wrecked by running ashore and others met with mishaps.

Quick loading and unloading are big factors in the successful operation of lake freighters, and this, of course, keeps freight rates at a minimum. Huge machinery loads a 10,000 or 12,000 ton ship with iron ore in a few hours, and they are relieved of their cargoes at their destinations by similar machinery in a half day or so. This enables them to hurry to a coal-loading port, take on a cargo of coal and steam up the lakes with it. In the old days a vessel used to spend three or four days unloading. This meant expense, and higher freight.

All lake freighters are now built for dispatch in loading and unloading in view. All the machinery and boilers are in the stern, the remainder of the ship being utilized for cargo. There are no deckhouses nor cabins to obstruct the decks, which are covered with hatches; in fact, a freighter's deck is just one hatch after another. This is to permit the operation of the maximum number of unloading rigs. The large number of hatches serve the same purpose in loading, for at a coal or ore loading dock, a pocket is run into each hatchway, and the coal or ore flows into the hold.

Looking from the forward end of a 600-foot lake freighter, the vista reminds one of a two-block section of a city street. There is nothing in the way to obstruct traffic.

The placing of the machinery and boilers of a ship in the stern is an idea originated on the Great Lakes. Only in recent years has the plan come into use on the oceans. Even now it is not in extensive use on salt water, the number being confined to some tank steamers and colliers, and some lumber steamers on the Pacific.

At one time, before the advent of steel ships, there were several shipyards on the Detroit River, and about every port on the St. Clair River had its shipyard. Those were the days when oak was plentiful. There were millions of feet near Wallaceburg, Ontario. This was all cut down to put into ships at the yards mentioned. Now what little oak that is used in ships is only to repair the old wooden boats that are still in service. And this has to be brought from a distance. About all the old yards have disappeared. Detroit has two yards, but not a wooden ship has been built in either of them for 20 years. Everything turned out is steel.

There is some traffic between lake ports and Montreal now, but this is confined to ships of the smaller size, because of the Niagara River barrier. The Welland Canal locks of the canal do not permit a vessel of more than 260 feet to make the passage. Small cargoes do not pay and the freight movement over this route is light.

The big lake freighter may carry 400,000 bushels of grain destined to Europe, but it cannot pass Buffalo.

Some years ago a fleet of steel ships built at one of the famous yards on the Clyde in Scotland was brought to the Great Lakes and put into the coal and ore trade.

"No storm that ever swept the lakes will bother those ships," was the proud boast.

It was only a few years until one of these boats utterly vanished in Lake Superior. It was caught in a severe storm, and the only trace of it ever found was a life preserver bearing its name, Bannockburn.

Above—Early sailing vessels of about 200 tons; they are here seen racing. Below—A wooden freighter of a type built 40 years ago, carrying capacity of approximately 700 tons.

Above—Wood freighter of type in use in the '80's. Center—Early type of Great Lakes steel freighter, about 2,700 tons. Below—Type of 4,000 to 5,000 ton vessel which appeared on Great Lakes about 1900.

Above—The last word in Great Lakes shipping. This is a modern 600-foot freighter with a carrying capacity of 10,000 to 12,000 tons. Below—Whaleback vessel, designed to minimize foundering peril.

BRIEFLY TOLD

Theaters in Berlin have rooms for checking dogs of patrons.

A piano tuner at Wabash, Indiana, tuned a piano at South Bend, Indiana, 65 miles away, by telephone. The customer was told by the tuner how to change the tension as each note was sounded into the telephone.

A humane bullfight without bloodshed was recently witnessed in Los Angeles. Instead of sharp-pointed blades, blunt prods with a glue-coated base were used by the picadors. The adhesive base held the lances against the hide, giving the appearance of reality without hurting the animals in the least.

A white snake captured alive near Hallville, Texas, recently has been sent to the Smithsonian Institution at Washington for classification.

More than 40,000 school children in Hawaii are enrolled in garden work as a result of the efforts of the United States Department of Agriculture.

A footpad arrested in Buenos Aires must travel over a "Via Dolorosa" of 46 stations. This is done to give the police of all sections an opportunity of making the man's acquaintance. The prisoner is photographed, finger-printed and a careful biographical sketch made in addition to being placed "on view" at each station 12 hours.

Eighty-eight per cent of all the automobiles in the world are in the United States and Canada.

A great national park of 2,000,000 acres has been set aside by the government of Argentine. The park contains snow-capped mountains, glaciers, tumbling rivers, azure lakes and foaming cascades. It is situated on the Chilean border and takes in the foothills and mountains of the Andes. Fully one-third of the territory has never been explored.

A battery-driven clock, without mainspring and needing no winding, has been invented. It will run a year without attention.

A Delaware man has invented a trouser creaser of such efficiency that the customer can have the operation performed without taking the trouble to divest himself of his trousers. A modification of the device creases the arms of a coat, making it possible for a man to have his entire suit pressed on him.

Only 36 per cent of the homes in America are electrically wired.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

A scientist of the Smithsonian Institution has perfected a cooker to use the heat of the sun as fuel. The apparatus consists of a parabolic cylindrical mirror with polished aluminum surface which focuses the rays of the sun on a tube filled with mineral oil which in turn communicates with an iron reservoir in which are two baking ovens. The heated oil circulating produces a very high temperature in the ovens and it is possible to cook meat, vegetables, bread and other foodstuffs.

Aluminum films have been invented by a German. They will wear longer than the transparent cellulose film. They have the added advantage of being 40 per cent cheaper.

A ship 600 miles off the coast of Washington recently picked up a number of grasshoppers more than three inches long. Hundreds fell on the deck and the sea was dotted with them. It is presumed that they came from an island in the Pacific Ocean.

Asphalt deposits have been discovered near oil fields in the Argentine Republic. The deposits contain considerable quantities of vanadium.

Caterpillars interrupted operations on the Hetch Hetchy Railroad in California recently. The insects crawled along the rails, covering them for a mile and making them so slippery that the engines could not get traction up the grades. It was necessary for the crews to cut the engine from the trains and run over the caterpillar-covered rails and coat the rails with sand before the train could be moved.

Of the 36,691 convictions for crimes committed in New York State during 1921, the state troopers brought about 11,830.

Tailings recovered from lead and zinc mines are being used in Wisconsin for fertilizer. Four to five tons to the acre benefit clover and alfalfa crops.

Booth Tarkington again won the Pulitzer Prize of $1,000 for the American novel best presenting "the wholesome atmosphere of American life and the highest standards of American manners and manhood," according to an announcement of Columbia University. The novel winning the prize was "Alice Adams." Edwin Arlington Robinson's "Collected Poems" won the $1,000 prize for the best volume of verse published during the year. Kirke L. Simpson was awarded the $1,000 prize for the best example of a reporter's work during the year.

The typewriter is the most deadly of all engines of warfare because it spreads the propaganda that causes war, according to Thomas R. Marshall, former Vice-President of the United States.

After serving 27 years as a school-teacher, Miss Mary E. Long, of Elgin, Illinois, committed suicide as a result of her being discharged by school trustees. Fourteen other teachers were dismissed at the same time but the dismissals were rescinded when the trustees were visited by a committee of citizens who demanded that the other teachers be reinstated at once.

There are now more than 1,500,000 radio receiving sets in the United States and the radio manufacturers in New York report more than $30,000,000 in unfilled orders.

For 12 years a Florida farmer has raised watermelons on 1,000 acres. In all that time he has never shipped a melon but let them spoil in the fields except those he and his neighbors eat. The melons are grown exclusively for their seed, which are sold to planters of Florida, Georgia and other southern states.

A 500-foot bridge across the Willamette River at Oregon City, Oregon, was built in 13 hours. Every part was built to the exact size and laid out on the river bank before any assembling was attempted.

The heavy steel doors of the Ohio penitentiary closed on a former chief justice of the municipal court of Cleveland, now a convicted perjurer serving a term of from 1 to 10 years. The former judge is now a comrade of thugs, crooks and gunmen, many of whom he himself sent to prison.

Eighty-one thousand six hundred and fifty-one tourists visited the Yellowstone National Park during 1921.

MAKE THIS YOUR JOB!

THE DEARBORN INDEPENDENT is your paper. It is published not for profit, but for service. You believe in this magazine and its aims—that's why you subscribed.

Has it ever occurred to you that your friends and neighbors, your business associates, your fellow workmen would also like to receive THE DEARBORN INDEPENDENT? The more readers we have, the greater is our influence and power for good. Urge them to subscribe. The local Ford dealer will gladly forward any subscriptions you obtain, or you can send them direct.

THE DEARBORN INDEPENDENT has established a name for itself as one of the most fearless, independent and progressive papers published. It should be read by everyone who believes in the maintenance of American institutions and their advancement along sound, progressive lines.

CHRONICLER OF THE NEGLECTED TRUTH

How Woodrow Wilson "Carries On" in S Street

Says Nothing of Administration, Holding Word Would Unite Republicans; Having Fewer Political Intimates Than Ever, Plays Lone and Silent Hand

By ROBERT KENTON

A MAN of wealth who has long been an admirer and supporter of Woodrow Wilson, when in Washington recently, told a friend he greatly would enjoy seeing the former President.

"Why don't you call on him?" the friend asked.

The visitor did so, and later that day called again on the friend.

"Did you enjoy your visit?" he was asked.

"Yes and no," he replied. "I found Mr. Wilson to be very agreeable and his mind is as quick and as certain in its operations as it ever was. But he gave me the mischief."

"What about?"

"He belabored me for not giving more of my time to public service. He said that many of the chief troubles with the country and the world at this time are owing to the fact that more men, like myself, who can afford to, are not cutting themselves loose from private affairs and devoting their time to the public."

To that visitor, as well as to others who have seen him lately, the former President, though still in an enfeebled physical state, showed all the fighting spirit of the days when he was at the height of vigor and power.

However, excepting an occasional spark drawn forth by the demands of specific cases—like the Senatorial fight in Missouri—there have been no public flashes of it. The former President has given to friends no indication of any early intention of breaking the silence and comparative retirement that have marked his life since he left the White House, a convalescing invalid, a year and a half ago.

He Has Not Been Idle

THAT year and a half probably has been the quietest Woodrow Wilson has known since, as a youth, he sat for nearly as long a time in a law office waiting for clients that didn't come. Again a law office has borne his name but he has visited it only a few times since it was opened.

Though quiet, it has not been an idle period with the man whose name a few years ago was on the lips of all the world. When he left the White House those responsible for his well-being thought their biggest job would be to keep him from giving way so completely to lassitude that the process of building up which had kept him going during his last year as President could not be carried on. So they conspired, against his intense longing for an uninterrupted rest and a human tendency, even when well, toward physical lethargy, to keep him busy.

"You must manage to keep occupied for at least two hours of every day," his physician told him. The patient was inclined to rebel, but appeal to the boy that was in him caused him reluctantly to obey.

The former President likes baseball and is an admirer of Walter Johnson, a pitcher on the Washington team.

"Suppose Johnson should keep his arm in a sling for three months, what would he then amount to as a pitcher?" Mr. Wilson was asked.

The illustration proved persuasive, but, as matters turned out, the fears of his friends were baseless. Circumstances have kept the former President occupied. He has improved steadily in health, but he still is not a strong man and never may be fully well again. He now can use the arm that for long was wholly helpless and, though he limps, can get about easily with the aid of a cane. He can alight from and enter an automobile without assistance and sometimes does so—when his attendants happen not to be looking.

He now attends to a large correspondence and sees many friends with whom he freely discusses public questions. But beyond a few letters, having to do with incidental matters of politics, no public expression has come from him since he left the Presidency.

There's No "Kitchen Cabinet"

A FEW months ago an old newspaperman friend saw him in his car which was standing by the curb in down-town Washington. He went over and shook hands with him. In the cordiality of the accidental meeting, the correspondent remarked: "It is an excellent time now, Mr. President, to say something on what is going on in national affairs."

"I couldn't render a better service to the party in power," he replied in effect. "I am probably the one person who can stop dissensions among them. A word of criticism from me would bring them together at once—and none would welcome such a word more than the leaders of the dominant party."

No "kitchen cabinet" functions at the S Street house; that has become a point of first interest in Washington because of its being the home of the former President. Rarely has Mr. Wilson seen a Washington correspondent since he retired from office, and perhaps not at all when the correspondent sought him on a professional errand. He has seen a few who called as friends and to one he talked quite freely but would not be quoted directly. Recently, one tried to get an added word from him on a subject on which he had expressed himself in a published letter to friends but he refused to be so much as seen. "Nothing to add," was the only word he could get from the Wilson home.

It is stated that innumerable efforts have been made to get interviews from him and offers of large sums of money have been made him for matter that he might write. One offer of a gigantic fee for a magazine article was declined on the ground that it was more than an article written by anyone was worth.

A group of leading Democrats recently formed a plan for operating a national Democratic newspaper with Woodrow Wilson as associate editor. They hoped that he would join in the scheme and support it with his name and at least one editorial leader a week. When it was first broached to him, it is said, he seemed sympathetic but when final and positive approval was sought he refused to consider taking part in the enterprise.

What his plans for the future are no one appears to know, even if he knows himself, beyond, of course, general intentions. It is known that he does not consider himself in permanent retirement. "And they will hear from me," a friend quotes him as saying recently upon declaring that the forces which seem to have subverted his political policies would not forever maintain ascendancy.

And it is known that he is writing something of a presumably permanent nature but what it is even those friends who are closest to him are not aware.

Even more pronouncedly than when he was the "lonely man" at the White House with few persons in his confidence and virtually none in the full enjoyment of it, does Woodrow Wilson now play a lone hand—and, so far, an almost silent one. Gossip around Washington credits only two persons, outside of his immediate family circle, with being truly close to him. They are United States Senator Carter Glass, a former Secretary of the Treasury in his cabinet, and Bernard Baruch, the financier who was chairman of the War Industries Board. Colonel Edward M. House, of once "assistant President" renown, has not seen him, friends say, since the return from Paris. Even Joseph Tumulty, his former Boswell, is now persona non grata because of the repudiated message the former secretary delivered to the Jefferson Day banqueters a few months ago.

People Go to His Home

"WITH increasing years, Mr. Wilson becomes more and more under the control of the Scotch-Irish trait that was a characteristic of his very able and strong-willed father." This is from one who sees him frequently. "It shows itself in a growing inability to get along harmoniously with individuals. Along with the evident revival of his popularity with the public there continues a falling off in close personal friendships. Always a lonely man, his strong-will traits that intensify with increasing years isolate him more and more from humankind, excepting *en masse*."

That with humankind *en masse* Woodrow Wilson has "come back" in a manner almost phenomenal is a fact no student of public opinion can deny. In fact, it is doubtful if there ever was the decline that the unusual election figures of 1920 indicated. For the contrary seemed to be evident immediately upon his becoming a private citizen. Washington, in whose cynical and suspicious atmosphere he, in his austerity, never seemed to inspire great enthusiasm (though there was no question about the respect he commanded), was astounded by the display of devotion made by his friends on the first day of his retirement. The crowds that moved almost wholly by spontaneous suggestion, gathered about his new home and swarmed the streets for blocks to give him momentary applause as he passed from official to private life, began a series of recurring demonstrations of a type new to Washington if not the country. In fact, the Wilson home in Washington has become a shrine of a new type, a place where the spirit of groups find singular expression. To the casual visitor it is one—though a prime one—of the "sights" of the national capital, to be pointed out to sight-seers by the spielers on "rubber-neck wagons." But to the crowds that go there for demonstration whenever occasion offers opportunity it is a place of high reverence.

Beyond a salute of acknowledgment and a word or so of appreciation, Mr. Wilson has never spoken in response to anyone of the several ovations that have been given him at his home. When women went there *en masse* not long ago, he merely repeated a favorite limerick about not minding his face "because he was behind it." On that occasion he tried, unsuccessfully, to dodge the camera-men.

Never while President did he receive a greater ovation than was given him on Armistice Day last November when he attended the burial of the Unknown Soldier at Arlington Cemetery.

And one of the rare and regular events in Washington occurs on Saturday nights when he invariably attends a vaudeville theater. A crowd always gathers to see him arrive and depart, and when he enters the house and with his party goes to the rear seat he always occupies the audience stands and applauds vociferously. Vaudeville performers in Washington, and elsewhere, have found that when nothing else will arouse it a mere mention of Woodrow Wilson's name will bring down the house.

The unique position that he occupies in the life of the national capital finds correspondence in his relation to that political realm wherein he for a dozen years was a dominant performer.

While he sees old supporters and is said to talk freely with many of them, there is no evidence of his taking any hand in the big affairs of politics. Yet it seems clear that he considers himself the national leader of his party. "If you believe in my leadership," is a phrase he used in a letter of advice to a Missouri Democrat with reference to the Reed-Long contest for the Democratic Senatorial nomination in Missouri. His warring on Senator Reed is the result of an old and bitter political feud that verges on the personal. However, he has not hesitated to express himself regarding other internal party fights that involve questions having to do with his Presidential régime or his political tenets.

Believes Ideals Will Prevail

THAT the national and international ideals for which he stood will ultimately prevail, his friends say, is beyond all question of doubt in his mind. That he will again fight for them when it seems expedient for him to do so also is their belief. And they believe that he will do all that he can to hold the Democratic party to the unqualified support of them.

However, it is not believed that he longer entertains any personal political ambition, such as hoping again to be a candidate for President. The state of his health, together with his age, precludes that, though some persons who were close to him declare it their belief that deep in his heart he wanted and thought he should have received his party's nomination in 1920, despite his physical condition. But it is doubtful if he ever said a word or gave a positive intimation to that effect. At that time, they say, he showed no sympathy with the McAdoo boom but in all probability was opposed to it—not solely because of the family relation but also because of a coolness that then existed between the President and his former Secretary of the Treasury. That coolness passed and the two are now on the most cordial of terms. And the impression in Washington is that Mr. Wilson looks with more favor on the rather ill-defined branch of his party known as the McAdoo faction than he does upon the other ill-defined branch known as the Cox faction. This, if true, is not because of McAdoo but owing to the fact that Democrats who are enthusiastic Wilsonites are more prominent in that branch of the party.

If his health continues to improve, or even holds its own, most students of national politics agree that the former President will have to be reckoned with in future as an individual as well as a tradition and symbol. The potency of the latter aspects are recognized even by Democrats who have never been strong Wilsonites. But to date, Mr. Wilson has shown no disposition to take a hand in the management of the big national affairs of his party.

Mrs. Wilson and Grayson Aid

WHILE his health is such that he now can be rated only as a semi-invalid, Mr. Wilson's physical condition still is beset by uncertainties. Persons familiar with it say that he may be able to engage in fair activity for many years to come, but some unfortuitous accident, such even that would be of little danger to a strong man, at any time might possibly bring on another crisis.

His partial restoration is attributable largely to his will power, assisted, of course, by the care given to him by Mrs. Wilson and Rear Admiral Cary T. Grayson, his physician.

Admiral Grayson's basic prescription for getting him on his feet again was substantially the same as the one he used in keeping him on them before the breakdown nearly three years ago. It is (1) system, (2) a sense of humor and (3) regular diversion.

Admiral Grayson warned him against the exertions that brought on the breakdown a year and a half before the end of Wilson's Presidential term.

When he planned the speaking trip through the country on behalf of the Paris treaty, his physician told him that the effort might cost him his life.

"I believe it my duty to take the risk," he said and went ahead.

He did not collapse completely until after, on the doctor's orders, he returned to Washington. For several days he was unconscious and for many weeks his life hung by a thread. Then came improvement, with steady but slow regaining of strength which has continued until the present.

Not once, except when it was obscured by unconsciousness, was there any weakening of the imperious will which next to his wonderfully well-ordered mind is the outstanding characteristic of the former President's personality.

And they say it is as virile today as it ever was.

Tea and Other Things With the Bally British

In Which Are Chronicled Sundry Tales of Bathtubs, Fresh Air and Sports

By WILLIAM ATHERTON DU PUY

"IT IS perfectly all right in America," one Englishman was assuring another. "It used to give me a jolly strong jolt when I saw them biting the ends off their cigars. But I have noticed by the American films that it is quite generally done. Their very best people bite their cigars."

And to think that, out in St. Louis, when you see a man produce his pocket knife for the purpose of establishing a draft in his smoke you are sure to conclude that he has false teeth! And further to recall the fact that there are people who deny the educational possibilities of the movies.

What, I began to ask myself, would one do if he had misplaced his penknife, had a cigar in his pocket and was nervous for a smoke? It did not take long, by dint of careful observation, to encounter a case of just this sort. And the Englishman with the cigar pinched and otherwise abraised the end of it with his nail and soon the smoke rings were ascending. I now sometimes do this myself when in company, a bit self-consciously as yet. It is a good scheme.

Take your Englishman. He runs true to form, reacts in certain ways, wherever you see him. He can, I believe, be better judged here where there are contrasting types by which to measure him than he could at home. At home, for instance, you would never appreciate that odd mental slant which makes him regard himself, wherever he goes, as the native, and the people around him as foreigners. So I ask you to observe in mid-Europe some of the idiosyncracies of these, our first cousins, while they mingle with our other more distant kinsmen.

What! Go Without Tea?

WE HAD met a delightful Englishwoman coming up from Cherbourg to Paris, had ridden with her in one of those six-seat compartments that an American can never visualize until he actually travels by the boat train. It was 4:30 on the following afternoon in Paris, this lady met two little girls, daughters of the chance boat acquaintance.

"Have the little girls had tea?" she asked. "No? The poor dears. I will show you a jolly little tea room."

As a matter of fact the little girls had never had tea in all their lives except when they played going to tea in the basement with the neighbor's children. But to this Englishwoman an afternoon without tea was like a spring without flowers. Or was like a breakfast without eggs to us, the which we have been eating seven days a week since arriving here, for they give you nothing but coffee and jam and you are a blighter if you don't eat it in bed.

As a matter of fact the British have pinned this tea idea on all Europe. Out at the International Labor Office, in Geneva, there are people from 33 nationalities on the staff, all banded together for the accomplishment of a noble purpose. What do you think happens every afternoon at four o'clock? Give it up? Well, you stop your work right where you are, even though you be in the very midst of ridding the wool industry of anthrax, that burning death of the spores, or reducing the working hours of children under 6, to 14 hours down Ganges way. You knock off, for the tea girls have arrived. One bears a pot of that steaming beverage and the other a tray of cakes, all furnished by the common and benevolent employer. You are not asked will you have some. It is fixed right up for you. These girls have never seen anybody in the whole course of their frugal Swiss lives who declined tea. You haven't the heart to do it. In a month you are as confirmed in tea drinking as any Britisher.

And another odd thing. They knock off here at 12 o'clock and nothing more doing until two. Two hours for lunch. Banks closed. Stores closed. Everything.

But all the time I am watching these Englishmen. They are splendid, clean-living, soap-and-exercise-loving, rut-following creatures.

"I place no value on the things I earn," one of them will tell you. "The only things that are worth having are those that come to you of themselves without the necessity of your in any way deserving them. I would not give a fig for a thing that I had to earn."

Just "a Bit of a Place"

NOW that is an odd viewpoint to the American who desires above all else to hew his way through a forest of difficulties to his own personal success.

And you ask a bally Britisher what it is in this world that he most wants and he will set it down as a bit of a place in the country where he can live as a gentleman on his own acres and let the world go by. And both of these attitudes of his are sincere and yet they are in every way contradictory of his own record else how could he have been the world's greatest pioneer?

But for entertaining situations hereabout take an Englishman and his fresh air. Always he is pressed hard against the immovable in continental Europe. For windows, from the continental viewpoint, are for purposes of illuminating the domicile. They are good things because they let in the light. They have served their purpose when they have done so. The last time that a window was raised on the Continent was that time when Juliet unclasped hers for purposes of "sweet sorrow" and let the bat of tragedy fly in.

You should get the continental viewpoint. I got it from a novel of the people, done in French, which I was spelling out with the aid of a dictionary while trying to jolly myself into the belief that I was acquiring a language. In this book the noble heroine, all lost save honor, sought to destroy herself. And how do you suppose she proceeded to accomplish that dire end? Why, she falteringly approached her casement, tremblingly released its fastenings, flung it wide. Then from out there beyond the walls the free roving air blew in upon her bare breast. It was death.

I am sort of case-hardened because I grew up in the country where children never get any fresh air. But on this occasion when I was riding up from the Eternal City with a very noble and venerable Roman I approached perturbation. We shared a compartment, six feet long, three feet wide, airtight, he having the lower berth and I the upper. With an eye to convenience I retired first. I left it to the Roman to open the window, but, having already started on the road of international education, I stayed awake to see that he did it. And he didn't. I rang for the porter, demanded that he raise the window, executed a pantomime of suffocation.

"Es imposseeblee! Es imposseeblee!" he assured me, waving his arms. Then he motioned to the door, indicating the keyhole as far as I was able to make out, and assured me that the ventilation was adequate. I knew that there would be death in that compartment that night but grimly appraised the superior vigor of my physique over that of the white-haired Roman and gloated on my confidence that he would go first.

I once put two flies and a candle in a milk bottle, clamped on the lid and burned out the oxygen. These flies buzzed weakly, crept about inanely, for a surprising length of time. The spark of life is persistent. Both Garibaldi and I were alive in the morning but not peppish.

Now such experiences are bad enough for an American who has just a fair to middling liking for fresh air. But your Britisher may properly be put down as an ozone enthusiast. There are those who maintain that he goes to unwarranted extremes in insisting that a heavy gale blow across him all the time. Put a Britisher in the compartment of a day coach with a flock of Italians, French, Swiss, Germans, and the situation is sure to become trying.

I was in such a compartment with an Englishman and his wife and a Frenchman and his wife. The Englishman put the window clear down, seemed determined, I may say, to scoop in all the air, more or less freshish, in the Alps. The Frenchman shivered rattlingly, endured for a time, deferentially went over and closed it. The Englishman waited a bit, pulled at his collar, registered the agonies of suffocation, opened it again—not so much. The Frenchman agued, turned up his coat, put his wife's furs about her, waited a bit, closed the window again. The Britisher was sorely put to, wanted to be considerate but also wanted to live, fanned himself, looked anxiously to see if his wife still survived, compromised on the window three inches down from the top. The Frenchman cached his wife in the most remote corner, swaddled in her furs, hung a coat above her head in such a way that she could completely envelop that member in it, merely peeping out through a tiny crack to see if Alfonse survived. So did these representatives of allied nations pass the day in complete misery.

Oh, Yes! the Briton's Tub

WE WENT to dine at the apartment of an Englishman in Geneva. No heat. There is almost no central heating in Europe, even in England. It is a raw and melancholy climate over here, very much worse than Chicago. There may be a dinky little stove in a hall or a few pieces of wood in a grate. But the people are economical and coal is thirty dollars a ton. But at this dinner party our host started a fire. Cheerio! The room got almost comfortable. We were rapidly unbending. Then he went into the next room, opened the window—wide. Indirect ventilation. The wind was blowing in from the lake. Temperature 40. Gloom.

The next day another Englishman who had been present said it had been a satisfactory dinner party but the host had roasted us.

The British have a great deal of trouble about their baths in continental Europe but puzzle through in a typically British way, never yielding an inch. In Geneva, for instance, only the most modern houses have baths. The agents tell you about an apartment that can be rented. They call them flats which nomenclature, again, comes from the English. In America an apartment is much more upstage than a flat but in Europe it is just the other way. The working class lives in apartments. They are tenements. Well, this agent says that he has a modern flat with every convenience and luxury. It is complete, perfect.

"Has it a bath?" you ask.

His face falls. Of course not. It is not to be expected. I can't just make out whether they dab themselves with a sponge, utilize the washtub in the family kitchen, or let it go until summer. But certain it is that they cause the British who are indubitably inordinately given to bathing, a lot of trouble. They pronounce it that way, too. Bath—ing. Sometimes I think they carry it too far. The slightest thing they do as, for example, a bit of monocle juggling, which might induce the tiniest demonstration of perspiration, they must hurry away and take a bath. They give themselves an extraordinary amount of trouble that way, don't you know.

Well, when an Englishman rents a flat in Geneva, he forthwith buys himself a bathtub and installs it. When you see an Englishman moving his household effects, there is always a bathtub on top of the load. They carry them about the same as the easy chair.

The Swiss, it may be remarked in passing, do not welcome all the nations into their midst wholly under the inspiration of hospitality. They have been known to send strangers away with less money than they brought. I am told that it costs more to live in Constantinople than in Geneva, but, for a mild appearing people, the Swiss get theirs here. I came direct from Washington where things cost more than anywhere else in America and the prices here are 25 per cent higher than those in Washington.

But to return to the Englishman and his bathtub which needs one more touch. One of these gentlemen rented himself a flat. Then he bought a bathtub and installed it at an expense of five pounds. Thereupon this Jesse James-William Tell from whom he had rented notified him that his monthly stipend had been raised 20 francs, because, forsooth, he now occupied an apartment with bath.

Language is a strange thing, and we Americans are least given to acquiring it. The Englishman more readily tackles the job.

The American idea of language is, I think, less flexible than that of the British. In language the British yield a bit from the assumption that only that which is of their tight little island is worth while. The American is more dogmatic in insisting on one language. Among Americans there are two theories of how to get along with those who know not the great language which we have improved so much over beyond the water. There is one school which holds that, if you will say it very slowly and distinctly in English it will be understood. I heard the voice of a woman, genial and communicative, in the room next to mine the other day, talking to the French chambermaid.

Dashing Off the Memos

"I LIVE in Cleveland," she said. "I—live—in—Cleve—land."

"Oui, Madame," quoth the friendly maid.

"I will leave tomorrow," the voice from Ohio went on, rasping out its R's. "I—will—leave—to—mor-r-row." She was sociably happy in the consciousness of indulging in conversation.

Then the other view of it is a slight variance of this. It is held by the American who believes that English should be the universal language and has appointed himself a propagandist for this idea. Wherever he is he demands what he wants in English. He sticks to it, insists. A benighted world has got to understand English. Most of the important people in it already speak that language. He takes his stand. I have never yet seen him fail to get what he wanted.

I am working here at Geneva at the International Labor Office. You know that child of the Treaty of Versailles whose province it is to make the world a better place in which to live. This it proposes to do by improving the condition of those who work. Well, the British system of carrying on business pretty well prevails out there and I bumped into corners something awful until I found out how it works.

In the British civil service, if you have been talking to an American and have picked up a good idea that will save the nation, or if the house is on fire and you want to tell the big chief about it you write out a memorandum.

These memoranda soon began to come to my desk. I had lost the knack of reading writing from long residence in an atmosphere of typewriters. I hadn't the slightest idea who were the people back of these unreadable initials. Was I fired or was my salary raised? Well, pretty soon I got the hang of it and now I dash off a flock of memos the first thing every morning.

And I get along pretty well with them. One of these youngsters got to feeling friendly toward me not long ago and he decided that he would go all the way and make me entirely happy. He would let me in on a stupendous compliment that had been paid me. He had heard some one say that it was hardly noticeable that I was an American, that I might almost be taken for an Englishman. He was sure that he was sending me humming about my work for the whole day. There is a certain boyish simplicity in their belief in their superiority that is amusing if one has the sense of humor not to be offended with it.

Their Way—and Ours

AND they are a manly, upstanding sort of people, these British. One of the finest things about them is their enthusiasm over keeping fit. The Swiss and the French share their seriousness.

There are two or three Americans among us but our sporting manners are quite different. While we play we overflow with conversation. We talk a wonderful game, jolly our antagonists, chortle gleefully. We are a rollicking lot, the youngest, most playful people in the world.

"Return the ball and let them beat themselves," we admonish our partners. "They have lost their nerve. They are slipping. Too old. Too old. We'll pick this one out of your eye."

It is old stuff on any American court but an unknown method over here. Oddly, when this conversation is introduced into British circles they are delighted with it. They laugh their sides sore over it. But indulge in it? Well, it isn't done. The British mind is not built for it and besides, this business of getting one's exercise is a quite serious matter.

"The Things That Are God's"

THE DEARBORN INDEPENDENT is in receipt of a letter from S. G. Davis, of Hydaburg, Alaska. It reads as follows:

"I am an Indian fisherman. I am 55 years old.

"The best fish that swims in the waters of Alaska is the red salmon. Ever since the Indian came to Alaska, it has been his food. He has dried them and smoked them for winter use. But the salmon is a thing of the past in the rivers where he once caught them for his children to eat.

"The salmon are now caught in large traps before they go up the river to spawn. So the Indian must go hungry because the traps get the fish first. These traps are built so the salmon swim into a large pocket. They can swim in but they cannot swim out. There are times when the canneries cannot touch the fish for days, and the pockets get so full the fish kill each other for want of space. Salmon must be cleaned at once to be of any use; it cannot lie around. Trapping fish is not cheap; it only wastes them, and keeps them from the fishermen.

"I saw an article that President Harding has written asking that people be kind to animals. I wonder what President Harding would say if he saw all these fish penned up in these traps. I do believe President Harding has too much heart to see even fish suffer.

"Let me say a word about cannery managers in Alaska. In the eyes of the Indian fisherman these managers are mighty big men. The manager goes around in a fast power boat, and goes to the best hotel. If the truth is known, he has learned about fishing from the Indian fisherman.

"I often wish some kind gentlemen would come up to Alaska and start a Human Association, and have things so the Indian and the salmon would be treated right.

"If the Alaska salmon is going to be cleaned out by fish traps, what are the Indian and his children going to live on?

"The Alaska Indian must ask Congress, not for money, but to take the fish traps away from Alaska, so the Indians can get something to eat. It has gone so far that he has to battle for food with the fish trap owners.

"Let me ask you with lifted hand: Are you going to see children tugging at the empty breasts of starving mothers? Are you going to see men taking their lives that their families may live? The Stars and Stripes never teaches, let capital live, and let men and mothers and children die because they are poor.

"Are the people of the United States going to see the fish trap owners starve out the Alaska Indian and his children just because fish traps are easy methods of making money?

"We are not asking for something belonging to fish trap owners.

"We are asking for something belonging to God, who made it for all mankind."

The Conservative

ALWAYS has he been in evidence—since and before the war, in Roman times, and in the old Stone Age.

Left to his own initiative, he would still be making fire by rubbing together two sticks, or by striking iron with a flint—if, indeed, he had advanced that far; for it was no conservative who first struck fire.

His eyes are seemingly in the back of his head, for he has a much keener view for the past than for the future, being very much satisfied with the Golden Age of his own boyhood.

Sometime in early manhood his brain crystallized, and whatever knowledge has been developed in the world since that time is for him taboo.

If he acquired a medical education before the development of the science of bacteriology, he cannot speak in too much contempt of what he is pleased to call the "germ theory." If he could altogether discredit his senses, he might also refer to the typewriter, the automobile, the linotype, the airplane, and the wireless as "theories"; for they did not have these things when he was a boy.

He makes a constant and desperate effort to maintain the validity of his ideas, and to this end, he ignores much that has been learned later than his receptive period. The conservative in politics and in business is altogether of a different type. He knows a good thing when he sees it, and does not propose to let it escape his grasp.

He knows full well that it is better to be on the inside of the ring than on the outside, and he antagonizes every movement intended to give the common man a chance. He is strongly of the belief that privilege for the few is preferable to justice for all, for he happens to be one of the few.

In plain terms, his eye is on the buttered side of the bread.

Perhaps it is human nature for the man who has been raised with a silver or a golden spoon in his mouth to object to its removal. Occasionally, there is a man who, with opportunity to enjoy all the fruits of privilege, deliberately sets about to share it with those who are not so fortunate. Such a man has tapped the true source of happiness.

But he will never be understood by the conservative, who will be dead sure that either he is "weak in the upper story," or else he "has something up his sleeve." The conservative, whether in politics or in business, while sharp enough to look out for number one, has never acquired that broad vision of life that makes it a delight to help raise the weaker brother.

Should Supreme Court Judges Reign for Life?

DISCUSSION by the California *Christian Advocate* of the proposition to abolish the life tenure in office of the episcopacy in the Methodist Episcopal Church South brings out a thought that may as well be considered in the State as in the Church.

Introducing the subject, the *Advocate* says:

> "With the growth of democracy throughout the world there is a growing skepticism as to the wisdom of life tenure offices in either church or state that is world-wide. The recent war has increased this doubt to almost a conviction that men are not generally so constituted as to be safely given such a claim on any position in life within the gift of the people. Of course, all life tenure offices grow out of the autocratic doctrine of the divine right of kings, which saw its last expiring gasp in the dethronement of the Kaiser and the Czar."

The argument, of course, refers to the church polity. Reference to the question of political office is, however, so pointed, one can hardly escape conviction that the recent questioning of majority rulings by our high courts have caused a feeling, growing in intensity, that legislation by the judiciary is un-American and must be stopped.

It was intended in the outset that the United States Supreme Court should be so far removed from politics that its decisions should stand unquestioned by all the people, hence the justices were given a life tenure of the position. How absurd the idea was soon demonstrated. President Washington selected men of known ability without reference to their political opinions, but when President Adams had occasion to fill a vacancy, the bank charter was a vital issue and he selected Chief Justice John Marshall, a stronger Federalist than himself, who was certain to rule according to Adams' belief.

President Jackson, on the other hand, selected Chief Justice Taney, one of the most radical supporters not merely of the rights of states, but the duty of other states to support the laws of any one state. Neither Marshall nor Taney could have agreed had they been contemporaneous.

Nearly every appointment to the Supreme Bench, as far as recalled, has been affected by party expediency, however real the appointee's ability might be. In the case of the Tilden-Hayes contest, a vacancy was procured by inducing Justice Davis to resign, to give place to a partisan, who became the real deciding factor in the case. No man will deny that political considerations gave William Howard Taft the crowning ambition of his life. Whatever his personal or professional merit he would have carried his unfulfilled desire to the grave under other circumstances. Life tenure in office is a prerogative, not a democratic principle.

A Money-Broker Trick

IN DISCUSSING the Federal Reserve Bank System there is an impression, dishonestly encouraged by the Money Trust, that its opponents are attacking all banks. This is unwarranted. There is no fight against legitimate banking. In fact, if the indictment of the Reserve System is sustained, banking in general, including membership in the system, will be benefited.

Starting from the fact that at this time less than a fourth in number of the banking institutions in the United States are members of the system, and bearing in mind that of the membership at least four-fifths in number are members through compulsion, it will readily be seen that any criticism of the system must be confined to a very small part of the banking business, even if it included all the membership, which it does not.

The struggle for financial freedom is a battle for the small bank and for independent financial institutions, as well as for the people at large. Outside of the national banks, by law compelled to subscribe to the capital stock of the Federal Reserve banks or surrender their charters, the number of institutions electing to membership in the system at the close of 1921 was but 1,621, making the total membership less than 10,000.

That the Federal Reserve System has not been satisfactory to these outside members is evidenced by the liquidation of some, and the withdrawal of others. That it is not a guaranty to banking prosperity, but rather an encouragement to monopoly, is shown in the failure of many member banks and the practical bankruptcy of others saved from actual liquidation by absorption by rival institutions; for the mergers so frequently noted in large cities are really but a style of foreclosure on the properties.

The extent of the dissatisfaction of the national bank membership with the system cannot, of course, be gauged. That some exists is apparent from the growing interest in the subject manifested in all parts of the country. Many inquiries come from sources which surprise, since information is sought by bankers who might be supposed to know all there is to know of the matter. The fact that the member bank is no longer master of its local situation seems the one great fault found with the system. Under the National Bank Act the local bank of issue dealt directly with the government and the volume of its circulation was limited only by the aggregate that could find profitable investment. The currency issue, too, was based on long-term security, so that commercial business could be carried on without regard to frequency of liquidation. Under the Federal Reserve System, the member bank's judgment is subordinated to that of the Federal Reserve Bank, which can act only on the advice of the Federal Reserve Agent, and the permission of the Federal Reserve Board.

Instead of the independent national bank circulation, unless some early legislation provides another, the basis will have disappeared in 1930, and the Federal Bank note must be substituted for it.

Enough has been pointed out in this connection to convince the banking interests, those threatened with disaster, at any rate, that the cry that opponents of the Federal Reserve System are hostile to legitimate banking, is absolutely unwarranted. To the contrary, such opposition is founded in a desire to eliminate every wasteful element in our currency system, and extend the circulation privilege to the full need of the business of the country, retaining the only bases of security ever known to money, the faith and credit of the people. Faith and credit maintain the equilibrium in the bulky plan now operating and without faith and credit the business of the country would sustain a disaster the like of which the world has never seen.

Business Is Good—Why?

BUSINESS is good. What makes it good? Money is "easier," they say. It is the same money that was "tight" six months ago. What has made it "easier" now? Do you really want to know what has made it easier? Then here is the answer: A group of men wired and phoned to all Federal Reserve centers in the early part of May, 1920—"The tie-up comes on the 15th." That is exactly how "deflation" came, by the decision and order of a private group. It was not a "deflation of the currency" but a deflation of the people. These same men recently said, "Let's ease up a little; tell them to come in and borrow some money." And then, all of a sudden, "business is good." The business was always there—waiting. Men, materials, need, all there; but no money. The money all there, too, but not "easy."

Some people rub their heads when they try to understand the Money Question. Let them be warned: don't try to understand it; no one understands it; our present system is so irrational as to baffle rational minds; financiers themselves don't understand it, they only play it. If the Money Brokers can induce you to try to "understand" the Monetary System, then they have you tied up for the rest of your life.

Mr. Ford's Page

IT IS probably necessary that the froth and falsity which is called forth by a discussion of the Money System, should be first expressed and disposed of, that the way may be clear for sober thinking and planning. Six months ago, the utterance of a few plain words, which simply said what hundreds of thousands of men, bankers and farmers and mechanics, have been thinking for a long time, called forth a hailstorm of adverse articles which are running to this day, and which promise to continue until it becomes perfectly clear that the time for a certain kind of pro-capitalist special pleading is past forever.

The Money Question has been up before, but always in the worst possible connection—that of politics. This time it comes up when politics is a distant second, perhaps a third, in public interest and importance. Entrance of the Money Question into politics in previous years can be explained by two causes; once the beneficiaries of a privilege-breeding money system used politics to establish the system more firmly, and succeeded; and once the people had recourse to politics to liberate them from the money chains thus forged, and failed. Both experiences have discredited politics in this connection.

Now, some very plain statements have been made, and their effect has been entirely out of proportion to their novelty—except on the assumption that the unfair Money System feels that at last its day of judgment is dawning. It has only been said that a dollar is very seldom a dollar, that indeed it is oftener 60 cents than it is a dollar. It has only been said that by a trick long concealed the people have been obliged to pay 120 to 150 cents for 60 cent dollars, that is, to give one and a half commodity dollars for one-half of a money dollar. Our people are so discouraged by the deliberately mystifying methods of economic discussion that they have accepted even these plain statements as textbook controversy, until now: now they see that it is not a technical question, but a work question and a food question and a life question—since the commodity dollar is the one that is taken from them, and the banking dollar is the one that is given to them. That is the point of danger to the present money system; the people are learning what it means to them.

If the peck measure in which potatoes are measured, or the yardstick with which cloth is measured were tampered with to one-thousandth the extent that money is tampered with; if there was one-thousandth part of the uncertainty about weights and measures in general that there is about this measure called money, business would be impossible. The government has standardized everything but the dollar. And if the owners of weights and measures could determine day by day that now 30 inches would make a yard and now 28; that now 12 ounces would make a pound and now 10; it is easy to see how the owners and controllers of weights and measures—buying at standard and selling as they liked—would contrive to keep the under-standard system in vogue.

That is all that has been said about money, namely, that it is not the best money, that it is unfair money, that it discriminates against producers in favor of mere money-brokers, that the unjust powers which have illegally been given its controllers make for poverty and hindered development.

It has also been said that the Interest Burden of the United States, and of the world, is intolerable, that modern Interest is a tax that few ancient tyrants would have dared impose. Interest in actual modern practice is a contrivance whereby all production is taxed by parasites, and whereby money is given a supremacy over men, material and management which it cannot sustain. It is true that in theory something can be said in favor of interest, but only for legitimate interest, and legitimate interest is not a drop in the overflowing bucket of the world's interest woes.

One of the curious and stupid bits of propaganda sent out declares that those who ask the people to scrutinize their Money System are enemies of interest on saving deposits. Even a banker will laugh at the thought of anyone regarding such interest as of any moment whatever in the question of the Interest Burden now bearing down the shoulders of the world. Cutting interest to what the poor savers of money receive, would liberate the world. Or even giving exorbitant usury to the savers of money would liberate the world. They are not exploiters; they do not seek another's destruction.

It must be very significant in the minds of the chief beneficiaries of the present Money System that a few plain observations, which every banker knows, could have caused such unrest among the mighty. Have they a premonition of impending change? Or are they merely aware that when the public mind does grasp the simple elementary principles of the modern financial game, it will abruptly rule it out, as it ruled slavery out, as it will, after it has settled the money question, rule war out. And this, not because of any latent revolutionary tendencies in the people, but because of their unspoiled moral sense in public affairs. If it were merely a question of method, one were as good as another; but it is a question of morals, a question of justice, and it is the genius of our race that the system which fosters injustice cannot last long after its true character is understood.

One very encouraging sign of the times is that the main contentions are slowly being acknowledged by disputants of all shades of interest. There are six or seven facts which all intelligent men can take together in the study of this question and which really determine the whole matter. Bankers can take them, money-brokers can take them, economists hired to defend the present system can take them, socialists and students of every degree can take them; and once these steps are taken the question is solved. We shall then need the services of men who are naturally gifted in this department of work to build the system better and eliminate the leaks; to make money that is money; to return to the government the constitutional power over money which power the government has unconstitutionally turned over to a few private money merchants. Money is a government monopoly handed over to be a private monopoly for private benefit. And that is not right. Everyone knows, the moment it is stated, that it is not right. And that, finally, is going to settle the whole matter, when the public mind comes to the point where it can say, "this is not right."

No one knows what form the future currency system will take. It is quite idle to invent systems. The system of the future will be determined by events. The present system is probably the best that has been conceived up to this time. Any other of the thousand systems offered will work out well if everyone agreed. But men don't agree on such matters; the money question is 90 per cent human nature; destiny itself will mold our money system into the form which it shall take.

The only changes necessary are those that will prevent tampering with the people's money. The charge that money is to be "cheapened by the printing press," and all such silly stuff, cannot be true of an idea whose sole purpose is to make money worth more to the people who own it. Cheap money is a device of the speculative financiers; it is the very thing we are all trying to avoid.

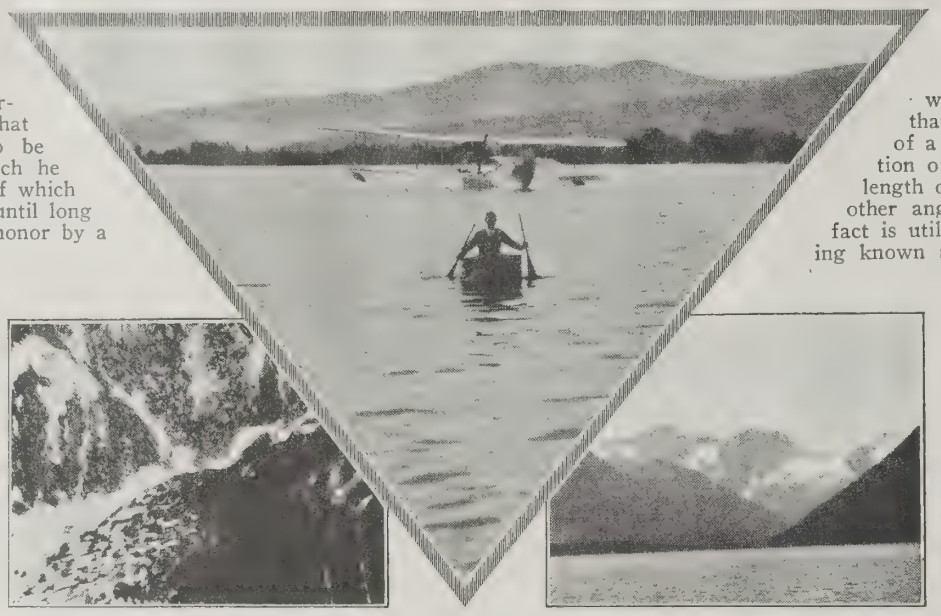
Many of the political and social proposals of the day which seem dangerous, are merely defensive proposals, and will be forgotten when a sound money system removes the causes which inspired them.

SIX months ago a few plain words were said about Money: such things as that Money should be honest; that a dollar should always be a dollar, as a yard is always a yard, or a dozen a dozen; that Money is a government monopoly and should not be made a private brokers' monopoly; that gold cannot practically and really be the basis of our money because there is not enough of it; that we are sailing along under a number of assumptions which we know are untrue—these very plain things which everybody says and everybody knows, caused great unrest and uneasiness. Why this extreme anxiety, except it may be a guilty sense of discovery? Why should there be such agitation of spirit if nothing is wrong? What is dangerous about the demand that money be always honest money?

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

They Are Putting Wings on the Canadian Surveyor

Giant Planes Carry Engineers Over Mountains to Unexplored Spots



By D. M. LE BOURDAIS

IF THE spirits of the departed are permitted to look back upon this mundane sphere it is entirely likely that the wraiths of such men as Thompson, Palliser and other engineers whose duty it was to chart the trackless wildernesses of Western Canada must cast envious eyes upon their present-day successors who soar in giant hydroplanes serenely above such petty obstructions as the Rocky Mountains and across what was to them the almost limitless wastes of the prairies.

David Thompson was a surveyor in the employ of the North West Company who did much exploration work in the Rocky Mountain region during the closing years of the eighteenth, and the early years of the nineteenth, century. In those days information regarding the great West was very meager indeed. Among other things, Thompson was instructed by his company to explore the Rocky Mountains. He did his best; but, although he has been dead these many years, and engineers innumerable have devoted a great deal of time, off and on since then, to the same end, a very large extent of the Rocky Mountain area still remains to be explored.

Thompson, however, did explore the Columbia River from its source to its mouth; and his name might with a certain degree of fairness have been given to that stream; but it was fated to be otherwise. Another river which he never saw, and the existence of which he was probably in ignorance until long afterward, was named in his honor by a fellow explorer.

A difficulty with which the early explorers had to contend was the great distances to be traversed, not only to reach the scene of their labors but to cover the vast areas over which their work extended. Their principal means of travel was on foot, excepting where canoes could be employed; occasionally they had horses. In addition to this there was frequently the danger of attack by hostile Indians. Under these circumstances it will readily be realized that the work of the pioneer surveyor was, to say the very least, filled with interest and very often with danger.

Left—Mountain peaks taken from above. Center—Pilot paddles ashore in collapsible boat, when flying boat alights in Douglas Lake, B. C. Right—Jones Lake, 2,100 feet above sea in the Cascade Range of British Columbia.

The Canada Air Board has charge of aviation in Canada and is maintained by the government to supply flying men and equipment for whichever of the different public departments may require their services. This is in addition to possible naval or military necessity. Thus at times men and machines of the Air Board are employed in connection with Customs work in preventing smuggling or apprehending smugglers; or by the forestry service in the detection and extinguishing of forest fires and in combating tree-destroying insects; or by the Department of Mines in transporting surveyors and their equipment to distant points such as the recently discovered oil fields on the Mackenzie River in the Far North; or by the Geodetic Survey in connection with the linking up of the primary triangulation survey at present being undertaken in the mountainous regions of the West, the story of which is the purpose of this article.

Last summer, between May 29 and the end of August, Mr. H. F. Lambart, of the Geodetic Survey of Canada, conducted a reconnaissance by hydroplane extending from the islands of the Puget Sound archipelago to the Okanagan Valley, 300 miles in a direct line eastward from the British Columbia Coast. This required flights totaling more than 2,000 miles and resulted in information secured and work accomplished which without the aid of flying equipment would have taken at least three years. Some of this information could not otherwise have been obtained at all excepting by, in many cases, painful experience. Two planes were used at different times, an H. S. 2L. flying boat equipped with a 385 horse power Liberty engine; and an F. 3. flying boat having two Rolls Royce engines of 360 horse power each. The latter machine has a gross weight of more than 13,000 pounds and has a cruising radius of 8 to 10 hours. In addition to Mr. Lambart and his assistant, the machines carried a pilot and mechanician and complete camp equipment as well as a seven-foot collapsible boat.

Aside altogether from the scientific value of being able to obtain a survey of a desired area from the air, there is the thrill which must come to the engineer as he sees the landscape unfolding below him in its infinite variety of field, lake, stream, forest and mountain range. In no country in the world, it is probably quite safe to say, will scenery be found which surpasses that in the territory covered by Mr. Lambart's operations during the past summer, save perhaps that which lies ahead of him next season.

As the plane "takes off" from the slip of the Pacific station of the Air Board at Jericho Beach, Vancouver, one sees on the west the deep green waters of the ocean with Vancouver Island lying in the distance and the island-studded Gulf of Georgia in the foreground. A bit to the south is Puget Sound; and, standing out in bold relief against the southern sky, its crown covered with perpetual snow, rises the peak of Mount Baker. Immediately underneath, but momentarily growing smaller in the distance, spreads the city of Vancouver sloping back from the waters of its beautiful harbor sheltered by towering mountains. Away to the eastward winds the valley of the Fraser down which flows the drainage from a territory greater in extent than many empires of the past. The coast range is soon crossed; and almost before one realizes it, the Cascades are passing in rapid review beneath. Sharp, jagged peaks rise upward in serried array, here and there studded with lakes that sparkle like jewels in the sunlight. Down the valleys rush foaming streams to swell the mighty Fraser. On every side as far as the eye can reach are mountain tops, snowcapped and glistening. Covering the valleys and the lower slopes is a thick carpet of green forest, shading to purple in the shadows.

Later on, the earth's floor spreads out somewhat; the snowcaps become fewer and the forest green gives place to the grey of sagebrush; the hills become lower and more rounded; the lakes larger and more shallow. A closer inspection shows a great pasture country over which graze many thousands of cattle. But this, too, is soon left behind and more mountains rise to view—and back of them still more mountains, until, away in the distance toward tomorrow's sun, the massive peaks of the Rocky Mountains become faintly distinguishable from the clouds which crown their crest. It would be difficult to imagine a grander panorama; a more thrilling experience.

The function of the land surveyor is to define the boundaries of a given tract of land. It may be such a small plot as a city lot or a quarter-section homestead; again, it might be an international boundary. However large the tract, it must "tie on" to some point whose exact location with reference to other known points has previously been ascertained. So that it shall be possible to have all surveys in proper co-ordination, one with the other, and to make sure that they shall not overlap or be found otherwise to be at variance, a primary system of surveys covering the whole country is made by which the exact location of various prominent topographical features is determined and become matters of record available for future use by surveyors and engineers. This is the work of the Geodetic Survey—geodesy being the art of measurement as applied to the surface of the earth as a sphere. A section of land is said to be a mile square, but in reality its east and west lines are not strictly parallel, but tend to converge. The degree of convergence is very slight, of course, but if the lines were continued to the pole they would meet there in a common point. The earth being a theoretical sphere, these lines are also not straight in the sense of being in the horizontal plane, but are curved in conformity with the earth's curvature. In dealing with small parcels of land the amount of curvature is practically negligible; but when a country having such magnificent distances as Canada is taken into consideration, this factor can by no means be ignored. Thus the necessity for a comprehensive system of primary surveys.

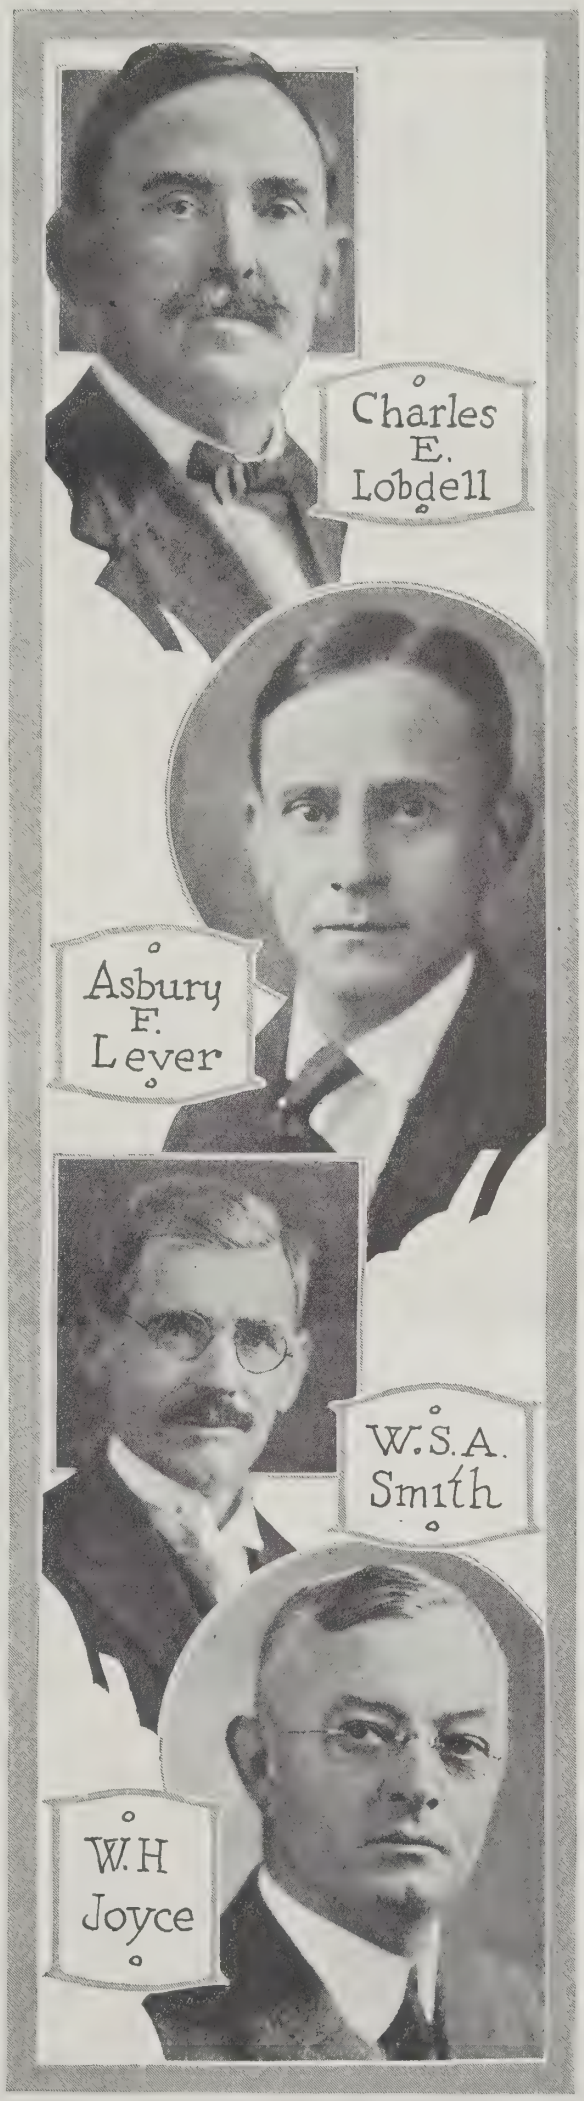
Now the usual method of measuring land is by means of a steel tapeline, still referred to as a "chain," because the earlier unit of measurement was a chain. Dragging a chain over the ground is obviously a very slow and laborious process where long distances are concerned, and also subject to a large degree of error. It is here that the mathematician comes to the aid of the surveyor. It is a well-known geometrical rule that given the length of one side of a triangle and the exact inclination of two of the three angles, the length of the other two sides and the other angle may be determined. This fact is utilized in the method of surveying known as triangulation. A base line usually from 8 to 10 miles in length, is very carefully measured, remeasured and checked. Then from each end of this base line imaginary lines are run to some high point, such as a hilltop or mountain peak—or in flat countries, a church spire—so as to form a quadrilateral. Lines are then run diagonally in such manner as to describe eight triangles within this quadrilateral figure. Observers are then stationed at each of the angles. Sights are generally taken at night because the atmosphere is usually more favorable than in the daytime. Rays of light are directed along the imaginary lines from each observing station by means of high-power incandescent lamps fitted with parabolic reflectors. At a great distance, when viewed through the engineer's theodolite, these lights look like stars. At the point directly over which the instrument is placed a copper bolt is cemented or wedged into the solid rock. The observer then carefully measures the angle at which the ray of light from each of the other points is received by his instrument. The readings are usually repeated on several successive nights so as to reduce the possibility of error to the very lowest point. The Geodetic Survey of Canada is not satisfied with its work unless when after the calculations are made the angular closure shows an error of not more than one second. Some idea of the accuracy desired may be obtained when it is understood that the total of all the angles in the triangles within the quadrilateral should equal 360 degrees and there are 3,600 seconds in a degree.

Having thus determined the length of the other two sides of the triangle, these two lines in turn serve as bases for yet other figures, and so on, until the whole country is covered with a network of triangles, the apexes of each being permanently marked in the manner described. In addition to this, a secondary triangulation system is worked out by which the exact positions of prominent topographical features within the larger triangles are ascertained and placed on record for the use of local surveyors.

The Geodetic Survey of Canada is at present engaged in linking up the triangulation work which has been done in past decades in Eastern Canada with the Pacific Coast. At present the work is progressing along the forty-ninth parallel westward from the Great Lakes. This is prairie country, well provided with roads and railways and presents no particular difficulties. Towers are sometimes built to secure longer sights, but the flatness of the country makes it impossible to obtain readings at distances as great as in the mountains, although the ease with which it is possible to travel makes the greater number of observations not a serious obstacle.

The Perversion of the Farm Loan System

Co-operative Democracy Inverted into Bureaucratic Oligarchy



THE chief trouble with government is governors. Legislatures write laws but administrators work them, and often there is no trace of resemblance between the conception and the product. There is no better illustration of the grip bureaucracy has on law-making than the sad perversion that has overtaken the Federal Farm Loan System. Congress, five years ago, set up with government funds a co-operative farm loan system, which was intended to make it as easy for farmers to tap the great reservoirs of long-time investment capital as it was for industries to get at such capital. It was to be co-operative, democratic, extensive and the efficacious remedy for the ills of farm land financing. Congress turned the "baby" over to the Federal Farm Loan Bureau with instructions to get it on its feet at the earliest possible moment, to foster its growth, and keep an eye on it in the public interest after it had attained majority and independence, just as the controller of currency looks after the national banks.

Instead of obeying instructions, the Farm Loan Bureau made up its mind right away—and said so in its first annual report—that Congress was all wrong in trying to set up a co-operative farm loan system; and it has blocked and is today blocking every effort to get the Federal Land Banks on an independent basis under the *control* of their stockholders, like any other bank, subject to the *supervision* of the board. Every one of the 12 land banks, from Springfield, Massachusetts, to Berkeley, California, has long since qualified for independence under the chartering act, by having $100,000 worth of its stock subscribed by the Farm Loan Associations, but there isn't a single stockholder on the board of a single bank. The farmers have invested more than $30,000,000 in the stock of these banks and haven't a word to say about their management, though Congress directed that as soon as they had subscribed $100,000 of stock in a bank they should have six out of nine directors on the board of that bank. In the near future every cent of the $8,892,130 put into the banks by Congress as a starter will be paid back into the Federal Treasury. Notwithstanding these facts, now comes the Farm Loan Bureau and asks Congress to give it perpetual control of the banks. It proposes that each bank shall have only three farmers to four appointees of the bureau on its board of directors.

In other words, the bureau seeks to nullify the intent of Congress to create 12 farm loan banks owned and controlled by the farmers, and proposes to let the farmers own the banks while it runs them. In this way the Farm Loan Bureau will establish itself as the compact control of what is now rapidly growing into an enormous financial power and may become a tremendous political power. In the course of the next five years it is more than likely that the loans and bond issues of the Federal Land Banks will exceed $2,000,000,000 and that their borrowers will number around 500,000. Already, under a slow-coach, hampering policy the loans of the land banks exceed $500,000,000 to about 160,000 borrowers. Furthermore, the Farm Loan Bureau now proposes that the 12 banks be authorized to create a central body which shall handle permanently the sale and distribution of the bonds of the banks. As the board controls the banks now temporarily and will control them permanently, if Congress complies with its recommendations, it will through this bond-selling agency be able to determine not only what banks shall be allowed to issue bonds but what ones shall get the money. Thus it will be possible for four men—five, counting the Secretary of the Treasury, who is an ex officio member of the bureau—sitting in Washington remote from farms and farmers, entirely in sympathy with high finance and the party in power to dictate the loan and all other policies of the farmers' banks.

But as if this were not enough of usurpation and centralization, the bureau virtually proposes to do away with the National Farm Loan Associations which Congress designated as the foundations of the system. As the law stands a prospective borrower must join his local National Farm Loan Association and have his application for a loan approved by that association, each member of which thereby becomes sponsor and to a certain extent indorser of his mortgage note. As it passes each loan the association takes additional stock in its land bank to the extent of five per cent of the loan, and the borrowing member takes stock in the association to the same extent. Thus the associations are the sole stockholders in the banks. The Farm Loan Bureau now proposes that it shall be empowered to make loans directly to borrowers and also that associations may be voluntarily liquidated. Taken together, these two provisions mean that the further formation of associations will be discouraged and that eventually they will be eliminated. The banks will then be composed of non-voting individual stockholders and borrowers and there will be no co-operative organizations. The placing of loans will then become permanently a matter of discretion by the management of the bureau-controlled bank. That is, of course, the situation at present under the temporary organizations. Thus the plan of Congress to provide for co-operative financing of their needs by associations of farmers absolutely independent of outside control will be nullified. The determination of local loans will pass from a local co-operative body to a distant bank controlled from Washington, even though the farmers own all the stock in the banks—they already own 85 per cent—and are responsible for all the loans.

The way in which the Farm Loan Bureau has administered its absolute power of control up to the present time indicates how it will curb the expansion of the system in the future if control be perpetually vested in it. Instead of endeavoring to float bonds in proportion to the applications for loans, it has consistently adjusted the volume of loans to the amount of bonds it has seen fit to authorize from time to time. It was the provision of Congress that whenever a bank had accumulated $50,000 of mortgages it should issue bonds against them. In practice the bureau waits until a large number of mortgages have accumulated in the different banks and then it puts out a large bond issue which is distributed through a syndicate in financial centers. If the syndicate so approves, the individual banks have little or nothing to do with the sale of the bonds and the borrowers are not permitted to take bonds in lieu of cash, as the law provides. Moreover, it appears to have been the view of the bureau that about $150,000,000 of bonds a year was all the market would absorb, although under recent critical pressure and following a virtual suspension of its activities by reason of litigation affecting its constitutionality, it has easily floated $175,000,000 in nine months. The last issue of $75,000,000 was taken at a premium 102⅜ in three days.

Note—Mr. Lever resigned his membership in the Bureau to take up a connection with a banking institution in South Carolina.

Unless the rate of issuance of bonds is greatly speeded up the Federal Land Bank System will wholly fail to enable farmers to secure necessary loans at low rates of interest and for long periods. As at least a billion dollars in farm mortgages have to be renewed each year, the Federal Farm Loan System as now conducted will never begin to take care of renewals, to say nothing of original loans.

During 1921 there were applications for $296,000,000 in loans and only $73,000,000 was loaned. The applications would have totaled much more if the banks had not refused to accept applications. The year 1921 was the hardest year that farmers have known in a generation. It was the year when they had the most need of the Federal system. Thousands of farmers lost their farms on foreclosure, and the loan companies and other loan agencies reaped a harvest of bonuses and commissions and heavy interest rates. At the same time it was a year of plethora of money for bond investments. The financial market absorbed four and one-quarter billions of securities, of which less than two and one-half per cent was Federal Land Bank bonds. During the months of November and December, 1921, and January, 1922, the market took $1,366,146,175 of securities and during those three months the Farm Loan Board did not put out a single bond, although thousands of farmers were clamoring for loans, with the best security on earth.

It is little wonder that the Farm Loan Associations have lost interest and become disgusted. They are not permitted to function. Having reduced the associations to dependence and lifelessness the Farm Loan Bureau now complains to Congress that they neglect their business, don't function and are fifth wheels which should be dispensed with.

Just how far the backwardness of the Farm Loan Bureau is due to the innate conservatism of its members and fear of going too fast and how much it is due to the influence of the loan agency and investment banking interests which suffer through the extension of co-operative rural banking is not determined. But this much is certain, that if those interests had been in undisputed control of the bureau it would have followed precisely the policy it is following. Men opposed to the principle of the law have been put in control of its operation. They have consistently endeavored for five years to keep co-operative democracy out of the Federal Land Bank System, though that is just exactly what Congress intended. Even if they do not persuade Congress to act on their recommendations they may be in control for 18 years more. This comes about through the fact that in 1918 the Treasury Department was anxious to keep farm loan bonds from competing with government bonds and so asked authority from Congress to purchase $200,000,000 of Farm Loan bonds, with the proviso that the temporary bureau organization of the farm land banks should continue so long as the Treasury held any of those bonds. The bonds will not mature until 1938 and in the meantime the bureau can continue its rule by keeping all or part of them in the Treasury.

Most of the associations have been so intimidated that they have done nothing to assert themselves. However, a National Union of Farm Loan Associations has been formed of some four or five hundred of the more aggressive associations to emancipate themselves. The bureau refused to permit them to appropriate money from their local treasuries to pay dues in this union. Some lawyers, including Senators Fletcher, of Florida, and Walsh, of Montana, assert that it is proper for the associations to unite and use association funds for the expenses. But the financing of the union is now through individual contributions. The associations demand to be informed of what is going on in their banks and assert the right to criticize their policies and suggest changes therein.

"The amendments to the act proposed in the last annual report of the Farm Loan Bureau," says one association, "are strictly against the principle of co-operation and if enacted into law will simply put the farm loan act in the hands of a political machine which will destroy the principle of farm loan credit and put the old mortgage companies back in power to reign in glory as they did prior to the passage of the farm loan act."

"We would like to inquire under what theory," says another communication, "does the Farm Loan Bureau, having no financial interest, assume to be able better to select the executive management of the banks than the stockholders who have their capital at stake? The present personnel of the bureau is composed of the chief executive officer, a lawyer who has been a county judge with some experience as a country banker; an ex-Congressman who has studied law; a sea captain who has had some experience as a clerk in the Agricultural Department; and a department store official whose chief qualification is that he has had a short banking experience on the Pacific Coast. They are Charles E. Lobdell, Asbury F. Lever, W. S. A. Smith and W. H. Joyce. Are these four men better qualified by reason of their experience and attainments to select the directors of the several farm land banks located in the 12 districts than the respective owners of each bank, residents of the several districts?"

People Pay for Interlocking in Anthracite

New Stock Issues Force Consumers to Pay Dividends on Additional Millions

By WILLIAM A. MCGARRY

This is the second of four articles on the anthracite situation.

HOW anthracite operators have reversed the fundamental principle on which most of the great industries and public utilities of the United States are founded may be discovered by anyone who will study the annual reports of the large mining companies, or read the financial columns of the newspapers with particular attention to coal company and coal railroad earnings. It will be noted that for 20 years the so-called "railroad mines" have been capitalizing profits until in nearly every case the apparent investment is far above the actual cash put into the projects.

In itself, that practice may not be indefensible. It has been used in other industries besides anthracite. But in most cases it is accompanied by an increase in efficiency in manufacturing methods or in distribution that makes possible reduction of prices to the consumer and thus bring about increased volume. It is from that extra volume that the money is obtained to pay dividends on the new stock. "Quick sales and small profits" is a familiar phrase that describes the process. More and more American business has come to depend on what is known as the turnover to produce its dividends. Even in many public utilities dependence is placed on volume of business. That is particularly true of the telephone and the street car.

Read of the Lehigh Case

WHEN fares, during the war, went to six, seven and eight cents, the public protest was nation wide. Complaint also was made against increases in the price of anthracite, but it did little good. In some respects it was rather late. Perhaps the best indication that it is still possible to halt the upward trend of prices and to force some reductions is the fact that within the last two years public protest has brought about the creation by the operators of a propaganda bureau to disseminate "information" about their troubles and the tremendous expenses under which they are burdened. Nothing whatever is said by that bureau about stock and cash dividends. Since the operators assert that their sole purpose is to let the public know the truth, they can hardly object to the presentation here of facts taken from official summaries of their annual reports.

A beginning may be made with the Lehigh Coal and Navigation Company. It will be recalled that Samuel D. Warriner is president of that company. He is also chairman of the general policies committee, representing the so-called railroad mines that produce 80 per cent of all the anthracite, and he is chairman of the General Committee of Operators now engaged in trying to negotiate a new agreement with the miners. He is the spokesman of the anthracite operators. As such he has admitted that the price of coal is too high, beyond the power of the people to pay, and that it must be reduced. He has asserted also that it cannot be reduced unless the wages of miners are cut. Some of the facts in connection with wages will be set forth later. In the meantime, Mr. Warriner's contention that his company cannot afford to sell coal any cheaper warrants study.

The company was one of the first in the anthracite field. It owns the canal from Coalport, Pennsylvania, to Easton, Pennsylvania, and leases the Delaware Division Canal from that point. Originally it was mainly a navigation company. Then it got into the railroad field. It bought up the Lehigh and New England and several others. There were mergers and other deals into which it is not necessary to go. Finally, the company leased all its railroad lines to the Central Railroad Company of New Jersey for a rental of one-third the gross; which was later changed to a minimum rental of $1,414,400 and a maximum of $2,043,000 until all improvement costs are repaid.

Now Pay on Many More Millions

FROM its many anthracite mines the company produces an average of about 4,000,000 tons a year. It is estimated that its lands contain 500,000,000 tons of coal. A new $1,000,000 coal breaker has been built at Coaldale, Pennsylvania, so that the production of the company will be materially increased when the miners go back to work. The new breaker is said to be one of the finest ever built. Presumably, it contains every possible labor-saving device, and the most modern mechanical equipment.

Back in 1901, the stock of the Lehigh Coal and Navigation Company was a good investment. It paid six per cent. The next year it paid five per cent, plus a 10 per cent stock dividend. Since then, in addition to the regular annual dividends, there have been five more such stock dividends of 10 per cent each. The last, paid in 1917, brought the capital stock outstanding up to $29,243,000. By subtracting all of these stock dividends—paid in addition to the cash dividends that ran up to nine per cent a year—it will be seen that when the system of capitalizing profits was first launched back in 1902 the capitalization was approximately $16,000,000. The company has been paying out eight per cent in dividends every recent year. But that sum, now $2,333,916, is on the capitalization of $29,243,400, of which about $13,000,000 represents extra earnings of the years 1902, 1904, 1908, 1909, 1911 and 1917, the years in which the stock dividends were issued.

In other words, the same public which yielded extra profits, over and above a fair return, of $13,000,000 to the Lehigh Coal and Navigation Company in those six years is now being compelled to pay eight per cent on the profits every year. The return exacted, however, is not limited by eight per cent. The annual report yields other information. *Poors Manual*, a standard financial work of unquestionable authority, shows that the company had a surplus, after the payment of dividends in 1920, for that year alone, of $1,711,137. The surplus for last year and for 1919 and 1918 averaged only about a half million dollars each, but in 1917, after the payment of the stock dividend, plus the eight per cent, it was $1,237,764. Last year was not a good year in the estimation of Mr. Warriner. After paying dividends on the inflated capitalization his company was only 12 or 15 cents a ton ahead, according to its own reports.

But there is more. The report for the year ending December 31, 1921, shows reserves of $11,731,347; unrealized surplus through appraisal of assets of $11,244,151, and profit and loss surplus of $8,075,352, not all amassed within that year, however. In view of these and the foregoing figures some of the statements made by the publicity bureau of the anthracite operators concerning the "losses" of that particular company are rather illuminating. Quite recently, on the very date that Mr. Warriner was issuing his latest demand for a wage decrease and reiterating the inability of the operators to cut the cost of coal without it, financial columns of Philadelphia and New York newspapers carried a report from the Street that the Lehigh Coal and Navigation Company is preparing to issue another stock dividend.

The Lehigh Coal and Navigation Company, however, is not one of the *big* profit makers of the anthracite field. Its capitalization has not been increased through profits to anything like the same extent as other and larger companies. It is generally considered one of the railroad group. Yet in recent years it was sometimes listed among the so-called independents. The Delaware, Lackawanna and Western Railroad Company furnishes even more amazing figures. Of course, the railroad is not now officially engaged in the business of mining coal. With other roads in the old coal trust based on the Temple Coal and Iron Company, it was ordered by the Supreme Court of the United States to separate itself from its coal properties. What appears to have been the final step in that "separation" took place by approval of the stockholders July 21, 1921, when the D. L. and W. Coal interests were "sold" to the Glen Alden Coal Company.

How the Dividends Pile Up!

THE Glen Alden Coal Company was organized in 1866. It was bought two years later by the D. L. and W. Railroad, along with all the mines that it had taken over. In August of 1909, the railroad organized a coal-selling division known as the D. L. and W. Coal Company. But that was not sufficient for the Supreme Court, which ordered complete severance. So when the time came to sell the coal mines, it was decided that considerable savings in taxes could be made by utilizing the old charter of the Glen Alden Coal Company. That company, owned by the D. L. and W. R. R., thereupon issued to the D. L. and W. R. R. $60,000,000 of four per cent bonds or notes in payment for the coal properties. And a month after that "sale" the railroad paid a stock dividend of 100 per cent to its stockholders.

In addition, the railroad paid a five per cent dividend in January of this year. From 1905, operating its own coal properties, until 1908, it paid 20 per cent annually in dividends. In 1909, it paid 70 per cent, including 15 per cent in stock. From 1910 to 1920 it paid 20 per cent, and prior to the 100 per cent dividend of last year it had disbursed 18 per cent. As in the case of most other divorces of mines from railroads, the change is merely one of title. There is no real change of ownership. The railroad will continue to draw profits from the earnings of the coal company, in the form of interest on its notes. It will also, if history offers any criterion, continue to haul most of the coal mined in the mines owned by the company it created and owns.

The Lehigh Valley Coal Sales Company is another of the large producers. It markets the coal of the Lehigh Valley Coal Company. It is perhaps the best illustration of the much criticized coal sales companies by which the operators exact extra profits. The company was created by the Lehigh Valley Railroad February 26, 1912, in line with the order of the Supreme Court for separation. Its capitalization was fixed at $6,060,800. To provide for that stock the railroad declared a 10 per cent cash dividend, and then notified stockholders they could use the money to buy the stock of the coal sales company. On January 17, 1914, the stockholders got a 25 per cent cash dividend from the coal sales company, with the same privilege of putting it into more stock. On June 1, 1917, they got 30 per cent in cash out of the surplus earnings, and bought more stock. By that time the stock outstanding had climbed to $9,801,435.

From October, 1912, to April, 1917, the stockholders drew, in addition, dividends of 10 per cent. From July of 1917 to April of 1921 they got only eight per cent, in cash. But on May 16, 1918, 10 per cent was paid in second Liberty Loan fours, and on June 16, 1918, five per cent more was paid in fourth Liberty Loan four and a quarters. Anyone anxious to know whether the Lehigh Valley Coal Sales Company can afford to reduce the price of its anthracite without any change in the wage rate may sit down with a pencil and paper and figure out the dividends on the initial dividend of 10 per cent—in itself a profit.

It would be possible to go on indefinitely. But another outstanding example of huge profits will suffice. The Central Railroad Company of New Jersey has just made public its report for 1921. It shows net revenue of $21,355,232. The non-operating revenue was $21,659,477, which was an increase of $13,701,065 over the preceding year. The reason for that showing was that the Lehigh and Wilkes-Barre Coal Company had a good year in the mining and sale of anthracite. It had such a good year that it paid 185 per cent in dividends on its stock, which is held in large blocks by the Central Railroad Company of New Jersey.

As a rule the coal sales companies perform only a book service. They buy the coal from the mining companies, on paper. Then they sell it to wholesalers or brokers, who sell in turn to retailers, by whom it is distributed to the general public. The miner gets his wage. Then the operating company must have a profit. After that comes a profit for the coal sales company. Then comes the railroad with freight rates admitted to be exorbitant for the type of traffic, all in solid trainloads. After that the broker, and then the retailer, six in all. Sometimes there is a wholesaler in addition to the broker. And bear in mind that operator, coal sales company, railroad and wholesaler are frequently one and the same; different companies owned by the same men or groups of men. It has been charged that some of the roads are interested in the retailers, whose margins of profits are now far above the level fixed as fair by Harry A. Garfield when he was Federal fuel administrator. Yet when that margin was fixed by Dr. Garfield it was also considerably above the prior average, and higher far than the retailers expected to get.

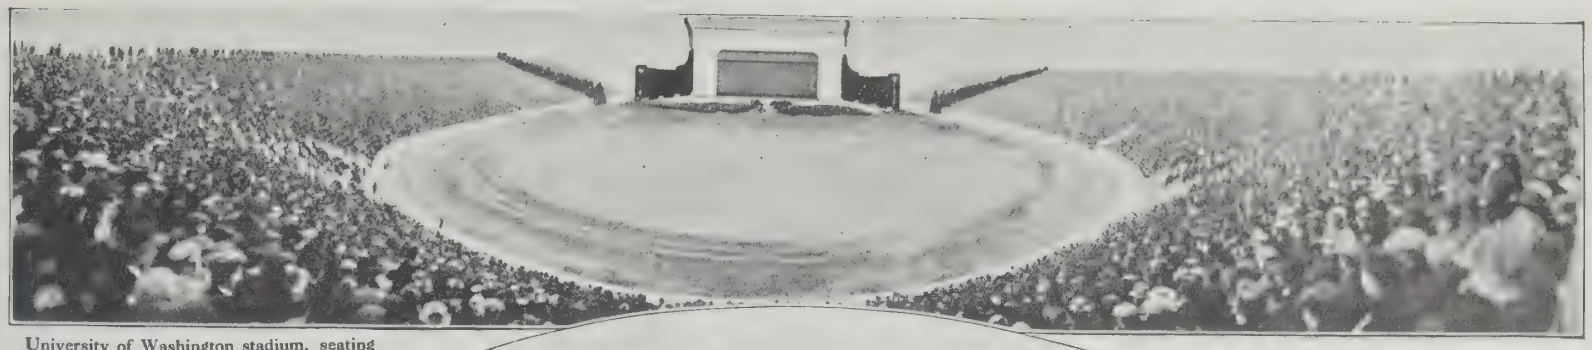
Miners Charge Extravagance

ALL the statistics that the operators are able to bring forth concerning rising costs of labor, timber, pumping, supplies and equipment, and all the furor about high royalties cannot obscure the final figures of the annual reports. Surplus profits cannot be concealed indefinitely. What has been shown of them here may give some inkling of the reasons actuating the operators in refusing to pay any attention to the demand of the miners for an impartial investigation of the costs of mining. For the miners back up that demand by charges of unnecessary waste and extravagance, of payrolls padded with relatives and of other questionable expenses that can be disproved only by a thorough investigation.

In early years, before the war, it was the practice of the operators to knock off 50 cents the ton on April 1 to induce the public to buy during the summer months, thus keeping the mines in operation and leveling off the peaks. That is a practice that has been dropped in recent years, due mainly to the fact that various coal shortage scares had the desired result. This year the operators recognized that the price was so far above the power of the buyer that a mere 50-cent reduction would not do. They have talked vaguely of a possible reduction in freight rates, and specifically of reductions in wages, but have given no promise in dollars and cents of how much they will take off the wholesale price in event the wages of miners are reduced.

Another occasional source of income to the operators is from coal taxes. Pennsylvania has made various efforts to collect a production tax. Ten cents a ton was ordered some years ago. The operators added it to their price. By the time the addition reached the consumer it had grown to 50 cents a ton. In due time, when it was estimated that the producing companies had gathered in about a million and a half, the tax was declared unconstitutional. But the difference never was returned to the buyers. Operators said it was impossible to distribute it. They might have reduced the price at the mines correspondingly, but apparently that idea did not appeal to them.

Unscrambled? Oh, No!



HOW anthracite interlocks is well illustrated by the figures of the Lehigh and Wilkes-Barre Coal Company, the Lehigh Coal and Navigation Company and the Central Railroad Company of New Jersey. Lehigh Coal and Navigation has no apparent connection with Lehigh and Wilkes-Barre coal. Operators would repudiate such a suggestion. But Lehigh Coal and Navigation draws a fat rental for its railroads from Central Railroad. Central, in turn, draws heavy dividends from Lehigh and Wilkes-Barre. In effect, the companies are so linked that the mines of Lehigh and Wilkes-Barre are providing a guaranty of return to the railroad operators and the railroad owners.

It was to correct just that sort of condition, with its accompanying evils, that the government started its long fight to dissolve the so-called trust, 20 years ago. Yet today the same men who then ruled anthracite, or their descendants, are stronger than ever. Their control is more absolute. If profits at times seem less, it is because they are spread over stock representing earlier profits. It is also because the same group of men have broken up the one big source of profit into several companies, many of which might be eliminated without any disruption of distribution and with consequent reduction in the price of coal.

In another article a study will be made of the contention of miners that they are producing more coal per man now than in former years, through the use of improved machinery and mining methods. Figures also will be given of the hazards of the mining industry, and the wage rates, about which there is so much ado, will be described. The demand of the operators would bring about 100,000 day-men to a rate of $3 a day in an industry that has never known full working time save during the years of the war.

"America's Passion Play" to Be Given in West

Chorus of 4,000 and 3,000 Others Trained for Great Pageant in Seattle

University of Washington stadium, seating 30,000 and having the largest stage in the world, where The Wayfarer is produced.

"Good tidings of great joy" brought by the angel and celestial choir in The Wayfarer.

The two Marys find the Messiah's tomb sealed fast on that first Easter morn.

Triumphant entry into Jerusalem—a scene from The Wayfarer.

THE Pacific Northwest is uniting in an undertaking that it is expected will achieve fame in a way never before attempted. In Seattle, "America's Passion Play," The Wayfarer, will be produced this summer each evening, July 24 to 29, in the University of Washington stadium, seating 30,000 persons. Proceeds from the pageant will go toward clearing the debt against the stadium. As a tourist attraction, The Wayfarer will bring thousands to the summer playground again this season.

It was while a resident of Seattle that the Rev. Dr. James E. Crowther conceived and wrote this masterpiece. It was his wish that this city be made the permanent home of the pageant.

The Wayfarer was produced first in Columbus, Ohio, in 1919, and although 24 performances were given, almost as many persons as saw it sought in vain to obtain admission, so great were the throngs seeking entrance.

In New York, The Wayfarer ran five weeks at Madison Square Garden and still the crowds who struggled to obtain seats could not be accommodated. Vast numbers from all parts of the country came last summer to see the production in Seattle. Approximately 100,000 persons saw the pageant in that city.

Montgomery Lynch, who produced and directed the pageant in Seattle and Columbus, is now training a chorus of 4,000 for the 1922 pageant. In addition to the 4,000 singers there will be 3,000 other participants. In Columbus and New York the choruses contained only 2,500 voices, so Seattle's chorus is the largest ever assembled and trained to sing the music of the great masters. Mrs. Montgomery Lynch, who was the accompanist at Columbus, is also the organist at Seattle. A large orchestral band in addition to two grand pianos and an organ will be used. The band will be one of the largest ever assembled to render music of this character. Scenery and lighting effects cost $265,000.

The story of The Wayfarer is intensely religious and fascinating. Wayfarer is symbolic of doubting, wondering humanity. In a war-blasted village of Flanders, Wayfarer stands aghast, terrified by the destruction and death of battle.

"'Tis a gloomy day for Christian faith;
"I pray that God may understanding give,
"And lead me back to faith, and rest, and peace."

This is the cry of Wayfarer as he stands amid the ruins of the Flanders village. Then Understanding, a queenly woman, appears.

"O pilgrim of the toilsome road, cast not
"Thy faith away, nor be dismayed, hear thou
"My words, and let thy heart fresh courage take."

This is her reply as she explains to him how God's word is more than mere doctrine. Under her guidance, Wayfarer is permitted to see the living Christ among men of the world.

One episode of the pageant depicts the processional to Calvary.

The following episode of the Resurrection is declared to be one of the most powerful ever staged. The garden of Joseph of Arimathea in which the tomb of Christ is shown; Mary and Mary Magdalene arrive to anoint the body. The stone rolls away and the angel announces the Resurrection. The disciples arrive and the news spreads quickly, bringing a crowd of 1,000 persons on the stage.

In the epilogue, Wayfarer is shown the Golden Age, with a tableau in which 5,000 persons take part.

This briefly is the gigantic spectacle that will bring thousands of tourists to the Pacific Northwest during the week of July 24 to 29 this year.

He Takes a Flyer in "Salt Fish Preferred"

And Learns What the Lawyers Mean by "Conscious Suffering"

By MARK V. O'NEILL

I TOOK a flyer in the market a short while ago. I call it a flyer. My family insists that it was a header, but let that go. It was really no fault of my own. It is one of the many things that I have to thank Abbot for.

He, Abbot, has been playing the market for years, on and off. Never took a loss. No, sir. He has a motto. It is, "Buy them when they're sick." I have one, too. Mine is, "Buy them and then be sick."

My flyer did not cost me much. I mean much money. It cost me a lot in another way, though. The lawyer chaps have a term that they use in their trade when they are suing for recovery of damages, in personal injury cases. The term is, "Conscious suffering." So much for loss of limb, so much for loss of employment, and twice the whole amount for conscious suffering. That was what troubled me mostly during my market manipulations. Conscious suffering. That is to say, I was suffering and I was conscious of it. It would do me no good to sue the market, though. My case would be thrown out of court, and myself along with it. Even I know that much.

Abbot's office is in the same building with mine, and almost every day we go to lunch together. We always eat in the same place. Have for years. To reach it, we have to walk through the financial district. Abbot is right at home then. He always sees a lot of fellows that he knows, running in and out of buildings and knocking down women and children in their hurry. They call out to Abbot cheerily as they run by. They say, "Hello, Poison Ivy," or "Ah there, old Nickel Nurser." They all know Abbot. The reason is, he used to work on the Exchange. He was connected with some descendants of the late Ali Baba. They ran a bucket shop, I think. They were a jolly lot, Abbot tells me.

One day as we were coming back from lunch, Abbot asked me if I was interested in the stock market. I told him no, but that I sometimes thought I would like to be. So he took me into his broker's with him. He said he stopped in once a day *just to look the board over.*

There were a lot of men in the broker's office when we went in. They were sitting in front of a big blackboard, smoking and swearing. The place fascinated me. Every few minutes a boy would jump up on a stepladder and make some chalk marks on the board. This would be followed by cheers, groans, catcalls and whistles from the men who were sitting in front. Just like a melodrama. I was disappointed because there were no suicides while we were there. I spoke to Abbot about it. He said that was all nonsense. He said the men who played the market never committed suicide *in there.*

Talking in Code

JUST then Abbot's broker came running up. They had a few curt words together.

The broker said: "Aeroplane Consolidated is off this morning."

Abbot grunted. "How much?" he asked.

"About a half," said the broker.

"Buy me a thousand," replied Abbot, dreamily.

"At the market?"

"At the market."

"G. T. C.?"

"Yes," said Abbot.

Just like that.

We went out then.

The following day we stopped in as before.

The broker spotted us immediately, and nodded briskly.

He said to Abbot, "That Aero Consolidated. It's up a point."

"Sell it," said Abbot, breathing through his nose.

"At the market?"

"At the market."

"G. T. C.?"

"No," said Abbot. "Today only."

On the way back to the office Abbot said he had made nine hundred and twelve dollars and twenty-one cents on the Aeroplane Consolidated. I asked him how he knew it was going to go up. He laughed mysteriously. As he left me, he stopped a moment, gripped my hand and looked me straight in the eye. It was very impressive.

"Buy them when they're sick," he said, and turned abruptly away.

I thought a lot about the thing that night. It seemed very simple. You went to a broker and he told you some bad news about a stock. You bought some at once. The next day you went in and sold it and made around nine hundred dollars. For some reason, I was interested.

We went to lunch as usual the next day, and I told Abbot that I had made up my mind to take a little flyer. He said he was glad to hear it. He also said that he wanted it distinctly understood that I was not to throw it up to him later, and say it was his fault.

We stopped in at the broker's and Abbot introduced me.

He said that I was thinking of taking a little flyer.

The broker smiled and cocked a knowing eye at me.

He asked me what I fancied.

I asked him what was off.

He laughed heartily and said he could see I was an old hand.

Then he looked around nervously, leaned over and whispered in my ear, "Salt Fish Preferred slumped a point and a half at the opening today."

I did not like the name, but it was no time to hesitate.

"Buy me a thousand," I said.

"At the market?"

"At the market."

"G. T. C."

"No," I replied hoarsely, "C. O. D."

When we got outside, Abbot said that I should not have said C. O. D. He asked me what possessed me to do it. When the broker used the initials G. T. C., Abbot said, they stood for Good Till Cancelled. He said that I had made a fool of myself by saying C. O. D. He seemed quite upset about it.

From that moment my conscious suffering began. I had bought Salt Fish at one. The next morning it was up an eighth, and I wanted to sell. Abbot told me to forget it. He said I would not make enough to pay my broker's commissions if I sold at an eighth. This was the first I had heard of commissions and I felt hurt. Why should the broker charge me anything for buying, or selling either, for that matter? He had everything to do it with, and it could be no extra trouble to speak of to take care of my few transactions.

At any rate, Abbot would not hear of my selling at an eighth. Positively would not hear of it. We argued back and forth about it for some time until I saw that there was no moving him, so I gave it up. He said that I was to take a full point on Salt Fish, and no less. That would be little enough. I grumbled, but finally gave in and consented to take a full point. I had bought it at one, Abbot said. When it got to two, I was to dump it. Those were his very words. I asked him if there was any doubt about it going to two and he replied that there was none whatever. It was merely a matter of endurance on my part. It would go to two sooner or later. Then I was to sell, making a cool thousand, less commissions. Until that time I was to forget that I had bought it. That was the secret of success in the market. Buy them when they were sick and then forget them.

Living by the Ticker

I FOUND it difficult. The forgetting, I mean. I scanned the papers night and morning, and I subscribed to several of the heavier type of financial publications.

At home, we ate a lot of salt fish. It could not do any harm, and if we could eat enough of it I thought it might have a tendency to inflate the market. I still think this was a very subtle move on my part, although Abbot has always sneered at it. He says it is impossible to raise the market price of any stock by merely eating the product. However, it did us no harm, and I think we all felt better for it. We felt as though we were doing our bit. I have never had much appetite for salt fish since.

Shortly after I had got into the market, it seemed to have a sort of slump. Someone was sick at Washington. I think it was the President himself, although I am not sure. It may have been Bryan or Henry Cabot Lodge.

Whoever it was, it raised the deuce with Salt Fish Preferred. Overnight it went from one and an eighth to seven-eighths. I was frantic. Two or three times I called Abbot on the phone, but he was away on some fool business trip. Had the bottom fallen out of Salt Fish? Who was this man whose sickness could drive down the price of my stock? Was this man insured, and if so, could I collect anything if he died? If his mere sickness drove my stock down a quarter, what would his death do to it? These, and a thousand questions, hammered at my brain. I shuddered. Why had he picked out this time to be sick in, just when Abbot was away and everything? In a way, it seemed unfair. Salt Fish had been doing nicely until this illness came up. Now heaven alone knew where it would stop.

I groaned all night.

Abbot was back at his office in the morning. I could hardly wait until lunch time. While we were eating, I told him about what had happened to Salt Fish. He was very calm. He said it did not amount to anything. President Wilson was sick, he said, and prices were a trifle off on the whole list. It was what they called a technical market, Abbot explained, and had no significance whatever. As for Salt Fish, it would probably go still lower. I was not to be alarmed unless it went to nothing. Then, Abbot said, we would have to look sharp.

His language positively took away my appetite. We hurried to the broker's when we had finished lunch.

When we got there the boy was just in the act of marking up some figures opposite the name of my stock. There had been a lot of trading in Salt Fish during the morning, and the quotations had run way down the board and onto the space reserved for the other stocks. The first figure that caught my eye was a half. I almost swooned, and leaned against Abbot for support. I could see that he was moved, too, although he tried not to show it. He said it looked bad. There was a bear movement on, he thought. They were probably shaking out the shorts. There was only one thing to do. That was to buy another thousand at a half. This would average me up, so Abbot said. I did not like the idea. I did not want to be averaged up. I objected feebly, but Abbot had made up his mind about it. He ignored me and beckoned to the broker.

"My friend wants to buy another thousand Salt Fish," said Abbot, grimly.

The broker was all smiles.

"At the market?" he cooed, with his pencil poised.

"No," said Abbot. "At a half."

"G. T. C.?"

"P. N. O. X." snapped Abbot, and hurried me out.

I went home early that afternoon. Somehow, I could not keep my mind on business. During dinner I was preoccupied, and by nine o'clock I had a headache. They put a mustard plaster on the back of my neck. I went to bed and dreamed that I had fallen into a pit full of fish cakes and could not get out.

The next day things were a little better. The President had passed a comfortable night and Salt Fish was up a quarter. I felt much better. I was even inclined to be gay, until I saw Abbot at noon. He said it was only a flurry. Salt Fish might drop again at any minute. We could only watch it and hope for the best. It was a tricky market. Anything might happen. Fortunately, he did not have a thing himself. Something had warned him to keep out. He didn't say what it was.

Things were like this for a month. Salt Fish would soar to three-quarters and then sink back with a moan to three-eighths. I had lost quite a bit of weight and my eyes were giving out from reading market reports. My food was not agreeing with me and I practically never slept.

Finally, I went to see my doctor. I have known him for years, and we get along famously together. He asked me what the trouble was. I told him nothing much except that I could not eat or sleep.

He laughed gaily and struck me in the stomach with his fist. I was not expecting it, so it knocked the wind out of me for a minute and made the tears come to my eyes. The doctor said that this was a bad sign. It showed that I had a weak stomach, he said. Then he told me to undress and lie on my face on the couch. He took his shoes off and walked up and down on my back. Every few minutes he would kick my ribs with his stockinged feet. It did not hurt me much, and I think he was disappointed. He told me to stand up then and say "Ah" six times. Each time I said it, he slapped my face. My reaction to this test was normal. Then he asked me to lie over a chair with my face to the floor. He put a machine like a letter press over my back and began to turn a big wheel on the top of it. He said when it got too painful, I was to call out. I stood it until he had me squeezed pretty tight and then I screamed. He left me there while he went downstairs to find a pencil. While he was down there, the telephone rang, and he talked with another doctor for about 15 minutes. Then he came back and let me out of the machine. This test did not show up so well. I had screamed at 80 and the normal screaming point was 81.

He allowed me to dress. He said that I seemed to be run down. My powers of resistance were low, he said. If I should contract pneumonia while in this condition, he thought that I would be a sick man. I murmured that I thought it quite likely. He gave me a prescription or two.

The main thing, though, was rest and relaxation. I had better go away somewhere, he thought. It made no difference where. Any place would do, as long as it was away. The seashore or the country or the mountains would be best.

Second Guess on Diagnosis

THEN I told him about the Salt Fish. He was very mad, and wanted to know why I hadn't told him that in the first place. That was the trouble, he said. I had no business fussing with the stock market, he insisted. I had not the physique for it. Who had got me into it? What was I thinking of? Now, more than ever, I would have to go away. And it would have to be some place where there were no mails or newspapers or telegrams. I was to think no more about the market for a month. In a way, he talked like Abbot. He said I was to forget all about Salt Fish Preferred. While I was gone, he said he would keep in touch with Abbot and they would try to get me out of this mess I had got myself into. He would promise nothing, but they would do their best.

I rather resented this line of talk, especially the part about Abbot. It sounded too much like appointing a lunacy commission to take care of me. It is one thing to have a doctor advising you, but I couldn't see why Abbot should be brought into the matter.

To save further argument, I said that I would go away. I made no promise as to the length of time, but I did agree to go. I would take myself to some little town in the Berkshires and put up at a hotel or inn. Then I would recuperate. When I felt strong enough, I would return to the city and watch Salt Fish again. This was my plan.

That night I telephoned to Abbot and told him what I was going to do. He said that I was crazy. It was the worst possible time to go away. The market was apt to do anything, and at any time. Salt Fish, he said, was in no condition to be left. I told him what the doctor had said, and that made quite a difference. He said for me to go ahead and have a good time. As far as that was concerned, he thought he could do better with my stock if I were away than he could with me hanging around and bothering him. He would feel more free, he said. I was to mail a letter at once, addressed to our broker, instructing him to take orders from Abbot on my stock during my absence.

I left the city that night. At the station I bought a late paper and turned nervously to the financial page. Salt Fish had closed at one and a half! This was great news. I felt much improved in health, and slept peacefully during the entire journey.

The Little Old Red Schoolhouse Up-to-date

Georgia Boys at Camp Dixie Happy Victims of Educational Experiment

By CLAIRE GILES

Getting a schooling in sunburn.

A MAN named Smith has written an unusual book. It is a forecast of the average youngster—his characteristics, capabilities, and habits—of the year 1950. He says: "Our people will have the habit of success, each in the range of his own possibilities, nor will those of superior ability be held back by those of lower caliber. Children's habits, characteristics, and emotions will be studied to avoid concealed weaknesses or festering hurts that may poison their lives. The school will have become a laboratory and workshop rather than a filing station for information. The school will go out into the world, and the world will be brought into the school, making use of any place as a classroom if it has developmental possibilities."

When one considers the strides made in education standards and methods in the past 30 years, he can well believe that such a forecast may be realized. Perhaps no other institution has undergone such a metamorphosis as the little red schoolhouse. Even to those of us who did not actually sit on its hard benches in mortal fear of the long hickory switch, laboriously and monotonously studying out loud the old blue-back speller, the picture has somehow appealed. Certain it is that the influence of the little red schoolhouse was with us all through the dreadful period of our own school days.

"Education," hung over us like a pall, a detested, intangible thing to be acquired at the threat of a "licking," and a thing as remote as possible from life. It does seem as if we were brought up in those days to believe that everything we liked was 'either indigestible or immoral.' Take camping, for instance. Whoever heard of a boys' camp in those good old days grown persons are always wishing they could live over again? To think about camping (a pursuit suitable only to robbers and pirates) was to confess to hidden and secret and villainous desires, acquired, most likely, through a surreptitious acquaintance with Jesse James and Nick Carter.

But education as a happy process—served up to the youngster on a silver platter—it is in the 1922 model.

It is not recorded who decided the best way to educate is to give the natural desires and tendencies of boys and girls a healthy, normal outlet. Most likely it was not discovered overnight. Many good things for young folks have resulted from the discovery, and not the least is the summer camp. In fact, the summer camp for boys and girls is now cataloged under "education," and if any victim of little red schoolhouse methods wants to be convinced that he has lived through a century of educational progress in 30 years, let him pay a visit to Camp Dixie in the Blue Ridge Mountains of North Georgia.

If the summer camp idea has been slow in developing in the South, it has been thorough, for camps for boys and girls are not to be undertaken lightly. To be sane and healthy, and actually safe, a camp must have behind it a very definite purpose, and the means at hand for working it out. This means that back of a successful camp movement there must be men and women who are in the broadest sense educators—who have studied boys and girls, have worked out definite ideas as to their needs, and have the courage and capacity for providing for these.

At Camp Dixie, the specific things that make the camp stand out as a successful experiment in boy culture are:

1. Before a boy is admitted to camp, his parents are required to fill out a questionnaire in regard to his habits, health, temperament, weak and strong points, and so on.

2. Camp Dixie has a highly trained supervisory personnel. Yet it could be run on one-third the personnel, and its patrons would probably be none the wiser!

3. Boys at Camp Dixie are grouped with a view to the help and inspiration they may give each other. From old friends and acquaintances they have already received all that the contact would afford, hence need new influences to bring out the best that is in them.

Canoe-tilting before an enthusiastic audience. At the right you see the class in horticulture.

4. Camp Dixie is purposely isolated from the distracting influences of villages with their hotels, boarding houses, stores, and so on.

5. It is customary in most summer camps for the management to sell to the boys all sorts of knicknacks. The story is told of one camp that made $1,300 on its store in one season, and some of the boys spent as much as $20 a week on trash. Camp Dixie has no store, and parents are urged not to provide their boys with spending money.

6. At one camp 30 boxes of food were received in one afternoon. Camp Dixie prohibits this practice. There is plenty of food provided, and one of the rules of the camp is the habit of eating regularly.

7. Many summer camps include regular textbook instruction. The directors of Camp Dixie believe that the line should be definitely drawn between a camp and a summer school. Camp Dixie makes no effort to cater to the ambitious parent or to the parents of the dullard.

8. Boys do not go to "town," as is customary in most camps. The daily program is made attractive so that the boys do not care to leave camp. They are not kept in camp. They stay in.

9. Parents are not encouraged to visit camp. It interferes with the daily normal routine and discipline of the camp.

10. The age limit is from 11 to 16 years.

Camp Dixie got a good start from the men who took hold of it. The two men who started the camp had spent years in preparation. Willis A Sutton, superintendent of the Atlanta public schools, is nationally known for his views and experimentation in educational matters. Committees of national educators have come to Atlanta to consult him. He is chairman of the Boys' Work Committee of the Young Men's Christian Association, superintendent of one of the largest Sunday schools in Atlanta, and an active worker in many civic organizations.

A. A. Jameson is nationally known as an expert in the training and handling of boys. He has had 28 years' camping experience as secretary of the Boys' Department, the Young Men's Christian Association in many cities, and is one of the pioneers in the Boy Scout movement, being at present Scout executive for Atlanta. He has made several trips abroad to study boy life. Associated with these two men are others of wide experience and a natural aptitude for working with boys.

Located on a 755-acre tract in the Tallulah Falls River and Rabun Gap country of the Blue Ridge Mountains of North Georgia, 100 miles from Atlanta, eight miles from the nearest town and a mile from a flag station, on an elevation of 2,346 feet, the camp adjoins the Nantahala government reservation of many thousands of acres, in a region of wonderful scenic beauty.

The object of the camp is to foster courage, initiative, and enterprise. The simple working hypothesis is that no normal child needs or can take three months of "rest"—that he is a dynamo of energy, and is bound to use that energy. And that, whether thrown on his own unguided resources at home or left at the mercy of himself at a summer resort without any moral direction, or the proper provision made for his physical energies, he is in danger of moral disintegration.

The camp proclaims its aims are purity, safety, development of character, good manners, spiritual ideals. High-sounding phrases, you may say, but these men have set a goal that involves teaching the boys of the land, the forests, the mountains, the streams and rivers—the geology of the country.

And the beauty of it is that the system works—the boys like it, and come back year after year for more!

Starting as an experiment, with the idea of working out some new things in the education of boys, with *group* as opposed to individual competition, Mr. Sutton and Mr. Jameson have regarded Camp Dixie as a laboratory where they have successfully worked out certain theories about the education of boys many of which Mr. Sutton has put into practice in the Technological High School, and is now extending throughout the school system of Atlanta. Seven cardinal principles are:

First, physically robust; second, mentally strong; third, politically sound; fourth, domestically true; fifth, vocationally correct; sixth, morally brave; seventh, spiritually deep. Great importance is attached to the point of *direct contact* between each boy and his leader, teacher and student being together the entire 24 hours. Every boy is measured and weighed and tab kept on his physical condition. His mental and social habits are studied individually, and his vocational tendencies are given every opportunity to expand.

The campers are divided into groups of seven, each group being assigned to an older camper who is a leader. This leader, a man 20 to 25 years old, lives in a tentalow with his seven charges. There are at Camp Dixie 15 such groups.

Truly there is not a more ideal setting than the Blue Ridge Mountains, where, accessible to town and village, the boy is abiding in that enchanted solitude where "Those that live much in the open catch the mighty pulse-beat of God."

The City Editor—the Man of Many Tasks

But His Noblest Deed for the Public Is Repelling Propaganda

By One of Them

WHEN the city editor of a small-town newspaper gets to his office at 7 a. m., he throws off his coat, rolls up his sleeves, fills his pipe with his favorite brand of so-called tobacco, lights it, pulls a new pencil from a drawer, sharpens it and sits down.

Suddenly the telephone bell rings and he picks up the receiver. The voice of a woman on the other end of the wire indignantly wants to know why the item regarding the ice cream and strawberry social to be given by the Ladies' Hope Society of the Presbyterian church wasn't in the paper the night before. It was such an important item and so many friends of the church were looking for it. "Cancel my subscription."

"You'll find the item buried on page one, fourth column near the bottom of the page," replies the city editor and joshes the woman for overlooking it.

His day's work has begun. He's in his element. He's happy.

Some one, probably about the time when the earth was emerging from chaos to order, remarked that variety is the spice of life. He must have had in mind the city editor of the small-town daily newspaper. What variety is, he gets. No two 10-minute periods of a long working day are the same.

He's the buffer between the public and the publisher. He gets blamed for all errors—typographical, grammatical, fact; and if there's a suit for libel, he's the cause of it. He's got to know his town and what's more, know the people in it. He's got to know their characteristics, their likes and dislikes. He's got to know what to print and how much of it, and what not to print, and sometimes it's more important to know what not to print than what to print.

In the plant, he's panned by the circulation department, chided by the advertising department, lambasted by the composing room and cursed by the pressman. Even the newsboys take a kick at him. But they all love him and he loves them all. And his reporters, well, they'll fight for him.

A certain judge in a certain county was called to another county to try a case. On his return, a reporter, a new one on the staff, asked for the facts. A man had been hit by a train and a jury had returned a verdict for damages.

"What were his injuries?" inquired the reporter.

The judge was a jovial fellow, kindly disposed to all.

"Well," he replied, "the man's left arm was broken, his back wrenched, one ear partly cut off, his face lacerated, his left foot mashed, and his right leg cut off at the knee, but outside of that he was all right."

The reporter quoted the judge verbatim and was the city editor to blame because it appeared in the paper? Spend a day with him and judge for yourself.

In the first place he has from three to five reporters to whom he must give assignments for stories each day. This in addition to the routine of police, court and other news sources.

All in a Day's Work

WHEN these stories are put on his desk, he must read them for errors, errors of all kinds, including names. He must then write headlines suitable for each. And in these days a headline is supposed to sell the story.

This, in itself, seems enough for one man, but for the city editor of the small-town daily, it is a small task. He must answer the telephone and write items of news himself. He must act as copy boy and, on occasion, jump in to help out the composing room and "make up" a form, usually page one.

That isn't all.

His biggest job and one requiring the most tact is in dealing with those who want free advertising—propaganda it would be called in the larger cities, but in the smaller towns it is classed as news and in many places it makes up from one-third to one-half of all local matter carried in the columns.

The city editor is proud of his town and he boosts the town and every worthy organization in it and everything the worthy organization attempts to do.

For instance, the Old Order of Urchins decides that its hall needs repapering and that possibly a new carpet would improve its appearance. A benefit is decided upon. The city editor is called upon to give free advertising matter, not only the space in the paper, but in nine cases out of ten he has to write it. The Order will spend $2.78 for paid advertising and in return will receive $50 worth of free advertising, classed as news.

The senior class at the high school decides to present its annual play. Formal announcement is made and the city editor writes reams and reams about it.

Three girls in a small town conducted classes in dancing, reading, and so on. They decided to give a pageant. It was a grand success and, as the reviewer said, "a good time was had by all." The girls paid about $7 for advertising and received several columns of free publicity.

Every city has its booster organizations and the small town is no exception. Plans are advanced for this and that improvement; nearly all have more or less merit and nearly all would add to the beauty or dignity of the town. Civic centers were the rage a few years ago, but the craze, like jazz, has spent its force. They would have been a wonderful improvement for nearly every city.

But, and here's the rub, they cost a lot of money. It's easy to plan what should be done, but it's not so easy to get the money to do it.

Then also there are organizations in various parts of each town to boost a certain section. Parks, playgrounds, schools, better streets, all are wanted.

And every one of these projects is given unlimited space in the local newspaper. And they should be, for if all, or even one-tenth, of the plans were brought to fruition, it would be a big thing for the small town.

And the small-town folk are proud of their town and they like to read of these plans. They like to believe that some day their town will be a big town. They're boosters, one and all, and the city editor is their mouthpiece.

And he's a booster himself, because he believes in his town and its future and because he knows his circulation. He treats local propaganda as news because it is news in his town. He goes on the theory that an ice-cream social in the Presbyterian church is a good thing for the church. Its members are known all over the city. They live in all the wards. Therefore, if he doesn't boost their affairs, they won't boost his paper.

In the pageant given by the three girls, there may have been 100 other girls whose names could be used. These girls like to see their names in his paper. And he makes friends by putting them there—as long as they are spelled correctly.

Courtesy and an even temper in any one are admirable; to a successful city editor they are indispensable. But there are occasions when he loses his temper, and one of these is when an alleged friend will come in during his busiest time and insist on unloading a lot of gossip for an hour or more.

Six months ago a man entered the office of a city editor of a small-town newspaper and handed him a box of good cigars.

"What's the idea?" asked the man of many tasks.

"Oh, just a little appreciation of the help you gave us on our musicale," replied the man.

It is not recorded that the city editor ever revived. He seldom gets any thanks for his free publicity. He doesn't expect them.

That is about all the city editor of a daily in a small town has to do except—and this exception, if h is new to the task, proves his greatest burden.

The editor knows without going through it, that in all that mail there may be one or two letters worth reading; others represent efforts to work him and the paper he represents for free advertising or pleading for a cause in which the sender is interested but very few others.

Some one recently suggested that a "drive against drives" would meet with popular approval but *a society for the suppression of propaganda would meet with the unanimous support of every editor in the country.*

In America there seems to be a society for everything and another society to counteract everything. An organization for a high protective tariff will attempt to broadcast to the world, through the editor, that unless a wall is built about certain industries, they are doomed for the scrap heap, thousands of men will be thrown out of work and millions of capital will be sunk without a trace.

The editor, after being bombarded with these appeals for two or three weeks, will about be convinced that perhaps these industries should get protection and that something should be done to support them. He has almost made up his mind to write something about it when along come letters from another organization that these industries are overcapitalized, and their dividends huge.

To enumerate the propaganda which reaches the desk of the average editor would be an endless task. The public little realizes the tremendous lot of bunk that is carried in the mails. Very little of it gets into the columns of the papers. Some will, of course, for even the most hardened propaganda wrecker will sometimes let an item pass.

Recently, a letter came to the desk of a city editor in a peculiarly tinted envelope, plain. The editor opened it and started to read a very clever story. It carried on for two or three pages and the editor was congratulating himself on getting an unusually good feature. Then in the last paragraph and ingeniously phrased was a boost for a nationally advertised product. That editor watches for that tinted envelope and it's never opened.

Only recently there were "weeks" of observance for quite a few things. For instance, there was "smile" week and "be kind to animals" week. A few years ago these would have been given some publicity. But not this year. Hundreds of papers didn't even carry an item about them, although thousands and thousands of letters were sent out urging their observance. The editors know their readers have been "fed up" on that kind of stuff and won't fall for it. So, why print it?

Reads Through Envelope

IF AN editor attempted to read carefully all of the propaganda which came to his desk, he would do nothing else, the day would have to be lengthened and he'd have to forego eating and sleeping.

He can tell, almost by looking at the envelope, whether the letter contains an appeal for the famished of China, the starving of Poland, or describing the conditions in Armenia. And his press association carries all that his readers want to know about those conditions. His printing of additional information would not help to alleviate the suffering. If it would he'd print it and be glad of the opportunity.

An editor recently kept a record of letters of purely propaganda material coming to his desk. A very careful sifting left 147 pieces of mail in which the senders sought free advertising for some cause in which they were interested or some condition which they thought should be given publicity. And this was exclusive of that legitimate "free advertising" which is a concrete help to the newspaper and of interest to the readers.

The stamps, envelopes and printing of this propaganda easily cost $5.

And there are more than 2,600 daily newspapers in America, and nearly 16,000 weekly, and biweekly papers. Figure the cost.

Not one per cent of this propaganda reaches the public; probably less than five per cent gets even cursory examination by the editors, especially in the small towns.

He Takes a Flyer in "Salt Fish Preferred"

Concluded from page 10

I found a nice little hotel and settled myself down for a rest and complete relaxation. Everything was comfortable. There was a bath and a big, soft bed, with a fine view of the mountains from the window. I felt that I was really going to enjoy myself and recover from the doctor's examination. Perhaps I would stay the full month out, after all.

About nine thirty the next morning, while I was shaving, the telephone in my room began to ring like mad. I answered it, and it was Abbot, calling me on the long distance. His voice was very faint, and he spoke hurriedly, like a man under a fearful emotional strain.

He said I must return as soon as possible. I was to wait for nothing, not even breakfast. He had looked up the trains and he said there was one at ten fifteen that I ought to be able to make if I looked alive. I told him that I was shaving. He said never mind, to come just as I was. Then I tried to find out what the trouble was. It seemed it was Salt Fish. Abbot was phoning from the brokers. The market had not opened but he, Abbot, had been tipped off that there was to be a raid on Salt Fish at the opening.

I washed my face, dressed, paid my bill and left the hotel in a taxi. Just as the train was pulling out, I threw my grips onto the rear platform and dragged myself on after them. Some boys standing around the station thought I was making a motion picture, and they broke into a cheer. I had not had time to lace my shoes, and one of them fell off as I jumped for the train. Only one side of my face was shaved, and my ears were full of lather. I had some slippers in my grip, so I put one of them on. Then I wiped off the lather as well as I could with my handkerchief, and went into the rear coach and sat down.

It was a miserable trip. I thought the train would never get in.

The raid was on in full force when I got there. Abbot was waiting for me. He was pacing up and down, gnawing a dead cigar, just like a man in a problem play. For some reason he seemed very mad with me. He said I had got myself into a pretty mess.

They were hammering Salt Fish hard, he told me. They had started at the opening, and they had beat it down to three-eighths when I got there. The trading in it was brisk, and everyone in the place was watching it.

Abbot and I stood in front of the board. He was very taciturn. Every few minutes he would light his cigar, and absently pass me the burned match. I could not get a word out of him. The strain was awful.

Salt Fish acted like something insane. It would rise to one-half, hover there a moment and quiver a few times, and then dip gracefully to three-eighths again.

Our broker was nowhere to be seen. Once I saw him peeking at us around the water cooler, but the minute he caught my eye he dropped to his hands and knees, crawled into his office and shut the door.

About twelve-thirty, though, Salt Fish commenced to perk up. It staggered to five-eighths and held there, amid shrill cries of encouragement from Abbot and myself. Shortly it was marked up at three-quarters, and I broke down and had a good cry. I felt better then. Abbot was standing it like a veteran, and he patted my shoulder as I stood there weeping.

I rushed for the broker's office, shedded my slipper as I ran. He thought I had come to kill him, and he began to pray.

I grabbed him by the arm and told him to collect himself. Then I ordered him to sell two thousand Salt Fish at three-quarters. I told him to hurry before it was too late.

He got the sale through at three-quarters. It was close work, but he did it. He had scarcely sold my stock, when Salt Fish bounded to one and a half. I did not care, though. I had all I wanted. Of the market, I mean. I had quit even on my two thousand shares with the exception of the broker's commission, and I was happy. I wrung Abbot by the hand and hurried home. Then I shaved; changed my clothes, and had a combined breakfast and lunch that threw my family into a panic.

My health improved from that day on; and in another week I was back to normal.

I still think that the market is a good place for some people. The brokers, for instance.

For myself, I feel much better. I doubt if I will ever try it again. My physique is not adapted to conscious suffering.

First Prayer in Congress: How Times Change

Artist Who Did "Spirit of '76" Painted Scene as Continentals Bent Knees

"The First Prayer in Congress," painted by Tompkins Harrison Matteson. The numbers are used to identify the following:

1 Caesar Rodney, Del.
2 Edward Rutledge, S. C.
3 T. Cushing, Mass.
4 Ephilet Dyer, Conn.
5 Samuel Adams, Mass.
6 John Adams, Mass.
7 Patrick Henry, Va.
8 John Rutledge, S. C.
9 George Washington, Va.
10 Peyton Randolph, Va.
11 Col. N. Folsom, N. H.
12 Robt. Treat Paine, Mass.
13 George Read, Del.
14 Silas Dean, Conn.
15 Richard Smith, N. J.
16 Philip Livingston, N. Y.
17 Thomas Lynch, S. C.
18 Stephen Hopkins, R. I.
19 John Dehart, N. J.
20 William Livingston, N. J.
21 Thomas McKean, Del.
22 Roger Sherman, Conn.
23 William Paca, Md.
24 Rev. Mr. Duche, Pa.
25 Samuel Rhodes, Pa.
26 Col. William Floyd, N. Y.
27 Stephen Crane, N. J.
28 Samuel Chase, Md.
29 John Morton, Pa.
30 Thomas Mifflin, Pa.
31 Charles Thompson, Pa.
32 Richard Henry Lee, Va.
33 John Jay, N. Y.
34 Isaac Low, N. Y.
35 Benjamin Harrison, Va.
36 Samuel Ward, R. I.

PRAYING was considered a mighty serious and important function with public officials in the days of the Continental Congress.

The first session of that historical body was held in Carpenter's Hall at Philadelphia, September 5, 1774. Its membership was composed of the greatest men of that period. Many of them will be outstanding figures in history as long as there is an American Republic. Among them were such staunch citizens as George Washington, Patrick Henry, John Adams, John Jay and Richard Henry Lee.

Those famous men who were willing to give up their lives and all they possessed in an effort to win independence for this land were not ashamed to get down on their knees in open Congress and reverently listen to an earnest appeal for Divine guidance.

How times have changed!

If a half-dozen members of the present Congress were to get down on their knees during the brief and perfunctory prayer of the chaplain, it would be so unusual and create such a nation-wide sensation, that the press of the country would front-page it with lavish photographic embellishment.

If one is to judge by the wonderful success of this country during and following the sessions of the Continental Congress, it is fair to assume that the praying of that period was worth while.

There is, however, this to say: the fact that the members of the Continental Congress got down on their knees does not by any means prove their devoutness. There is reason to believe that the Continental Congress was numerically stronger on the free-thinking side than on the orthodox side. French illuminism, which later had to be severely rebuked and driven out of the hiding places it had made for itself in this country, was strongly represented in some of the leading minds of the new Republic. It is a matter of history that in the Constitutional Convention, when Benjamin Franklin (himself by no means an orthodox believer) suggested that prayer be offered for Divine guidance, he was not able to find sufficient support to carry his proposal through. Religious people like to think that Franklin saw the use and place of prayer in national deliberation, but the fate of his motion shows to what extent the ruling classes of the time were devoid of personal belief in the central practices of their religion.

The famous painting which portrays the members of the Continental Congress on their knees may preserve accurately the posture adopted by the men during the ceremony of prayer; indeed, it is quite likely that it does, because in that time the church of most gentlemen was the Church of England, now known as the Protestant Episcopal Church, and as a consequence these men would be familiar from childhood with the kneeling posture at prayer.

Of foremost significance in the picture is the fact that the Congress of that period was made up of Americans of Christian inclination, who had some sense of the sanctity of the Christian tradition and some feeling of the continuity of racial obligations. The last act that could be expected of them would have been the condemnation of any of the practices which marked the ordered life of their times. Regardless of their private beliefs, they respected public prayer. They had no qualms, as many present-day "Americans" have, in hearing this described as a Christian Nation. Certainly they would have swept out of the bounds of respectability any who used his influence to destroy an old landmark of moral meaning.

Herein the Continental Congress was more American and far more Christian than the present Congress. It is almost impossible to recall a Representative who has had nerve enough to say on the floor of the House that this is a Christian Nation. There are too many anti-Christian orders, with representatives on the floor of the House, whose antagonism would be sharply felt.

As to this question of prayer at present, the Morning Prayer has been shoved off the Order of Business.

One morning, during a sparsely attended session, the anti-Christian, racially alien members of Congress, started the ball rolling. Prayer was to be given a jolt—to be insulted, if, indeed, not abolished altogether. Prayer, up to that time, was the first item on the day's order of business. A member objected that the point of "no quorum" should not be raised with regard to the Prayer, because it was a religious exercise and not a matter of business. On the spur of the moment, Speaker Gillette, as any American would do, overruled this revolutionary point of view. According to the rule, Prayer was to remain the first business of the day, and Members were expected to attend to make a quorum.

Later, however, for what reason has never been learned, Speaker Gillette reversed his decision. He ruled Prayer out of the Order of Business. True, prayers are still being offered, but only by courtesy of the Committee on Rules. When a sufficient number of anti-Christian alien members become members of the Committee on Rules, we may expect to see Prayer ostracised completely.

Anyway, the enemies of Christian America won their first battle. It is significant that the only story carried in American newspapers about this sudden change of the status of Prayer in Congress was written by a Jewish correspondent who has been for years the close personal friend of William Howard Taft.

The people of America are indebted to an artist named Tompkins Harrison Matteson for the painting entitled, "The First Prayer in Congress." In 1840, a beautiful steel engraving was made from this painting by H. S. Sadd, which was widely circulated at that time. Matteson also painted the "Spirit of '76," known to every school boy for many generations.

The career of this artist was typically American. He was born at Peterborough, New York, in 1813, and died at Sherbourne, New York, in 1884. His father, who was a well-known local politician, named him "Tompkins" in honor of a recently successful candidate for governor.

While the father was serving as deputy sheriff, young Matteson was permitted to make daily visits to the cell of an Indian who was imprisoned on a charge of murder. This Indian was known all over that section of New York for his clever drawings and carvings.

A strong attachment sprang up between boy and Indian. In exchange for certain crude art materials that he needed, the Indian taught the lad all that he knew about colors and painting. The boy was fired with ambition and was eager to devote all his time to studying. The need of bread and butter in the family home, however, made it necessary for him to work at something that would bring immediate returns. For a time he served as chore boy in a drug store, and then became apprentice to a tailor. During a lull in the work, or whenever the boss happened to be out for a moment, the boy would be drawing something on any blank space that happened to be handy. But the art bee was strongly intrenched and he could not be happy and contented mixing pills or making pants. Soon thereafter he got together a supply of colored crayons, and with knapsack on his shoulders started blithely forth toward Albany fully believing that he would make oodles of money drawing portraits and thus be able to live on the fat of the land, and send much money home, as he went from settlement to settlement. Fate ordained otherwise. The Dutchmen he encountered were more enamored of their money than of his proposed drawings. Much needed meals and greatly desired beds were not forthcoming. He was frequently obliged to go mealless and was often obliged to sleep in canal boats and haymows in wayside barns. He finally managed to get back to his home somewhat wiser as to human nature, but still determined to become a great artist. Finally, a kindly disposed citizen of Lenox who had faith in the young man's ability lent him sufficient money to go to New York and study. Upon reaching that city, Colonel Trumbull, the noted artist, gave him a discouraging lecture, which was followed, according to his usual custom, with words of encouragement and cheer. Soon Matteson opened a studio on Broadway and met with success. In 1839, he returned to Western New York where the Rev. Dr. Hale, of Hobart College, took a fancy to his work and assisted him for several years in keeping busy with portrait work. It was upon his return to New York that he produced his celebrated "Spirit of '76." Praise was accorded him from all sources and from that time on he met with fame and prosperity.

Matteson did not suffer from "artistic temperament." He was always so popular among the people of his home county in New York that in 1855 they nominated him for the state legislature and elected him by a handsome majority.

Steamboatland—Where the Past Lives On

Early Customs and Ancient Legends Persist on the Ohio River

By HARRY E. BARNET

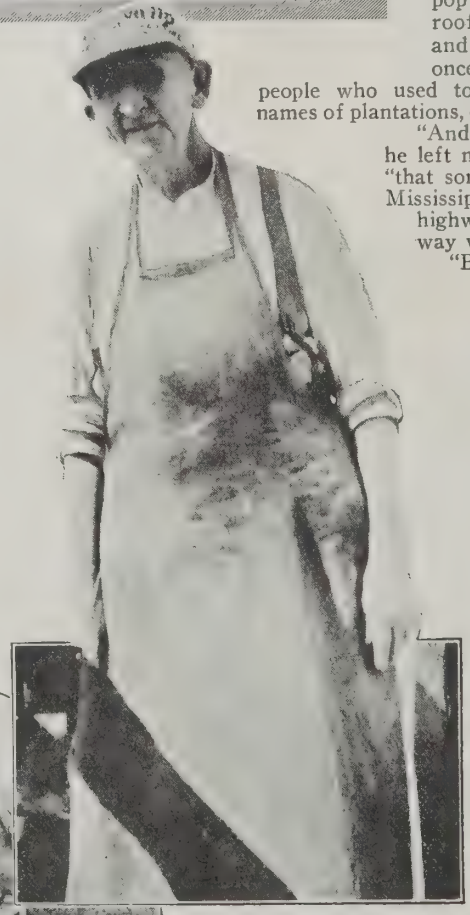
Above—Constance, Kentucky, where the last mastodon leaped the Ohio. At the right—Viewing the river by moonlight from the Cincinnati shore.

YOU take a fling in an old-fashioned world when you range the Ohio River aboard a steamboat. The remote ancestor of Ohio River steamboats was the "New Orleans," built at Pittsburgh, in 1811, by Nicholas Roosevelt. She was owned by Fulton and Livingston. This pair had a scheme to monopolize steam transportation on the continent, and they sent the boat to New Orleans to further the scheme. On the way there she floated into the New Madrid, Missouri, earthquake which upset that part of the country. While the earth shuddered, it tossed the channel of the Mississippi River until that stream darted about like a snake with its tail tightly grasped in the pincers of a gigantic crab—the river even flowed backward for a spell. The "New Orleans" pushed through the ruckus, and reached her destination in 1812. This performance of the "New Orleans" showed that "steamboats can walk over any sort of water, untroubled or turbulent," and shortly after that time steamboats were the gentility of transportation. This importance, however, died down long ago. But the resemblance of Ohio River steamboats to their remotest ancestor keeps up. The "New Orleans" pushed herself with paddles nailed to a wheel. Your craft gets around now by doing the same thing. It has the general appearance of a headless goose, with outstretched neck, going elsewhere on a broad ribbon of blue. The protruding gangplank is the outstretched neck. All steamboats are painted white.

Steamboat "landing" as it was, as it is, and will be.

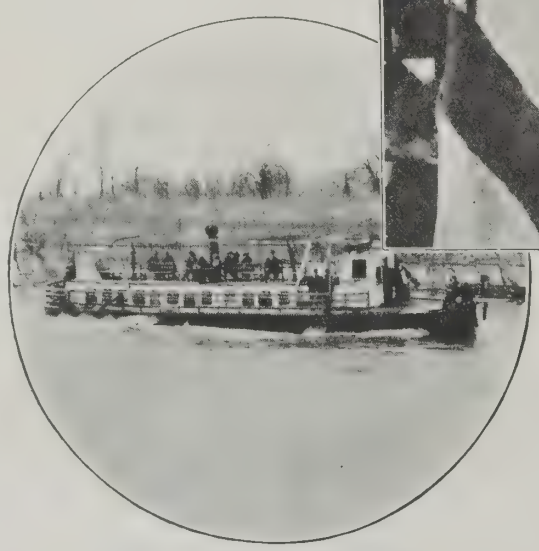
Of course, there are flecks of color about. Stateroom outside shutters are invariably green. Black letters, outlined with red—occasionally gilt letters—flaunt the name of the boat on both sides of the engine room and the pilot house. Usually, there is an old-style, glittering ensignia of the steamboat line, or an adornment, between the stacks, because something of the kind always has dangled there. Came a period when scrollwork was the craze—like the iron dogs eyeing iron rabbits across Indiana lawns a few decades back. Then steamboats were trimmed with lace effects. That was away back in history, but Ohio River steamboats still are bedecked with this finery. In short, a picture of the "New Orleans," and of a queen of the river in the late 1860's, laid alongside a picture of the boat in 1922, wouldn't show very many changes.

An Ohio River steamboat shows no move not sanctioned by long usage. You find that out before your craft swings to midstream. Customs and niceties of conduct that grew up long before Mark Twain's time are practiced still. You forget you are a passenger. You feel that you are a house guest of men who astonish you when they tell you how many years they've been "steamboatin'." Comparatively few are young men, but they do not show their age. There can be few places where men go to work younger, live longer, and stick closer to their job and its traditions than on an Ohio River steamboat. George Hamilton, his father, and his son, who lived in Gallipolis, up to a short time ago, were active pilots on different Ohio boats.



Yet, all steamboatmen have the same thing to say: "Next year I'm going to leave the river, and live on a farm the rest of my life." Never leave the river to spend the rest of their lives any place near it, "but on a farm, away back from the river."

"He'll never do it," Joe Smith says, when he hears the threat, "for steamboatin', it's a disease. You get away from it, for maybe five or six years, or maybe ten, and then you come back. And when a steamboatman goes away from the river, and comes back, the first thing he makes for is the coffee pot. It's the same 's whisky to a river man. He's got the craze for steamboat coffee."



Joe Smith is "Gravy Joe," who has been a steamboat cook since—well, long enough to establish a reputation for being the best gravy maker in any steamboat cookhouse between Pittsburgh and Cairo. A tradition has grown up among steamboatmen that when Joe makes gravy, the smell of it floating to the shores stirs up all the dogs in the neighborhood. They come to the river bank on both sides, and follow the boat for miles, loping along, and whining and howling for a taste.

"I got to stay close to my cookhouse," Joe told me one Saturday evening, "because when I'm makin' gravy it sets the women to running after me, too, all the time."

"Why," he exclaimed, "they haunt me, tryin' to git me to let them come in the cookhouse to learn how to make gravy. That's the reason I never could get married."

"Gravy Joe" at the door of his cookhouse.

Gasoline packet in the "short-trip" trade.

When you go adventuring in the romantic realm of the Ohio River, the shank of what you see, and what you hear, is what Mark Twain saw and wrote about—that shank considerably brightened in spots, but even there the cajolery of it shows through the glint. An idle remark that Ohio River steamboats are arks of romance, carrying the customs of lang syne over the flood of extreme modernism, brought a look-in on the unfolding bud of "Life on the Mississippi."

"I entertained Mark Twain on my boat when he was writing that book," Captain Samuel Pennywitt said, as we floated beneath Suspension Bridge at Cincinnati, one warm April morning.

"He was making the route, from where he lived as a boy, to New Orleans on the short-trip boats," the captain continued. "That is, he'd take a boat that didn't go very far, and that stopped at nearly every landing, and did most of its work in the daytime. Then he'd change to another boat. I carried him from Natchez to Baton Rouge. My boat was the Stella Wilde. She was carrying the mail to all the landings between the two towns.

"The wharfmaster introduced me to Mark Twain, and asked me to give him the best room I had on my boat. So I gave him my own room on the texas, because there was so much noise downstairs. I put a big table and a couple of chairs in this room, and had his meals sent up there to him."

"Mark Twain was a peculiar looking man then," Captain Pennywitt mused. "I remember his hair and his eyes. It was yellow-colored, and hung down on his shoulders. His eyes were white-blue. He carried a shorthander with him—the first shorthand writer I ever saw—but no typewriter, because we didn't know about the machines in those days.

"Well, Mark Twain didn't bother anybody on the Stella Wilde. He'd walk like a hyena in a cage up and down on the roof of the boat for a while as we went along, and then he'd run into the room, and talk to the shorthand man. Then he'd pop out of the room, and onto the roof. He didn't talk to anybody, and nobody talked to him, unless, once in a while, when he'd ask about people who used to live along the river, or the names of plantations, or one thing like that or another."

"And, Mark Twain said to me when he left my boat," the captain concluded, "that some day the Ohio River, and the Mississippi River, would be the greatest highways in the world, when some way was found to control them.

"But I think you'll find most rivermen will tell you Mark Twain did more harm to river travel than he ever did good. He made people afraid of the rivers, because he talked so much about river disasters, and didn't explain enough.

"Big river disasters happened then, because nobody knew much about the use of steam. You take the idea of breaking up the furniture, and tearing out the woodwork for fuel, and throwing smoked meats and pitchy wood into the fire to get up a big head of steam, and then putting a darky on the safety valve to keep it from popping off when boats were running a race or trying to make a new speed record. That's all picturesque enough, but it was a fool's trick. When they quit doing that, steamboat disasters seldom happened, and now they're practically done away with. And, in those days, most of the travel was by river. Boats were crowded with passengers from everywhere. They didn't have very much that was exciting to talk about, and they made the most of the horrors."

Forasmuch as the world of steamboatmen on the Ohio River is an old-fashioned one, most of their talk is of legends and traditions. Talk that isn't just chatter when you hear it, because you're attuned to it—you have a feeling of aloofness from the everyday world the minute your boat leaves the shore. And steamboatmen have an abundance of leisure to sit around and talk.

Some of these legends and traditions you hear over and over, if you travel on the Ohio. Others are not so frequently mentioned. Among the latter is a legend that's been making the rounds since civilization was sappy. It declares Lilith was Adam's first wife, though:

"Not a drop of her blood was human . . . .
But she was made like a soft, sweet woman."

Before Eve came in sight, Lilith left, because she resented Adam's show of authority in his own house. What went with her isn't settled. Some say she turned into a screech owl. Others say she was the original vampire—took the shape of a hellhag, and at night roamed the world as a bonny woman in order to beguile and destroy. Goethe set her down as a witch. And there is the standing claim that she was transformed into a showy stream.

This belief is securely fastened on the Ohio. Steamboatmen say Lilith is that stream. If you're skeptical, talk immediately shifts to the beauty of the stream as proof, and some of its tricky ways are pointed out—moving along for months, as an example, like "a soft, sweet woman," then, suddenly, and in a tantrum, rising as much as 50 feet above low watermark. But no one says much about Ohio River floods . . . .

Be that as it may, when you're afloat upon it, the river gives you the comfortable feeling of being supported by something substantial. You have confidence. There are rocks and hills on either shore—massive rocks and sugar-loaf-like hills alone, in pairs, in threes and fours, and in whole companies in palisade formation. Between these hills are lowlands—away down toward the end of the Ohio River are some plantations. The look of these rocks and hills and lowlands inclines to take some stock in the claim that Lilith is the Ohio River.

Other streams seem to have spent all of their money for the dress of notoriety, and have nothing left to go on. Apparently all has been said about them that can be said. When you travel there, even on your first trip, you're navigating old waters. On the Ohio River there is virginity of scenery. Pomeroy, Ohio, for illustration, is almost crowded into the river by the hills behind it. It has two streets parallel with the river, and the hindermost street is overhung by bluffs that create the impression of block after block of windowless skyscrapers, built side by side, with no passageways between them.

Over these towns, tiny villages, and mere landings where there is no railroad, is an air, and the customs, of days gone by. Cities haven't altogether lost that look along their river fronts. The reason is, the Ohio was the main avenue of expansion toward the West. It gave these towns their life, and when the railroads overshadowed the river, the reaction hit these localities a terrific thump. Many places are memories, like Wilmington, eight miles above Paducah. This town started out brimful of ambition. Its site is now an open field, with a few rotting logs lying around. But whether your craft stops at a city, or at the merest landing on the beach, you find character there—but with traits that vary wherever you land between Pittsburgh and Cairo, so that your anticipation always is agog. The sides of the river were not settled at the same time. They were settled by different people—people unalike in temperament and training. This is reflected in the places they occupied. Portsmouth, Ohio, and South Portsmouth, Kentucky, are contrasts.

Legends of all sorts—particularly about snakes—come down from the time when the banks of the river were jungles—forests whose tree tops were matted solid with vines that shut off sunlight. Driftwood, piled there by floods, took the place of undergrowth. These piles were colonized by snakes, the only life along the shore, except parrots on the Kentucky side. Bird life generally did not appear until white men came and cleared out the snake harbors.

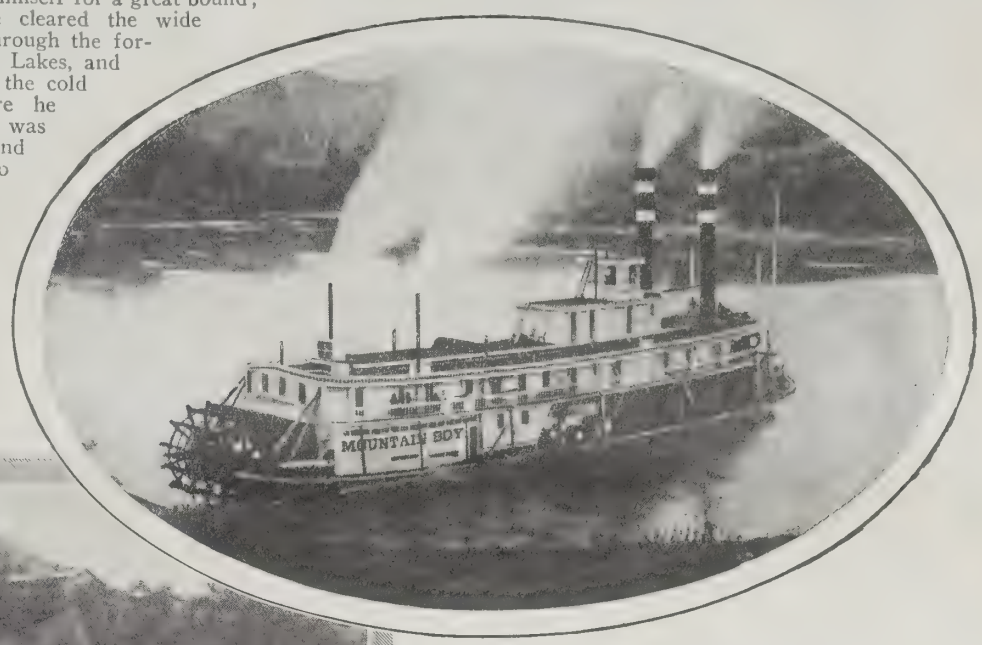
Snakes from these driftwood piles were horrors to the Indians. They had weird ceremonies to placate the reptiles. If you land at a few of the out-of-the-way places, and have time to look around on shore, you will come across an old-timer or two who likes snakes, and who follows a distorted form of the ancient Indian ritual. He does it as a sort of demonolatry. One of the most picturesque of these characters, who lived in a cave, died recently. His ritual was a mixture of stalking about his cave in a circle, gesticulating and shrieking, plus voodoo ceremonies of serpent worship, doubtless picked up from runaway slaves from the South, the performance winding up with a spectacular Eveless story of Genesis.

Constance, Kentucky, is a tiny village, whose site is said to have been the point of departure of the last mastodon from the Ohio Valley. "Many moons ago," as the story came from the Indians to the steamboatmen, "ere the white men came, and while the hunting was yet good, the elk, the buffalo and the deer, went often to the valley of springs to drink the smelling waters," the which are Big Bone Springs, located a short distance from the river, in Boone County, Kentucky, so named because of their medicinal waters, and the number of mastodon bones unearthed there in comparatively recent years.

"But many and mighty mammoths also came from afar to drink, and as the days went on they killed or frightened away the elk, the buffalo and the deer, so that the Indians could no longer hunt. An appeal was made to the Great Spirit. When he undertook to drive the mammoths away, they defied him. Then the Great Spirit was angry at the mammoths, and he came down from the sky, and from a high hill he hurled thunderbolts among the great animals within the valley.

"Mad with terror they tore through the pathways of the valley, and the deer and buffalo that remained fled into the forests, but the Great Spirit's thunderbolts were more terrible and more destructive to the mammoths than they were to the game. All save one was killed before they could rush from the valley. A great bull, father of the herd, had only his long tusks broken off by the lightning. He was old and cunning, and he fled screaming across the hills, sweeping trees out of his path as an Indian would a bit of grass, until he came to the great river. There he paused only long enough to gather himself for a great bound; then, leaping, he cleared the wide river, and tore through the forests to the Great Lakes, and across them into the cold Northeast. There he disappeared and was seen no more; and there he lives to this day, his tusks gone, but still terrible."

Well upstream, toward the mouth of the Big Kanawha River, is a sheer-sided hollow place, with a beach as smooth as a dance hall floor. It once supported "Hell's Half Acre," a bluff that was a pilot's landmark, topped with a saloon. This place was a favored gathering place for the "half-horse, half-alligator" clans, and there they fought among themselves every night in the week. A murder a day was the record.



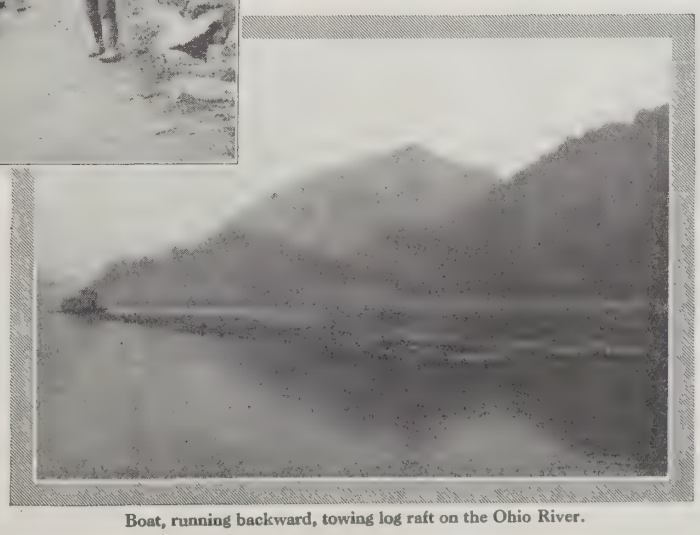
Years ago, on a clear night when there was a battle in progress, the Devil took his half-acre home with him. A hairy hand emerged from the middle of the river, old pilots say. The hand grasped a knife that was shaped like a scythe, and that was as long as three flatboats tied one behind another. "Hell's Half Acre" was carved level with the water's edge. The chunk of earth, rocks and trees, with the saloon and the brawlers in and around it, was balanced on the end of the knife and carefully lowered beneath the water.

When steamboats came, population increased 182 per cent in the Ohio Valley. Between 1810 and 1820, Indiana's population increased 500 per cent. Traditions of the river underwent a change.

Shantyboats cluttered the river. People who lived in them, as a general thing, were not overly energetic, and lived as easily as they could.

Through the windings of the Ohio there has been interwoven the romance of a legendary history of the days that are past. Its banks breathe of an age long gone, of an era less industrial, more human.

NOTE.—From time to time THE DEARBORN INDEPENDENT will publish equally interesting stories by Mr. Barnet having to do with lovable characters of the Unknown America that exists in the southern mountain region.



Ohio River steamboat, typical of its kind, built in 1869.

The Perversion of the Farm Loan System

(Concluded from page 7)

Other associations complain that it was impossible to purchase any of the recent $75,000,000 issue through the Federal Land Banks, although bond firms were advertising them extensively. Still another complaint is that individual subscriptions were limited to $2,500. It took three days, one of the union representatives points out, to dispose of the last issue at a premium of 102⅜ for which the bond houses received $750,000, or $250,000 a day. He maintains that if an effort were made to have the banks distribute their own bonds, the rural regions would take a large part of them.

Many vendors of lands would gladly accept bonds in place of cash, and mortgages could be financed locally throughout the country by the simple expedient of giving the local capitalist the bonds that the local borrower is behind. It is well known that a considerable volume of farm mortgages has always been held in the locality of the mortgaged lands. A Federal Land Bank bond is nothing but a farm mortgage cut up into standard units, and the local man who has been wont to lend the whole sum of a given mortgage, with all the details and costs that involves, would much prefer to take the farm bonds with their additional security, their tax exemption and their ready salability in small or large units. Nothing has been done to utilize this great home field of investment and keep in the rural regions the vast interest sums that will be paid on all the bonds in the course of the long amortization period. On the contrary, the whole bond distribution policy of the board is contributory to financial centralization.

The National Union of Farm Loan Associations hopes to secure the emancipation of the land banks and the associations from the domination of the Farm Loan Board by the instrumentality of a suit brought by the Brentwood, California, association, contesting the constitutionality of the law delaying permanent organization until all farm loan bonds are withdrawn from the Treasury. It takes the form of mandamus proceedings to compel the Berkeley Land Bank's organization in accordance with the original farm loan law. Should this suit fail, the union will take the fight into Congress; in fact, in response to a circular letter sent out on January 28 by the president, M. Elwood Gates, of Brentwood, members of Congress are receiving letters from associations demanding their rights and protesting against the "betrayal" of the co-operative principle.

"The National Farm Loan Association," says President Gates' letter, "is the corner stone of the whole co-operative theory. The law was based upon the principle that the borrowers in a community, knowing each other and knowing the value of each other's property, would, by co-operation, mutually guarantee the repayment of each other's loans through the Farm Loan Association's indorsement, and thus secure money more advantageously than could any one acting alone."

BRIEFLY TOLD

The famous Ferris wheel of Paris is being torn down to make way for a more profitable investment. The axle of the structure alone weighs 72,000 pounds, and is set at a distance of 164 feet from the ground. It was built in 1900, at the time of the Paris Exhibition, from plans of Ferris, an American engineer.

Luxuriant vegetation including ferns and palm-like plants once grew in Alaska which indicates that the climate there was very unlike that which prevails now. Coal beds disclose fossil remains of many tropical plants which grow only in a warm climate.

A bachelor hotel containing 750 rooms will be built on Michigan boulevard, Chicago, and opened in the spring of 1923.

A nest of six petrified eggs was discovered near Montesano, Washington, recently, when a workman blasted away part of a hillside. One egg, when broken, disclosed the color and formation of the yolk. The eggs are about the size of duck eggs.

A hydro-airplane is a motorboat and is therefore subject to a libel, according to a decision reached by a United States commissioner of Louisville, Kentucky. The Department of Commerce has ruled that flying water craft are motorboats while navigating streams and must follow marine regulations.

Filipinos have torn down and burned for fuel the house in which General Emilio Aguinaldo lived when he was captured by General Funston nearly 20 years ago. Only a few posts of the old structure are left standing, according to reports.

The most patient man is a resident of Buenos Aires. With only a file, he has worked 11 years in making a miniature locomotive of scrap iron. The locomotive can be operated under its own power by the use of compressed air. The iron was not heated in the making but was worked cold. A small coal tender and passenger coach were made at the same time and the whole thing is a little more than six feet in length and weighs 170 pounds. More than 1,300 screws and 2,000 rivets were used in the work. The train is complete to the last tiny detail and is built on the model of the equipment used on the British railroads of that country.

A new way of checking fire in mines is by means of fine rock dust placed in boxes and suspended across the roof of the tunnel. Explosion shocks cause the boxes to break away from their support and the finely divided dust falls into the passage preventing the flames from spreading.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

Strikes are not of recent origin. Tablets found in the ruins of Thebes show that 3,000 years ago a large number of workmen notified their employers they would discontinue work unless a new wage scale was arranged and back pay given them at the new rate.

The town of Navestock, England, for centuries has awarded a side of bacon, at the annual village fete, to the local married couple who have gone without a family quarrel for 12 months.

Abundant fossil flora found in rock beds in North Dakota shows that what is now a treeless plain was once covered with splendid forests of hardwoods, interspersed with conifers. Numerous and thick beds of lignite make it clear that in this region there were great swamps at one time. Fig trees and a fan palm with leaves six feet across indicate that the climate was as warm or warmer than that now prevailing on the South Atlantic slope of the United States.

During the 19 months that we were at war, 91,000 persons were killed on our highways—almost twice the number of Americans killed in battle or who died of wounds.

An imperfect copy of the first edition of Robert Burns' "Poems," 1787, containing the three poems with his autograph, "On Scaring Waterfowl in Loch Twist," "Written at the Fall of Fyers," and "Written in the Hermitage at Taymouth," sold for more than $1,500. Seven hundred dollars was paid for the autograph song, "O Wat Ye Whas in Yon Town."

The average discharge of water of the Ohio River is about 300,000 cubic feet a second, the maximum flow approximately 1,500,000 cubic feet a second or 30 times the minimum flow.

Twenty women in 11 states have announced themselves candidates for the National House of Representatives. Four women in as many different states have become candidates for the Senate.

A moving pavement under the Paris boulevards may soon be installed. If the plan goes through, a circular moving subway will pass by the Palais Royal, the Bourse, the Opera and the Place de la Republique. Passengers can get off and on at any point on its route and by means of frequent staircases reach streets above. The traveling platform will consist of three bands moving at progressive speeds to enable passengers to step from one to another without danger of falling. Ten miles an hour would be the speed of the fastest band.

Raising and holding at arm's length a full-grown person sitting in a chair proves that Brigadier General Charles Granville Bruce is a man of remarkable strength. Bruce is the leader of this year's ascent of Mount Everest.

The United States alone imports 10 times more crude opium than Germany, France and Italy together. It is estimated there are 5,000,000 drug addicts in this country today.

The finest of the African game is fast disappearing and many valuable species are threatened with extinction. Only about 30 specimens of the white rhinoceros are left and they are badly scattered in Zululand. Only 1,000 of the beautiful nyala, or native antelope, are left and the mountain zebra are reduced to but 400. The laws are far from adequate and such as exist are generally disregarded.

Three million tons of potential fuel in the form of soot, escapes into the atmosphere of London annually. This represents a direct waste of approximately $25,000,000, according to official reports.

California produces 8,600,000 boxes of navel oranges a year. This huge industry sprang from one little slip budded to a navel orange from Brazil 51 years ago. The original orange tree is still standing in the greenhouse of the Department of Agriculture in Washington, D. C.

Travel by air has now reached the same luxurious standards as travel by land. Danger from fire and engine trouble has been reduced to a minimum by new inventions. One can travel through the air at a speed of 125 miles an hour with less discomfort than is experienced on trains. Hospital airplanes with operating rooms fully equipped are a practical reality. Stabilizing appliances permit the surgeon to operate while the machine is flying through space.

MAKE THIS YOUR JOB!

THE DEARBORN INDEPENDENT is your paper. It is published not for profit, but for service. You believe in this magazine and its aims—that's why you subscribed.

Has it ever occurred to you that your friends and neighbors, your business associates, your fellow workmen would also like to receive THE DEARBORN INDEPENDENT? The more readers we have, the greater is our influence and power for good. Urge them to subscribe. The local Ford dealer will gladly forward any subscriptions you obtain, or you can send them direct.

THE DEARBORN INDEPENDENT has established a name for itself as one of the most fearless, independent and progressive papers published. It should be read by everyone who believes in the maintenance of American institutions and their advancement along sound, progressive lines.

Crime and the Failure of the American Bar

In Which Is Discussed the Menace That Crooked Lawyers Have Brought; American Bar Association Condemns Many Lawyers as Criminals

By JOHN B. WALLACE

This article is in two parts, and the second will appear in the next issue.

THE United States is today being swamped by the greatest crime wave in its history. Contempt for law by a portion of our population is only equaled by the indifference of the remainder. The average citizen peruses the daily record of assaults, robberies and murders in his newspaper to exclaim: "It is terrible. Something ought to be done about it." But he, himself, does nothing. Occasionally, in some of the southern and western states, citizens take the law into their own hands, and organizations such as the Ku Klux Klan spring up. Most of these attempts are so interwoven with religious prejudice that their effect is nullified.

Crime and criminals we have always had. There are men and women whose diseased minds cause them to prey upon society. But criminals in the past to a large extent were isolated, their crimes sporadic. Today there is an interwoven fabric of crime covering the continent. Crime has become a business. Its tentacles reach into every stratum of society. Crime has taken a leaf from the book of big business. In fact, it is now itself big business.

Crime, which itself is defined as any violation of human or divine law, can be roughly divided into crimes against property and crimes against man. These can be subdivided into crimes of guile and crimes of violence. Crimes of guile are compassed through trickery; crimes of violence by the application of force. The first almost invariably leads to the second. A brainy crook will seldom resort to violence, but for the crook of low mentality it is the only recourse. The success of master crooks inspires the lower criminals to emulation in the only manner of which they are capable.

High Finance and Crime

WHENEVER there is an era of what might be called "high-class" crime, sometimes sugar-coated by the term "high finance," by means of which crooks, whether in the guise of promoters, financiers or captains of industry, rob the public of its savings, it is followed by a wave of violent crimes.

The center of crime is, today, as it has always been, in the larger cities. In these congested centers of population, where no one knows his neighbor's business, the criminal can work to better advantage than in the country or smaller towns where all eyes are focused upon him. In the cities, criminals of all degrees have gravitated into organizations which have their ramifications extending into the very citadels of the officers whom society has chosen to defend it. It is this discovery by criminals of the value of organization together with the laxity and indifference of the general public that causes the "crime wave" of today to be of such potential menace to the nation.

From New York, Chicago, St. Louis, Boston, Seattle, New Orleans, Cleveland, Cincinnati, Detroit, San Francisco, Los Angeles, Philadelphia, Milwaukee, Kansas City and many other cities these rings of arch criminals radiate out to the surrounding country. Here we have rings of automobile thieves, bank robbers, bootleggers, white slavers, dope peddlers, burglars, bunco men, blackmailers and even murderers.

These rings, through liberal use of money and political influence, have corrupted members of the state, county and city police forces, have purchased the bar and often reached the bench itself until honest officials who really wish the law enforced find themselves helpless, their hands virtually tied. Thus the public is left defenseless, at the mercy of the enemies to society. The press, which should sound the alarm and awaken the lethargic public to its danger, usually expends its energies exploiting the results but ignoring the basic causes.

There is a remedy for this menacing state of affairs. It is an obvious remedy, and a simple one. If the members of the legal profession, if 50 per cent only of the members of the bar would forget their private interests and *devote themselves unreservedly to the public welfare,* the crime wave could be wiped out in six months and future crime reduced to a minimum.

Lawyers, Defend Yourselves

THE truth is that the bar upon which the public depends for the proper administration of justice and protection from those who flout the law is no longer either efficient or honest. Graft, mental and moral corruption, the greed for money and notoriety and the "Let George do it" spirit have brought it to a point where instead of acting as a crime deterrent it functions largely as a crime inciter.

Crime is not only defined as a violation of Divine or human laws but it is also defined as an omission of a duty commanded. It is the sworn duty of every lawyer to uphold the law. Failure to do so classes him with the criminals.

A few honest and courageous individuals in the legal ranks are battling bravely to overcome this inertia, this inefficiency, this disregarding of professional ethics and ideals, and downright dishonesty swamping their profession.

That the leaders of the bar have begun to realize this condition themselves is evidenced by the investigation now being conducted by the American Bar Association.

The report of the committee which is looking into the causes leading to the present crime wave gives five probable causes, three of which reflect directly upon the bar itself.

This committee consists of such eminent members of the profession as W. B. Swaney, of Chattanooga, Tennessee; Charles S. Whitman, former governor of New York; Judge Marcus A. Kavanaugh, of Chicago; Charles W. Farnham, of St. Paul and Wade H. Ellis, of Washington, D. C.

The five probable causes for the crime wave, which the committee discovered after taking testimony in the principal cities of the country, are as follows:

"First, that the crime wave is a natural outgrowth of the World War.

"Second, that the crime wave instead of being an outgrowth of the war is merely one of the causes that lead to the war and which is continuing in aggravated form since the war has ended.

"Third, a growing belief on the part of the masses throughout the country that the courts are only for the rich and that they deny justice to the poor with a resulting tendency on the part of the poor to take the law into their own hands.

"Fourth, that the trouble is largely WITH THE MEMBERS OF THE BAR THEMSELVES. Many men practicing law today (the committee has been told) ought to be in jail.

"Fifth, that conviction for crime in the courts is becoming increasingly difficult and that the criminal once convicted is not punished sufficiently to deter others from repeating his offense."

That the trouble may lie in all five is true, but for this article the first two causes may be dismissed. They were largely psychological. A few weak minds may have been influenced by war-induced hysteria and a sense of the injustice of the scheme of things to turn against their fellow men but it is difficult to convince a reasoning mind that the great mass of the men who went abroad to give their lives if necessary would so quickly reverse their convictions. Our excuse for going into the war was to preserve democracy and democracy does not mean anarchy and crime.

The High Cost of Justice

THE third cause given "that the courts are for the rich and deny justice to the poor" is not a new complaint. Here the trouble is not with the law itself which, in theory, places all upon the same plane, but with its practical administration.

Daily in every court is witnessed the man with money and influence escaping the penalty of his misdeeds whether on a murder charge or an arrest for speeding. Minor offenses, it is true, furnish a better example of this than graver charges where public attention is focused and the force of public opinion felt. In any case, the poor man without money to hire competent lawyers and without influential friends is handicapped. Except in cities where the office of public defender has been established he is forced to depend upon fledgling attorneys or those who, because of the small fee allowed by the court, devote not more than perfunctory attention to his case.

But it is not so much the system of determining the guilt or innocence of the accused, nor its administration, that is at fault. Despite its defects there are surprisingly few innocent persons convicted, whether rich or poor. It is conservatively estimated that for every innocent person wrongly convicted a thousand guilty ones escape. It is in the degree of the punishment wherein lies the injustice as between rich and poor.

Immediately upon conviction of a wealthy man, or one with political influence, the machinery is set in motion to obtain a pardon or a mitigation of sentence. The poor man stays in prison, forgotten by all except perhaps his immediate family. The penalty of poverty is also felt in the administration of the alternative of fine or imprisonment. The rich man pays his fine without suffering even temporary inconvenience. The poor man pays his debt to society with his body, by the sacrifice of his liberty.

The fourth reason given for the crime wave places the blame for it squarely on the shoulders of the bar itself. It should rest not only on those crooked members specified but also upon the other members whose lack of initiative and moral courage allows such conditions to exist.

Occasionally there is a lawyer who dares to speak out. Thomas Lee Woolwine is district attorney for Los Angeles County, which embraces a population of more than a million people and Mr. Woolwine is in a position to know whereof he speaks.

In a statement to THE DEARBORN INDEPENDENT, Mr. Woolwine says:

"I am convinced after many years of experience that I am justified in the assertion that fully 75 per cent of the attorneys who make it their business to defend persons charged with crime are suborners of perjury and should be in the penitentiary themselves.

"There is no single force in the United States today that so menaces the lives and property of the people of this country as these crooked criminal lawyers. The stock in trade of these vultures is to suborn perjury by the wholesale, to terrify witnesses and by every villainous trick and device to discredit, if possible, the prosecution. As if this were not enough they glory in cheap tricks to create 'atmosphere' by all kinds of false pretenses and baseless arguments and motions. They do not hesitate to corrupt and terrify witnesses and in many instances to drive them from the jurisdiction of the courts of the state. In my own experience it has often been necessary to have armed guards accompany the witnesses for the people, to protect them night and day from the machinations of these scoundrels.

Sentimentalizing Over Criminals

"ALSO among the worst enemies of the people in the orderly administration of the criminal law is the lying, unscrupulous press.

"During the progress of the prosecution of notorious cases the representatives of these evil institutions are busy molding public sentiment to the belief that assassins and murderers are being terribly oppressed and, in fact, are heroes and heroines of the most admirable type. Long, slushy, oozing sob stories by sentimental misguided females envelope these criminals in an atmosphere of false romance and maudlin pity. These stories aided by ingenious innuendo deify the murderer and blacken the memory of the murdered dead."

This attitude of the bar, aided by the yellow press, the stage and the motion pictures, as Mr. Woolwine points out, has created a false sentimentality among the general public that handicaps and almost nullifies the efforts of those public officials who are conscientiously attempting to protect society from its enemies.

A few years ago novelists and playwrights, by harping upon certain undoubted abuses of their position by public prosecutors and police officers, were greatly instrumental in forming a prejudice in the public mind against officers of the law. This prejudice has never entirely died out and recently it has been awakened and fanned into flame by clever, unscrupulous lawyers, by the yellow press and by the motion pictures. A large alien element in our population, an element that is quick to cash in on sickly sentiment that disguises the acquisition of dirty dollars, is also a contributing factor.

There has been a great deal of mystery hedged about the law. The average citizen is prone to regard it as an intricate affair, something standing aloof and apart from him. Lawyers have done much to encourage this idea as it trebles their importance and enables them to collect fees not commensurate with the value of their services.

Yet law is or should be one of the simplest things in our daily experience. Law in its general sense is nothing but a rule of conduct. A few persons living off by themselves can get along without any laws except perhaps certain oral agreements. A person living entirely apart from his kind needs no law whatever. But as the size of a community increases, rules of conduct are necessary until, in the present complex stage of our civilization with nearly one-half of our population crowded into cities, so many rules or laws are required that one-tenth of the citizens are utilized to draw up, interpret and enforce the legislation laid down for our guidance.

The Producers of Law

THE politicians who make our laws, the lawyers who interpret them, and the peace officers who enforce them are fundamentally a parasitic class as they contribute nothing in an economic sense to society. Yet they constitute a vital part of our social structure. They might be said to be inflicted upon humanity because of its sins. With the Golden Rule followed to the letter, the necessity for lawyers and peace officers would vanish and with them would go the parasite of parasites, the professional politician.

The function of the law to society is as oil and grease are to machinery. It is supposed to lubricate the wheels of our social organization so that it will run smoothly with a minimum of friction. The law should adjust minor inequalities of temper and temperament, compromise in the clash of conflicting interests, bring order out of disorder through the strict application of the principle of justice; a most important function, one of inestimable service to humanity if the bench and bar had kept the faith. That it has failed and failed lamentably is shown by the condition of society today.

Instead of greasing the machinery of society the bar seemingly has delighted in throwing sand into its gears. Instead of compromising and reconciling, it has aggravated and irritated. In unholy alliance with the professional politician it has added to the rules of social conduct until by their very multiplicity they are practically nullified.

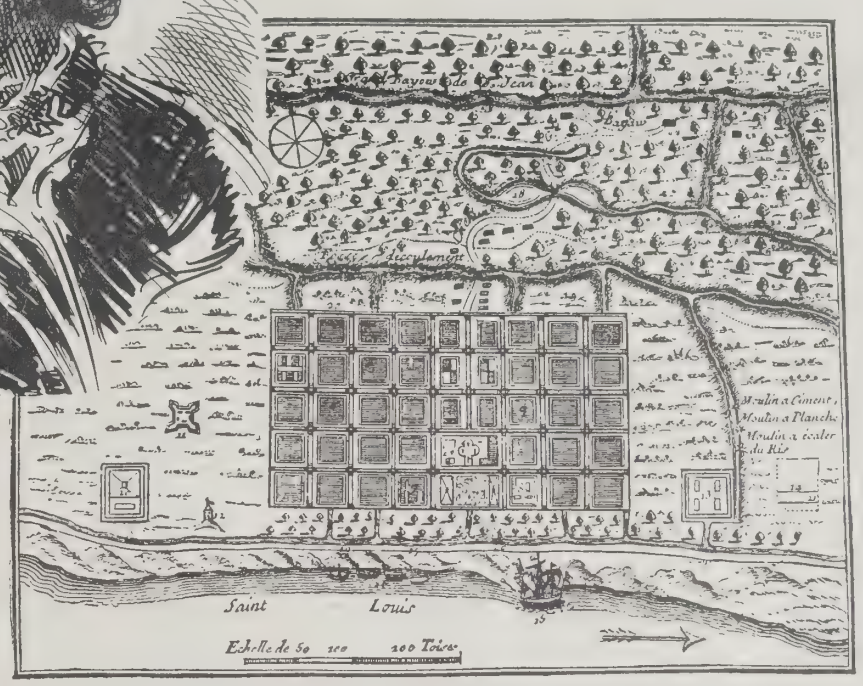
New Orleans Founded by Gallant Canadian

Son of French Innkeeper Who Emigrated Was Ever City's Champion

By D. M. LE BOURDAIS

JEAN BAPTISTE LE MOYNE, Sieur de Bienville, who was in 1718 to lay the foundations of the city of New Orleans, and who for a quarter of a century thereafter, through adversity and the relatively infrequent periods of prosperity, was to be its builder and champion, was born February 23, 1680, at Ville Marie, now Montreal, Canada.

His father, Charles Le Moyne, was the son of a Dieppe innkeeper who had emigrated to New France at the age of 15 and had rapidly won for himself a name throughout the colony, not only as an Indian fighter, but more particularly as a negotiator of treaties with them. So great had been the services of Charles Le Moyne to the colony and to the king that he had been granted an estate and the distinction of a title of nobility as the Sieur de Longueuil — which was confirmed by the English conquerors after 1763 and has been borne by his descendants to the present day.



THE SIEUR DE BIENVILLE

To Charles Le Moyne and Catherine Primot, to whom he had been married in 1654, there were born two daughters and 12 sons, to each of the latter of whom was given at birth a surname as a mark of distinction. It is perhaps safe to say that not since then has Canada produced a family more uniformly imbued with the qualities of greatness. Of the 12 sons, three met early deaths in the wars with the Iroquois or the English, but not before they had shown themselves worthy members of this heroic family. The most famous was undoubtedly Pierre, surnamed d'Iberville, the third son, who, before his death from yellow fever at Havana in the prime of his life, had fought the great enemy of France, England, victoriously from Hudson Bay to the Gulf of Mexico, thereby adding many of the most glorious pages to the history of France in the New World, and staking out for France an empire greater even than the dreams of her indolent kings had she but the will and the vision to retain it.

Jean Baptiste was the twelfth child. He was the second son to bear the surname, Bienville, the fifth son, Francoise de Bienville, having come to his death at the hands of the Iroquois. At the age of 16 the subject of this sketch first comes within the purview of history as a midshipman in the French navy, in which capacity he gained his first experience during the campaign in Newfoundland in the winter of 1696-7 when Iberville practically drove the English from the island. Late in the following autumn he was with Iberville on Hudson Bay when the latter, after the ships of his squadron had been dispersed by a fierce storm introducing an early winter, found himself with the guns of Fort Nelson before him and three British vessels, carrying a total of 114 guns and 350 men, approaching down the bay under full sail, against which he had but one ship carrying 50 guns and 150 men. It was a situation to daunt the staunchest heart, but it was the ability of the Le Moynes to rise superior to just such situations as this that had rendered their name a terror to the enemies of France, an emblem of pride to the inhabitants of New France and an increasing object of respect at the court of Versailles.

Stationing Bienville on the upper tier, Iberville took his position near the pilot where his commanding figure and mane of blond hair soon attracted the attention of the English who now had good reason to hope that at last this inveterate enemy of their race was at their mercy. But the odds only made Iberville more determined to win. Striving to keep the enemy apart and to fight each one separately, so able was his seamanship and so inspiring to his men were his courage and audacity that, in the short and sharp engagement which followed, one English ship was sunk with all hands, one was captured and the other compelled to take refuge in flight. Iberville's vessel was too badly battered to pursue. But now that he had conquered his human enemies, nature again took a hand, and a terrific storm, attended by a blizzard, set in which drove the remaining battered hulks aground on a sandbar. Iberville realized that the storm would very soon complete the destruction begun by the cannon fire of the enemy. As most of the boats had been shot away, he set all hands to work making rafts of the wreckage upon which to transport the wounded and some few effects to the shore which lay a few miles beyond. Swimming and wading, the dauntless crew succeeded in reaching land well-nigh exhausted after their twelve-hour battle with the enemy and the elements. They had no food, but had saved their arms and ammunition. Snow covered the ground to a considerable depth; and it was exceedingly cold. Without ships in which to depart, and stranded upon a hostile shore within two leagues of their enemies' stronghold, their condition had not been greatly bettered; but with characteristic audacity Iberville resolved to capture Fort Nelson, and sent a demand to the governor which was, of course, refused. Just at this juncture, however, the rest of Iberville's squadron, that had been dispersed by the first storm, appeared, and after a short resistance the fort capitulated.

Plan of New Orleans made by Le Blond de la Tour and Pauger (1718-1720).

The Treaty of Ryswick, signed even while Englishmen and Frenchmen were battling in Hudson Bay, released the energies of both France and England for the extension of their boundaries in the New World. At this time the English occupied a narrow strip along the Atlantic seaboard. The French, following the fur trade, had continued along the St. Lawrence to the Great Lakes and had passed from thence to the Mississippi which La Salle had descended to its mouth in 1684. The Spaniards held all Mexico which included much more than its present territory, and had also gained a foothold in Florida at Pensacola. But so far no one had reached the mouth of the Mississippi by ship. Iberville dreamed of annexing the vast interior of the continent to the crown of France through the control of this great waterway. For this purpose it was necessary to locate its outlet and to confirm the claim established by La Salle, who had subsequently perished on the Texas plains after a fruitless effort to locate the mouth of his river from the sea. And no time must be lost, as the English also had their eyes turned in the same direction.

On his return to France, after the victorious expedition in Hudson Bay, Iberville was successful in inducing Pontchartrain, the minister of marine, to supply him with ships for a voyage to the Gulf of Mexico.

After some difficulty, the mouth of the Mississippi was located March 2, 1699, but no suitable site for the establishment of a colony was discovered on its banks for a considerable distance inland as the low-lying country through which it ran was subject to periodical inundation, and consequently Iberville chose a bay in the gulf some 60 miles to the eastward, named after the Indians found there, Biloxi. Later on another settlement was established at Mobile, which became the capital—such as it was—of Louisiana until it was removed some years later to New Orleans.

Ruins of the home of the Le Moynes at Longueuil, Quebec, which was finished in 1690.

Iberville died in 1706, the intervening years having been spent in bringing out colonists and supplies to his infant colony, in spurring up the flagging enthusiasm of the French court for a colonial enterprise that required so much outlay without any immediate promise of return, and also in stimulating the courage of settlers subjected to frequently recurring periods of famine and ravaged at all times by the incursions of tropical epidemics. During the first two years the colony had been under the charge of the Sieur de Sauvole, but after his death the command fell upon the shoulders of Bienville, just 21 years of age. Bienville seemed to have inherited the faculty possessed by his father of establishing friendly relations with the Indians. He had great facility in acquiring their dialects and so understood their nature and characteristics that he was able to gain great ascendancy over them.

The Continental War which broke out in 1703 once more diverted the fickle attention of the French court from projects of colonization; and had it not been for the determination and resource of the Le Moynes—Bienville and Iberville, until the latter's death, and two others who followed later, Joseph, de Sierigny and Antoine, de Chateauguay — the colony would have dwindled and died. As it was, the settlements numbered but 400 persons when Louisiana was handed over in 1712, according to universal colonial policy of the times, to a rich merchant of Paris, Sieur Antoine de Crozat, to whom was given a monopoly of trade for 15 years. Apparently the impression still prevailed that the New World was a vast mine of gold, silver and pearls which could be picked up without labor. Its wealth was in the ground, however, but before it would yield a return it must be cultivated. For this agriculturists were needed, but the imagination of princely speculators flew too high ever to come down to such prosaic measures as agriculture. In 1718 the first structures were erected on the site of the present city of New Orleans, named so in honor of the regent.

During the next few years the forest was cleared, streets were marked out and public buildings erected under the guiding hand of the Chevalier le Blond de la Tour, the engineer-in-chief to the colony, and his assistant, Pauger. Settlers poured into the country. During the month of August, 1718, alone, 800 persons arrived at Mobile and New Orleans. In 1722 the seat of government was transferred to New Orleans, thus bringing nearer the realization of Bienville's dream that his city should one day become the capital city of the Mississippi Valley.

Meanwhile, Bienville had been giving the best that was in him to the interests of the colony. But as population increased the need for governmental machinery of a more complicated nature arose and Bienville was compelled to share his authority with a succession of officials sent out from France. He was not always successful in maintaining amicable relations with these imported officials. They complained that the Le Moynes constituted a sort of family compact. Undoubtedly the Canadians were aggressive and direct and averse to sharing their responsibility. That they were using their position to advance their own personal fortunes, as charged, was not proved, but on the contrary the very existence of the colony had more than once depended upon personal loans made by the Le Moynes. At any rate, the newcomers had the ear of the authorities at home and in 1724 Bienville was recalled; he was deprived of his rank and his property was confiscated.

Once more does the gentle, kindly but firm figure of Bienville emerge from the obscurity of the oblivion to which he had retired in Paris. England had gradually forced France from North America. The Treaty of Paris in 1763 ceded all the territory of France in America to England, save Louisiana, which by a secret clause of the treaty was transferred to Spain. It was not until the next year that the people of Louisiana became aware that they had been handed over like so many chattels to the despised Spaniard—who had not even fought for his prize. Consternation mingled with indignation reigned in New Orleans.

Bienville, now in his eighty-sixth year, was besought to plead on behalf of the people who had come to know him as the "father of Louisiana"; but the effort was in vain. The exigencies of European politics were more important than the wishes of a few thousand devoted subjects. Bienville died in 1768; but of his tomb there is no record.

Alien Bloc Still Busy

THE attempt of the alien bloc to break down the all too few American immigration restriction laws has not stopped. The method merely has been changed.

For years the favorite method of fighting proper immigration safeguards was a resort to tearful pleas on behalf of the "oppressed and persecuted of foreign lands." Uncle Sam, being a person of large sympathy and ready trust, was long looked upon as an easy victim for this cajolery. But a number of things have happened during the last few years which have taught the United States that its sympathy has not always been well placed, and its trust has sometimes been abused.

The passage of the three-per-cent law, restricting alien immigration, brought loud wails on behalf of the "persecuted of other lands." But for the first time in American history, it failed of its effect, and Congress this year strengthened instead of weakened the law.

Whereupon, the alien bloc promptly abandoned its sentimentalist attitude, and sought a new weapon of offense. That weapon, the existence of which is just becoming widely apparent, is a more insidiously dangerous one than the worn-out wail of former years.

To wield this weapon, the alien bloc has ready at hand New York newspapers, always pliant, and chain-newspapers and magazines which cater to group disaffections, and anti-American propaganda.

Neither tears nor reasons enter into the propaganda of these interests for opening wide again the doors of the country to hordes of alien undesirables. The tears have been found ineffectual; the reasoning does not exist. The editors and writers of these pro-alien publications instead have adopted the expedient of *assuming that the mistake of enacting immigration laws has already has been proved,* and the only thing to do now is to hurry and repeal them.

"The immigration restriction laws, which, it is conceded, have gone too far—," reads a typical expression in this latest type of propaganda.

The only person who has done the conceding in the particular example cited is the particular editor who has done the writing, and who feels permitted to set forth his momentary policy, in terms of axioms.

The theory behind this propaganda is that children, if caught early enough, may be convinced that two and two make three—provided that the statement is pounded into their memory sufficiently often, and also provided that no concrete examples are set before their eyes to controvert the statement.

Authors of this type of propaganda feel—and perhaps they are right—that those who read *their* assertions are incapable of reasoning, and so with commendable charity, they furnish the conclusion, ready-made, with no bothersome logic attached.

Ridiculous as this alien propaganda may seem, there is no denying its powerful effect. It behooves persons concerned with the continued protection of the American standards, to be on the alert.

The Worm That Turned

OUT from the sweatshops of New York's East Side have come the vast majority of the soap-box orators who have gone up and down the country during recent years. Harsh, rasping voices, speaking in broken English, have uttered the most vehement denunciations of American industry as "wage slavery," and have coupled with these denunciations veiled attacks on American Government. It was this class that swarmed into Russia with Trotsky and forcibly prevented the formation of a government modeled after our Republic.

"Down with the capitalist," was the burden of their shout.

Now comes the news of the capitalistic enterprise of the Amalgamated Clothing Workers of America in Russia. They have organized the Russian-American Industrial Corporation, capital, one million dollars, to operate nine clothing factories which represent concessions from the Soviet government.

This grant to the labor union of the big Russian concession is no surprise to persons acquainted with the close relationship of blood and sympathies between the East Side garment workers and the individuals who hold the reins of rule in Russia.

The concession costs the Soviet nothing to give. The factories, built by individual capital during the Czaristic period, were to be had for the taking. For the alien-born garment workers who invest in the corporation, there are bright prospects for financial success. They are to receive for nothing factories worth $5,000,000. Stripped of the original capital costs, the money they raise will be necessary only for operating costs.

Viewed calmly from the financial end, it would look as if the garment workers have good chances of success. There is one thing only that worries them. They are concerned over the Russian labor problem. Whether they will be able to obtain Russian labor on the same sweatshop terms as they operate in New York is not such an easily determined problem as would be imagined.

However that may be, they will have to enact a rôle in Russia contrary to the vociferously enunciated principles in this country. They will be capitalists, "wringing their profits out of the labor of other human beings." But in view of the fact that the persons forced to do the labor in Russia now are not racially akin to the New York garment workers of today, perhaps the latter will be able to bear up despite the opprobrious title of capitalists.

But There Was No Panic

ONE of the tragedies of the Federal Reserve Board's deflation activities which cannot be estimated is revealed in the current statement of one of the largest mutual life insurance companies in the United States. The message is congratulatory, and shows a degree of growth that is pleasing to those who have been able to keep up their assessments, which are moderate. The tragedy is read between the lines, in that part of the statement dealing with lapses:

> "There has been a decided reduction in the high lapse ratio of recent months due to financial depression."

Life insurance is something no man will give up willingly. It is the protection of his dependents in case of his death, and often the only saving the wage earner has been able to set aside. It is not among the well-to-do these lapses have occurred, but among those thrown out of employment by the suspension of industry; among the elders who have for years been putting aside their little surplus, only to lose all because income was reduced so much that premiums could not be spared. There is not a community in the country which has not shared this loss; not a home in the land that has not felt the burden; not a family which is not a loser, save those who live by usury.

How much of mental suffering, to say nothing of physical want, has resulted from the calamity of the past two years no one may compute. But "there was no panic," and the profits of the Federal Reserve System piled up as never before.

Taking It Out of Wages

THE rights and wrongs of the railroad situation, whatever they may be, will all be tested sooner or later by this truth: *Competent management never draws its operating capital out of the pay-envelopes of its employes.* The very cheapest way and the most stupid way to make both ends meet is to cut wages. There is something so supremely futile about it that it is no wonder the railroad managers got the government to make it appear official by having a government department approve the cut. It was as unjust to the government as it was to the men and to railroading as a service. Railroading *as a service* would never have needed to cut wages. Railroading *as a service* would have been able to raise wages and reduce freight rates. It is not *railroading* that is responsible for what has been done; banker-management and stock-jobbing and wholesale dividend-driving are responsible. The strike that should have occurred long ago was the strike of real railroad managers against using railroad properties as the roulette wheels of the stock market. Such a strike would have prevented what has occurred the last 10 years, and would have saved our railroads. As it is now, they have lost their chance. Railroads now are not good enough even for Wall Street to take a chance on. Wall Street values the "movies" at a higher rate.

For the sake of the day's business, the strike ought to be settled now. For the sake of next winter's coal for the people, the strike ought to be settled now. But in the wider problem involved the strike means nothing and will settle nothing. Stronger forces than a strike are at work to abolish the basic irritant of the entire situation.

Meyer, Successor to Warburg

AT THIS writing "feelers" are appearing throughout the American press which indicate that Eugene Meyer, Jr., may be chosen to head the Federal Reserve Board. It is privately stated in Washington that President Harding will not reappoint W. P. G. Harding.

Eugene Meyer, Jr., is a member of District XII, the ruling group of the American Jewish Committee. This means that he is a member of the highest cabinet of the Jewish nation. He received his financial training in Europe, presumably in the international offices of his people. It is therefore fitting that he should be made ruler over the Federal Reserve Board, an institution which was shaped by Paul Warburg and in which Bernard M. Baruch exercised such great influence during the war.

There are apparently no financiers of Anglo-Saxon heritage who are capable of taking this place. With the Administration being advised on "publicity" matters by Mr. Lasker, another member of the American Jewish Committee, it might just as well be advised on financial matters by Mr. Meyer. Mr. Meyer's advice has been received, whether sought or not, at the White House of late. His most recent advice was a favorable report on the Grain Growers' Association, which is Barney Baruch's pet organization just now.

The underground publicity in Mr. Meyer's behalf has been most adroit. At first he was mentioned for Secretary of the Treasury. Even men not easily alarmed raised their eyebrows at this. Now the governorship of the Federal Reserve Board is mentioned as an alternative.

We should say, offhand, that it is too close a connection between the American Jewish Committee and the Government's chief financial instrument. We should say that the descent, from Warburg, through Baruch, to Meyer, is much too direct.

Savings Depositors

SPEAKING before a meeting of Colorado bankers recently, John H. Puelicher, a vice-president of the American Bankers' Association, complained of the small number of savings accounts in the United States compared with European countries. For instance, he indicated Switzerland, where he says 550 of every 1,000 are depositors, while in this country there are but 99.

Calling attention to the increase in farm tenancy in the last decade, the speaker made the point that indications were that bankers had a problem they must reckon with. Stability depends on home ownership and home ownership depends on general savings and gradual purchase, was the burden of the argument.

There are several reasons for the apparent lack of savings deposits in this country, aside from the American mode of life, which alone would account for some difference.

The chief factor is the administration of the country's finances by the authorities whom bankers as a class support. The years of 1920-1921 deprived millions of farmers and wage earners of the opportunity of earning a living, say nothing of laying aside anything for the future.

The spirit of American thrift is to make more money than will accrue from savings deposits in banks and the people are realizing that more can be had than banks will pay. This is true not only of sound investment. The glittering promises of self-evident frauds find victims eager to get rich quick.

The figures quoted are misleading since the census returns give us only bank depositors while in this country loan association competition is so keen it is a wonder banks can secure patrons at the low interest they pay. These competitors have so perfected their methods, too, that the convenience of withdrawal is precisely the same as the banks afford.

The banks themselves discredit the savings department by selling securities carrying an income return much larger. There is no occasion for the man who can spare a part of his income to accept a mere three or four per cent from a savings bank. He can purchase good securities which return 7 to 100 per cent better returns and are sound. Even higher rates can be had for money that can be hoarded for a long term.

There is another factor in the situation which promises an early appearance in the banking field, and one which present institutions will do well to give earnest thought. Co-operative banking is bound to revolutionize the present system, and the bank which first recognizes the fact and inaugurates a plan for dividing its profits with those who furnish the working capital—the savings depositors—will have a long start ahead of their rivals.

Mr. Ford's Page

IF IT IS difficult or impossible to learn during school hours what is wrong with our educational methods (and the educators are loudest in saying that much is wrong), it may be possible to learn during vacation time. What is concealed under school routine may be revealed in vacation freedom. The benefit of school discipline, if any, ought to be apparent when opportunity comes to use it.

The first thing that school vacations impress upon us is the helpless condition in which the schools leave most boys. They have learned nothing that they are eager to practice; they have studied nothing that they are eager to test. So far as their own feeling goes, there is a gulf between the interests of the classroom and the interests of the world at large. To the eyes of the boy, the school and the world are not engaged in the same things at all. His experience has not given him any practical hand-hold on the life that swirls about him. As a consequence, the vacation period is not nearly so pleasant for the boy as older folks think it is. It throws him out of the routine that exercised authority over him; it does not throw him into anything else but idleness. He is largely left to his own devices. He tries to "play," but it is harder for a boy to "play" in this mechanical age than it ever was before. After his temporary gladness because of his release from school, vacation becomes really a problem for the boy of energy.

Sometimes he tries to work, to get a job somewhere, but there are not many jobs for boys who can stay only two months: and so we learn another thing from vacations, namely, we have no place for our boys. We have not taken them into consideration. We have rid ourselves of them by placing them in school, that is, by placing them in the atmosphere and under the control of the most unpractical element of our population; and then we have forgotten them.

Time was when there was a place for the boy: he was his father's successor and it was never too early to begin to learn. The economic conditions of fathers were such that they could have their sons with them, learning and helping and growing up into the real life of their times. From generation to generation there was a bond of work as well as domestic ties running along in all families. Farming communities were like clans. In the towns it was common to see business signs like these: "John MacDonald and Sons," and then later, "MacDonald Brothers," and still later, "MacDonald Brothers and Sons." On the doctor's signs there were often two names: "Thomas Higgins Smith, M. D. & Dr. T. H. Smith, Jr." Families clung together because they had been brought up together and learned to work together. If a man had a farm, his boy was with him there. If he had a store, there was a place for his boy. If he was contractor in a small way, there was always something for his boy to do.

This has largely passed. Men go to their work in the morning; it is not their own place where they are free to have their boys; at night they are tired, or at least have little surplus enthusiasm for a boy-raising job. And so the head of the house goes one way, and the boys of the house their other ways. Less and less do boys follow the trade of their fathers. Boys formerly boasted that when they grew up they were going to be what their fathers were. That was when boys knew something about what their fathers did. But now they don't know. In many cases fathers don't want their boys to follow them in trades or business; in many cases boys think that progress consists in substituting white collars for their fathers' shop overalls. However it may be accounted for, there is the condition: *there is little place for the boy at the really formative period of his life.*

> *"THE dangerous age" for a boy is that period when the school is through with him, having told him everything but how to get a start in life, and practical life looks at him askance. The truth is, we have left no place for the boy. We have refused to give him a hand-hold on life at a time when his development urges him to get that hand-hold. We have forced him to pursue a course which if it does not unfit him for his part, at least does not fit him for it. The result is that, to many, study becomes abhorrent in youth, and work becomes abhorrent in maturity. Instincts thwarted at both periods become obstructions all the way through. Freedom is an essential element in life; freedom with discipline is consistent; freedom with repression is not.*

The school, of course, would fit triumphantly into this period if it were more of a character-training institution. There were a lot of educational fads we did *not* learn in the old McGuffey days, and there were a lot of facts that were *not* stuffed into our heads, but there was one thing we did learn and it was this: there is such a thing as *character*. As you turn over the school readers of the day, that note is lacking. They seem afraid of it. Our education has become morally colorless. The moral element has been smothered. This fact, of course, is the last indictment against the common run of schools. If the schools only turned out boys and girls, young men and women, strongly equipped with at least a sense of the ideals of *character*, all the rest could easily be cared for.

It is a lamentable fact that what the authorities call the "criminality" of the young begins at the period we are discussing. "Criminality" is too strong a word. A profession has grown up in this country whose sole business is to fasten "criminality" on everybody. It is a profession of exceedingly dangerous tendencies. It is always dangerous to make a profession dependent on the cataloging of defects: it usually winds up with a mass of imaginary defects charged up to men. Most of the "criminality" of boys could be more accurately termed "mischief," and appended thereto should be the note —"caused by neglect."

"Satan always finds some work for idle hands to do"—that is the explanation. Modern educators would doubtless object to the form of the statement, and in doing so would throw the whole truth overboard. But the truth is there. And if the world is fortunate, it will learn how to act upon this truth before long.

We may have to revise the notion that boys must go to school and do nothing else during the first conscious 15 or 20 years of their lives. The better way would be to have education free for the individual when he wants it. Many boys don't want it at 15, but keenly desire it at 30. We talk about education making a boy appreciate life; well, it works the other way too—life makes many a boy appreciate education. It may be that those years when the parental and civil authorities are absorbed in holding the boy at school, and while he is just as greatly absorbed in trying to get away, are the very years when it will be found better to let the boy follow his bent or judgment, even though it may be mistaken, relying on the fact that there is more educational value in a boy's discovery of his own faults of judgment than there ever can be in his constant doubt of his elders' judgment.

We may have to get entirely away from the notion that education consists only in book-work. We may even have to get away from the modern manual-training idea which has so much of the artificial about it. We may have to make a place for our boys in the industrial world—not an amateur place, not a manual-play place, not a charitable place, but such a place as they are entitled to in their character as our heirs and successors. Instead of work being the badge of a boy's poverty or his lack of opportunity, it ought to be made one of the marks of his freedom and one of the instruments of his development.

Not only is education at a wrong angle, but so is industry. As boys, we don't like the school; as men, we sometimes don't like the shop. The school seems to cut us off from life as it is; and then the shop seems to cut us off from life as the school taught us to regard it. Necessity in both instances does what spontaneous desire ought to do. In both instances we have somehow lost connection with life as it is lived. To remedy this, to make work educational, and education workable, and to keep both an integral part of a unified life, is a challenge to every lover of right conditions for mankind.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

One of several fords which add charm to drives through capital parks.

The Why of Washington Parks

Capital's Beauty the Result of Century's Planning

By GEORGE HENRY HEALD, M. D.

IF A city begins to take on lines of beauty, its shacks and slums giving way to substantial, artistic, well-ordered buildings, tidy streets and trim parks, harmonizing with one another and with the surroundings, it has not "just growed" like Topsy, neither has it developed through the activities of chronic faultfinders. Every improvement appeared first in the brain of some person who, viewing sordid streets, shoddy shops and shambling shanties, and visioning the possibilities of a charming parkway or other beauty creation, was able to make valuable constructive criticism, and to inspire others with the idea of civic betterment. Civic beauty develops first in someone's mind.

The splendid architectural and landscape effects of the World's Columbian Exposition, Chicago, in 1893, conceived and executed by a body of America's greatest architects and artists, was an object lesson which stimulated civic consciousness in many American cities, and set the pace for a more artistic type of city. Previous to that exposition, civic pride—as related to beauty and harmony—was not sufficiently developed to produce the best results.

Born in a wilderness, obliged to develop its civilization right from the raw material, its rugged people too busy with problems of self-defense and securing the necessities of life to think much of luxuries, this nation developed a habit of mind which valued utility more highly than beauty. For the first century it was much like a small boy who has not learned to take pride in his appearance. To him finally comes a day when he blacks his shoes with scrupulous care, combs his hair with a nicety never manifested before, and in other ways shows a growing interest in his appearance. Such a time came to many of the American cities after the Columbian Exposition.

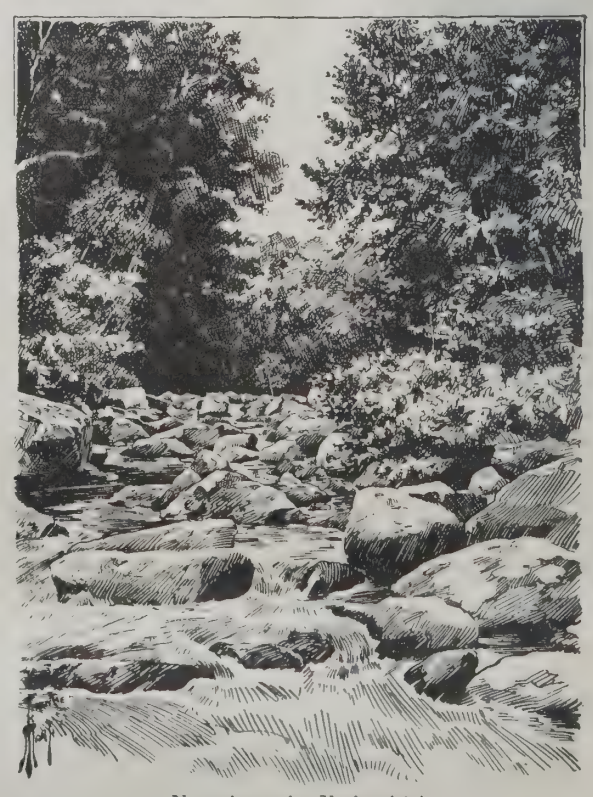
The influence of this exposition became manifest in Washington at the time of the centennial anniversary of the founding of the city, when the sentiment for a more beautiful city began to crystallize. The matter was taken up by Congress, and a Senate Park Commission was appointed, consisting of the architects, Daniel H. Burnham and Charles F. McKim; the sculptor, Augustus St. Gaudens; and the landscape architect, Frederick Law Olmstead. The first three and the father of the fourth had helped create the Great White City in Chicago. Their report, submitted to Congress in 1901 by Senator McMillan, has since been known as the McMillan Plan. These eminent men, after careful study of the development of civic art in European capitals, decided that the plan of Major Pierre L'Enfant, prepared under the direction of Washington and Jefferson, could not in its general outlines be improved. Following its essentials, the commission developed it in accord with the needs of a greater Washington; and so well did they do their work that in 20 years no important change has been made, and with one or two exceptions, now generally recognized as unfortunate and costly mistakes, civic improvements have all been made in accordance with the plan.

That the government might have a permanent advisory body, Congress in 1910 created the Commission of Fine Arts, to consist of experts serving without pay.

The McMillan Plan includes, in addition to the Mall system, with its buildings, memorials and monuments, still in a more or less undeveloped state, a complete system of outer parks and boulevards which, when completed, will have few if any rivals.

Beginning at the Capitol grounds, and extending westward to the Potomac, the Mall is a park two blocks wide and approximately two miles long, having the Capitol at the east, and the Lincoln Memorial at the west, and containing a number of government buildings, including the Smithsonian and the agricultural groups. At right angles to the Mall is a park with a north-and-south axis, a little more than one mile long, having at its north end the White House group of buildings, and to have at the southern extremity a group to commemorate the founders of the nation. The square formed by the intersection of these parks, known as the "Monument Grounds," has the Washington monument, in its simple grandeur a fit emblem of our first President. The two parks form a sort of Roman cross. The avenues joining the extremities of the cross inclose a kite-shaped tract, now occupied by business blocks, but destined some day to be acquired by the government and included in the great civic center.

Belting the city, a chain of parks with connecting boulevards is in process of development. Along the river front is the Potomac park, destined to be one of the city's important playgrounds. Then north through the center of the district, occupying the picturesque Rock Creek gorge, are the Zoological Park and the Rock Creek Park; and skirting the Anacostia River on the east are the Anacostia parks, still undeveloped. Here many acres of unsightly marsh are being reclaimed.

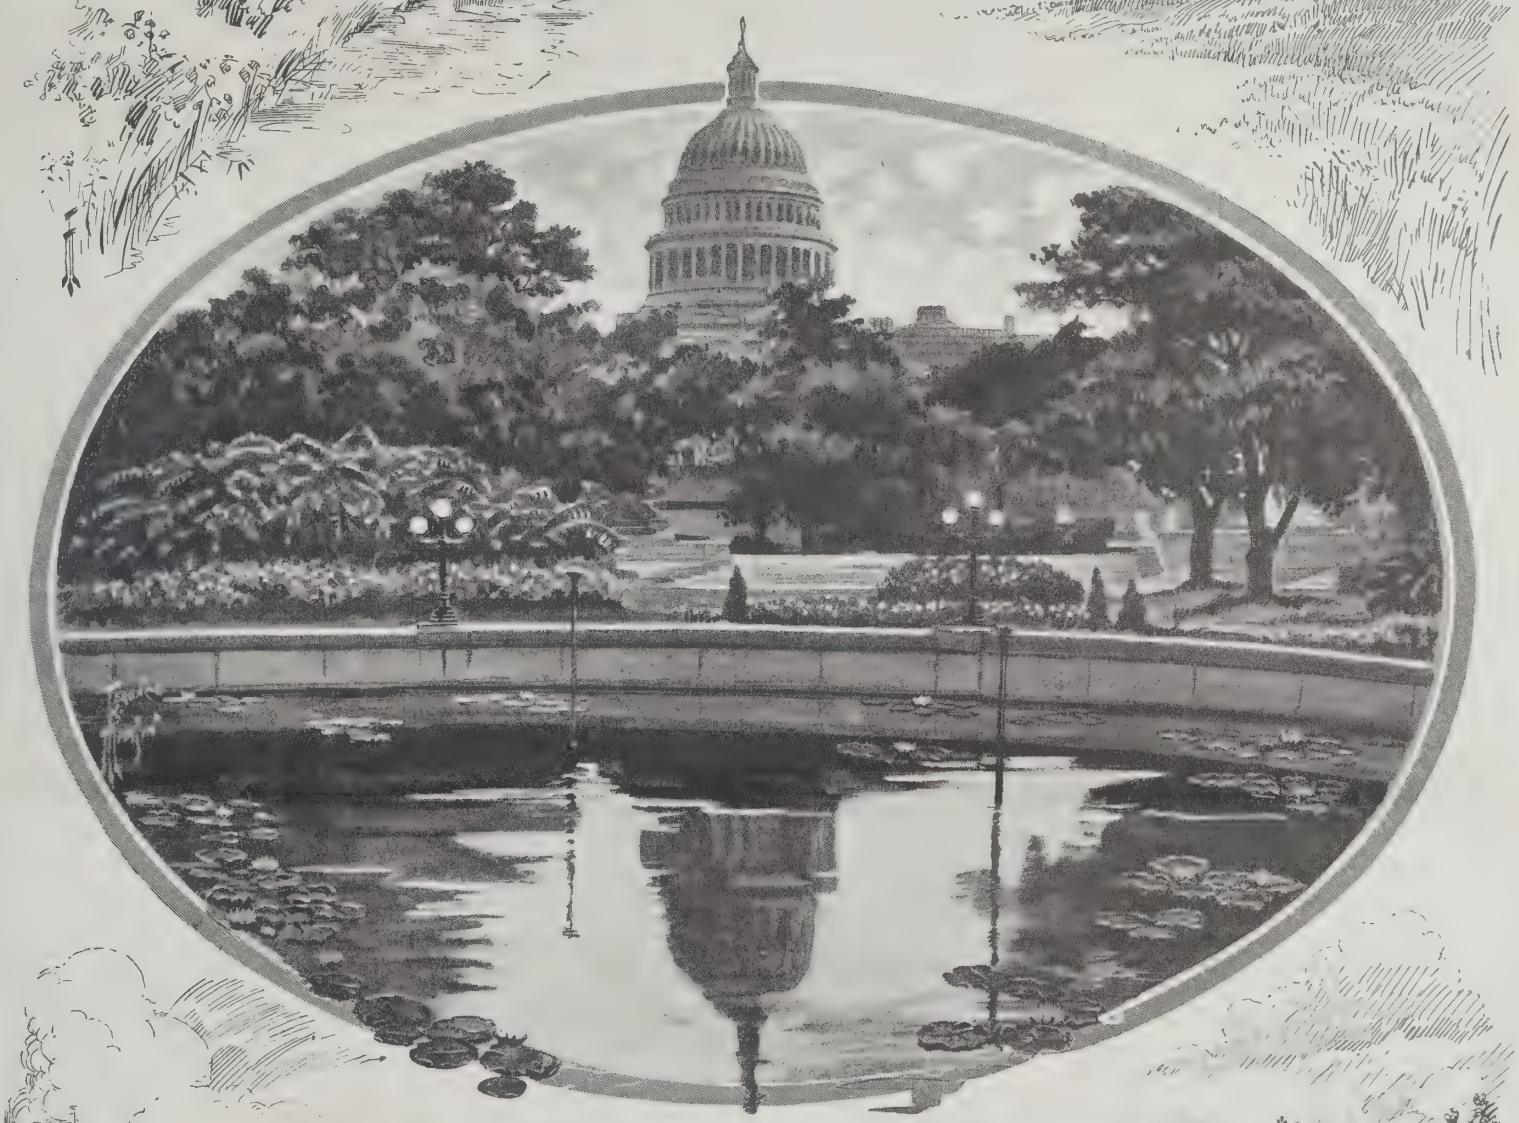


Among the Washington parks, Rock Creek Park and its continuation, the Zoological Park, easily take the precedence, both for size and for beauty and variety of scenery. As one rides down this gorge beside a stream foaming over large bowlders, it is hard to realize that just outside on either side is a busy city. It must be remembered that Rock Creek valley starts almost at the northern point of the District of Columbia and extends southward to the river. It is flanked on either side by city.

In the development the effort has been made to retain as far as possible the park's rugged beauty. Automobile roads, bridle paths, footpaths, footbridges and fords have been made with the slightest disturbance of natural conditions. Unfortunately, some failed to realize the historical and sentimental value of a number of old water mills that at one time furnished the flour for the capital. Of these mills, only one, the Pierce Mill, built in 1801, remains. It is now a refreshment house.

At the northern end of the park is another historic structure, the cabin that was once the dwelling of the poet, Joaquin Miller. The parks of the district if in one rectangular piece, a mile wide, would be six miles long; or if 300 feet wide, would be 100 miles long. The government owns the parks, the public reservations, and the sites occupied by buildings. Only those tracts reserved by the original owners are now owned by individuals. There is no parallel in any other American city.

Rock Creek Park where joy is unconfined.



Name the creek. You're right!

Amid the Beauties of Rock Creek Park in the National Capital

One of the delights to visitors is the quaint bowlder bridge shown in the upper right-hand corner. Opposite is a cabin built by Joaquin Miller. The view in the center is the Capitol from the Botanical Gardens. In the lower left-hand corner is the old Pierce Mill, while in the lower right-hand corner is a picturesque rocky bluff.

Company Assessors Bring Light Coal Taxation

"Soft Jobs" Created for Public Officials Who Decide on Mine Values; Operators Deny Charge and Impartial Investigation Should Be Had

By WILLIAM A. MCGARRY

This is the third of four articles on the anthracite situation.

MINERS who took part in the conferences with anthracite operators in New York to negotiate a new wage agreement asserted from time to time, without being able to produce statistical proof, that they are producing more coal per man now in the three great Pennsylvania hard coal fields than in prewar days. They say that is so in spite of alleged continued growth of what they call the family tree idea, under which nepotism—the employment of relatives—is said to be generally practiced.

According to the workers, costs are made to seem high in the figures put out by the operators, because of the prevalence of that practice, and others leading to the employment of more men than are actually necessary, generally in sinecures. As a rule, these time-servers are friends or relatives of superintendents and petty bosses. But it is also a widespread and undeniable practice in the coal fields to give easy jobs to public officeholders, particularly to the tax assessors.

For some years now a bitter political fight has been waged in Schuylkill County to bring about an increase of assessments on coal lands. The Schuylkill district is the largest of the three anthracite fields. Various efforts have been made to estimate the total amount of coal in its seams. Most experts are agreed that it is almost beyond computation. Yet assessments in that particular region are far below those applied in the Lehigh and Wyoming-Lackawanna districts. The reason for the low assessments becomes obvious when it is stated that the practice of hiring tax assessors is far more general in Schuylkill than in the other fields.

Statistics Puzzling

TO PROVE definitely, however, that pay rolls are padded would require an impartial investigation into mining. Operators naturally deny the charge. From time to time they have put out statements through their propaganda bureau designed to show a falling off in per capita production. But it is interesting to note that each such statement which has come to the attention of the writer is confined to a single mine, or group of mines. In such cases there is no additional information as to the conditions under which low production records are made.

Quite frequently the output of a mine will fall off because of purely local conditions. It may be one of the many "button strikes" by which the miners seek to keep the mine one hundred per cent unionized. It may be a sudden development of gas, entailing some change in the ventilation system. It may be a lack of cars. Sometimes a thick seam strikes a fault, and there is loss of time and production while new drifts are being cut to the new face of the coal seam. Or seams thin out to the point where miners working under contract are unable to earn enough to pay for their supplies. Operators seize on the final statistics of production in their effort to show that the miners are not doing as much work as in former years.

It happens, however, that in this instance, as in others, the operators have produced specific evidence which is of considerable interest, and which goes far toward proving the contention of the miners that per capita output has increased rather than diminished. Their evidence is taken as official. It is given to various statistical annuals, appearing in the *World Almanac*, among others. According to that source, the total production of anthracite coal in 1914 was 81,090,631 tons. It dropped to 79,459,876 tons in 1915 and to 78,195,083 tons in 1916, but in 1917, under the stimulus of the war demand, it climbed to the record-breaking figure of 88,939,117 tons. That record was almost equaled the succeeding year, 1918, when 88,237,575 tons was produced. In 1919 there was a slump; the same slump marked in all lines of industry after the winning of the war brought on a let-down of effort. The production fell to 78,501,931 tons, but in 1920 it got back to 80,032,175 tons.

Fewer Men, More Coal

NOW the value of all those figures lies in their relation to another set, the records of the number employed in anthracite mining. According to the *World Almanac*, the number varies. It was 180,000 in 1914, but by 1917 it had dwindled to 154,000. The *Almanac* does not give the number for each year. But the writer is in possession of a circular, dated Philadelphia, May 29, 1918, bearing the letterhead of the United States Fuel Administration, Anthracite Committee. Members of that committee, whose names appear in a corner of the circular, were Joseph B. Dickson, S. D. Warriner and W. J. Richards. The circular was addressed to the National Coal Association. After an introduction pointing out that the welfare of the American people and the nation's war requirements were involved in the distribution of anthracite, the circular continues:

"First, certain basic conditions must be correctly understood. They stand as stern facts. We are in war times. In consequence, anthracite and fuel of all kinds are in such demand as never before. There are new demands of imperative kind for anthracite. At the same time the war, directly through the army and in less direct but even larger ways, has drawn down the anthracite mine workers' army from 177,000 to now about 145,000 in number. There is going on a further reduction in the force which, already down to a point where it restricts the production of coal, is most threatening."

That was in 1918, in which year the miners made the second largest production record in anthracite history. At that time the shrinkage of labor in and about the mines was still going on. Statistics for the total number of men employed during 1919 are not available, but it is quite possible that with the lure of high wages, still in existence well into 1920, in some industries the drift away from the mines continued. Figures are not available for the number of men employed in 1920. But there are official estimates of the present number. Both operators and miners agree that the total is approximately 155,000. Samuel D. Warriner made that estimate last February. Yet with 25,000 fewer men than in 1914, the anthracite miners produced last year a total of 80,607,359.

Improved machinery had something to do with that increase of per capita production. Also, since 1914 the number of washeries has shown a marked increase, it is said. A washery is that branch of the industry that salvages coal thrown into the culm banks, in the early days of anthracite mining, as of no value. Washeries came into being with the introduction of pea coal as the "poor man's coal," as it was ten years before the operators got enough of a market to increase the price. Coal experts say that washery coal which has been exposed to the action of the elements for many years has less heating value than new coal. But the great evil of the washery is the extent to which it has led to the sale of slate and other non-combustible materials. Stories are told in the anthracite regions of washeries being established on dumps made within comparatively recent years, since the advent of modern machinery, for sorting out all the coal. Such dumps are considered so much waste material. But many of them are being washed to produce a small percentage of coal and a large percentage of dirt, for all of which the public pays. It would be wrong to say that the whole industry countenances such practices, but it cannot be denied that they exist.

The Casualties of Mining

AT THE wage conferences in New York both sides have presented masses of statistics. Operators produce figures from the company stores to show reductions in the cost of living. Miners have figures to show that there has been no reduction in some of the most populous mining districts. It is a fact that in March, when the rest of the country was suffering from a general business depression, conditions were almost booming in Scranton and Wilkes-Barre. By the same token prices there were as high as they had been in Philadelphia and New York back in 1920, for many commodities. But altogether apart from the question of those figures, the miners demanded an increase in wages on the ground that it is necessary to enable them to maintain an American standard of living.

One of the items that plays a tremendous part in the maintenance of such a standard is that of safety. Despite everything that has been done to protect the lives of workers—and much remains to be done—the hazards are still great. The miner is considered an extra hazard by the insurance companies, for good and sufficient reasons. Perhaps the best illustration of that reason is the evidence of the State Compensation Board of Pennsylvania. The Department of Labor and Industry has a complete system of accident reporting, but when its figures are used the operators say that every little scratch is listed, and that the figures have no value. That argument cannot be raised against the figures of the Compensation Board, which includes only the cases in which a man was killed, or so badly maimed as to be awarded compensation.

Those records show that every day the hard coal mines are operated, two men lose their lives. In the years from 1916 to 1921, inclusive, 3,785 miners were killed or died of injuries sustained at their work. In the same period mine workers lost 685 eyes, 58 arms, 154 hands, 89 legs, and 125 feet. The figures do not include cases still in controversy. They are only the cases for which payment has been or is being made by the operators. In view of those figures, the miner contends that he has a right to a saving wage, rather than a mere living wage. His argument is that since the risk is so great he should be paid enough to enable him to provide against the day when he may be brought home minus his sight, his arms, or his legs, or even killed. No one asserts that the compensation allowed by law is high enough really to compensate the widow and children or the maimed man for the loss of his productive capacity.

Yet with coal selling at approximately $8 a ton at the mines, operators demanded that the miner share virtually the whole brunt of the burden of reducing the price to the ultimate consumer. The miners want a 20 per cent increase for contract miners, and $1 a day for day men. Operators ask a 21 per cent decrease on the average, based on 18 per cent reduction of contract rates and reduction of the day scale from $4.20 to $3.00 a day. According to Mr. Warriner, about 100,000 men are listed as day men. The great majority of that number does not work underground. They are employed in the works above the surface. Contract miners, however, go down to the seams and take their own chances, some in mines 3,000 feet below the surface.

It is estimated that about 35,000 of the miners work under contract; in other words, by piece work. Perhaps 20,000 are "company miners" and are paid at the day rate. Some operators say they get $5.20 a day, but when he was talking of the so-called high wages, Mr. Warriner, spokesman for the operators, made no such claim. In the Lehigh and Wyoming-Lackawanna districts seams lie flat, and contract miners are paid by the carload of coal. In the Schuylkill district most of the seams pitch, and in most cases the piece rate pay is calculated on the running yard of coal dug.

Do Not Have Steady Work

UNQUESTIONABLY, the contract miner often earns high wages. Operators are fond of producing statistics of a single man or a group, men who have struck a thick seam of coal easy to mine, whose earnings run into several thousands of dollars every year. Naturally, the operators say nothing about the other extremes; the men up against difficulties that reduce their earnings to $1 a day and less. Miners say that for every case of a contract miner earning high wages they can produce another contract miner trying to get along on starvation earnings. Some years ago the Anthracite Board of Conciliation was established to make readjustments in such cases. Mine union officials say there are 200 cases now pending before that board of men not earning enough to pay their living expenses, because of changes in the seams or other conditions not existing when their piece rates were established. There are records on file of miners who worked two weeks and then owed money to the operator for supplies. What coal they had been able to dig was not enough to pay for the powder and tools used to cut it.

It is a matter of common knowledge that the miner does not have steady work. The average number of working days for the anthracite miner is given as from 230 to 300, but the latter figure is rarely achieved. Accepting 265 days as the average, the operators' new wage rate would yield annual earnings of $821.50 to the day man, or about $15.80 a week on which to support a family, pay extra hazard rates for insurance and attempt to save for a rainy day. Contrast that with coal retailing at $16 a ton and higher, and earnings enabling one large producing company to pay a dividend to its railroad owner of 185 per cent.

From what has been said heretofore it will be gathered that the powers controlling the output and distribution of anthracite never overlook anything that will cement and strengthen that control. Under normal conditions it would be useless to hope for a reduction in prices. But when the public strikes, as it did last winter, when coal piles up and fails to sell despite all sorts of propaganda about the menace of a possible shortage, there is a chance that something may be done. The operators themselves have pointed the way by their admission that substitutes for anthracite are coming into general use.

Soft Coal Overdeveloped

SUCH substitutes, it happens, are not many. There is always the danger in such action that the price of the substitute will be raised with the demand. But in the case of anthracite that does not apply, for the reason that the best and cheapest substitute is soft coal. It has many disadvantages for burning in furnaces built to use hard coal. But after all, hard coal is a luxury. Soft coal of some varieties will do just as well, with some grate construction changes. The capacity of the soft coal fields is so great that if all the anthracite mines were to go out of business the soft coal miners could take up the demand without opening any new mines. All authorities agree that the soft coal fields are over-developed, are far ahead of the country's capacity.

Any concerted movement in that direction will continue the process that the operators in hard coal experienced for the first time last winter. It will not be necessary to destroy their market utterly, even if that were possible. A drop of 10,000,000 tons in the demand would soon force down the prices to a level within the reach of the average householder. It might also have the effect of restoring some of the original prepared sizes, nearly all of which have suffered a shrinkage in size in recent years.

How the operators have turned to profit millions of tons of coal that formerly went to waste will be narrated in the next article. It will contain also a description of the almost immeasurable wealth of the anthracite fields as shown by "the richest township in the world" where the average citizen pays almost nothing in taxes.

Promising Jockey Ruined to Make a Senator

And Now Charles Curtis of Kansas Finds Weight No Handicap

By E. B. CHAPMAN

A SKILLED rider of running horses had turned 16. He had been riding since he was nine. In those seven years he had won many races. He expected to win many more. His employer owned two of the fastest horses of the time. The lad was paid $50 a month and 10 per cent of the winnings. It was a lot of money for those days. And the jockey, intimately acquainted with the distasteful side of poverty, already was saving some of his pay, which helped make him an unusual jockey.

His parents were dead. His mother had died when he was a baby and he still was a small boy when death relieved his father of a disease, dating from his service as a captain in the Civil War. The youngster then had gone to live with his grandparents.

As time for the racing season of 1876 approached, the jockey noted his grandfather studying him silently, several times. He didn't understand that, but gave the subject a little thought. A few days later the grandfather explained his actions.

"Charlie, you are getting big and fat," the grandparent said. "You can't ride many years longer. What are you going to do?"

The jockey didn't know just what he was going to do. It never had occurred to him he couldn't always ride.

"You've saved a little money," the grandfather suggested. "Why not go to school?"

The jockey thought it over. A day or two later he visited his employer. It was explained the boy wished to go to school.

"But I'm under contract to ride," he said. "I'd like to have you let me off. If you don't let me off, I'll ride, just as I agreed."

But the employer was more than that.

"If you'll go to school I'll do more than let you off," he said. "Here's $50. Use it to help in getting your education."

So a jockey entered high school. At Christmas another $50 came from the employer. In the meantime, an ancient cab had been found in a livery stable. The jockey made all the trains late in the day and until midnight. He went to school mornings and early afternoons. He studied between trips and as he had time, at school and at home. The cab receipts were divided with the livery man. The jockey's share provided enough to keep him in school.

A few weeks ago, after the death of Senator Knox, a new chairman of the rules committee, one of the important committees of that body, was sought. The Senator chosen to succeed to that chairmanship was Curtis, of Kansas. Curtis, of Kansas, was the jockey and cab driver of the seventies.

It is a long way from the chairmanship of the rules committee to the cab driver at the railroad stations of Topeka. But the mode of travel in making the journey is the same, virtually, at all stages. It is work. The cab driver worked his way through school. He studied lessons while waiting for the trains. Thus he graduated from the Topeka high school. But he did more than study the lessons in his books. He studied the people he hauled; he studied the men who were in the public eye. He made friends.

One of the two or three great lawyers of Kansas in those days was A. H. (Hib) Case. He appeared in virtually all of the higher courts of the Middle West, particularly in Kansas. He had known the cab-driving student when he was a jockey. Returning from journeys he usually rode with the young man. They became quite friendly. One day after graduation, young Curtis called at the office of his lawyer friend and expressed a desire to study law.

The older man pointed out the discouraging features of legal practice. The town was filled with poor lawyers who couldn't make a living. People didn't need lawyers as much as they formerly did. But the student wouldn't be discouraged. It finally was agreed he should sweep the office and combine other janitor duties with those of office boy in return for the privilege of reading Mr. Case's law books.

Again the former jockey went to work. His cab-driving days had taught him how to avoid the waste of time. His only interest was his work and two months after he began studying law he was taken to a justice court to assist Mr. Case in handling an action. Six months later he was doing all of that work for the older attorney. He was the firm's collector and in Topeka they still tell how Curtis would get money from tardy debtors.

A couple of years at that sort of thing and Curtis was admitted to the bar. It had been necessary, meanwhile, to have him declared a citizen. Indian blood inherited from his mother had given him a membership in the Kaw tribe.

Curtis became a member of a Republican Club, as his first dip into politics. He marched in the processions that were frequent in those days. He wasn't an orator but he had an all-absorbing interest in politics. He never wondered what his own precinct would do, he found out by a personal talk with most of the voters in it. After a while that knowledge of conditions was extended to include the ward. Of course, the next step was to ascertain conditions in the city.

That involved a tremendous amount of work. But work and the young lawyer were the closest friends. And Curtis even then had developed a characteristic that has been a big factor in keeping him in public life. He knew everyone of any consequence in town. And he knew a lot of people who were not of the consequential sort. As a jockey everyone had known him. He added to that acquaintance as a cab driver. His appearances in justice court added to his list of friends and even as a bill collector he met people who liked him. Not only did these people give him information but a surprisingly large number were fond of him. And so Curtis was equipped to keep close tab on the situation in the city, particularly as regarded politics.

Curtis was a delegate in the county convention in 1884, the year of the Blaine fight. He was the youngest delegate and was expected, along with most of the other delegates, to do as he was told. But Curtis, sure of his ground because of his perfect knowledge of conditions, jumped into the fight for Blaine. He wasn't

(C) Harris & Ewing

CHARLES CURTIS

an orator but when he concluded his speech that afternoon the convention instructed its delegates for Blaine.

That knowledge of political conditions long has been another of the Curtis characteristics. It alone saved him when enemy interests became so powerful, in late years, that they took away from him the district he had got in the habit of carrying in his race for Congress every two years and made his county a part of the district thickly inhabited by enemies.

But to go back to the convention. Curtis didn't upset the program at the convention without making enemies—and friends. On the advice of the later he decided to make the race for county attorney. He had, in the meantime, become a partner in the firm. In those days the liquor interests still were hoping to defeat prohibition in Kansas. Curtis's firm was retained by them at the rate of $500 a month, whether there were cases to try or not. And Curtis announced his candidacy on a platform that called for the resubmission of the dry amendment.

Five of the leading local attorneys were drafted by the prohibitionists to defeat Curtis. The most bitter campaign the county ever knew followed but Curtis was elected. He saw virtually every voter and so did his opponents. It was charged Curtis was a former cab driver and hadn't studied law regularly. As one resident of the town says of the campaign "all the hammers were worn out nailing lies." But Curtis was elected.

The new county attorney took office in January. He inherited 100 liquor cases from his predecessor in office. There were some 80 places carrying Federal liquor licenses. Curtis prepared to try one of the left-over liquor cases and half of the men accepted for jury service were known to be "drinkers." Curtis told them he didn't like the law but it wasn't up to him to say whether it was good or bad. He was sworn to enforce it. They were sworn as officers of the court to do their duty. He expected them to convict. And they did.

A month later there wasn't an open saloon in the county. In the four years Curtis served, a saloon operated four hours, one time, at a fair before the authorities learned of it. That is all. And the surprising part of it is that Curtis, the resubmissionist, never took a drink.

"I had no high-flown moral principles against drinking," he said, "but I had seen loafers and beggars who had been good husbands and fathers. I saw how liquor broke down men, took away their pride, made wrecks of them. I let it alone."

In his first term, Curtis prosecuted all the 100 left-over liquor cases, obtaining convictions in virtually all of them. He handled the other cases, too. That term he lost only five criminal cases. The next term he didn't lose one.

After he had cleaned up the city and county those who had opposed him accepted him. He was pointed out with pride. It was believed he had accomplished the ultimate. From a poor Indian boy to the county attorneyship of Kansas's second largest and most important county was some jump. He was pointed out to youths as a wonder.

But that was only the beginning for Curtis. He decided to make the race for Congress, from his district, the fourth. He was elected after a traitor in his ranks defeated him for the nomination the first time. He denounced the traitor, pledged his help and gave it in electing his opponent, and set to work to retire that individual at the end of two years. He did it.

After his first election it came to be just a matter of the lead each election would give him over his opponent. Kansas went to the Populists but Curtis returned to Congress. Then came the gerrymander, that masterpiece of political manipulation that was expected to end the career of the Indian, as his enemies scornfully called him. Shawnee County was taken out of the fourth district and attached to the first district where powerful men, each opposed to Curtis, controlled each of the counties with which Shawnee had been allied.

But work and Curtis had remained friends all through the years. And Curtis recognized early in his political career the importance of organization and personal acquaintance. So he accepted the challenge and went to work in the remodeled district.

Beginning early in the spring he visited every community in the district. It was said he shook hands and had a personal visit with some 9,000 voters in the campaign of that year. It was a battle. Each county had a candidate. The bitterness of the first campaign for county attorney seemed pleasant compared to the onslaught in the Congressional fight. But the "Congressman without a district," as he had been called, wouldn't give up. And on the 714th ballot he was nominated. He was elected. All told he spent 14 years in the House.

Meanwhile, the Curtis acquaintance had grown. His friends and enemies extended to every nook and corner of the state. The Congressman from the first district, more than half his mail came from other sections of Kansas. His old friends in the fourth district were taken care of just as when he depended on their votes for re-election. A letter from a man a hundred miles west of the district brought a response as quickly as one from one of the leaders at home. And eventually Curtis ran for the Senate.

It didn't seem possible Curtis could be a candidate in 1920. All was too serene in Kansas politics. There was no crowd out "after Curtis." It was too peaceful.

Senator Curtis and work still are good friends. He is about 60 years old but still he wastes no time, the plan which began with the lessons studied while waiting for trains still being the Curtis plan. He has a tremendous correspondence. Anyone in Kansas that desires anything writes to Curtis, it would seem from the sacks of mail that go to and from his office. No letter is unanswered. If the aspiring or requesting Kansan desires anything within reason, it is obtained for him. Pensions. In his "docket" are the names of more than 10,000 veterans for whom he obtained that aid. That is one of the reasons his enemies couldn't end the Topekan's political career. No matter what was the story the orders or the request carried to the family of an old soldier, if "Charley" had obtained the pension the efforts were useless. Often they were useless because of the knowledge of a friend who had been thus assisted. And the politicians point out, Curtis is a "handshaker." He is more. He has one of the most remarkable memories for faces and names of anyone in the West.

"I always associate some incident with a man's name and his face," he explained. "When I see him again it is easy to call him by name."

At one time or another he has had the opposition of every faction of his party but one. That is the Curtis faction. There are many factions in Kansas. From Boss Leland to William Allen White they all have fought the Senator. But he insists the people never indicated they wished to retire him. Even when he was defeated he could prove by the returns how the majority of the people really were for him.

Senator Curtis doesn't make a good speech as speeches by public men go. His tie is more likely to be out of plumb than in it. His trousers are as likely to be uncreased as creased. But he works all the time for Kansas and Kansans. He gets what he asks from the departments at Washington. He has been high in the councils of his party 30 years. Never a flashy legislator, he has been influential. He is said to be the first in the Senate as he was in the House on keeping his ear to the grass roots. He knows Kansas from the ground up, where to get anything any Kansan, black or white, Republican or Democrat, wants if it can be obtained and why it can't be obtained if it can't.

The Hague and the Consumers of America

National and World Welfare Dependent on Proper Credit Balances

By H. B. BROUGHAM

IT MIGHT seem absurd to say that the American coal strike which has brought 600,000 men to idleness has anything to do with the financial conference of the powers at The Hague. Or that the fact that five or six million men out of jobs in the United States points the same way. Or that the threat of a reactionary American tariff, raising the prices of everything, heads up there. Or that the record amount of business failures and amount of indebtedness as recorded this year of any four months in our national history, relates to The Hague. Or that the reduced purchasing power of so large an element of the American people has anything to do with it. Or that the sale of the crops of the United States for the coming year will be vitally affected by its outcome. Or that the motion picture shows and the proprietors of soda fountains have a profound interest, together with the sales girls in department stores and schoolma'ams and cattle raisers and fishhook vendors and college presidents and fathers and mothers and newborn babes—in the deliberations at which M. Barthou, of France, and Premier Lloyd George, of England, are presenting the views of the bankers of their respective nations, and of the rest of the 32 nations there represented, on the prostrate state of Europe.

The purpose of this article is to show that *neither Europe nor any other civilized grand division is in ruins, nor really poverty-stricken;* in fact, it is to show that *the world was never better off*—if it will but come to its senses and see plainly. Yet if Lloyd George struck the keynote of The Hague and the Genoa conferences in his speech in the House of Commons which won him that body's vote of confidence, the consumers of America will have cause to rue it. They will rue it in Lloyd George's hard phrases about establishing the "convertibility of liquid assets lodged in banks of a country maintaining a free gold market," and the "convertibility of currency into gold or its equivalent."

Wealth on Fire

UNDER cover of these and similar forms of words one of the most gigantic and momentous struggles in the world's history is being waged. It may result in an era wherein we shall behold the masses uplifted into wealth. It may result in the economic ruin of civilization as we know it.

For if Europe is again to go to the gold standard, which its powers wildly abandoned by the issuance of bogus currency notes by the billion, they will do more reckless things. They have already, Lloyd George declares—he uses downright phrases—virtually gathered together their mobile wealth into one pyramid and set it on fire. The British premier sees the world battered, bruised, crushed, its vital organs injured; a bomb, he says, has been thrown into the machine and has shattered it. Between certain countries commerce has gone back to where it was thousands of years ago, with primitive methods, methods of barter. In Europe, hordes of revolutionaries seem only to await the end to reduce its countries to the terrible condition of famine, pestilence, and dissolution which afflicts Russia—Russia, where is an impenetrable jungle; where the world cannot tell what terrible things are happening.

But is Europe really, or only seemingly, so prostrate?

She is starving with plenty. She groans under a glut of machines and goods.

Look at France. Except for the devastated area, France is today better equipped than ever for purposes of production. In England they are giving unemployment doles by hundreds of thousands. But with respect to England's present and pre-war wealth, a comparative study published in its engineering supplement by the *Times* of London, concludes: "After making allowance for all deterioration that has occurred, none of the firms reports that it has less plant than it had before the war, while four-fifths of them state that they have more, in some cases up to four times as much."

Sir Edgar Crammond, managing director of the British Shareholders' Trust, confirms this report. "Our industries," Sir Edgar declares, "have enormously developed on lines of standardization and mass production, and the productive capacity of Great Britain is now at least 50 per cent above the pre-war standard."

Production Increased

IF WE consider Germany and Austria, we find that these countries, which were not subject to invasion during the war, multiplied their productive capacity in like measure with that of England and France. Despite their losses in man power, there is some, though not much, complaint in any one of the lately warring countries that they lack operatives for their highly developed mechanisms.

In the United States, the farmers have produced foodstuffs to such an extent that the railroads, the markets, and the credit system—particularly the credit system—have failed to place them in the hands of consumers, while the supplies of coal and fuel, wood and metal products and fabrics are in excess of any available market.

It is untrue, then, to say that production is limited by the laziness or inefficiency of the workers, either here or abroad. Employers on both sides of the Atlantic are as enterprising as they were before the war. Of the workers it can be said that they not only provided for the support of their nations during the war, including millions of unproductive soldiers, but they performed the task of building up the producing plants of Europe and America to half again their former size.

If, then, there is more than enough to go round—if production and its tools and skills are at their height of potentiality—the real difficulty which has called the financial powers together lies in the world's system of distribution.

Now that which permits, or forbids, things to be distributed to large masses is price. Whenever the price of goods rises to any point higher than the buying power of the population, "effective demand" ceases and we have what is called over-production. When goods are unsold, producing plants shut down, and industry charges the upkeep of their idleness to the price of such goods as the community must have, pushing prices yet higher.

America's commerce with Europe fell off during 1921 by nearly one-half. "Last year," the British premier declared to the House of Commons, "our international trade was only 50 per cent of what it was before the war." So for all Europe. The foreign trade of every country was cut in half, or still further. It was this phenomenon which Lloyd George deplored. The cutting off of foreign markets, he remarked, "depresses the home market because the population have not the same means of purchasing goods if they are deprived of that great trade of buying and selling and carrying abroad."

But this begs the question. If the home market is healthy, if the people have the power to purchase the product which they make—and that will be the case if their financial system is right—they will have to build up no such great trade of buying and selling and carrying abroad.

How is it with our American people?

The United States Bureau of Labor Statistics reported to the United States Senate on August 12, 1921, that 5,735,000 workers of all kinds were then out of employment. During 1921, the steel mills in the Pittsburgh district ran at but 30 per cent of capacity, and machine shops at but 25 per cent to 45 per cent of capacity. Ohio and many states in the Union made similar reports of slowing down in the basic industries.

The reason for all this was a "glut of goods," not famine. But it has produced famine and need through unemployment, through the cutting off of purchasing power of the mass of consumers in the United States. The production engineers have for some time contended that we are producing but one-fourth or less of the real capacity of the industrial plant, and that the potentiality of the other three-fourths, unused and unavailable because the people cannot buy the goods, harbors vast credits that under a decent money system would yield a splendid livelihood to everybody.

Instead of letting these credits go to waste, as is the case today, why not prime the pump of business with them by awarding them to the consuming population in fresh buying power?

Magnified Buying Power

SUPPOSE it possible, by a sound method, to supply the population with four times its present buying power for goods at retail.

To assure that the power shall be wielded at the retail end, we will assume that the agents selected for amplifying the buying power of the people shall be the retail dealers in goods and services. Among such are included the railroad companies, in respect to passenger fares and the dispatch of commodities at retail; landlords who let private dwellings; telephone and telegraph and light and power companies in their charges for home consumption; theaters and other recreational agencies; colleges and other educational institutions in their tuition charges; and professional and all other agencies that cater to individuals for private consumption.

These agencies might be chosen without compulsion.

Suppose the government announces that the privilege of distributing to the public this fourfold purchasing power as it buys goods and services at retail, should go into the hands of only such agencies as would voluntarily sell at cost plus a fixed percentage of profit on investment, say eight per cent.

Suppose the public were notified that for every dollar of the present currency paid in to these selected agencies the retailer should be empowered through the banks to retire that dollar, receiving in a new series $4 in exchange, of which he must return $3 to the purchaser. Let this process go on until all the present legal tender money is exchanged for the new issue of fourfold volume.

One of the regulations for the retailers would be: When the public makes its heavy draft on their stocks, to stock up again only from such wholesalers and prime producers as also agree to receive only their costs plus a fixed return of eight per cent on their investment. Their inducement would be the privilege of benefiting by the broadened markets of the new system, and, upon throwing their books open to inspection, to have their investment, in turn, insured for eight per cent, which would be their fixed reward.

There would be for all industry, as it chooses to come in, a great insurance system, based upon a record of previous production in excess of national consumption, and determined by the ratio—in this case 75 per cent—between the two. Next year it might be whittled down to a much smaller percentage; but at the consumer end there would have been put into circulation a fourfold currency to balance the great current of hitherto unrealized production, and to let it loose and let it flow on as long as the new currency flows. The new discount based on a new high watermark of production in excess of the first year's consumption and depreciation would enable the insured retailers and wholesalers and prime producers to bring the custom continually their way, with fresh currency bonuses to the public as it comes to buy goods at retail.

Then the consumers would control credits and industry.

They would control them, not through a committee saying what should or should not be made, or which goods should be delivered first. They would control credits and industry merely through the weight of their effective buying power precipitated into those goods which they, as consumers, prefer.

Such goods—naturally, at first, food, clothing, rentable houses, and fuel; then comforts; then luxuries—would be the first to sell. No central "priority board" need be established to see that such goods for ultimate consumption should be made first; the new orders pouring into the factories and the farms would attend to the priority business. Money talks. Those goods would be made first which the consumer wishes first, and the supply would be suited to his multifarious orders.

With the consumers' purchasing power multiplied by four, fourfold the volume of goods for retail consumption would soon issue from the great producing industries. Farmers would increase their acreages. The steel industry would wake up and produce the framework of thousands of apartment houses needed. The building industry would resume at full blast. Cheap transportation—for railroad fares would go down three-fourths—would take populations out into the suburban districts and the country. The theaters and movies would run to capacity, and more of them would be built.

Tapping the Production Reservoir

THE net result would be re-employment of those out of work, to fill the nation's fourfold volume of orders, and the deflation of all speculative prices to the lower limit of price plus the insured investment return. These beneficial results would be attained by a system of inducements, not by legal compulsion, to profit by the vast reservoir of production credits now latent, inactive and unused because of a contracted and "cornered" money system.

Of course, we have now in America not only the spectacle of an unregulated and anarchistic gold "standard," but also of an unregulated paper currency based upon the shrinking values of current commerce, which acts through highly speculative prices to check the production of consumable goods and to produce surplus "plant." The financial system attempts to base its credits on currency and yet allows prices to rise with its issues of both. On this current of rising prices which chokes consumption and trade, we issue currency on commercial paper which depends on the sale of commodities to make it good. If they are not paid for, the banks must get additional interest and commissions to hold them, and as costs mount the volume of sales shrinks further.

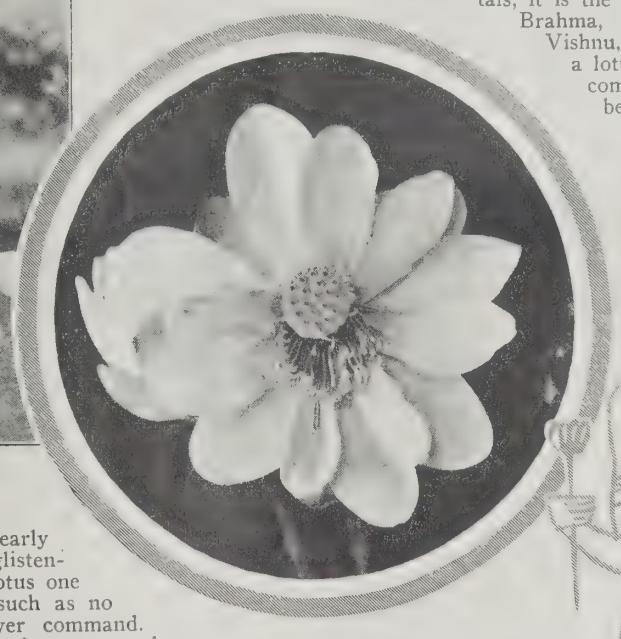
The plight of consumers, which is exhibited in unexampled degree at the Genoa conference, is manifest through the operation of this crazy monetary system. The checking system of the banks is not yet for the masses. They depend almost wholly on legal-tender money for the purchase of all commodities for which industry really exists, namely, things to eat, to wear, for fuel, housing, and generally for use by individuals. Some method by which reserves of money can be done away with, the entire currency kept in circulation and buoyed up by a constant flow of productive values in excess of consumption and depreciation, would deliver America and the world of the hypocritical fetish of the gold standard. Credit would expand with production and contract with consumption, and money would act constantly as an accurate measure of values.

Control Is Automatic

THE method of "priming the pump" of industry proposed in this article, that of placing credit in the hands of the mass of consumers up to the productive capacity of producers, in order that the whole product may be bought and consumed, is subject to automatic control. If productive capacity is seen to exist far in excess of the goods actually delivered in response to existing purchasing power of the masses, then fresh issues of currency are warranted to cover the whole estimated productive capacity of the industrial machine. Provision, of course, may be made to retire such issues to the extent that this capacity is diminished from whatever cause.

Just now the American situation keeps pace with The Hague. Just now a restriction of European finance to the gold standard means the further restriction of our foreign trade, more unemployment here, the steady fixing of our standards to a meaner basis, the cramping of our industrial machine and of our life. But it is because, first of all, we have thought meanly of ourselves and have done our own domestic cramping. The solution of our difficulties is in our own hands. It is at home, and it lies with the credit of the American consumer. In this solution is an example for the world.

Call It the Lotus, and Sing of Gold and Jade



Or Name It Water Lily, and Slap the Romance of Mosquitoes

By WYMAN SMITH

THROUGHOUT America from Canada to Cuba grows a great wild water lily, its blossom poised on a single dull green stalk, its yellow-tinged petals facing the sun. It is the American lotus—largest of all wild flowers in the United States, surpassing all others in the gorgeous array of its gold and jade.

Leaf and flower of the American yellow lotus found in Iowa.

Single flower of the lotus.

Out in the sunshine of early morning with the light glistening across a pond of the lotus one may see a magic carpet such as no mortal monarch could ever command. Flat on the surface of the water, the smooth circular leaves rise and fall with the breath of any wind which passes, forming a veritable mat of the green pads; above them gleam the golden yellow flowers opening in the sun, flowers from five to 10 inches in diameter, so beautiful, so mystical they appear indeed to be jewels of a lost goddess. Boats approach closer, and the pads swish against the sides and part as best they can their one and two foot orbs. Rare, brilliant, elegant, the lotus flowers rise among them, and sprinkled between are the buds shaded in innumerable hues from the sepal green to the chrome of the finished bloom. All is a mosaic of olive and amber—flashing and dancing in the sunshine and cast as though to reflect from the earth, in a thousand variations, the sun ball of the sky.

Men from the cities have told me about some solitary field which they have discovered, so attractive and beautiful that they visit it every year. In one state a statute forbids even the cutting of the flowers, and, frequently enough, some hamlet boasts that in its vicinity is found one of the three lotus beds of the world.

Lotus—the very name itself breathes forth an aroma of legend, symbolism and romance older than history. In painting, sculpture, architecture, religion, may be found traces of the ancient esteem for this rare flower. Scarcely a single public building but does not have about it somewhere one or another of the symbols which 5,000 years ago represented to the early Egyptians the "bride of the Nile." From it, according to Goodyear, have been evolved the Ionic capital, the Greek fret or meander, and the swastika, earliest of symbols and ornaments found on pottery. The triangle of the lotus calyx has been given for explanation of the Trinity and it is even possible that the cornucopia, showering plenty upon the world, may have been suggested by the seed pods. It was a custom in those days also to inclose the seed in balls of clay so that they might be thrown into the water to start new plantations of the plants.

Charles Skinner wrote: "It is the representation of the sun and moon; the attribute of silence; the symbol of female beauty; the breath of gods; the source of nectar that gives eternal life; the cradle of Moses; the seat of Buddha; a memorial of the ark; the resting place of great spirits."

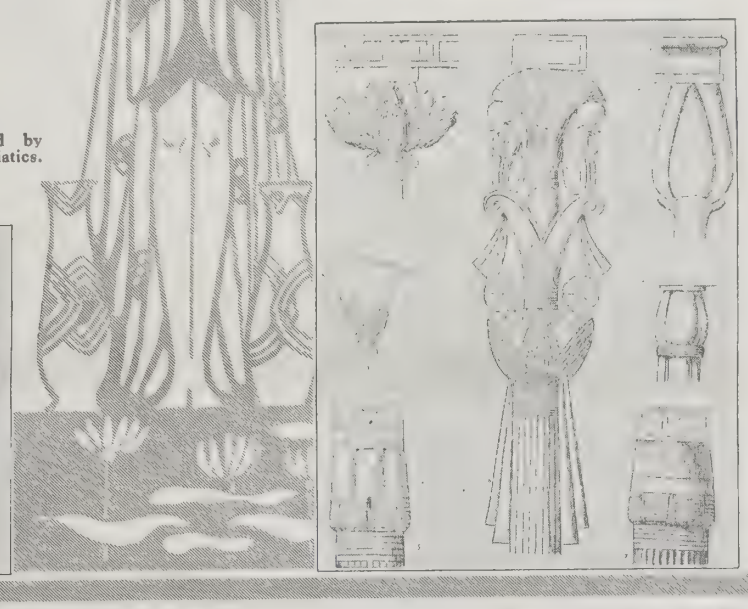
The Greek Pythagoras, believing that souls took up their habitation in the lotus, was one day pursued by enemies who drove him to a pond of the flowers. He accepted them as brothers, refused to hide among the leaves and consequently was killed by his pursuers.

Again, Mr. Skinner says: "Lakshmi, the Hindu goddess of love, is couched upon it, the fragrance of her body filling the heavens; Kamadiva, the Hindu Cupid, floats down the Ganges on this flower; the Japanese Fudo or Mercury, glides through the air on lotus sandals; the new-born Buddha in setting foot on earth caused a lotus to spring from it and in his first seven steps northward a lotus marks each footfall. With the Egyptians, it is the flower of Osiris, the sun god; and Horus, son of Osiris and god of silence, sits like Buddha on a lotus with finger on lip enjoining peace. This peace of eternity is expressed in the contemplative figure of Buddha which Japanese carvers have put into such exquisite form, and which represents the god as seated on an opened flower, ready to listen to the prayers of the faithful, 'Oh God, the jewel of the lotus.' In Greek legend, this 'bride of the Nile' is the body of a lovely nymph, who, deserted by Hercules, flung herself into the river and was drowned. But among the mystic Orientals, it is the emblem of the world, for Brahma, springing into life from Vishnu, the Absolute, alighted on a lotus, and from that rostrum commanded all worlds into being."

Thus for pages and pages, go on the legends and references to the lotus made by the sages of all countries from Egypt to Japan. The name has been broadened until it includes several of the finest water lilies. In the Orient, the "rose lotus" is meant, and only the Egyptian symbols, brought to them either by invading armies or by quiet merchant traders, remain identical with those of the true lotus. In America, what difference does it make that our queen of lilies is botanically a water lily! "Lotus" has grown into such common usage that no suggestions will change it.

But there is an interesting difference between the two flowers. The lotus of the Nile grows just upon the surface of the water, has a circular leaf slashed inward to the stem, is pale blue, pink or white, and has small delicate petals, while that of America and the East Asian countries is yellow or rose color, has an uncut leaf, carries the flower well above the surface of the water, and resembles a wide, open bowl in general form and spread of petals. Who named the lily in America may never be known, but the christening may have been suggested by the reference of Longfellow, in Evangeline:

"Resplendent in beauty, the lotus
Lifted her golden crown above the heads of the boatmen."



Or it may be the old myth of Ulysses, the hero of Troy, who came in his wandering to a country which he named "land of the lotus eaters." People ate the seed and bewitched travelers to partake of it also. There where sunshine and gorgeous glory succeeded each the other, men forgot all their previous existence. Wives, sweethearts, country, home, all were forgotten in that summer madness. When one observes a pond of the yellow beauties greeting the sun in their wilderness surroundings, he readily believes he could forget.

Queen though it may be, the lotus is less particular in many respects about its throne and its food. It thrives in ponds, lakes and river sloughs with clayey bottoms covered with marsh gumbo; it is generally surrounded by the white water lily, yellow cow lily, a host of grasses and plants of the marshy margins. While it grows in water from two to four feet deep it thrives also in some of the deeper places where the water is cleaner.

Several months of growth are required before the lotus blossoms—in Texas the flowers appear in June, in the northern states they unfold during August. Once in blossom, the delicate pale yellow flowers look as though they might have been cut from old ivory. It is found in 26 states, in Canada and in Cuba. It grows in the states just west of the length of the the Mississippi River except the Dakotas. It appears in Michigan, Illinois, Wisconsin, Indiana, Ohio, New York, Massachusetts, Connecticut, Pennsylvania, New Jersey, Delaware, Maryland, Virginia, South Carolina, Georgia, Alabama, Florida, and has been artificially cultivated in Golden Gate Park, California, since 1863. Once established, it grows readily, but at present it is found in no state more than a score of times.

Lotus pods, relished by ducks and some Asiatics.

Egyptian lotus capitals, native to public buildings.

In the Lotus Lake on the Mississippi River at McGregor, Iowa.

With blossoming completed, the seeds appear in pods shaped like sprinkling can spouts—brown ocher in color with a lighter yellow blend on the stem. These pods remain above the ice in winter, or may be pulled down by ducks and other birds which relish the acorn-like seeds. The people of Northern Africa and Asia still use the seed for breadmaking.

Great yellow coral beauty in summer, graceful swaying seed pod in winter, the lotus earns its name and reigns as the rightful queen of inland waters. Food it was and still is, but as a cherished fragment of romance, it remains in America the most beautiful of all wild flowers. It is the lily of the sun, once seen, never forgotten.

The Small-town Newspaper in the Making

Where Personal Items Surpass World Events in "News" Interest

By EMERSON ROBINSON

IF THERE is a catastrophe on land or sea, in Ohio or in the Orient, the resident of the small town wants to know about it at once and if his newspaper doesn't get out an extra edition within half an hour after the first bulletins are flashed to the office, the editor hears about it. When the world's series games are being played, the fan in the small town loafs near the newspaper office and watches the contests play by play. If he is interested in a certain horse race or a prize fight, he calls up his newspaper. If he is a rabid fan, the chances are he'll make the editorial rooms his headquarters while the event is in progress.

The small-town resident of today expects his newspaper to give him all the information he wants on any subject and without delay. And the newspaper does so. But hear the small-town editor of 60 years ago:

"Yes, I remember very distinctly when Lincoln was assassinated. The town was all excited. Did we get out an extra edition? No! Why should we? Everybody knew about it. We figured that as the news was all over town, there was no use in us trying to sell papers.

"When Garfield was shot the first information we received was from a reporter. He heard the news on the street and brought it in. We didn't get out an extra because we were going to press the following day anyhow."

And the editor might have added that as news is scheduled today, the assassination of Lincoln and the shooting of Garfield would have been history by the time the extra was on the street.

What the People Want

TODAY the newspaper, large and small, is primarily a business proposition. A successful newspaper can serve the public, its advertisers and its subscribers best when it is successful from a financial standpoint. And too, no matter how much emphasis an editor puts on his special features, he knows that his live news, the happenings of the day, must be recorded. In the small town, it is the purely local items that are given preference. The editor knows that his subscribers will overlook the fact that he has failed to carry the news of the revolution in China or the agitation in Ireland but they will never forgive him for failing to print each day, the small and interesting little items in which they personally are interested.

How different from the small-town newspaper of 40, 50 or 60 years ago!

Politics was the rock on which many a small-town newspaper was founded and its success or failure depended largely on the personality of the editor and the cause which he espoused.

Rival factions in the same political party sometimes would start newspapers and when the purposes for which they were organized were accomplished, publication would be suspended. Usually they were not money makers and in many instances they were not expected to be. As an old printer put it they would "start out as dailies, then issue semiweekly, then weekly, then biweekly, then they would be too weak to issue at all."

The editors of those early days wielded a mean pen. They were not afraid to call a spade a spade. Their attacks were venomous and their shafts were intended to hurt, and they did hurt, and many a small-town editor has had to defend his editorial or his news with his fists.

In one of these small towns an editor used an item about one of the prominent citizens. No names were mentioned but every one knew to whom it referred. The following day, the man, a physician, accompanied by two friends, entered the editorial sanctum. They greeted the editor very friendly but formally and gradually surrounded him.

They laid him on a table and were preparing to pummel him in decorous and scientific style, when hardboiled compositors intervened in behalf of their chief. The intruders left the office quicker than they entered.

Time Not "News" Element

NEWS, as it is recognized in the modern small-town newspaper office, received scant attention in those early days. An attempt, of course, was made to print the principal happenings of the town; but if either in the daily or the weekly a story was overlooked, nothing was said, unless by chance it happened to relate to politics. Then there was a jacking-up all along the line.

As far as telegraph news was concerned, neither the editor nor the owners nor the subscribers seemed to think it worth while to get. There were telegraph offices in many of these towns but none of the newspapers knew what it was to get news there. They would subscribe for the metropolitan dailies, clip what matter they cared to print and call it a day. The fact that it was several days or several weeks, and in many cases several months late made no difference.

But as the success of the newspaper was built around the editor, it was only natural that his editorials should be given first rank. They were, and whether he wrote of politics or his hobby, if he happened to have one, it made the paper, no matter what the news of the day might be. They were proud of these editorials and would send them throughout the country. Some of these small-town editors had national reputations and their subscribers lived in many states.

It was no uncommon thing, an old editor recently remarked, for the news columns to be filled with a three or four-column editorial, a wedding, perhaps a local item and a discussion on the best method of cultivating strawberries.

There was a great agitation throughout the country 35 or 40 years ago. There was too much noise in the land! and the editors, both in the small towns and the great cities, were calling upon the proper officials to do something to curb the ringing of the bells and the blowing of the whistles. The people are being disturbed too much, they proclaimed.

"I wish some of my old colleagues could come back today," said the old-timer as he wistfully looked upon a heavy traffic street and the noise of the gas engine filled the air. "We thought we had noise in those days! What would those boys say if they were suddenly transported back to the present-day city!"

If there was a wedding, the proud and happy father would call on the editor and give him all of the details "just to mention." If he brought two jugs of whisky he expected and got a little "puff." Quite a lot of them brought the two jugs. "It was good stuff, too," whispered the old editor.

As the small-town newspaper developed with the passing years and new opportunities presented themselves, editors began giving their readers more news. In addition to carrying more local items they clipped more from other papers and later received from organizations, plate matter to fill their columns. This consisted of news, semi-news and features, set up in type in another city, a matrice made, the matrice cast and the resultant plate shipped daily or weekly to the small newspaper. Some of the smaller publications use this yet.

Organizations of news-gathering agencies placed at the disposal of the small-town editor, the happenings of the world, at small cost. In the beginning, only a few sheets of "flimsy" or telegraph news on very thin paper was received in skeletonized form.

Within the last decade only, have the small-town newspapers installed the leased wire service—that is, a wire in their own offices.

Today the reporter who writes with a pencil is a unique figure. He's of the old school. The new reporter, the cub, is told the first hour he starts work, to use a typewriter.

The Old Joke Stuff

COMPOSITORS who set the type in those early days were a happy, joyous, contented lot, from the devil to the oldest vet. The dictionary defines the devil as "a printer's apprentice." The origin is indefinite but the name is appropriate.

"I hadn't been in a composing room half an hour," said an old printer, reminiscently, the other day, "when one of the journeymen asked the workman next to him if he had a type stretcher. He hadn't, of course, and did not know where the one that belonged to the plant was. I was told to go over to our competitor and borrow one. I hustled out, glad of the opportunity. The foreman of the other shop knitted his brow for a moment as though in deep thought and then said that he believed he could let me have one if I'd promise to return it. He directed me to an iron bar which must have weighed close to a hundred pounds and I carried that thing three blocks to our plant. When I walked into the composing room—well, you can imagine the way those hardboiled printers razzed me.

"On another occasion a devil was sent out for some italic spaces. He went from one printshop to another, there were several small ones in the town, and finally was given a big package. When he returned he opened it. It was filled with ashes.

"Type lice was a great gag to work on those not familiar with a composing room. This went for old and young alike and it never failed to rouse the anger of the victim.

"In those days we used to wash off the type with lye water.

"The uninitiated would be asked to look between type in the form where there was some of this water and to watch closely and he would see the lice swimming about. At the proper instant, the joker would shove the type together and the dupe would receive the dirty water in his face. Of course, the printer would see that there was not enough lye to hurt the victim."

Put the modern printer in the composing room of 30 years ago, yes, less than 30 years ago, and he would be all but helpless.

Then all type was set by hand. Today, more than nine-tenths of the newspaper is set by machine.

Speed and More Speed

IN THOSE days, if a printer could set a column and a half of news matter by hand, he was considered an expert.

Today, if an operator, setting straight news matter on a small-town daily, doesn't get from 12 to 15 columns of type out of his machine, he is not classed as more than fair. If he turns out 20 columns, he's a wizard. But there are quite a few wizards.

Sixty years ago, the small-town daily or weekly might carry from three to five columns of editorial and news. Today, its successor will carry from 40 to 60 columns of editorial, news and features.

Fifty years ago, some of the advertisements would stand for months without a change. Today most of the advertisements are changed daily.

Then the paper would be printed by a press operated by hand, in some cases on one side only. It would take two hours to print a few hundred.

Today, the modern newspaper in the small town, with its up-to-date stereotyping outfit, and its electrically driven press will print 10,000 forty-page papers in half an hour and they will be distributed to every subscriber within the city limits in 40 minutes.

Two young reporters in a small town in Ohio in 1870 were idling some weary hours in the office, as reporters are apt to do.

"We need subscribers," said the editor. "Suppose you boys go out and get some."

They were willing, so they left the office and went fishing, as reporters in those days were prone to do.

Returning late in the afternoon, they passed a cemetery, entered and copied the names of their subscribers from the tombstones.

They were the first to work this stunt. How they placated the editor is not related. But they held their jobs—as reporters.

In Their Last Wills—By ALBERT SIDNEY GREGG

SOME years ago Adolph Metzer, a retired soap maker of Evansville, Indiana, wrote his name in the hall of fame by making a very curious will. He left $11,000 for the benefit of homeless cats and dogs. The money has been invested at compound interest and the will sealed in an airtight metal tube. Not a penny of this money is to be used to feed a hungry dog or cat until the year 2163. A human calculating machine has figured it out that eventually the beneficiaries will be entitled to $201,559,641.

It is a tradition of the legal profession that the "dead hand" provides many fat fees for the experts who know how to break wills. And such an expert must be quite proficient.

Some wills make painful reading. Spite, and a determination to provide for pet animals at the expense of relatives are sometimes the actuating motives.

Shakespeare cut his wife off in his will in this fashion: "I give unto my wife my second best bed, with the furniture and nothing else." This line at least qualifies him to rank as a human being—just a mortal and nothing more.

Miss Susan L. Munro, of Fall River, Massachusetts, bequeathed $100,000 to her horse, Daisy. She says: "In case my horse Daisy survives me, I give her and all her belongings, carriages, harness, and so on, to my niece, Annie B. W. Munro, and I leave in trust my money in the Fall River Savings Bank, also my stocks, the income of all to be used for the care and support of said Daisy. In case Daisy becomes disabled and suffers from some incurable and painful affliction so that in the judgment of a good veterinarian it seems humane to kill her, I direct the said Annie to see that this is mercifully done, and that said Daisy be properly buried, the necessary expenses to be paid from the income. Daisy is 31 and apparently has many more years of life ahead of her. After the death of the said Daisy the income of this fund, or the proceeds thereof, is to be divided equally among the children of my brother, John H. and Josiah."

Dr. Zudzense, of Grand Rapids, Michigan, owned two monkeys that occupied a front room in his affections. He also had a farm valued at $3,000 and an old housekeeper. He provided in his will that the income from his farm should be used to maintain the monkeys and that the old housekeeper should be permitted to remain in the home so long as she took care of the pets.

George C. Watts, Board of Trade operator in Chicago, set aside $30,000 in his will to provide a home for his fox terrier, Bill, and his riding horse, King. Mrs. Corrine Snodgrass, of Lower Chanceford, near York, Pennsylvania, left $11,500 of which $10,000 was to be used in caring for her favorite horse, Betty.

Mrs. Mary B. Snow left $32,000 for the care of her horses, $1,000 for each of her ten dogs, and sympathy for her husband. Mrs. Ellen J. Kneweare, of La Salle, New York, willed $40,000 to her cats and dogs and cut a child off with $5,000.

The Emperor Maximilian I in his will decreed that his hair be shorn, his teeth brayed in a mortar and publicly burned in his chapel, and that his body be buried in a sack with quick lime.

Henry Green provided in his will that his sister, Catherine Green, should perform a very unusual service each year. She was directed to give four green waistcoats to four poor women in a green old age, such waistcoats to be lined with green galloon lace, and to be delivered to the women on or before December 21, yearly, so they might be worn on Christmas Day.

An Irishman who had suffered a great deal in crossing the plains in a prairie schooner in the pioneer days, later made a fortune and left it for the benefit of people who later might make the same journey. Meanwhile the development of railroads has completely altered conditions of travel. There is no need for the money.

The Chair of Creative Art in the University

Robert Frost, Fellow at Michigan, in New Educational Experiment

By J. M. SEABRIGHT

EDUCATION, a thing imposed by those who have gone before?
Or—
Education, something acquired by the seeker's own powers.

More and more institutions of learning are delving into the question of whether education may properly be considered simply the acceptance by the students of such information as the slow processes of the past have cataloged.

Of late, a new spirit has manifested itself in the great colleges and universities. It is the desire to capitalize the individual's natural power for acquisition of knowledge, his power to explore, to imagine, to initiate, finally, to create.

It is a revolutionary movement.

It has expressed itself in the establishment of what have been aptly termed "Fellowships in Creative Art." Their features are as refreshing as they are iconoclastic.

Can you imagine a scheme characterized by a teacher who conducts no classes, who delivers no lectures, who thumbscrews no students with examinations, who, in short, engages in no formal teaching? Quite a change from the old order, isn't it? Yet that summarizes the fellowship plan.

The University of Michigan is one of the few institutions where this novel plan is being tried out. Happy was the choice of incumbent there, the person so honored and so honoring being one of our foremost contemporary New England poets, Robert Frost.

Before viewing Mr. Frost's work and influence in his new field, consider for a moment the why and wherefore of the plan's adoption.

About two generations ago, James Russell Lowell, then occupying the chair of modern languages at Harvard, wrote these words: "Democracy must show its capacity for producing not a higher average man, but the highest possible types of manhood in all its manifold varieties, or it is a failure. No matter what it does for the body, if it does not in some sort satisfy that inextinguishable passion of the soul for something that lifts life away from prose, from the common and the vulgar, it is a failure. Unless it knows how to make itself gracious and winning, it is a failure. Has it done this? Is it doing this? Or trying to do it?"

Many years passed before that expression of need found lodging in a receptive soul. President R. M. Hughes of Miami University, Oxford, Ohio, in 1920 addressed the National Association of State Universities, at Washington, D. C., with an urgent appeal that "Fellowships in Creative Art" be created.

Among other things, on that occasion, he said: "I wish to suggest the advisability of the universities establishing fellowships in art—poetry, painting, sculpture, drama, music—open to creative artists of established reputation. History shows . . . . that the greatest artists have been under the patronage of the nobility, or of the rich, or, occasionally, of the state. It is certainly repugnant to the American spirit, either of the people or of the artist, to be under the patronage of individuals. It would seem to me, as our country is constituted, there is no institution more eminently fitted to be the patron of art than the universities and colleges. On the other hand, I believe nothing would do more today to leaven the increasing materialism of the American university than to have a great creative artist working on the campus."

The absence of a formal pedagogic program in the plan he explained as follows: "Such fellowships . . . . should be free from all academic duties; should be a frank recognition of return other than work in his chosen field. I believe that the establishment of a professorship would very largely defeat the purpose to which I am directing your attention, the development of American art. It is only as this would be developed freely without restriction as to hours or time that the greatest results could be gained."

In the same address, President Hughes suggested the names of representative leaders in the several branches of art, and among the poets he named Robert Frost. Through the generosity of ex-Governor Chase S. Osborn, the eminent poet was invited to Michigan for one year—the university year of 1921-1922.

Mr. Frost, while called a New England poet, was born in San Francisco in 1875. At the age of 11 years he moved to Lawrence, Massachusetts, after the death of his father, a journalist. In New England he grew to manhood, and there his mind retained those photographic images so faithfully reproduced in his verse. His college career was brief: he entered Dartmouth in 1892, but stayed only a few months; and he studied at Harvard in the years 1897 to 1899. For the next five years Mr. Frost engaged in the arduous duties falling to a New England farmer. He was, to use his own words, "a real farmer, but a bad one." How fruitful was that period was not to be realized until 1913, when his first book, "A Boy's Will," appeared, bearing the imprint of a London publisher. Its issuance from a foreign press casts no reflection upon the foresight of American publishers, for Frost was, at the time a resident of England. (Incidentally, *The New York Independent* lays claim to having "discovered" the poet, it having published one of his poems in the year 1894.) Two other volumes have flowed from his pen—"North of Boston," in 1914, and "Mountain Interval," two years later.

Though a critical estimate of Mr. Frost's verse is beyond the pale of this article, nevertheless, let it be said that in the works mentioned he has more adequately interpreted New England than any living poet. He is a plain man and, like Burns, he sings of plain things. He is the poet of neighborliness. He is, besides, an outdoor poet. What a graphic picture, for, example, does he limn of a country road in the pouring rain, where "the hoofprints vanish away"! One critic speaks of him as being "as indigenous and as American as Walt Whitman"; and Amy Lowell tells us that "Frost's is not the kindly New England of Whittier, nor the humorous and sensible one of Lowell; it is a latter-day New England, where a civilization is decaying to give place to another and very different one."

A writer in *The Michigan Alumnus* pictures the

ROBERT FROST

poet in this fashion: "Robert Frost, poet—plain, wholesome poet—has come to spend a year as Michigan's guest of literary honor. He is to do as he pleases, to live without the bother of classroom obligations, that we may find out how his presence will affect the academic atmosphere, and how the academic atmosphere will affect his poetry. After a most pleasant hour with Mr. Frost, the writer is of the opinion that the academic atmosphere is more likely to be changed than the poetry. Mr. Frost impresses me as being born that way. He is absolutely authentic."

In the same interview the poet aired his views on the training of writers. "He takes little stock in drilling students to distinguish among the categories of rhetoric. He himself, like most writers, does not consciously write description or narration or exposition or argument, but just writes down the best thoughts he can get hold of . . . . Every time he has written he has believed that he was producing literature. Of course, he smiled when he said that, and added that most of the time he was wrong, but that he had to find out his mistake later."

Intensely interesting and helpful is his philosophy contrasting the poet and the journalist. "Experience," says he, "should be gained in a perfectly natural and unconscious way. A youth need not worry about the acquiring of worldly knowledge. If he but holds his mind open and in a relaxed state of impressionability, the course of a lifetime is bound to bring him the rich experience which he desires. The would-be poet who seeks ideas to put into verse is placing the cart before the horse. Poetry is a product of mood rather than idea. When the poet finds himself in this creative mood, there often occurs to him a theme with which he has been unconsciously impressed during the course of past experiences, and which suggests itself at such a time."

"The journalist," he continued, "consciously seeks ideas in order that he may express them in writing. He must perpetually maintain 'a nose for news,' as it is his business to present timely ideas to the reading public. The poet is under no such obligation and should avoid this search for material. Not until late in life does the poet see a possibility of poetry in his experience, and then the beauty of them is often tainted by the thought. A definite purpose, like blinders on a horse, inevitably narrows its possessor's point of view. Worth-while poetry demands an unrestricted observation. For this reason, it is dangerous for one who aspires to write verse to chase copy too long."

The rationale of the doctrine is that he believes the poet should remain an amateur, using the term in its broadest sense. Mr. Frost would have the aspiring singer pursue some trade or profession as an insurance against material want.

Since Mr. Frost has no curricular loads to weight him down, what opportunity, one asks, has he to make contact with the students? First, consider his home. In a modest dwelling in the typical college town of Ann Arbor, the poet lives, surrounded by family, faculty and students, all of whom read "Welcome" on the doormat. His personality is unassuming but not shy and the visitor finds at once that he is in the presence of a friend, genial, gentlemanly, and wholesomely plain. Mr. Frost is ever in demand to address informally this organization or that. One evening his presence may be desired at a reception tendered by the student body; on another he may speak to a classical group; on a Sunday he may address a students' class in one of the local churches. Thus one can readily see that the opportunities for contact between fellow and students are not merely abundant; they teem with great possibilities, as well.

Until the inauguration of the fellowship plan such as the one here considered, the pattern for which was furnished President Hughes by the successful functioning of Edgar Stillman Kelley, the eminent American composer, in a somewhat similar composer's fellowship at Western College, Oxford, Ohio, our colleges concerned themselves almost wholly with the historical criticism or exposition of literature, poetry, drama and the other liberal arts. From now on, inspired by the success of the Kelley fellowship, by the incumbency of Percy Mackaye, dramatist and poet, at President Hughes' own Miami University, by the sure molding of the artistic tastes and ideas of student clay at Michigan by Mr. Frost—inspired by such examples, the colleges and universities of America see a new and decidedly important task before them.

Jenks Enters a Protest—By CHARLES PHELPS CUSHING

"I WISH some of these doggone newspaper men would quit insulting my intelligence." Jenks glared over the top of his Sunday paper at the Missus. "Listen to this, will you—" Then he read:

"'The residence of John J. Smith is a mass of smoldering embers this morning.'"

"Well, my dear," the Missus inquired sweetly, "what is there about that to make you feel so irritable?"

"Listen to this, then." Again Jenks glared and read:

"'As a result of painful injuries received in a motor car accident, Mrs. P. J. Dillpickle is suffering untold agonies on a cot in the Baptist Hospital this morning.'"

"Yes, dear. It's very sad. But why get yourself so worked up about it?"

"Don't you see? It's all a trick. Do they think they can fool me with a stall like that—sticking in the words 'today' or 'this morning' everywhere they can? Why the dickens don't they quit stalling around like that? Why don't they come out flat with it and say Smith's house burned down last night, and Mrs. Dillpickle got smashed up yesterday afternoon? It's just a trick, and easy as shooting fish. Anybody can do it. Listen—I'll give you an example:

"BAGDAD—and the date—(from our Special Correspondent with the British Army of Occupation)—Babylon, ancient and powerful city, capital of Babylonia and long famous the world over for its magnificence and luxury, is no more. Babylon, it was learned early this morning, has fallen.

"Travelers arriving today by river steamer up the Euphrates report to the British authorities here that the streets of Babylon are almost deserted, and that most of the city lies today in utter ruin, baking under a desert sun. These travelers gloomily predict, moreover, that it will be not a matter of days but perhaps of many years before Babylon will fully recover from the slump.

"In many quarters, the blame for this almost complete collapse is laid at the door of an over-fondness for luxury and vice.

"Then go on and rehash the old story of the fall of Babylon. And you could do the same thing with any story ever told."

"So that's what's been worrying you?" And the Missus sighed in deep relief. But she appeared not entirely convinced. "Could you do the same thing with Noah and the flood?"

"Simplest thing in the world," Jenks answered. "Here's how:

"WASHINGTON—and the date—A rumor, not yet confirmed, but undenied, is in circulation at the offices of the United States Shipping Board this morning that government naval experts are investigating a remarkable story concerned with the buoyancy and seaworthiness of gopher wood. As an immediate result of this rumor the price of yellowwood, sometimes popularly described as 'gopher wood,' and common to parts of Kentucky, Tennessee and North Carolina, went soaring today to levels hitherto untouched.

"No official denial was forthcoming at the offices of the Shipping Board for a report that a well-known wooden ship expert is taking passage tonight on the Liquitania, headed for Ararat in Armenia, whence this account of a remarkable test of the virtues of gopher wood arrived early this morning by wireless to Arlington.

"This story has it that a ship constructed of so-called 'gopher wood' withstood in entirely satisfactory fashion a terrific storm of 40 days and 40 nights duration, heavily laden throughout the test not only with stores and provisions for the skipper and his crew, but also with a record-breaking menagerie cargo of animals and birds of every species."

"You win," the Missus agreed. "It's just a trick, and I wish they'd stop it. If a thing happened yesterday they ought to say so."

Uncle Sam Preserves His Only Living Volcano

Mount Lassen, More Than 10,000 Feet High, Only Active Peak in Country; Bowlders, Thrown High Into Air by Eruption, Imperil Forest Supervisors

By HARRY H. DUNN

THE United States Government has lately come into possession of the only real live, active volcano between the Canadian border and the Mexican line, and one of the two active peaks on the continent of North America, the other being Mount Colima, on the southwest coast of Mexico. Since Uncle Sam took over the American volcano, it has been costing him $5,000 a year to maintain it. Now, however, if the Senate approves a measure known as the Raker Bill, passed by the House of Representatives in March, the $5,000 limit will be taken off, and the volcano given support commensurate with its standing as the only thing of its kind within the continental area of the United States.

The volcano is Mount Lassen, in the southeastern part of Shasta County, in Northern California, about 200 miles, as the airplanes of the Forest Service Patrol fly, from San Francisco. The peak, which is 10,437 feet in height, is within, though on the western edge of Lassen Volcanic National Park, approximately 81,000 square miles in area, of which only about 800 acres are owned by parties other than the government. The whole of this park, which is filled with mud-springs, geysers, boiling lakes, as well as streams and lakes of cold water, cinder cones, burned-out craters and lava beds, lies above the 5,500-foot level, and presents a greater variety of manifestations of the activities of earth's internal fires than does the Yellowstone. Because of its comparative inaccessibility, and the lack of accommodations for tourists, sight-seers and campers, however, the wonders of the Lassen Park are virtually unknown to Americans. The Federal Department of National Parks, of which Stephen T. Mather is the head, and the United States Forest Service, which has charge of the Lassen National Forest, and of which C. E. Dunston is supervisor, are prepared to provide roads, camp sites and other needed improvements, as soon as the increased appropriation for the development of the volcanic area into a national park becomes available.

Though Mount Lassen broke out in active eruptions in 1914 and 1915, and showed strong symptoms of a return to its activity in 1921, the last real explosive outburst, and the last time at which lava was expelled from the crater, was approximately 200 years ago, according to geologists who have made extensive studies of this most interesting volcano. Since the eruption of 1914-15 consisted in the main of smoke, sand, ashes and bowlders, during which a new lava plug was forced up into the throat of the crater, students believe that it will be some time before there is another explosive eruption, for the lava plug has cracked, in cooling, leaving large and wide-open vents, through which the steam and gases from the interior escape with ease. Geologists hold that, until these vents are filled by the falling back of waste material, or by the forcing up of fresh streams of lava, it will be impossible for the gases and steam so to be confined that another eruption will take place, though it is believed that the volcano will continue smoking, and, occasionally, throwing out fine ash and sand.

Thus, if Uncle Sam has to wait 200 years for another exhibition on the part of his only volcano, meanwhile expending more than $5,000 a year for Lassen's upkeep, Mount Lassen may prove an expensive pet. One of the unusual features of the recent eruption of this volcano has been that no molten lava was seen by any observer, and that no unusual heat was noticed, except that of escaping steam. This lack of heat was particularly noted in the falling of the volcanic ash, and even bowlders in the snow. Instead of melting through this snow, the ash lay thickly on top of it, while the bowlders sank of their weight through the snow, and did not melt their way through. The source of the heat which caused the outbursts of 1914 and 1915, and of the smaller outbreak of 1921, is not definitely known by any of the geologists or seismologists who have studied Lassen, but the general belief among these men of science is that the forcing upward of a column of lava, from the depths of the earth, created sufficient heat in fissure or seepage waters in the old crater, to cause the explosions which tore out a new vent in one side of the old crater. This, however, is admittedly only a theory, for man knows less about volcanic activities than he does about earthquakes.

Mount Lassen marks, at least approximately, the southern end of the Cascade Range of mountains, and is a volcanic cone, in many ways similar to its kindred, but burned-out, peaks of Shasta, Adams, Hood, Mazama, Rainier, Pit and the Three Sisters. As the whole Cascade Range is volcanic, so all the area about Lassen is volcanic, while just across the gap made by the Feather River, lie the high peaks of the Sierra Nevada, which, according to geologists, owe their height to "uplift," rather than to eruption. There are a half-dozen other volcanic peaks within 50 miles of Lassen, largely to the northward, which in times past have spewed lava freely over the landscape, but are now silent beneath caps of snow which they lift to heights of 7,000 to 9,000 feet.

Within the Lassen Park, and about 10 miles distant from the mountain which gives this reservation its name, stands the largest of several cinder cones, known as the Cinder Cone, some hundreds of feet in height, composed of a solid mound of volcanic cinders. Some 28 years ago, J. S. Diller, investigating this region for the United States Geological Survey, wrote of Lassen and of this great cinder cone, one of the largest, if not the largest, in the world, as follows:

> "The volcanic action which has built up Lassen Peak with its many associative cones is comparatively recent. It began at the close of the Ione Epoch, and occurred most violently at the time the Sierra Nevada was upheaved, but it has continued spasmodically to the present time. * * * * The latest volcanic eruption in the Lassen Peak district, and possibly, the latest in the United States south of Alaska, occurred at the Cinder Cone about 200 years ago. Some of the trees killed at the time are still standing. The lava, though very viscous, spread more than a mile from the vent, and formed a huge tabular pile, which extends across a little valley. The lava dam thus formed developed Snag Lake, which contains stumps of some of the trees drowned at the time the lake originated.
>
> "That volcanic activity is not yet extinct in the Lassen Peak district is shown by the presence of numerous solfataras and hot springs. At Bumpas's Hell, near the southern base of the peak, there are boiling mud pools, and vigorous solfataric action. Near by, at the head of Mill Creek, the sulphur deposited by such action is so abundant that attempts have been made to mine it. Similar phenomena occur in Hot Springs Valley and at Lake Tartarus and the Geyser, near Willow Lake. The Geyser is much less vigorous than formerly, and now the column of water rises scarcely a foot above its pool."

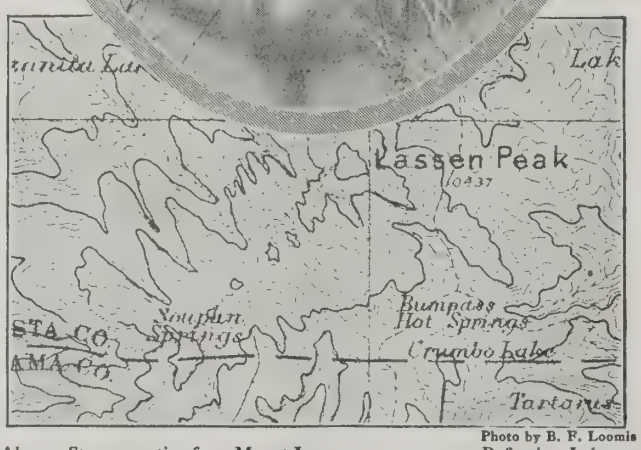


Photo by B. F. Loomis

Above—Steam eruption from Mount Lassen, as seen across Reflection Lake, a beautiful body of cold water within the Lassen Volcanic National Park. Below—Lassen Peak and vicinity, from U. S. geological survey of 1882-84, the latest obtainable.

Since the eruption of 1914-15, however, the Geyser has increased in height and volume, and is understood to be still gaining, probably because it is one of the outlets for heat, which otherwise would produce eruptions in the ancient crater of Lassen. Lake Tartarus, an interesting feature of the newest national park, is a pool of hot water, boiling over the vents from which it arises, and uncomfortably hot. From the great lava flow which came from the Cinder Cone so many years ago, today flow a number of streams of clear, ice-cold water, later uniting to form voluminous rivers.

The Cinder Cone itself—in fact, nearly all the cinder cones—are now covered with grass, some of them with small trees, and, in a few years, will be merely huge, rounded hills, whose source and character are known only to geologists. In the other mountains surrounding Lassen, but dwarfed to the size of foothills by comparison, are ancient craters, probably active before the Cinder Cone gave out its flood of molten lava, and none of them now showing signs of activity. With all these "infernal attractions," as one geologist said, within the area of the Lassen National Park, the peak, with its occasional wisps of smoke and steam, remains the center of interest. In other words, the park is the peak, and the peak is the park. In view of this, a description of the crater, by a member of the Forest Service, who actually looked down into the mysterious pit between eruptions, on June 4 and 5, 1914, is of unusual value. The United States Forest Service maintained, at the time of this eruption, and still maintains a fire lookout house almost on the summit of Mount Lassen, and the new vent, broken out from the old crater, burst forth about one-quarter of a mile from this lookout house, while Ben Macomber with two other foresters, Boerker and Abbey, remained in this flimsy shelter, almost on the rim of the crater, overnight. Here is Macomber's description:

"When I saw the crater on Lassen on June 4 and 5, the vent, by an engineer's tape, measured 275 feet long."

Imagine a man calmly measuring a volcano's mouth while the volcano was in eruption! But the forester continues:

"It (the crater) was then in one of the pauses between the heavy explosions. Thick volumes of steam, laden with sulphur smoke, were rising, and cracks were appearing in the ground. From three different places on the edge, I looked down into the crater. Sixty or 70 feet down, a pile of rocks was visible in the center of the vent, but at either end was a large dark hole from which the steam poured in clouds. The walls were absolutely perpendicular and around the top were *hung with icicles,* formed by the condensation of steam in the chill air of the peak.

"On the west side of the crater, everything was buried beneath a heavy fall of light gray ash, into which we sank over our boot tops. So light was this rock powder that it flew into the air at every step. On the east side, the same material seemed to have been thrown out in the form of mud, and lay frozen, hard as a rock. What little snow remained near the crater was buried under a layer of stones and bowlders. The larger bowlders had sunk down into the snow, creating many treacherous pits."

W. J. Rushing, then forest supervisor for the Lassen National Forest, bears witness to Macomber's feat when he says:

"At 8:05, June 1, 1914, a second outburst occurred, throwing out large quantities of sand, rocks and mud. Some bowlders weighing all of a ton were thrown out. The vent was enlarged (from 25x40 feet on May 30) to 60x275 feet. Boerker, Abbey and Macomber went up June 4, and remained on top in the lookout house overnight, and came back June 5."

Forest Ranger Abbey, on June 12, went back, with a party of five, when, "as we were climbing upward, half a mile from the crater, a mass of ashes and bowlders shot with a great roar into the sky above. Immediately, stones began to fall about us, and 300-pound bowlders began to drop a short distance above, bounding down the mountain side toward us." A motion-picture operator set up a camera and "took" the eruption.

Above, left—One of more than 100 entrances to the vast lava caves which run for miles through the lava beds of Lassen Volcanic National Park. Out of these caves flow at least three considerable rivers, and the caves never have been explored. Indians in large numbers once lived in them, and they are now inhabited by mountain lions, wolves and bears. Above, right—Mount Lassen from an airplane of the U. S. Forest Service Patrol.

Writing a Tariff Bill

THE real story of how Congress writes a tariff bill into law is, or ought to be, interesting to every consumer, for every American, young or old, little or large, is a consumer, and every commodity of the many thousands that Americans eat, wear or consume in any way is touched by the tariff, that touch usually meaning an increase in its cost to the consumer.

Under the Constitution of the United States, all revenue measures—a tariff act is a revenue measure—must originate in the House of Representatives. Therefore, it was, of course, in the House of Representatives that the McCumber-Fordney bill, now before the United States Senate, had its origin.

The first stage of the enactment of the pending bill began on January 6, 1921, when the Ways and Means Committee of the House began open hearings preliminary to what was announced would be a "permanent revision" of the tariff. These hearings continued for about three weeks, during which several hundred—probably two thousand in all—interested persons were heard. Of course, each individual appearing had an axe to grind. He or she—for women were among those appearing—wanted either a high duty, a low duty or no duty at all on the particular commodity about which he or she appeared. Those who appeared journeyed from far and near, coming from every state and from some of the insular possessions as well as Cuba.

After the hearings had been completed and several thousand pages of their record had been printed, following the long-established custom, the minority members of the Ways and Means Committee—in this Congress they are the Democrats—were excluded, and the 17 majority, or Republican, members, headed by Representative Joseph W. Fordney, of Michigan, were divided into some half-dozen subcommittees. To each of these subcommittees was assigned the task of fixing the rates and writing the one or more of the 14 dutiable schedules, the free list and the administrative sections of the bill. One of these subcommittees, usually numbering three majority members of the committee, would write the wool schedule, another the metals schedule, and so on.

When the subcommittees had finished their tasks, the full majority membership was called together by the committee chairman, the subcommittees submitted their reports, and the bill was written. Maybe those who formed one of the subcommittees knew something about what was in the schedules the other subcommittees had written, and maybe they did not—often they did not.

Now to pass a measure of such importance and containing so many items as a tariff bill through the House under the ordinary rules of the House would require something like a short lifetime, so to expedite the bill's passage, the Rules Committee of the House was applied to for a special rule, suspending the regular rules of the House and permitting the bill to be put through under suspension of the rules, or a "gag" rule, as such a suspension of the rules is usually termed by those happening to be in the minority, and therefore the victims of such rule. In the case of the Fordney bill, as the pending measure was known as long as it was still in the House stage, only two weeks was allotted for consideration before it was put upon its final vote, and until amendments that had been referred to and reported out by the Ways and Means Committee were all disposed of, no amendments were allowed to be offered from the floor. The Ways and Means Committee majority saw to it that there were enough such committee amendments to consume the entire two weeks allowed for consideration of the bill. In fact, when the two weeks had lapsed and the final vote required under the "gag" rule was taken, there were committee amendments still pending, so that general discussion of the bill was never permitted, and no amendments that individual members of the House may have wished to offer were ever considered. In that way, the House passed and sent the bill to the Senate.

When the Fordney bill reached the Senate, it was referred to the Finance Committee, of which the late Senator Boise Penrose, of Pennsylvania, was then chairman. There the formality of open hearings was gone through just as it had been in the House Committee. These closed, again the minority members—still the Democrats—were excluded, and the majority, or Republican members, sat themselves down to write, or rather rewrite the bill. The only departure from the plan the House Committee adopted was that the majority members made themselves a single committee-of-the-whole instead of dividing into subcommittees, so that all of the schedules were considered, and rewritten, by the same committee. This accounts in some measure for the fact that it required the Senate Committee so much longer to rewrite the bill than it had required the House Committee to write it in the beginning. The sessions of the majority members of the Senate Committee at which rates were fixed and the House bill rewritten were supposed to be secret, and outsiders were supposed to be excluded, but as a matter of fact, scores, even hundreds, of persons who wished to be heard found their way into the committee room by one means or another, usually as a "courtesy" to the Senator whose constituent the person applying happened to be.

After months of work in committee, the bill was finally reported to the Senate by the Chairman of the Finance Committee, Senator McCumber, who succeeded to the important post of the late Senator Penrose, and it is still there. Supposedly, it is being delivered upon in the Senate chamber at this time, and it is being considered after a fashion. It is being debated anywhere from six to twelve hours daily, and is likely to be debated for many, many weeks, for under Senate rules, unlike those of the House, debate may not be limited save by a two-thirds vote, and that the majority can't muster. But regardless of the importance of the item under consideration, or how important the industry affected by the proposed rate of duty, it is an actual fact that there are seldom more than a dozen Senators on the floor during the debate, and, frequently, the number does not exceed a half-dozen. Chairman McCumber, in charge of the bill, and Senator Smoot, next ranking Republican member of the Finance Committee, who probably knows more about what is in the bill than anybody else in either House, may usually be counted upon to be in the chamber, while on the other side, Senator Simmons, ranking Democrat on the Finance Committee and leading the fight against the bill, is usually on hand, and present with him most of the time are Senators Jones, New Mexico, and Walsh, Massachusetts, other Democratic members of the Finance Committee, and King, of Utah. These Senators and Senator Curtis, Republican whip, whose duty it is to shoo Republican Senators in from the cloakrooms when a vote is about to be taken, are about the only Senators who are present during the major part of the time the bill is being debated. But when voting time comes and the bell is rung, in flock the Senators from the cloakrooms, the Republicans to vote as they are told to vote by Senator McCumber, or Senator Smoot or Senator Curtis, and the Democrats to vote as their leader, or leaders, tell them they should vote. Sometimes they know and understand what they are voting about, but more often they do not, or at least it is difficult to understand how they can or could know, because for the most part, the cloakroom is about as near as they get to the subject that is being debated until the bell rings and voting time arrives.

That is how it happens that a tariff bill is written by a few men, and is rewritten by an even fewer number. The Ways and Means Committee of the House, where the bill is written, numbers 25 members, of whom 17 are Republicans and eight are Democrats. Nine constitute a majority of the majority, and may dictate the bill. Under the House "gag" rule methods, what these nine say shall be in the bill is usually what is in it when it is passed. Then it goes to the Senate and there referred to the Finance Committee, which numbers 16 Senators, of whom 10 are Republicans and 6 Democrats. There, six are a majority of the majority. They write, or rather rewrite it, and it goes to the Senate. The bill is changed in the Senate and to adjust these differences, it is sent to conference. For the House, the three ranking majority and two ranking minority members of the Ways and Means Committee are named; on the part of the Senate, the relative ranking members of the Finance Committee are named. The six majority members of the two committees iron out the wrinkles and a party vote adopts it.

BRIEFLY TOLD

The cabrogoya, a huge lizard attaining a length of four and one-half feet, is found in Ceylon. It is beautifully marked and its skin when tanned affords a fine leather of excellent wearing quality and waterproof. It is used for making women's shoes.

A new rotary spray pump weighing but 59 pounds is expected to revolutionize orchard spraying. It is declared that the machine, running at normal speed, can deliver from 300 to 500 pounds pressure and will distribute from 20 to 35 gallons of material a minute.

A New York specialist on mental and moral disease, declares that "smoking for a woman is a sign of degeneration. It is a brand of moral instability."

There are 3,500 persons in the United States more than 100 years of age.

The American Bible Society, Astor Place and Fourth avenue, New York City, now publishes the Bible in more than 700 different languages and dialects. Where savages have no written language the missionaries hit on the scheme of "phoneticizing" the spoken language and then translating the Bible into this phonetic language.

The inhabitants of a vast region in the arid interior of Australia are still in the stone age and an effort is being made to keep them there. Sixty-five thousand square miles have been set apart as a sanctuary for the natives and no white men are allowed to enter the sanctuary. These natives fashion their rude weapons and implements of stone and wood, and are entirely ignorant of the use of metal. Cannibalism is still in full force among the natives of the Everard ranges and they have to be constantly on the march to obtain food.

Wireless telephone operation across the English Channel has made possible continuous communications between English shore stations and flying planes in the Brussels-Paris service, and is particularly helpful in heavy fogs, as orders or explanations of conditions at landing fields can be conveyed to pilots of aircraft.

The Boy Scout movement originated in England.

A new machine for reducing oil from shale rock is at work near Denver. The invention is a series of revolving retorts, heated by oil burners. The shale rock is dumped in the hopper and comes out at the rear of the machine as black dust made up of hydrocarbons of high commercial value. According to the president of the Colorado School of Mines, the invention will revolutionize the oil industry.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

A new aluminum alloy has been developed which is sold under the name "silumin." It is the invention of a German and contains 11 to 14 per cent of silicon and 86 to 89 per cent of aluminum. It is unaffected by wet steam and resists concentrated nitric acid better than aluminum. The alloy is made from its elements in the electric furnace or directly.

It is estimated that about $8,000,000 is invested in fox farming in the United States alone.

A prize of $5,000 has been offered by the city of Trujillo, Peru, for the best small model for a monument to Liberty, 60 feet high, to be erected in the principal square as a memorial signalizing the centenary of the declaration of Peruvian independence.

Sand dunes are forming over a large area north of Winnemucca, Nevada, and the vast field of dunes is slowly traveling eastward. In certain spots the telegraph poles have been buried so deep that they have had to be spliced to keep the wires above the sand.

A porpoise will devour its weight in fish every 48 hours.

Fires in the peat bogs of Minnesota continue the year around. Buried under the snow in winter, the fires smoulder, and in spring their presence is made known by the smoke which sifts through crevices in the baked soil.

A great white way between New York and Chicago is to be built to guide night fliers in the mail service. Great beacons are to be installed not more than 25 miles apart and at Chicago two immense fields suitable for night landing are to be built.

County agents of California have the rank of assistant professors in the university and are entitled to all the rights and privileges of the resident teaching force. One county agent who has served eight years has been granted sabbatical leave. He will travel in Europe studying rural co-operation.

Blast-furnace slag as a material for concrete road construction is to be tested by the Bureau of Public Roads. At various parts of the country great quantities of slag are to be found at blast furnaces and tests will be made for resistance to wear, water absorption, strength and general utility. Test roads built with slag as the coarse material will be built in various parts of the country and reports will furnish information which can be fully relied upon.

The Brotherhood of Locomotive Engineers are investing $200,000,000 in West Virginia and Kentucky coal mines which have a capacity exceeding 6,000 tons a day. The Coal River Collieries is the new company and it is owned by hundreds of locomotive engineers throughout the country. They plan to retail the coal to railway men and other workers in the large cities throughout the United States. Miners will be paid adequate wages.

There are four mutual savings and loan associations engaged in co-operative banking in Spokane, with 12,000 depositors, and $6,000,000 in savings accounts. The dividend disbursements of July 1, were $135,000 or five per cent annually.

Alaska has 1,000 automobiles. Three years ago there were only 201.

For the first time in the history of the Vatican, the papal housekeeper is a woman. The present Pope brought his mother's old maid to the ancient buildings. The Cardinals protested. "I shall set a precedent for my successors," said Pius XI.

Albert D. Lasker, head of the United States Shipping Board, was born in Germany and is a member of the American Jewish Committee, the ruling body in American Jewry.

Food cards are to be distributed to children and women with babies in certain centers in West Virginia and Pennsylvania where industrial strife has brought misery. The food is to be distributed by the Quakers.

Two or three hundred farms containing 20 acres each are to be laid out in eastern North Carolina as Farm City. These farms are to be sold to men and women of means, who are weary of schoolroom and office and eager for an independent farm home.

MAKE THIS YOUR JOB!

THE DEARBORN INDEPENDENT is your paper. It is published not for profit, but for service. You believe in this magazine and its aims—that's why you subscribed.

Has it ever occurred to you that your friends and neighbors, your business associates, your fellow workmen would also like to receive THE DEARBORN INDEPENDENT? The more readers we have, the greater is our influence and power for good. Urge them to subscribe. The local Ford dealer will gladly forward any subscriptions you obtain, or you can send them direct.

THE DEARBORN INDEPENDENT has established a name for itself as one of the most fearless, independent and progressive papers published. It should be read by everyone who believes in the maintenance of American institutions and their advancement along sound, progressive lines.

MONKEY TO MAN

What Does Science Teach?

CHRONICLER OF THE NEGLECTED TRUTH

Monkey to Man!—Does Modern Science Hold It?

A Symposium on the Origin of Man in Which Students of Science and Religion in Representative Institutions of Learning Give Their Views

By A. S. GREGG

DID Man slowly evolve from the lower forms of animal life or was he created fully developed as he is now, by a direct act of God?

A good deal of ignorance, inaccuracy and bigotry has been displayed in this dispute, and for that reason the writer has undertaken to ascertain and set forth the conclusions of scientific leaders in a representative group of colleges and universities, for the benefit of the "man in the street."

Five questions were submitted. The replies given in this symposium are from students who have earnestly investigated evolution in the light of reason and revelation. They are truthseekers of the most advanced type, and are representative of the educators in denominational, state and private institutions who are shaping the thought life of coming leaders in industry, education and religion. What they say is entitled to the highest consideration.

The institutions represented in this inquiry include Boston University; New York University; Stanford University; St. Vincent's Archabby, Beatty, Pennsylvania; Temple University, Philadelphia; Oberlin College, Oberlin, Ohio; Arkansas Baptist College, Little Rock, Arkansas; University of Michigan, Ann Arbor, Michigan; Pennsylvania State College; Lynchburg College, Lynchburg, Virginia; University of Kentucky; University of Vermont; Nebraska Wesleyan University; University of Utah.

The Five Questions

1 As far as you have observed, do reputable scientific investigators hold that Evolution postulates the ascent of man from the ape (the sense in which "Evolution" is commonly conceived by the people)?

2 Did Darwin ever teach that, or did he merely advance it as a speculative hypothesis?

3 Has not post-Darwinian scientific research greatly modified the earliest Darwinian tendencies?

4 Has science ever found sufficient ground to declare that one species has become another species? Have not most of the advances in knowledge been made in the region of development of species within their natural limitations?

5 Are not Mr. Bryan and the clergy who are opposing him both wrong in so far as they confine their discussion to the Darwinism of 30 years ago?

ROBERT A. BUDINGTON,

Department of Zoology, Oberlin College, Oberlin, Ohio

1. No one acquainted with the general field in which evolution has occurred postulates that present-day man has ascended from the present-day ape, or from any members of the Anthropoidea below the family Hominidae (men). Such a doctrine would assume that the apes have remained stationary during the age-long changes which man has experienced; the only reasonable supposition is that both have taken part in their wide diversion from the type of their common origin. That their origin was the same is wholly reasonable and probable.

2. Darwin did not teach that present-day man is a descendant of any present-day animals, which would thus be considered man's ancestors. He, of course, did teach a common ancestry of man and the other Primates—holding essentially the same view as is held by any evolutionist today. You ask, "Did he merely advance it as a speculative hypothesis?" to which one must always allow that the doctrine of evolution will always be a hypothesis, but with such a body of evidence in its favor as to make it as convincing as a fully known matter of fact.

3. Post-Darwinian scientific research has assuredly greatly modified the earliest Darwinian doctrines. (I am not sure what you mean by "Darwinian *tendencies*" in this third question.) The idea of evolution as a historic biological occurrence greatly antedated Darwin, of course; Darwin merely offered a big contribution to the answer to be given to the question—"What factors contributed to and brought about organic evolution?" It is true that some factors in this process, considered causal by Darwin, have now been largely discredited by recent scientific research; for example, his adherence to the so-called "pangenesis" theory of inheritance.

4. You ask—"Has science ever found sufficient ground to declare that one species has become another species?" I think there is abundant evidence that this has occurred, through mutation. In this connection one must guardedly refrain from confusing species with genera; and there is much danger of confusion due to essential disagreement as to a definition of the term "species." But in any case we know that numerous instances are well recognized of new types being derived from the same parent stock, each with its own characteristics and *breeding true,* without tendency to return to the parent type; such types maintain their identity even when cross-bred with the parent stock.

5. You ask, "Are not both Mr. Bryan and the clergy who are opposing him wrong in so far as they confine their discussion to the Darwinism of 30 years ago?"

Darwinism and evolution are not the same thing. The former is only a doctrine as to the factors which, by their actions and reactions on organic material, resulted in evolution; while the latter is the doctrine of descent of the "higher," more complex (anatomically, physiologically, mentally) organic forms from the "lower" and simpler forms—a theory entertained for centuries, at least since the time of Empedocles (495-435 B. C.). The evidence in favor of evolution is more abundant than ever today, and the acceptance of the idea is immeasurably more general, among thinking, informed people, than at any previous time.

Many of the contributions of Darwin are as credited today as ever; but some of his contentions as to the factors active in bringing about evolution are no longer tenable.

If I understand Mr. Bryan, he is not especially criticizing the teaching of Darwin, but rather he is taking leave of the whole idea of evolution so far as it involves man; I believe he is not specially offended by the contention that all other animals may have experienced a history involving progression, an evolution from good to better. Only in the case of man has there been an inhibition of improvement, imposed upon an unnatural origin.

I trust you have seen the excellent articles by Dr. Henry Fairfield Osborn, of the American Museum of Natural History, and by Professor Edwin Grant Conklin, of Princeton University, in the special feature section of the New York *Times,* for an early Sunday in March; I regret I cannot now give the exact date. They are replies to Mr. Bryan, and are worthy of wide reading.

HAROLD R. HAGAN,

Head of Zoology Department, University of Utah, Salt Lake City, Utah

1. No.

2. Darwin did not teach that, nor advance it as an hypothesis.

3. Yes, Darwinian theory of evolution was based on natural selection. It is no longer believed that natural selection originated species but merely causes their survival.

4. In answer to this question may I earnestly request that you read the two following books:

"Readings in Evolution, Genetics and Eugenics"—by H. H. Newman, chapters I to XV.

"Theory of Evolution."

5. I have not yet received a verbatim copy of Mr. Bryan's opposition to the teaching of evolution, nor do I know the stand of the clergy. I do not see any reason why they should be incompatible or why there should be disharmony between religion and science.

C. L. BRISTOL,

Professor of Biology, New York University, New York, New York

1. No reputable investigator has held that Evolution postulates the ascent of man from the ape in the sense that the man in the street interprets Evolution.

2. So far as I know, Darwin did not teach it, nor did he advance it as a speculative hypothesis.

3. Recent research has modified some of the earliest notions of Darwin and most of the modifications have been constructive. It is an eloquent proof of the grand features of Darwin's theories, that advances in research have contributed to them instead of destroying them.

4. It has been urged that no change from one species to another has actually been observed. Read Huxley on this point. But, evidence is so abundant that this has been the ordinary process in times past, that we are forced to accept it. The nature of the evidence is unmistakable, though it is circumstantial, and not direct.

5. The sad thing about Mr. Bryan and his colleagues is that they have not kept up to the times in their discussions. My students have expressed themselves several times thus. If Mr. Bryan only knew this fact, would he take his present position?

I hope that you may be able to enlighten the man in the street of the present stand of science in this matter. You may be able to do it better than one of us.

STANTON C. CRAWFORD,

Department of Biology and Geology, Lynchburg College, Lynchburg, Virginia

As far as I have observed, reputable scientific investigators do not hold that Evolution postulates the ascent of man from the ape. Darwin was only offering a possible explanation when he spoke of this ancestry, and was wholly surprised at the attention given to his speculations. Post-Darwinian research has left the old "Darwinism" in the background, and modern "Evolution" is not Darwinism.

Our artificial method of designating "species" makes it possible to say that in a few famous cases under observation one species has become another species. But probably no change from one fundamental species to another has been observed among living forms. Indeed, it is not to be expected that such a change may be *observed,* so gradual are the transformations. The observed changes are among varieties, not species.

Those who oppose Evolution usually do so by railing against Darwinism, and in so doing, hit at a man of straw, for modern Evolution, as noted, is not Darwinism.

A. FRANKLIN SHULL,

Department of Zoology, University of Michigan, Ann Arbor, Michigan

1. Reputable biologists hold that man has ascended or descended, whichever you prefer to say, from an animal that was near enough like both man and the anthropoid apes to be the ancestor of both of them. It is hardly correct to say that they hold man to have come from the apes for that would mean that the apes have remained unchanged while man had evolved from them.

2. Darwin advanced this idea as a hypothesis although at the same time I would be willing to say that he taught that doctrine. I cannot quite see the difference between teaching a thing and hypothecating it, for the advancement of a hypothesis is, in a sense, teaching.

3. A number of things that Darwin taught have been modified by subsequent research but this statement will mean nothing whatever unless it is specified what those things are. The principal fundamental tenet of evolution remains firmly established.

4. It would not be quite true to say that one species has become another species. Certain members of a species have become changed and their changed nature is transmitted to their descendants and subsequently it might happen that all of the old unchanged members of the species perish. This would leave the new species a successor of the old one without the old species having produced in its entirety the new species. The second part of your fourth question is not specific enough to mean anything to me.

5. I would not want to say that Mr. Bryan and the clergy are "wrong" by confining their discussions to the Darwinism of 30 years ago. It is their right to do so if they make it clear that that is what they are doing. Whether it is desirable to discuss Darwinism of that period without taking into account the modern work is another question. I do not think you are raising that question.

LEONA L. BURLINGAME,

Department of Botany, Stanford University

Stanford University, California

1. It was the view of Darwin, Huxley, and other earlier writers that the similarity of structure between man and the higher Primates shows a "community of descent." By this they had no intention of asserting that man has evolved from any living anthropoid but merely that apes and man trace back to a common ancestry.

2. Today scientific men interested in researches of this character recognize that more recent discoveries of fossil remains of man all tend to confirm this hypothesis. The question at issue is, of course, largely one of whether one may employ the same processes of reasoning concerning the origin of the human race as he uses concerning the lower animals and plants. It is today, as it always has been, a hypothesis or, perhaps, a theory to account for the *observed facts* that three or possibly more species of men have existed on this earth within recent geological time.

3. The answer to the third question as to whether we have evidence showing that one species has become another depends for its answer very largely on how one defines the term species. It is the everyday experience of the geneticist that he makes new combinations of hereditary characters. Sometimes he deals with those which in nature differentiate recognized species of the systematist and more frequently with those which belong to so-called varieties. In a few cases new "sorts" of animals or plants have been made by combining characters from different genera. One of the most noted and successful is that made by Dr. Orton, whom you may remember having been here a few days ago. He crossed a watermelon and a citron and from the offspring selected and established the plant which now produces the southern "watermelons" which are sold on the northern market. Many other illustrations of the same sort might be cited. Whether this is to be considered as the origin of one species from another obviously depends on the definition of species.

4. Whether Mr. Bryan and the clergy who oppose "evolution" are wrong or not depends on whether one regards a reasonable interpretation of facts more or less probable than the literal interpretation of the Old Testament. Practically all modern Biblical scholars reject such an interpretation of the Scriptures. It would seem therefore that the dispute is largely one between two schools of theology. The scientist regards evolution of organisms, including man, as more probable than special creation but he does not, so far as I know, teach it as anything other than a matter of logical probability.

L. H. MURLIN,

President of Boston University,

Boston, Massachusetts

1. No.
2. Purely a "speculative hypothesis."
3. It has.
4. The latter part of this paragraph is the correct answer to your question.
5. They are, absolutely.

There is not the slightest conflict between the Bible and the acceptance of theistic evolution. Darwin never pretended to be a philosopher nor a theologian. He advanced only a scientific hypothesis. Herbert Spencer based a little philosophy and much science on the Darwinian theory. Borden P. Bowne exploded the Spencerian philosophy 25 years ago.

Even the acceptance of the theistic theory of evolution is not final; it seems, however, to be a perfectly natural and reasonable exposition of the way in which the Divine activities have expressed themselves. Nor does it by any means mean that man came from the monkey instead of coming from the garden.

THADDEUS L. BOLTON,

Professor of Psychology, Temple University,

Philadelphia, Pennsylvania

1. It is my opinion that the reputable biologists do not hold and never have held that man is a direct descendant of the apes. The prevailing opinion is that man and the apes can trace their ancestry back to a form of life much more primitive than either that was the common ancestor of both. The popular opinion that man is descended from the apes is attributable to aspersions that were cast against Darwin in the long religio-scientific controversy that went on in England before 1883.

2. My opinion is that Darwin taught that man and the apes had a very remote common ancestor. The apes and monkeys are rather degenerate representatives of this ancestor while man is a highly evolved creature belonging on a plane far above his remote ancestor or his distant relatives, the monkeys.

3. Post-Darwinism has modified very much the suggestions thrown out by Darwin himself. To use a common phrase, much water has run under the mill since his day. The modification is, however, strongly in the direction that there has been evolution. The problem is now to work out details showing directions of evolutionary change.

4. Some biologists hold that there is much ground for declaring that species are mutable and that one species has been shown to arise from another. Professor Bateson, of England, seems to hold that there is not sufficient ground for such claim. I myself have seen a salamander change sufficiently in one generation under experimental conditions to make the animal difficult to identify even by persons expert in their knowledge of this creature.

5. It seems to me that the discussion should cover only, at least especially, the position of biological science of today. Darwin should be read in his original books, and the writings of the great men of today—Osborn, Conklin, Thompson, Davenport, Haeckel, Wiedersheim, Brooks, Loeb, Wheeler, and so on—should be the basis of the discussion. Let Mr. Bryan and the clergy go into the laboratories, the experimental gardens and the breeding stations and spend months in close observance of what is being done. In that way they may know. Science is not a matter to be got by reading alone; it must be studied at first hand in the laboratory and the experiment station.

BARRY O'TOOLE, Ph. D., S. T. D.,

Professor of Theology at St. Vincent's Archabby, Beatty, Pennsylvania, and Professor of Biology at Seton Hill College, Greensburg, Pennsylvania

1. To the best of my knowledge, all modern zoologists and anthropologists have completely abandoned the theory of Man's direct descent from the ape; but very many scientists still continue to uphold the so-called Theory of Indirect Descent. In other words, the modern theory regards man, not as a descendant of the monkey, but as the offspring of some undiscovered bestial ancestor of the Tertiary period, common to apes and men.

2. Charles Darwin categorically taught the descent of Man from the Monkey. To quote his own words from the second edition of the "Descent of Man": "The Simiadae then branched off into two great stems, the New World and the Old World monkeys; and from the latter, at a remote period, Man, the wonder and glory of the universe, proceeded." ("Descent of Man," 2nd edit., chap. vi, pp. 220, 221.) Note that he does not say "probably"; his language is not the language of hypothesis, but of unhesitating affirmation.

3. Post-Darwinian research has tended not so much to modify, as rather thoroughly to discredit classic Darwinism. It may now be regarded as an obsolete system, whose value is historic rather than scientific. To quote from William Bateson's presidential address of 1914: "For us that debate stands adjourned. We go to Darwin for his incomparable collection of facts. We would fain emulate his scholarship, his width, and his power of exposition, but to us he speaks no more with philosophical authority. We read his scheme of evolution as we would those of Lucretius and Lamarck, delighting in their simplicity and courage." (Heredity, Presid. Add. to British Assoc. for Advanc. of Science, cf. Smithson. Inst. Rpt. for 1915, p. 365).

4. Science has so far failed to unearth any experimental evidence of the origin of one species from another. The nearest approach to an experimental proof has been the observed origin of mutations, but these new mutant forms have proved to be new varieties, not new species. Moreover, none of the known mutant forms would be capable of survival in the wild state, and owe their preservation exclusively to artificial conditions. On the other hand, Comparative Anatomy and Paleontology appear to offer a considerable amount of inferential evidence in favor of evolution. But such evidence, however persuasive, can never become conclusive until supported by experimental proof. Besides, the cogency of the inferential argument, which deduces the common ancestry of forms from their resemblances, is greatly diminished by the counteractive force of a threefold objection: (a) the existence of numerous instances of convergence proving that resemblance is perfectly compatible with independent origin, and does not necessarily presuppose common ancestry; (b) the absence of intermediate species to bridge the gaps between the fossil genera; (c) the persistence, throughout enormous lapses of geological time, from the very earliest periods down to our own day, of unchanged forms, such as the horseshoe crab, the worm and the brachiopod lingula, which seems to be incompatible with a general law of evolution.

5. Mr. Bryan is right in his opposition to Evolution envisaged as an atheistic and materialistic philosophy, but like all ignorant defenders of a good cause, he is likely to do it more harm than good.

JOSEPH A. BOOKER,

President Arkansas Baptist College,

Little Rock, Arkansas

1. In one way or another, I have studied the doctrine of "Evolution" very earnestly and some times critically. I have not only studied Darwin, but Spencer as well, and have also studied Mother Nature and her children, and her workshop and methods. I am therefore giving you the positive "No" to the first question. I have always thought that even Darwin himself was misinterpreted by the ordinary reader,, and misrepresented by the careless reader. Darwin has never asserted that man originated from the monkey. He simply laid down such an hypothesis, which he confessed that he could not prove till he had found the "missing link" between man and the monkey. The last heard of Darwin was, he had failed to find that "missing link." Hence his hypothesis remained unproved.

3. As the second question is answered in the first answer given above I am dismissing number two and passing to the third. Post-Darwin scientific research *has greatly modified* the earliest supposed theory of Darwin. But there are very few real students found among the fighters on either side, hence the "war of words" has gone on apace for the past generation or more without real scientific results.

4. Science has never seemed to find sufficient grounds to set forth the doctrine that one species can become another species. And here is an important point which the ordinary debater on the subject seems to have overlooked. Furthermore, Spencer's doctrine of evolution gains its point right there. Spencer believes in the evolution of things from their own species; that all the progress of nature and of peoples is carried on in that manner. Perhaps Darwin believed the same, after he failed to find the "missing link"; but neither side has stopped, it seems, to "hear the conclusion of the whole matter" in Darwin's latter days.

5. I am very slow to pronounce anybody right or wrong on a question of hypothesis; even on a question of doctrine, wherein there may be proof very conclusive on both sides. But it does seem to me that a little more scientific toleration, like a little more religious toleration, would work wonders. It would be another illustration, that "politics (common belief in things) makes strange bedfellows." The truth is, very few of us "know" anything much about the world of nature around us; we are just beginning to get our eyes open upon the great and inexhaustible wealth of knowledge of nature and of science. We should rejoice to become fellow-students rather than fellow-soldiers, in our search for conclusive knowledge.

H. F. PERKINS,

Professor of Zoology, University of Vermont, Burlington, Vermont

1. Yes. It should be understood that the ancestor of man was not necessarily very much like any existing species. Evolution has had a chance to work downhill or along parallel roads in the line from which man may have originated just as much as in an uphill direction with man himself.

2. Darwin believed and taught that an *ape-like* ancestor had given rise to the human race. It was more than a speculative hypothesis with him as with modern biologists.

3. Yes, but not particularly this human ancestry aspect of it.

4. Yes, many times. (b) Perhaps so, recently, at least.

5. Decidedly yes.

EDWIN ERLE SPARKS, Ph. D.,

President of Pennsylvania State College

1. The ape is a hazard and little concerns the great law of evolution.

2. An hypothesis. Only a possible link in the chain. Just as well say the amphibious animals or the primordial germ.

3. Naturally.

4. Evolution of a new species has been explained by many theories; none satisfactorily. Perhaps we shall never know. "For who by searching can find out God?"

5. Far be it from me to criticize either Mr. Bryan or the clergy (scientists?). I see no reason for any conflict. Granted that there be a law known as evolution, who made that law? Granted that there is a common origin in the primordial germ, who made the germ? A creating cause is inevitable to those who consent to read with their eyes and minds rather than their prejudices.

I. B. SCHRECKENGAST,

Chancellor, Nebraska Wesleyan University, University Place, Nebraska

1. So far as I know, no reputable scientist thinks that man is descended from the modern ape. The ape is himself a specialized development from certain simpler forms of life. Back somewhere nearer the trunk of the tree, the ape branched off. The relation of man to the ape would be like this—instead of going directly from the end of one limb to the top of the tree, you would go down the limb to the trunk and up the trunk to the top.

2. I am not a specialist on Mr. Darwin's teaching. I have read his book but his writings are very voluminous and I do not want to attempt to interpret him as a whole.

3. It is my understanding that modern evolutionists have abandoned much that Mr. Darwin suggested. His great contribution was a conception of evolution as a whole.

4. I do not know.

5. Without any doubt.

From my point of view, Mr. Bryan is very unreasonable in his suggestion that either evolution is wrong, or Christianity is wrong. The papers reported him in Lincoln as saying that if you accept evolution to eliminate the supernatural, you destroy the Bible and you destroy the deity of Christ. To my mind that is silly. Evolution is simply a mode of divine procedure and is just as dignified and worthy of our conception of God, as the special creation theory. From the Christian viewpoint, evolution brings God into the world instead of putting him out of it. I conceive of God as present in every step of the process. Evolution requires very little religious adjustment in our interpretation, even of the Bible, and how it can affect the divinity of Christ, is a mystery to me.

FRANK L. McVEY,

President, University of Kentucky, Lexington, Kentucky

1. Answer is No.
2. Answer is neither.
3. Great modifications have taken place.
4. Answer is No.
5. Answer is Yes.

The Strikes and the Country

UP TO the moment this is written the country has never seen a menace of industrial breakdown so incompetently handled by the Federal Government, as are the twin strikes of the coal miners and the railway men. Hesitancy and uncertainty, contradictory attitudes, have marked every statement and every move, the Administration appearing to be swayed by any and every advisor that got its ear. At this writing Fuel Administrators have been appointed, which cannot be interpreted as anything but a surrender before a defeat. The American people must regard with chagrin the feeble hands that grope and fumble around the nation's helm.

The Government itself is "in wrong" to begin with. It was with Government approval that the railway workers' wages were lowered when it was absolutely certain that such an act would precipitate a strike and a tie-up. An agency of the Government undertook to do the dirty work of the railway owners, to give a corporation act the aspect of a Government edict, and now that the strike has come, there are United States officials silly enough to say it is a strike against the Government! Committed to the railway owners' side of the wage disputes, the Administration must back up its folly, or repent—and repentance is about the last thing to expect in affairs of this kind.

And not the Administration only, but the associated powers of wealth and exploitation must share the very serious responsibility. There is no doubt at all that this strike is part and parcel of the process of "deflating labor" which was begun so deliberately and carried on so heartlessly at the close of the war. It is even now being whispered across the country, as a kind of secret campaign argument, that manufacturers —especially manufacturers—must be patient with the present destructive situation because it is only part of "the program of putting labor where it belongs." It is openly charged in various reports in the hands of the President that these strikes were desired by the owners of railroads and mines. The strikes were desired by the railroad owners because they would encourage by fair means or foul the government purchase of the roads. And the strikes were desired by the mine owners because of an intolerable condition which has been fastened on coal mining. The railroads are so decrepit that even Wall Street has discarded them in favor of the movies, as investment propositions. Coal mining has been so separated from the public by a brokerage system that only drastic readjustment can be of any use.

In both of these instances, however, the Administration is not blameless. The time for a Government to act is before the catastrophe, to prevent it. The Administration had full knowledge and ample warning of what was to occur; it knew the protest of the railway workers uttered at the time a Government agency was busy slashing $600,000,000 off the workers' annual income; it knew the situation with regard to coal; yet not by one act of forethought or one step toward prevention did it seek to forestall what it clearly saw would occur, and what it must have known the enemies of labor dearly desired to occur. No amount of tardy bluster and fluster will make up for that.

In the railway matter the wages of the men must be put back. The strike is wrong, but the men are right. Railway management has made its last confession of absolute failure when it takes its working capital out of the pay envelopes of the men. The salvation of the railroads does not lie in that direction. Reduction of wages and increase of rates is certain suicide. Reduction of rates, increase in the quality of the service and higher wages are the guaranties of railroad prosperity. Minds of the old order cannot see that, but it is the truth of railroading.

And when the service is resumed, the Administration will have no right to light a cigar, sit back and congratulate itself. *Settling a strike* doesn't mean anything any more. Too many strikes have been settled without touching the sources of the strike. The annual chokings of the nation's life have been intended by certain concealed forces as rehearsals for a final choking which should inaugurate a national struggle for life. Strikes grow more numerous and threatening every year, not because labor grows more threatening or less American, but because each succeeding strike has a deeper alien fringe around it and is a signal for the activity of Bolshevik and anarchist groups that are not related to the strike at all. These latter come out under cover of the strike season and spread their poison. And each year they find their prospects better. The Administration has been so busy with Russia that it has had little time to give to America. Who is it, anyway, that is so interested in keeping our national eyes overseas when they should be scutinizing affairs at home?

As to the coal situation, the conditions of coal mining are and always have been a disgrace to a civilized people. We have enjoyed our coal at too great a cost of flesh and blood. We have permitted our public press to degrade the name of miner until it means little less than outlaw. We have forgotten that the best of the British stock comprise the bulk of our mining forces—Irish, Welsh and Scotch—men whose minds are fit soil for the seeds of liberty and Christian justice. We have thought, because they belong to one of the most ancient trades in the world, the trade of mining, that anything was good enough for them and that they must somehow be themselves to blame or they would not have so many sufferings. And that is about the total extent of the public's contribution of thought to the mining problem.

The mine owners want a strike because it will reduce stocks, make coal scarce and raise prices. There is colossal irony in the fact that the country faces a coal famine because there is too much coal. There is so much coal produced and so many mines running that, in spite of the high daily wages paid to miners, the days' work are so few that in West Virginia last year miners earned $500 and in Illinois $1,000—the lowest and highest figures for a year's income. And in earning that pittance, 2,500 were killed and 30,000 injured!

The miners produce coal at the highest cost of $2.91 a ton, often at a much lower cost. And that coal sells for $11 to $14. When the Federal Trade Commission tried to discover where the $8 and the $11 difference went, an injunction stopped them. The President knows all this—it is before him in reports!

And yet the owners of the mines do not get all this excessive profit. The owners and miners produce 700,000,000 tons of coal annually in a country needing only 500,000,000 tons. Fully 40 per cent of the coal mines are not needed. But they are all working. And the anxiety of mine owners to sell their coal is as great as the anxiety of consumers to get their winter's supply. What is the explanation of this strange state of affairs? The Man Between, the Broker, the Coal Speculator—he is the explanation. *It is the old story which* DEARBORN INDEPENDENT *readers know very well by this time: the breed of those who wedge themselves between the producer and the consumer, to make them both enemies, start them both fighting, and reap shameful profits from the struggle.* That is the heart of the coal strike. And the President knows this, too!

There is a philosophic view of all this chaos which is difficult to take when one considers the mental distress of the country and the colossal stupidity which causes it: yet the true American, retiring from the heat and anxiety of the present jumble of things, must reflect that perhaps all these things must come, and must grow increasingly worse, until the blindness of our people be broken through and until they see that they are not the helpless victims of universal law, but the sport of greedy men. These thoughts have been hushed of recent years because some have denounced them as bearing kinship to the "reds." Let all those who think to shelter greed behind the plea of loyalty, let all those who would cloak commercial sin in patriotic pleas, learn this, and learn it well: when the overturn comes which shall straighten up our country, and drive forth from its bounds all things that corrupt and strangle it, it will not come from the "reds." The "reds" never yet destroyed an evil, they have only increased the tale of evil. But when the overturning comes it will be due to the awakening of a Christian conscience in our people, a Christian conscience and nothing else, a conscience that will refuse to be the beneficiary of blood and tears wrung out of any race of men. That conscience has awakened before with swift and final judgment upon entrenched wrongs and bitterness; it will come again. Today it is the main hope of the nation.

The Lords' Rebuke

THE debut of Earl Balfour in the House of Lords was destined to be a sorry one, when he selected for the subject of his first extended address, a defense of the British mandate over Palestine. The new dispatches at the time of the incident simply chronicled the fact that the Lords had disapproved overwhelmingly of the mandate. The arrival in America of more extended explanations makes clear why the British peers exerted themselves so extraordinarily to attend the session, and rebuke Balfour and others recently raised to the peerage.

It develops that the chief feature of the Balfour address had to do with the Rutenberg concessions which he defended warmly. Pinchas Rutenberg, a Russian Jew, who was connected with the Kerensky administration, was the chief beneficiary in these. Rutenberg was given two immensely valuable concessions, which put in his power for 70 years the electric development and water supply in Palestine. The grant was made, of course, by Herbert Samuel to whom the British Government foolishly intrusted the rule over the ancient land.

Britons are notably unexcitable and reserved. British peers carry these traits of character to the extreme. The world has heard of the House of Lords as a legislative body only about once in a dozen years. But when Balfour's defense of the Palestine mandate was scheduled, it brought peers from all over the realm. Britons, peers and commons alike, are suddenly aware that an alien government has been erected over them and that their home liberties and colonial rights have been seized by the international race.

Then, too, even the British reserve was pierced by the calmly related details of the plan for damming the Sea of Galilee and diverting the River Jordan. From the Lake of Huleh, known to the Biblical world as the Waters of Merom where Joshua vanquished the Canaanites, to the Dead Sea, there is a fall of 1,300 feet. This fall of water the shrewd Mr. Rutenberg plans to utilize. But somehow the English lords could not bring themselves to approve of the scheme, involving as it does the making over of the spots viewed as sacred by those who love the stories of New Testament history. The English Jew Samuel, giving outright so valuable a concession to the Russian Jew Rutenberg, who in turn throws the machinery contract over to German Jews, and peddles out parts of the plum to American Jewish banking houses, is too bold a piece of procedure for even the phlegmatic lords.

Medals and Memory

THE action of the War Department in awarding a Distinguished Service Cross to Major Andrew Rowan for carrying the message to Garcia immediately after the Declaration of War against Spain in 1898 calls attention to the changed American policy in recognizing valor.

The practice of be-medaling is common to Continental countries and our Latin neighbors. But Anglo-Saxon peoples have been more reserved in their outward manifestations of appreciation for high courage. With persons of the stock from which real Americans come, appreciation is a deep emotion, rather than a surface demonstration. Who can measure the feeling that beats through American hearts at the name of Nathan Hale? Who can hear without a stirring of the blood, the story of Stephen Decatur's exploit at Tripoli? These deeds and a few others show above the high level of bravery set by rank and file of American arms in all wars. But it is the deeds, rather than the medals given for them, that are enshrined in memory.

Major Rowan's exploit was something similar. He entered Spanish lines in disguise, risking death as a spy. The inspiring story of the act flashed over the entire country. But it was the carrying of the message to Garcia rather than the name of Rowan which was made the subject. Thus his name did not receive the recognition to which it was entitled, and he escaped the fulsome adulation which marred the splendid deeds of Dewey at Manila and Hobson with the Merrimac. His recognition now is just.

In the World War our association with countries prone to bestow medals lavishly induced us to depart somewhat from our established policy of granting very few ribbons for valor. Many citations for gallantry were made. It should not be suggested that those awarded these tokens were other than abundantly deserving of recognition. But it is manifestly impossible to measure bravery, and there must have been thousands upon thousands of others whose exalted courage failed of recognition because they performed their exploits without the dash and verve which attracts attention, or performed them, unseen by the eyes of those empowered to recommend citations. That many of these unassuming soldiers should have gone without recognition while it was within the power of the Secretary of War to pin a medal upon himself is the flaw in the system of giving tangible rewards for duty.

Mr. Ford's Page

IT IS remarkable how fanatical the denouncers of "fanatics" can be. In any reasonable view it should be the worshippers of a fetish that best deserve the description of "fanatic" and not those who try to show that the fetish is a fetish. But in discussions of the monetary system it is always assumed that the fetish-worshippers are the normal minds, and the abnormal minds those who question the validity of the fetish.

Take the gold standard. Apart from the fact that it cannot be as "sound" as its supporters say that it is, else they would not be in such a fright for it, there is instruction to be had in the two positions held with reference to it.

As everyone knows, the gold standard was not handed down from heaven, nor was it established by natural law. Again, as everyone knows, gold was not always the standard, and has even at times been known to the financial world as "cheap money," much cheaper than silver, for example. It became a standard in parts of Europe because those who had it wished to make it so, and were powerful enough to make it so. It became a standard in the United States, at a comparatively recent date, because those same people in Europe wished it to be so and were able through their influence here to realize their desire. It became a standard by act of Congress, not by act of God or decree of nature. It was voted so, just as a tariff is voted, or a maximum man strength of the army, or anything else. And it can be reduced from being a standard in just the same way. Everyone knows that, and it would simplify matters if those who know it would candidly admit it once in a while.

The gold dollar is the standard, and there are some millions of people in the United States who never saw a gold dollar; mighty few gold dollars have ever been made.

All our money is supposed to be based on gold. That is to say, the assumption is that if it were necessary, the integrity of our money could be proved by converting it into gold at any time. Of course, that is only an assumption. Possessing the largest stock of gold in the world, through the misfortunes of the rest of the world (and our gold is nothing to boast about; it is more likely something of which to be ashamed), there is still not enough gold in the country to redeem the money that is supposed to be based on it. If one-quarter of the people tried to prove the gold standard tomorrow, there would be the greatest financial disillusionment that has ever occurred.

But nobody is going to test our money that way. By a true instinct the people don't care anything about the gold standard; the word of the United States and the wealth of the United States is good enough for them. It is, however, not good enough for some people, among whom are the International Financiers. No money is good enough for *them,* but their own, and their own is gold.

That is to say, gold does not matter, or rather it would not matter, but for one thing. There is not enough of it to carry on business. The people seldom see it any more. Business is carried on by what the gold fanatics call "printing press money," for that is what all our currency is, and that is what our silver and copper coins are. Business is still more largely carried on by money that is not even printed, it is only *written*—checks, notes, receipts—a sort of private currency circulating between business houses to facilitate trade. To facilitate trade is the only service that money has to perform.

We do get along without gold very nicely. Practically, the people are off the gold basis as clearly as if they had never been on it.

And so, to repeat, gold would not matter, but for one thing. There is a law which nails down gold as the standard. But the law is not operative except when it is invoked, and it is only invoked when the owners of gold wish to assert its supremacy again.

> *THE gold standard does not matter until you insist upon it, and nobody insists upon it except those who own the gold. If those who hold the Government's "printing press money" were to insist on the promised gold redemption, something would happen. But they don't. The insistence on gold is always from the other side, as against the people who hold mere "money." The gold standard is never insisted on by the holders of money—they don't care enough about it. Gold would not matter at all if it were not that the law gives power to its owners to destroy a large amount of wealth that is in excess of the artificial value of gold. That is the trouble: Gold is not much of a help, but it can be made a cruel and destructive hindrance.*

To explain: We have a Federal Reserve System whose advertised function was to expand the currency as business required; that is, to provide all the paper money necessary to carry trade. Paper money based on what? On the private wealth—the notes and other evidences of wealth—owned by the men who are in business. Federal Reserve currency was paper money, "printing press money," created at the will of financiers who are in the business, on the basis of the private holdings of the men who needed the currency in their business. The purpose of the System was also advertised to be to contract the currency as business contracted. The currency was to be "elastic," it was to meet the needs of the people, much or little. This, of course, is all that the wildest "fanatic" ever asked. The advertisement was good.

Now, *it has been possible to ignore the needs of business in the matter of currency,* and serve the gold owners. Gold owners said, "Here, our stuff is the standard and you are letting your currency get out of all proportion to it. We demand that you haul in your lines, draw tight your functions, and let the people understand that Gold and not Money is the main thing here." So that was done. They called it "deflation." As almost every one in the United States has been deflated, the process needs no description. When you "deflate," you deflate people, you don't deflate money.

Whenever the practical demands of business bring into existence a Federal Reserve System or any other that allows for an "elastic" currency, the tendency is practically to go off the gold basis, and of course in the eyes of the owners of gold this is a dangerous procedure. It lowers the price of their commodity. Gold as *money* is worth much more than gold as *gold.* So they prefer to tamper with the prices of food rather than risk a danger to their gold.

That is the only point where gold matters much—because, being set up by law as the standard, it is always possible in critical times to make all money bow to it, and the men who own the gold can thus make a bigger "corner" than ever was made on the stock exchange; they can literally corner the world, and they have cornered the world. And it is the worst thing they could have done. By overplaying their hand they have called attention to the very thing the people most dislike to think about, the inside workings of the money system. There are more people thinking and inquiring about it today than ever before, because they are determined to find out how all these things can come upon them from a clear sky.

Now, as to fanaticism, judge between these two attitudes. The first says, gold, gold, gold, there is no money but gold; to gold all other money must bow. The second says, keep gold if you want it; use it for all the superstitious financial practices you desire; hold as much as you please for the "psychological effect" on those who want to feel that their money is gold-based. But there isn't enough of that kind of money to carry business. It is like trying to float an ocean steamer on a country creek—the creek cannot carry the load. The true basis of money is not gold, anyway, but the usable wealth that can be exchanged between human beings. There is enough wealth to carry twenty times, fifty times, the money we need to support life with. Keep your gold if you want it, but make some arrangements by which things may flow to those who need them and who are able to exchange basis wealth for them. Don't dam up the stream of prosperity because your gold outlet is too small to let the stream run through. Make other openings.

Which attitude is the most "fanatical"? The fanatics are those who cannot see over their bags of bullion. They are worshipping a dead thing. They are placing their whole dependence on the most useless metal in the world. If that is not fanaticism, it would be impossible to describe what fanaticism is.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

In the Old Days Business Wasn't Impossible!

Industry and Commerce Staged Quick Come-back in War Ruins

BACK in Babylon—in the days when the center of the Roman Empire was a wilderness and Chicago's site had probably not emerged from the lake—it was the custom of the Federal Reserve officials to conduct business with one eye on the books and another on the plain just outside the city wall. When an enemy appeared with enough men to overcome the local standing army, the officials gathered up all the silver and gold and scuttled around to the temple, where the valuables were placed in the safe keeping of the great god Enlil. Then they either took to the hills, or settled down with folded arms to await developments.

If the conqueror happened to be a foreign monarch, those who waited were frequently out of luck. But if, as was more often the case, he was a native son out on a mere electioneering campaign to extend his dominions, the placid priests of Enlil knew that it was only a matter of a short time until business would be resumed as usual. Of course, it would be dusty for a spell, what with the minions of the new king industriously tearing down the walls and public buildings and destroying the inscriptions that told of the glory of the monarch dethroned. But in due time they knew that the parcel post system would start up again, trading would be resumed in the market places and caravans made up for the long journey to the Mediterranean.

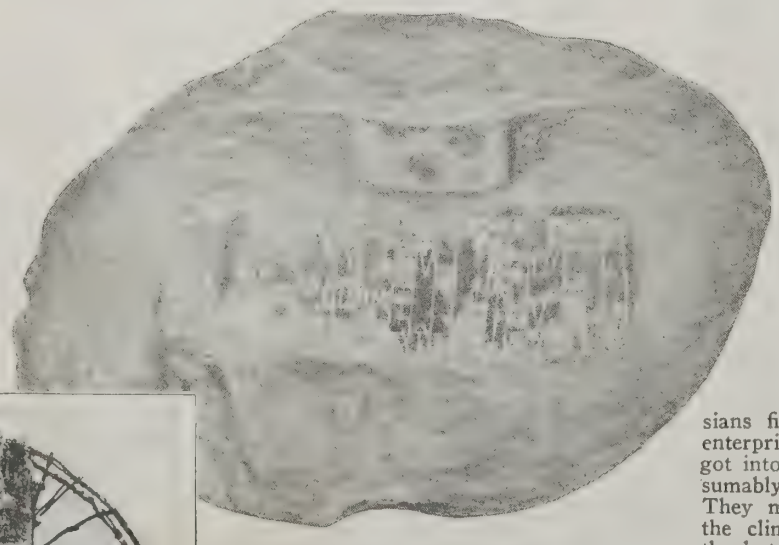
Quite often, however, the invader was a foreigner; which means that his home town was so far away that as a matter of enlightened self-interest he had his soldiers smash everything in sight. Nobody knows how often this happened at Babylon, which was a sort of an upstart metropolis, anyhow. At Nippur, which is called Calneh, in the Bible, it happened at least 21 times in 4,000 years. That is to say, on 21 distinct occasions the city was taken, its wall was torn down, its temple wholly or partially destroyed, and the "tower of Babel" alongside demolished. At such times the population was disposed of by killing, capture or driving into the wilderness. Presently the dust and some of the soldiers settled down. Fugitives who had not found refuge in some other of the hundred walled cities that reared themselves above the Mesopotamian plain straggled cautiously back. Barter and trade were resumed. Custodians of the herds of goats and cattle who had escaped came into town to shop. Here and there a merchant began to accumulate enough profit to rebuild his house. He hired a man to level off the ruins of the old one, salvaging, perhaps, as many of the sun-dried bricks as he could. On top of this rose a new dwelling. Before long the construction industries were in full swing again. The temple grain elevators and warehouses were rebuilt and slowly refilled with merchandise. When it became necessary to move this, caravans were formed to trade with distant cities and countries.

So was business done in the dawn of civilization essentially as it is done today, yet under difficulties that would make the modern business man, grumbling over ephemeral problems that come under the head of depression, sit up and take notice. In Babylonia the merchant had no telephone, no railroads, no telegraph. His cart was primitive and his asses and oxen were slow. For a pen he had a sharpened stick of wood; for ledger and cash book, for letter and billhead, he had plain old-fashioned Babylonian mud. When a tablet of this dried it made a perfectly good record. More mud was fashioned into an envelope. Another lump made an address tag to be fastened on a basket or bale of merchandise. Checks, drafts and notes of hand were written on mud tablets, witnessed and sealed before a notary and deposited in the temple bank.

Consider, to be specific, the case of Murashu. He was born about 1500 years B. C. Unhappily, nobody ever took the trouble to write in detail the story of his life, but its outlines are left in his own records. Banking then, as earlier, was a temple prerogative. This grew out of the dictum laid down by every ruler that everything belonged to Enlil, or Bel, or Baal, to give him a few of his many names. Since the kings were finally committed to the divine right idea it followed as a matter of course that the king was custodian of everything in sight. Young America prates of customs that are not easily broken. But this had been a custom since the Flood, and the Babylonian stood ready to argue that 32,000 years had elapsed since that event, during all of which time it had been the established custom to let the king get away with the banking privilege, and more, as will be shown. Yet here was Murashu with a good banking mind, but presumably without the social position that would have given him the necessary prestige to be admitted into the priest school where higher education was kept from the minds of the mob.

Murashu was clearly up against an impossible proposition. His job was harder than that of a modern business man trying to sell in a stagnant market with millions of men out of work. There was not the shadow of a precedent for what he started out to do. It is not of record that he had any royal blood. But by some means he managed to squeeze his way into the banking game. It looked good to him. The rate of interest was generally 40 per cent, and never less than 20, so he cannot be blamed for this ambition. And after he got in he established a firm that still makes the Rothschilds look like beginners. In the face of war and devastation it continued doing business for more than 300 years. The records of its transactions remain to prove this. They show that Murashu Sons' influence spread all over the then known world.

Above—Clay tablet containing map of agricultural area around Nippur, 2,000 B. C. At right—A balance sheet of ancient Nippur. The smaller inscriptions on the margin are made with cylindrical stamps and correspond to an auditor's "O. K." today.



The private banker, or Damguru, operating under license of the king, was known, of course, before this time. One of them got so powerful that in 2400 B. C. King Ibi-Sin, whose seat was at Ur of the Chaldees—where Abraham was born some 400 years later—gave him an exquisitely carved seal that carried with it the franking privilege. The supposition is that Ibi-Sin was a weak ruler—he was the last of his dynasty—and that this particular banker was making a deal with another outside monarch. But the point is that for 3,500 years not one of these private bankers was able to set up a really big and lasting firm until Murashu came along.

In the history of all Babylonia, including its science, art, literature, religion and war, Murashu is only an incident. In the history of its business he is only a chapter. But for the modern business man he is by all odds the most important and valuable chapter, because he and his sons kept their mud index so completely and so thoroughly that thousands of their transactions have been preserved. The men who carried out these deals are dead and gone for 3,500 years. Nothing is left of them but dust. But now that it is all over, their books of dried mud show that it was possible to do business, and big business, in spite of conditions that would be considered impossible if the world was suddenly to revert to them today.

Banking then was less a matter of gold and silver and notes of hand than of grain, beef, mutton, hides, dates, wool, and other basic commodities. The records show that during the reign of Darius, the great Persian conqueror you read about in your history books at school while the explorers were just digging up the facts about Murashu, the latter had even taken over a slice of the beef trust, which had also been the temple's exclusive business. And the beef trust of Babylonia was a real trust; not a mere slaughtering and selling organization such as we know today. It owned the land, the herds, the packing houses, the warehouses and the side lines or by-products. It never overlooked a bet.

At a certain time every year the temple, and later Murashu, leased herds of sheep and goats to enterprising individuals for stock raising. The contracts specified the rate of return in offspring, wool and—in the event of death—hides and sinews. In some cases they called also for the return of the bones, but that seems to have been a temple habit which Murashu Sons did not insist on, indicating that the private bankers probably cut rates to get business. There is a contract preserved on clay in the buried ruins of Nippur for 3,500 years, and now in the possession of the University Museum at Philadelphia. It was made between Bel-supe-mukhur, an overseer for one Arsham, and Akhushunu, son of Bel-etir, for the hire of 375 sheep and goats, white and black, the property of Arsham. It specified the rental in offspring, wool, and butter; also the return of the hide and two and a half shekels of sinews for each one that died. Another, between Bel-nadin-shum, son of Murashu, and Jakhulunu, and his servant Na'id-shipaq, seems to have been more in the nature of a warning by the former to the latter of certain dire things to happen if they failed to patch up the bank of the canal Sin where it ran through their property. Akhushunu and his hired man assumed responsibility.

After Darius came hordes of rich Persians filled with the lore of Babylonia's wealth and enterprise, and anxious to see for themselves. They got into business on a large scale in Nippur, and presumably in other cities. Murashu Sons didn't mind. They merely waited, knowing a thing or two about the climate and its effect on invaders. In due time the hot spell arrived. The Persian nabobs longed for the coolness of the hills and the winds of the high places. Murashu Sons knew the time had come. At the psychological moment they sent around one of their bright young men with a proposition to have the banking firm act as agents. And as a rule they managed to sign up the prospect, handling his business while he spent the excess profits at a summer resort. Thousands of tablets recovered at Nippur attest that accounts were kept by Murashu Sons for wealthy men, and at times even for the crown.

A Landlubber on a Whale Hunt in the Arctic

The Thrills That Come to a "Greenhorn" in Capturing Giants of the Deep

By GEORGE C. HENDERSON

Above—Captain C. T. Pedersen, of the schooner *Herman*. Left—Bomb gunner. Right—harpooner.

"A BLOW! A blow!" cried the captain, pressing a push button and waving to the sailors on the deck of the *Herman* below us.

I stared down from the dizzy height of the crow's nest at the ice-specked waters of the Arctic Ocean on a surface that resembled an irregular checkerboard of black and white. The white was the ice and the black was the tarry, becalmed sea.

"Where's the whale?" I demanded.

Captain C. T. Pedersen glanced at his watch and pointed out across the frozen waste that seemed more desolate under the yellow glare of the midnight sun. It was 1 a. m.

A tiny wisp of vapor was visible. I could barely discern a huge black shape.

"He's sounding," said the captain. "That means he's blowing water out of his head. You see he sucks great volumes of water into his mouth as he moves along to get the small fish that are in his course and then he blows the water off. The fish catch in the branch-like stalks, called whalebone, which are located in his jaw."

I had climbed to the crow's nest up the rope ladder with fear and trepidation. A "tenderfoot" in the Arctic has his troubles. Now I was about to be rewarded by the sight of a whale.

Earlier in the day we had sailed into the far northern regions where breeds the bowhead whale, the only variety which pays in oil and bone for the killing. An "oil slick" on the water which the captain said was due to the presence of schools of jellyfish or "whale food" and the sight of "bowhead birds," reputed to be pilots of the whale, had informed the veteran whalers that they might expect a "blow" at any moment. This news had sent me to the crow's nest despite a trembling of limbs and dryness of the throat occasioned by the frail supports.

Natives in oomiak or skin sailboat.

On getting into the bowhead's grazing grounds the engines had been stilled and the sails hoisted. I could not account for this because it cut our speed in half.

"Engine noises scare the whales away," was the explanation. "The whale has very acute hearing and if we went through here under steam every bowhead in the country would leave."

Looking down from the crow's nest I expected to see the crew galvanized into action. Instead, they lounged about gazing out to sea. Why didn't they launch the boats and go after the whale?

The inevitable question of the "greenhorn" brought a reply. The explanation was simple enough. The captain wanted to wait to see whether the big fish was traveling. He knew that the second spout would show almost 20 minutes after the first one sighted. This is a peculiarity of this type of whale. It comes up for air, "blows" and then goes back down to come up in 20 minutes for air again. Mariners can set their watches by the whale's movements.

"If he comes up quite a distance from where we saw the first blow, then I'll know he's traveling and there's no use going after him," said Pedersen. "You see they go pretty fast and get under the ice. Boats can't catch them. But if he is loafing around we have a chance."

Pedersen snapped his watch shut.

"Twenty minutes," he said, adjusting his binoculars. "Keep your eyes pealed."

The words were hardly out of his mouth before a tiny geyser seemed to shoot up from the sea not 100 yards from where we had first sighted the whale.

Quickly the captain pressed the button and waved to the crew. He had an electric bell system connecting the crow's nest with the deck.

"Better hurry and get down if you want to go out in a boat," he said.

Two boats were being launched when I reached the deck. I got in that of Jim Lee, the second mate.

In this whaleboat, large and well-built, were the second mate, three white sailors and Pete, the smelly, fat-faced, blubber-eating, skin-clad native boy.

Most conspicuous of the equipment was the bomb gun. It looked much like an enormous shotgun but is so heavy and kicks so hard that it requires a strong man to handle it. It expels an 18-inch-long brass bomb filled with tonite and is timed for six seconds. It has a range of 125 feet only and is thrown by the explosion of a 10-gauge shotgun shell. The six seconds permit it to enter far into the carcass of the whale before exploding.

The other weapon was the darting gun with harpoon. This is thrown into the whale at close range and when the harpoon has penetrated into the blubber far enough a trigger is sprung and a bomb set off which blows a big hole in the creature. To this harpoon is attached a line, gathered in buckets and which may be payed out for many fathoms.

Silence was the order of procedure. Not even oars were used. The sails on Lee's boat and on the other boat were raised and we set out on a noiseless chase. Only the creaking of the rigging broke the silence.

The second mate watched the crow's nest. Captain Pedersen was signalling directions to him. Both boats closed in on the spot where the whale had disappeared.

A dark shape like an emerging submarine came to the surface so near our boat that it almost upset us. The spray blew in our faces and wet me thoroughly as the bowhead spouted. The great shape was fully 90 feet long.

The helmsman drove the small whaleboat over the slimy black body. At the same instant the bomb gunner and harpooner fired. They both had aimed at the vital spot some four feet above the fin or "fluke."

The boat raised perilously as if we were on a bucking horse, perched for just a second on the whale's body and then turned over.

Ice-cold water swallowed me up. I could feel some force sucking me down into the deep. My lungs were bursting, my limbs numb. By swimming valiantly I struggled back out of the black depth. A hand gripped my hair and I was dragged bodily into the other whaleboat.

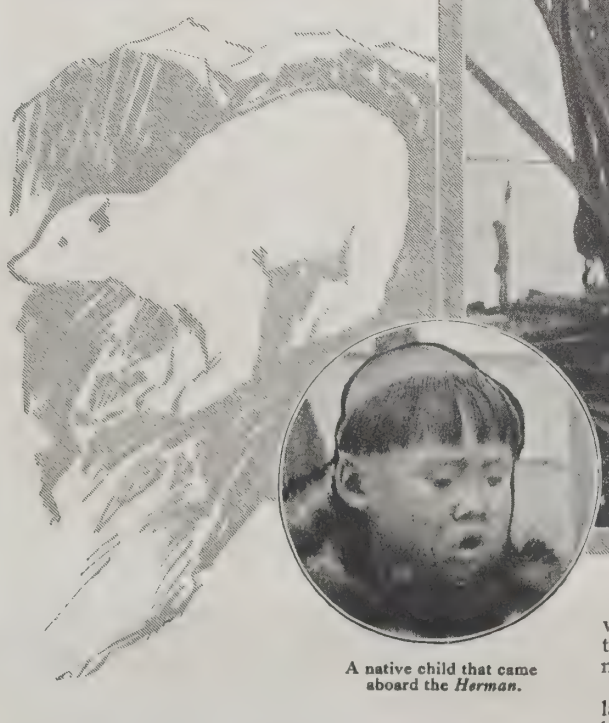
The phlegmatic whalers had righted our boat and the wet crew was loaded into it.

A pail was thrust into my hands and I bailed vigorously.

No one seemed to pay any attention to the ducking although I for one was frozen through and through. At least I thought I was frozen.

The whale had settled to the bottom of the ocean, apparently, and was lying still. The customary 20 minutes passed.

"Bye'n bye come up," growled the Eskimo, through chattering teeth.



Thirty, forty minutes went by and members of the crew voiced the opinion that the whale was dead. They talked of sinking dynamite alongside and raising the body by concussion.

Fifty-five minutes after the harpoon had been launched the first mate's boat received a shock that knocked the rudder in the air and the whale spurted to the surface.

Before the creature became aware of the presence of the boat, the bomber and harpooner launched their missiles. The bomb gun kicked the gunner into the bottom of the boat with its recoil.

(*Concluded on page 13*)

Even the denizens of "farthest north" contribute to approaching gasoline famine.

The branch-like stalks are whalebone.

Coal Prices Raised When Operators Save

Consumers Only Hit the Harder When Culm Bank Waste Is Salvaged

By WILLIAM A. MCGARRY

IN FOUR articles of which this is the last, THE DEARBORN INDEPENDENT has set forth some of the phases in connection with the coal situation. They show the record of the development of the industry, disclosing a singular disregard for the interests of the consumer. Prices have gone up when the number of employes was reduced, when production was increased, when costs were cut, when waste was salvaged.

Independent concerns have been driven out of business. There have been charges that mining property is grossly under-assessed. Stock dividends have been repeatedly allowed, so that without an increase in invested capital, mine operators might take dividends from the public. The government has conducted a long war through the placid channels of the courts to prevent monopolies, rebates and interlocking relationships between mines and railroads, but today the men who ruled the coal industry 20 years ago still rule it.

Coal operators insist there is no price-fixing in the industry. But consumers the country over find little opportunity to "shop around" when buying.

The coal industry, as no other, seems to have defied the economic rules in creating labor and supply conditions, whereby are possible the highest profits. The industry, as no other, is tinged with the public interest. The solution of the coal strike should be reached with the public under first consideration, miners and operators second.

TEN or fifteen years ago artificial mountains were almost as plentiful in the anthracite regions of Pennsylvania as the natural brown hills and ridges into which men drove tunnels to reach the seams of hard coal. In the parlance of the industry they were and are known as culm banks. At every breaker that reared its black bulk against the sky, one of these dumps was to be seen. Some of them stretched for a half mile or more. Into them went millions of tons of rock, slate and refuse, including coal dust and small sizes. For a half century the latter classification included the sizes now known as rice, barley, buckwheat Nos. 1 and 2, and some pea coal.

Statistics of the great coal-producing companies show that despite the tremendous waste represented by the culm banks the industry made huge profits. As far back as 20 years ago, the system of capitalizing profits was in operation. Yet at that time the only source of profit was from the sale of prepared sizes—chestnut, stove, egg and broken. The modern breaker, with its high efficiency machinery, was unknown. There was no such thing as an electrified mine. Methods of mining were archaic. Accidents were frequent. The system of ventilation was poor and the terrible mine gases took a large toll of victims.

A Reduction of Waste

MINING and combustion engineers had been aware for a long time that the coal in the culm banks would be of value some day. Their prophecies bore fruit when the washery idea previously confined to gold mining was adapted to the salvaging of the culm. At first, its use was spasmodic and uncertain. Its chief initial value lay in the fact that it demonstrated there was a market for pea coal. That meant that every coal mine was able to reduce the amount of material thrown into the dumps by the simple expedient of setting up a pea-coal screen. The pea coal of those days and even of years as recent as 1917, was a better coal than is now generally sold. Originally, it was almost as large as the stuff some dealers now sell for chestnut. The small size grew in popularity, mainly because it was cheap. It became known as the "poor man's coal." A ton of it could be bought for less than $2 in the anthracite regions. Today, it costs the consumer four times that price.

In any other business the discovery of a method of utilizing a waste product would have been followed eventually by a reduction of prices all along the line. But that has never been the policy of the anthracite interests. Pea coal rose in price as the distributors expanded their markets beyond the confines of near-by states in to New England and the Northwest. It continued to rise even when the washeries were perfected and increased in number, and new markets were discovered for still smaller sizes. Buckwheat was the first of these. It was never meant to be sold for household consumption. Operators put it on the market as a substitute for bituminous coal in industry, shading the price of soft coal to get the trade. In time, the business expanded to the point where buckwheat No. 2 was used. Then methods were found to fire boilers with even smaller sizes, rice and barley, which are really not much more than dust.

The average ton of coal contains the following percentages of the various sizes: Broken, 01.7; egg, 12.8; stove, 14.5; chestnut, 25.6; pea, 10.3; buckwheat No. 1, 13.3, No. 2, 11; barley, 09.2 and rice, 01.6. Pea coal and all smaller sizes represent no less than 45 per cent of the total salable production today. The market value of pea and all smaller sizes in a ton is $1.48. The total value of a ton at the operators' wholesale price is given as $5.84 and the production cost at $5.18, leaving a profit of 66 cents a ton. The figures are based on prices of $7.75 for broken and egg sizes, $8.10 for stove and chestnut, $6 for pea coal, $3.50 for buckwheat No. 1 and $2.50 for No. 2, $1.50 for barley and 75 cents for rice.

Prices and Production

IN THE days described previously, when pea coal and all smaller sizes represented waste and were thrown into the culm banks, prices were far below present ones. If the operators threw away those sizes today they would have left, according to their own figures, the average income of $4.36 a ton. Consider that in less than two decades their price at the mines has nearly tripled and then examine their own records of profits made in years when 45 per cent of the present production was an expensive waste. Then as now it was necessary to pay somebody to remove that 45 per cent, to separate it from the salable coal and to unload it on the culm banks. In other words: In the old days, for every one hundred tons now produced, the operator sold only 55 tons. By creating a market for the smaller sizes, he salvaged the 45 extra tons, thus increasing his production by approximately 83 per cent. His income was smaller, of course. But according to his own figures, based on present prices and assuming that the relation between the price of small and large sizes was the same, the sale of smaller sizes increased his income 30 per cent.

Despite these figures operators continually defend high prices of anthracite with the assertion that 60 per cent of the total production is in prepared sizes, pea and larger, and the rest is sold "below cost." Sometimes one of them admits that the yield of these sizes is really 70 per cent. On the basis of their own figures it is 65 per cent. In the figure of 55 given above, pea coal was not included. But because of its price of $6, it must now be so included. No matter how they may be juggled the figures prove that in the anthracite industry an increase of 83 per cent in production and 30 per cent in cash yield has been paralleled by a continuous process of price increase. Thus the American business principle of reducing prices with the increase of production and turnover has been reversed.

Coal From River Bottom

THERE is another phase of the calculation. Operators today mine relatively less coal than in former years to satisfy a given demand. The total production, of course, is larger. Also the cost of operating washeries to get the coal out of culm banks is generally considered negligible, in comparison to the mining cost. Nobody knows how many million tons mined in previous years have been taken out of the culm banks by the washery process in the last 10 to 15 years, and sold at exactly the same high price as the operators exact for freshly mined coal. The operators do not issue statistics on that point. They do not tell how many tons have been taken from the bed of the Susquehanna River. Twenty years ago the youngsters waded across that stream in the coal regions over vast deposits of culm. Today the river is navigable for small steamers, the culm having been salvaged. Dredges have worked on it as far down as Harrisburg. Mine union officials estimate that the average cost of producing a ton of washery coal is only 27 cents. Yet the consumer pays for it the same rate as for the coal freshly mined.

If the supply of anthracite was so small that the end of all available deposits could be expected during the present generation, the policies set forth in this and preceding articles might be justified. It might be argued that the producing companies were entitled to get all they could while the supply lasted. But the truth is that there is no possibility that the deposits will be exhausted for many years. Even the operators admit that with a continuance of the progressive increase in consumption, the fields will continue to yield for 200 to 400 years. Other authorities have asserted there is enough coal in the Pennsylvania beds to care for the natural demand for more than 1,000, and possibly for 2,000 years. Even at the lowest estimates, the value of the coal still to be mined runs into uncounted billions of dollars.

Reference was made in a previous article to Hanover Township, so-called "richest township in the world." Hanover is located within a short trolley ride of the city of Wilkes-Barre. According to mining engineers, there is 132 feet of minable coal under the township, which is 21 square miles in extent. That coal, of course, is in several seams. Several mines are operating in the area. Hanover is located in Luzerne County, where the voters have been more successful in forcing adequate assessments for taxation purposes than in Schuylkill County. Accordingly, Hanover's coal lands are assessed at $64,000,000. Of the total taxes paid within the township, it is estimated that 97 cents of every dollar is contributed by the companies owning the coal.

All deeds in the coal regions for building lots give title only to the surface of the land. Hanover is in many respects an ideal community. It contains some of the finest workingmen's homes in the world. It has 30 miles of road, of which 28 miles are of modern brick or concrete, all permanent construction. The roads are maintained out of the tax levies on the coal companies. A tax association is maintained by the operators and the work is done directly under that organization. There is not a frame school building in the township, which has a population of 15,000 persons.

Yet the tax rate and assessment in Hanover can be shown to be relatively low. Just on the outskirts of the city of Wilkes-Barre is Wilkes-Barre Township, one square mile in area. According to mining engineers, its veins of coal are no better than those of Hanover. Yet the single mile of Wilkes-Barre is assessed at seven million dollars. If the same rate were applied to Hanover the assessment would be $147,000,000 and Hanover would have more money than it could spend. The assessment of $7,000,000 for Wilkes-Barre is considered low in comparison to the real value of the coal under the township. Near by Wilkes-Barre and Hanover is the township of Newport, 13 square miles, and valued at $23,535,750 for purposes of taxation. Its roads are on a par with those of Hanover.

The miners' demand for a saving wage seems rather insignificant in the light of the total existing wealth of the anthracite regions, the total profits taken in the past and the existing prices of the commodity. There has been much argument of late as to whether or not mining is a young man's game. The miner says it is. He says old men, even middle-aged men, cannot stand the hardships of the industry and are forced to the surface after 10 or 15 years. Some of the operators contend that most of the contract miners are older men. The hazards of the industry, set forth in a previous article, cannot be denied.

Independents Driven Out

IT WOULD be futile to go into some of the court records of past practices in the anthracite industry; the "car shortage" by which independent operators were forced out of the business or into line with the railroads, the rebates and so on. As recently as 1920, the Lehigh Coal and Navigation Company was fined $100,000 by the District United States Court of New Jersey for accepting rebates from the Central Railroad of New Jersey, to which it leases many lines of railroad. The decree was set aside by the United States Circuit Court of Appeals and a new trial awarded. Some of the operators now living have been under fire for the practices widely condemned. The reasons are all down in black and white on Federal Court records.

From time to time demands for an investigation of the anthracite industry with particular reference to actual costs have been answered by the assertion that the Federal Trade Commission has made such an investigation and has found the costs. It is rather interesting to note, however, that the only interest accepting those costs are the operators. Statisticians for the miners scoff at them. They assert that the figures were taken from the books of the operators, and that the Federal investigators did not even see all the books. Since then an effort to compel coal operators to prove costs has been blocked by the United States courts.

Anyone who has been in touch with the mine workers will have become impressed by the extent to which the campaign for Federal operation of the mines has made headway, not only as regards anthracite but also in the bituminous fields. Unquestionably the operators realize the peril of that movement. There are other business men utterly opposed to any such plan who recognize that it will grow in popular favor as long as the ultimate price of anthracite remains beyond the reach of a large number of its natural consumers. Pressure from that source on the operators has been particularly heavy since last winter.

Little Hope for Consumer

THE obvious objection to government ownership is the experiment with the railroads. But the miners answer that with the statement that everybody knows it was the railroad men who ran the roads though they were ostensibly under government control. They contend that the skilled railroad executives managed to run up costs to give the public a final dose of government ownership. Miners insist it would not be possible for the operators to do the same thing in the coal mines. Through their unions they say they could force the elimination of all useless workers. That, of course, is all in the field of speculation. But for those who are opposed to Federal operation the situation now existing should be worthy of careful study.

It is possible that by the time this article is published, an agreement will have been reached between miners and operators, and that anthracite mining will have been resumed. But unless there is a sharp change in sentiment among the miners there will be no agreement calling for a reduction in wage rates. Assuming that the mines are reopened on the basis of the existing schedule, as they might have been perhaps two months ago, any relief for the public must come through a reduction in the price at the mine charged by the operators, a reduction in freight rates and a reduction of the margin now charged by the retailer. After all, most of the small householders using anthracite are concerned first with the price. And most authorities outside the ranks of the operators are agreed that only a complete collapse of the demand for coal, or Federal intervention of some kind can bring about the reorganization of the industry, including elimination of coal sales companies that perform no service, without which the price will not be reduced by any important sum.

Colorful Radio Evenings Outdo Arabian Nights

Each American Home Entertainment Center Since Broadcasting Is Vogue

By J. OLIN HOWE

AT THE Army-Navy football game at the Polo Grounds in New York last fall the managing editor of a metropolitan newspaper, himself a former Cornell guard and an All-American selection, talked a graphic descriptive story of the game into a telephone transmitter and interested thousands, scattered all about the eastern part of the United States, and even into Canada, eagerly listened in. There is no knowing in how many households they laughed over his description of the raindrops falling upon the bald pate of Secretary of the Navy Denby as he uncovered in the presence of Marshal Foch. The phone into which he spoke had to do with but the first 10 miles of wire transmission. It was connected directly with WJZ, the powerful broadcasting station in Newark, where his words were sent to the four winds on the radio wave.

This was just at the beginning of the popularity of broadcasting by radio telephony. Not the beginning of broadcasting, but of its popularity, and certainly not of telephoning by means of the radio wave. But the phenomenal development in the use of the radio phone, this craze which has spread with such rapidity sweeping over the country, has all come in a few months since.

Estimates vary, but well-informed persons figure there will be a million and a half radio receiving sets in use in this country by the end of this year. Some authorities place the figure much higher. Manufacturers of radio apparatus have not yet been able to come up even with the demand, though scores of concerns have abandoned other business to make it. The brass industry has received a new lease of life from the sudden rush for small brass parts needed for radio. By the same token, no blue-sky law is strict enough to prevent an influx of radio securities. And there is no point in the 48 states where it is not possible to hear the broadcasting from one or more of the big stations on but an average set. Under favorable conditions San Francisco has heard WJZ and the Newark station's broadcasting has reached a ship 1,800 miles out in tones as clear as though but 20 miles away.

A bewildering variety these broadcasters offer. At any time of day there is something in the air. One has but to throw the switch and listen. In music, radio telephony carries the tones of the human voice with marvelous fidelity and even the finer instrumental tones astonishingly well. No Arabian nights could compare with the American evenings which have come in with radio.

Lectures, sermons, speeches, fairy stories for children, informative talks on matters of moment and readings by well-known authors vary the musical programs. There is general news—agricultural reports and other matter of interest to farmers, shipping news, weather forecasts, the baseball scores.

The United States Public Health Service is constantly sending matter of real import. The Industrial Conference Board sends a weekly review and other government departments have used the radio phone.

Among the special purposes to which it has not as yet been put—at least, to any extent—is advertising, though one might think the radio phone an ideal method of publicity. Yet how long would you listen at the wire telephone if the voice at the other end was extolling the virtues of a new shaving cream or crying a bargain in silk hosiery? Advertising will have to be heavily sugar-coated to gain the attention of the radio fan.

The radio dance has become popular. One was even held on shipboard several hundred miles at sea, all the music being furnished by radio from a New Jersey coast point. Many automobiles have been equipped. Radio telephony from ship to ship on the high seas and between ship and shore is an interesting development. In one test, President Thayer, of the Bell System, at home in New Canaan, Connecticut, talked with Captain Rind of the steamship *America*, 370 miles at sea. They could hear each other as well as though in adjacent houses.

A highly interesting use of radio is on airplanes. The wonderful airplane head set, whose transmitter and receiver keeps out noise of propeller, motor or rushing wind, enabling him to talk in his ordinary tones and be heard thousands of feet below and to hear as easily, is a wartime accomplishment. All landing stations of the air mail have been equipped with radio and broadcasting is done from many of them. The planes are being equipped.

Where it took the wire telephone years to reach popular recognition and come into general use it has taken the radio phone weeks—though it is only the receiving end of radio telephony which is in use in home or office or likely soon to be. What really has caught on with the public is broadcasting. Its popularity begins with the return to his job on the Newark *Call* of William F. B. McNeary from two or three years with the Army Intelligence Service in Europe. He had seen a bit of wireless and had an idea. A newspaper man's rapid investigation of the radio situation at home, which included all the government had done and knew, convinced him of its possibilities and McNeary presented his idea to the Westinghouse company in terms which induced it to put in a high-power sending station in Newark, the WJZ station already referred to, and his newspaper set out to exploit radio. Other newspapers followed suit.

A. W. STURR, of Belleville, New Jersey, who sent first radio message to Scotland in test for amateurs.

The world's series baseball games, between the two New York teams at the Polo Grounds, were selected for the initial broadcasting. Before the series was over the two electrical dealers in Newark who handled radio supplies in a small way on the third floor rear in side streets were seeking ground floor stores where they could make adequate attempt to meet the sudden demand.

Radio supply shops sprang up overnight and soon department stores had radio sections and even corner cigar stores were carrying the apparatus. The demand for radio receiving sets overwhelmed manufacturers. At the beginning of this year the Newark district was absorbing 80 per cent of the product, but that is far from the case now.

Next WJZ covered the big football games. From Mississippi Valley farms came word that listeners had learned of the Yale-Harvard game and its final score hours before the printed word. Sixteen hundred and forty miles at sea a ship operator heard the story of the Army-Navy game. General news broadcasting followed. The Newark paper was not first in this, though. Since the spring of 1921, the Detroit *News* has broadcasted special news bulletins. Then came children's story evenings twice a week, when the Man in the Moon would talk to the little tots and name a star after those who had written to him.

The first broadcasting, other than of phonograph music, was from a station erected in the spring of 1909 atop the Metropolitan Opera House in New York by Dr. Lee De Forest, inventor of the audion and oscillion which make possible the radio telephone of today. A microphone was placed on the Metropolitan's stage and Caruso as "Turiddu" in "Cavalleria Rusticana" was the first singer to have his notes broadcasted.

Dr. De Forest has long been an advocate of broadcasting and might have aroused more interest in it but for the war. In 1916 his company gave a regular nightly concert service from its radio station at the Highbridge plant, on the Bronx side of Harlem River in New York City. This music was frequently heard as far as Buffalo and Toronto. The first radio dance was held in Elizabeth, New Jersey, to music specially arranged for from Highbridge. Election news in 1916 was also broadcasted from there.

The Westinghouse company has a fourth station in Chicago, devoted mainly to opera music. The big naval station at Arlington, opposite Washington, sends much of the way around the world on a high wave length and the army has installed a powerful station on Bedloe's Island in New York Harbor. Hartford, Connecticut; Atlanta, Cincinnati, Dallas and Austin, Texas; Madison, Wisconsin; Lincoln, Nebraska; Kansas City, Denver—all these have long-range stations for radio broadcasting; while on the Pacific coast the same is true of Los Angeles, San Jose, San Francisco and Seattle.

Clear, cool, crisp nights, with low humidity, are the times when radio is at its best; and, conversely, the heavy, soggy atmosphere of summer is a poor conductor. And always there are atmospheric disturbances to be reckoned with and holes in the air and static electricity, Old Man Static.

Popular broadcasting is mostly done on wave lengths around 360 meters, for a short wave length is best suited to the usual receiving set. The technical committee of Secretary Hoover's recent radio conference at Washington proposes the different wave lengths to various sending agencies and its table is taken as the standard, though Congress has not yet passed radio legislation. The wireless amateur is limited to waves between 150 and 275 meters long, sharing the last 75 meters with technical and training schools. Between 275 and 310 meters, the Hoover conference set aside for city and state public safety broadcasting. Private and toll broadcasting have reserved for them the waves between 310 and 435 meters in length. The Hartford station sends on 425. Aircraft are assigned exclusively wave lengths from 500 to 525, 850 to 950 and 1,500 to 1,550. Wave lengths of 750 to 850 meters are reserved for the radio compass, which is another story. Government and public broadcasting 700 miles inland may work on 700 to 750 meters, but on the coast these use the variations between 1,050 and 1,500, and the government may also broadcast on waves from 1,850 to 2,050 meters in length. Above that the table runs to 6,000 meters, mostly to be used later for public service broadcasting and the last lot between 5,000 and 6,000 for transoceanic work.

When the first long-distance wireless telephone experiment was made in 1915 and Arlington talked with the Eiffel tower in Paris, an operator in Honolulu, 'way 'round the other side of the earth, heard the conversation and came into it. This was the first conclusive experiment in long-distance telephoning by radio. The Navy's great station was linked with land wires so that President Vail and General Carty of the Bell company, the former at his country home in Vermont, and the latter in New York, listened in and then themselves talked with Paris.

In a proper world, radio telephony would have been discovered before wire telephony. Its principle is fundamental to the latter. Wire telephony is but directed wireless. Instead of being scattered to all points of the compass through the air, the ether impulse passes through an electrically charged wire, or along it.

One can buy a receiving set, with a crystal detector, for little more than an audion bulb costs, which will be perfectly efficient within a short distance of the broadcasting station. One can also well spend $250, but not more, on a vacuum tube set with different accessories dear to the heart of the radio fan. A first-rate set can be had for $75, which will deliver everything sent within 100 or 150 miles and sometimes, under just the right conditions, from a much greater distance. One can connect these better sets to the phonograph horn to make a loud speaker. Sending sets are another story. These cost from not less than $2,500 to several times that for a sending range worth while.

In broadcasting, radio telephony has a unique field peculiarly its own. Also as a supplement to the wire telephone—to leap across spaces where it is impossible or impracticable to build wire lines or lay cable—it has also already established itself.

Broadcasting's future is well worth considering. That now going on is largely a private affair, its primary purpose to sell apparatus. Inevitably it will, sooner or later, come to an end. It is only an expense. Nor do the newspapers which carry its programs find profit in it—beyond small increases in circulation and advertising patronage and a certain prestige.

There are those who hold that the government should take charge of all broadcasting, and something may be worked out along this line; but it is not so easy to visualize the Federal Government putting on musical concerts, vaudeville shows and lecture courses for the radio fans.

ROBERT F. GOWEN,

Who first talked a thousand miles by radio on a single kilowatt of electrical energy.

An inventor has recently come forward with a novel plan for illustrated lectures by radio. His service would include a small stereopticon, using a two-candle power incandescent lamp with its pictures not on slides but on a strip of film. At intervals the lecturer gives signals at which the possessors of the picture outfit throw on the home screen the picture which accompanies his words.

The American Telephone and Telegraph Company (the Bell company) has erected on its building in New York the first public broadcasting station. The station is a powerful one, the steel towers supporting its antennae 100 feet high, and will furnish service for 200 miles. It can send several different wave lengths simultaneously. The company will furnish no program but will let the station to broadcast entertainment, news or other matter.

Crime and the Failure of the American Bar

Spirit of Commercialism Threatens the Law as It Menaces Press and Sports

By JOHN B. WALLACE

This is the second and concluding installment of Mr. Wallace's article, the first part having appeared in last week's issue.

THE more laws the more work for lawyers and the more work the more fees. The spirit of commercialism has invaded the bar as it has invaded the press, the pulpit and even penetrated our sports and games. It has caused the loss of those fine ideals, those higher spiritual qualities that once caused men to consider it a great honor to be a judge, an editor or a minister. The scholar has given place to the charlatan, the statesman to the demagogue and the sportsman to the sure-thing man.

Back of it all there is a sinister force, a force that the American people are just beginning to recognize and publicly to name.

This force was accurately described in a recent address by Bishop Adna W. Leonard, of the Methodist church.

"The Pilgrim Fathers came," he said, "with a government founded upon an open Bible, an open church and an open school. Their aims were idealistic.

"In the last 25 years, however, the entire complexion of the population influx has been changed. The greatest population movement of all times was completed with the immigration of 30,000,000 people who came to this country in the quarter century just preceding the war. The million Hebrews lead by Moses across the wilderness of Arabia have left their impress and their mark upon all the succeeding generations throughout the thousands of years. The movement of 30 times as many people in about half the time cannot fail to have some influence upon America and upon the world.

High Standards Once

"ALL these people have their racial characteristics, their beliefs and their creeds. They come from every nation and every race on earth and they bring with them all of their various ideas and ideals. But there is one outstanding idea back of this entire migration. The earlier immigrants came from religious motives while this immigration for the past 25 years came from materialistic motives almost entirely. They have threatened the government of this country by their doctrines of radicalism, atheism, Marxism, socialism and anarchism. Great groups came with a group psychology but no individual responsibility."

Bishop Leonard might have added with truth that one of these groups, the most materialistic of all, has grown to immense, almost preponderant power and has seized control of some of the most important sources of our culture—the press, the stage and the motion pictures. Neither the bench nor the bar has escaped its contamination and no little of the present decadence of the bar can be traced directly to the influence of its materialistic creed.

It was not always thus with our bar. There was a time when the majority of our lawyers stood for high ideals, when they looked upon their profession as something more than a vehicle to obtain money and notoriety. Then a man who indulged in the common practices of today was called a "shyster" and looked upon with scorn.

Now the situation is reversed and it is only the minority that dares to tell the truth, to call a spade a spade. It takes courage to brave the wrath of your compeers, and courage, the moral courage inspired by the aspiration to high ideals, is sadly lacking in the rank and file of the bar today.

Instead of little "shysters" we now have big "shysters," a difference in degree but not in kind. Local bar associations formed to maintain the standard of ethics are now mainly "whitewashing" organizations which lack the nerve to probe into the sore and, taking refuge in technicalities, content themselves with adopting resolutions of a general nature that sound grandiosely inspiring but mean nothing and get them nowhere.

A Man's Word Once Good

THE difficulty is that so many of the members have uneasy consciences themselves that they dare not attack lest the victim find ground for retaliation. Occasionally they disbar some attorney who happens to be very small fry indeed and whose offense is so flagrant that it cannot be camouflaged. Yet in many instances these very attorneys disbarred for acts which show their utter unfitness to be officers of the court—as all lawyers are—are, after a year or two, reinstated, having learned the lesson to be more careful about being "caught with the goods" next time.

The ethics of the majority of those who practice civil and commercial law are thin enough, so thin and elastic that they can be spread to cover nearly any case with money to be gained. The law to the majority of these civil practitioners is but a game in which justice plays but a minor part and in which the rules are so juggled and befogged that the average layman throws up the sponge in despair. Leaving out the vast horde of cheap lawyers who make a precarious living by chasing ambulances, inciting damage suits and fomenting family quarrels leading into the divorce and probate courts, the skirts of the big commercial lawyers are far from clear, considered from a strictly ethical standpoint.

There was once a time in our history when a man's word was good, if he was that kind of a man. Now even his written and signed contract is worthless if he chooses to repudiate it. A prominent and successful lawyer recently told the writer that there was never a contract drawn up that could not be broken by a skillful attorney.

It is the sole occupation of a certain class of lawyers practicing commercial law to draw up contracts that are supposedly unbreakable while another group spends its time devising methods to break them. It is remindful of the contest between the makers of armor plate to invent a shield that cannot be penetrated and gunmakers to fabricate a weapon that will hurl a projectile through it. These lawyers are men of high standing in their profession. They would be highly insulted at an insinuation that their methods are unethical. Yet what are they doing but aiding and abetting men to break that which should be held most sacred, their word of honor.

Civil law has come to be largely "dog eat dog." It is a matching of wits, of sharp practice against sharp practice. A code of simple honesty between man and man would leave our courts barren of cases and cause nine-tenths of the lawyers to turn their talents to productive lines. It is a safe prediction that 75 per cent of the disputes that congest the courts could be settled in a half-hour talk between the litigants if their lawyers would so advise them. But how few attorneys do this. It would mean the loss of the fat fees that, in prolonged litigation, eat up the property of the disputants.

It is not, however, in civil law that our present danger lies. Fools must pay for their folly and if neighbors will rush into court to settle their differences they must accept their portion of the blame. Lawyers who encourage such litigation are aiding in lowering the standards of civilization and humanity but their responsibility is light compared with that of the lawyers who practice criminal law.

Laws in restraint of crime are enacted to protect those who do the productive and constructive work of the world from those who would prey upon them. A criminal is one who will not play the game of life fairly. He is a person who lacks the moral stamina to endure himself the buffets of existence and who tries to take an unfair advantage of those who do.

Every criminal, whether of high or low degree, invariably has a tale of real or fancied injustice which he whines to excuse himself. The truth is that he is unable to stand the gaff. He wants the good things of life without paying the price of physical and mental toil.

Therefore, he takes what he wants from others either by guile and trickery or by force. There are exceptional cases when it almost seems that the criminal is justified but "two wrongs never make a right" and no individual or association of individuals can remedy an injustice by committing another one.

Lawyers or Actors?

IN THIS ceaseless war of society against its outlaws it would surely seem that society would be entitled to the protection of the legal profession, every member of which takes an oath to uphold the law and serve the ends of justice. How lightly this oath is regarded is seen in the previously quoted statement of Mr. Woolwine. Instead of aiding justice these crooked criminal lawyers, as Mr. Woolwine dubs them, do everything in their power to thwart it.

Taking example from the tactics of big business, the big criminal rings engage lawyers versed in every shady trick of their profession. This ring generally revolves around one big lawyer, a man of considerable standing in his profession, who seldom appears in court in behalf of his clients but who plans the campaign that his lesser associates carry out. One or two members of the ring are trial lawyers of repute, men possessing little legal knowledge but of histrionic talent who endeavor to sway the emotions of the jury by theatrical appeals to its sympathies and prejudices. These men are in reality not lawyers but actors with all an actor's mannerisms and studied eccentricities. No one better understands than they how "to tear a passion to tatters."

Then there are lesser attorneys who do the leg work, attend to bail matters, assist in locating and coaching witnesses. In addition, the ring, or rather its attorney, employs heelers recruited from the ranks of ex-police officers or detectives who have quit the force for good and sufficient reasons. If the lawyer does not maintain his own staff he is usually connected with some private detective agency which does this work for him.

The duty of these men is to shadow the prospective jurors and those selected, also to shadow witnesses for the prosecution. They make it a point to discover the affiliations, prejudices and weaknesses of these jurors and witnesses and then to play upon them for intimidation or bribery. In many cases they have caused witnesses to go upon the stand and repudiate the story they told the prosecutor, in other instances when this was impossible they paid witnesses to leave the jurisdiction of the court. Another duty is to provide alibi witnesses in desperate cases, men and women paid to go upon the stand and swear falsely that the defendant was in their company far from the scene of the crime when it was alleged to have been committed.

It is disconcerting and often fatal to the case of the prosecutor to have a witness go on the stand and tell a story differing from that he had previously told when the state was collecting its evidence. He may later be able to convict the witness of perjury but often too late to affect the case on trial. The disappearance of an important witness will also cause the case of the state to sag while alibi witnesses, the truth of whose stories the prosecution has not the time to investigate, interpose a fatal handicap in the administration of justice.

Coached and trained so well are these professional witnesses that they often cause the stumbling and halting stories of the witnesses for the state, who are really telling the truth, to appear as clumsy fabrications. The adage that "truth will prevail" is correct but the difficulty is that by the time the real truth is discovered the trial is over and the defendant has been freed.

The handicaps in a criminal trial are all imposed upon the prosecution. It must prove the man on trial to be guilty beyond a reasonable doubt. No juryman who is a normal human being desires to send a man to prison or mayhap the gallows or electric chair unless he is absolutely convinced of his guilt. These crooked lawyers take full advantage of this feeling. By placing a multitude of witnesses upon the stand, even when they know the jury will not believe them all, they hope to confuse the jurymen sufficiently so there may be that doubt that will incline them to free a possibly guilty man rather than to suffer the self-reproach of having voted to convict a man who might be innocent.

The "ace in the hole" of these gentry, however, is their ability to bribe a member of the jury. Through their secret force of ferrets they are able to discover the financial condition and the susceptibility to temptation of the members of the panel. A mistake in approaching the wrong man would be fatal to their case and such mistakes rarely happen. They know their man thoroughly before any overtures are made. But even though a mistake should be made the attorney has so covered his tracks that it is almost impossible to trace the offer back to him. Second, third and often fourth parties are used to cover up the transaction and when caught one of the tools is paid a large sum to be "the goat." If there are no witnesses—and usually good care is taken that there will be none—it is the case of one man's word against another and it is seldom that the briber fails to escape.

The Newspaper Sob Story

WITH one fixed juror the case for the defense is as good as won. He can hang the jury until doomsday and there is no requital. Not only that, if he happens to be a clever man with a gift of persuasion, he can often bring some of the other jurors around to his side. While a hung jury does not mean acquittal, by successively hanging a number of juries it is possible to discourage the prosecution, who, to save the taxpayers further expense, will dismiss the case. In this lies the secret of so many jury disagreements where the general public has fully made up its mind as to the guilt of the accused. If the prosecution refuses to dismiss the case entirely it will often compromise upon a light sentence after several disagreements of a jury.

Another favorite and probably unconscious ally of these crooked lawyers is the press, especially that portion of it that plays up news from a sensational angle. These attorneys make it a point to curry the favor of newspaper men and women. Women writers, who write the human-interest stuff, as it is called, and who are nicknamed "sob sisters" by the profession, assist them greatly in creating public sentiment in favor of the accused.

There is seldom a criminal so hardened but who has some human qualities and the "sob sisters" in discovering these good traits harp upon them until the public is convinced that the defendant is a poor victim of circumstances who is being cruelly persecuted by society. Popular sympathy is always with the underdog and often a public prosecutor through the dissemination of propaganda of this sort in the newspapers finds himself at the beginning of a trial confronted by a hostile atmosphere that renders his task even more difficult.

Sensations and Advertising

THESE columns of publicity are welcomed by criminal lawyers not only for the effect that it has upon a trial but also for the personal advertising and exploitation they get out of it. They stage many small sensations which have no effect upon the issue of the case simply to furnish their newspaper friends with something to write about, knowing that they will reap the benefit in notoriety and prestige as a smart lawyer.

Although usually liberal with cigars and other small favors they seldom attempt to bribe reporters. It is not necessary. The reporter holds his job through his ability to turn in good copy. It is but natural he should have an unconscious bias in favor of those who furnish him with live stories.

There was a time when these lawyers were satisfied simply to defend criminals after they were caught, but now they go further. They advise and often actively aid them in conspiring to break the law. Judges and the state's attorney in Chicago openly charge that the great criminal rings of that city are under the guidance of lawyers. Yet so powerful is the political influence of these arch-criminals and so great the timidity of their fellow members of the bar that they are seldom brought to book even before the bar associations which are organized for the purpose of maintaining a high standard of ethics in the profession.

The bar can only be cleaned up by its own members. As long as its members are content to allow crooks to besmirch its reputation they must expect to share the stigma. Those lawyers who have the courage occasionally to speak the truth about conditions fail to receive support from their associates.

On the contrary, they are made to feel the weight of their displeasure—socially and, when possible, politically. They are called radicals and hotheads and are ostracized by the profession.

Under present conditions there are only two classes

(Concluded on page 13)

City Asks Boycott to Protect Its Boulevards

By ORSON ANGELL

The corner of a Kansas City boulevard which the park board and property owners vainly attempted to protect.

Protests in Vain, Another Plan Is Employed

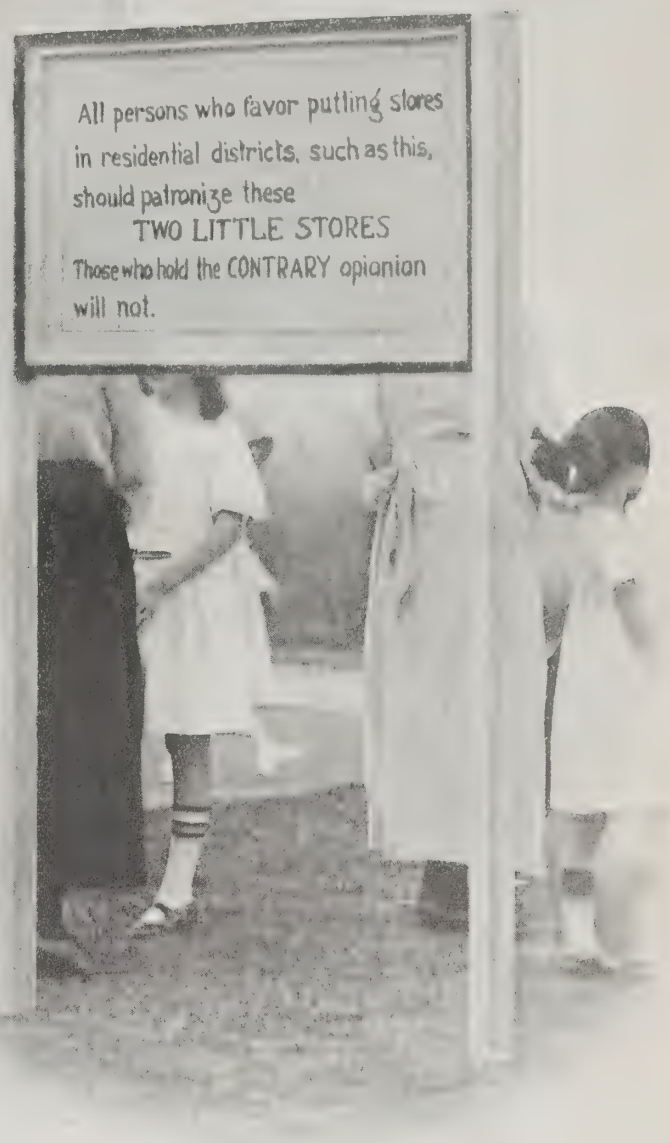
KANSAS CITY has resorted to boycott to protect its boulevards from the invasion of unsightly business houses. A few hours before a floral parade, one of the features of the city's recent celebration of the thirtieth birthday anniversary of its park and boulevard system, passed along Benton Boulevard, the sign shown at the right above was erected, by order of the park board.

The opposite face of the signboard bore an explanation:

NOTICE

These TWO LITTLE STORES were erected CONTRARY to the wishes of all the residents along this boulevard and contrary to the known policy of Kansas City, as declared in Ordinance No. 42796, constituting this a residential district. BY ORDER OF THE PARK BOARD.

The two stores are in a small, single-story, brick building, erected five months ago by Solomon Laner and Lewis Laner, brothers, who own several groceries over the city. The district is one of fine residences and small apartment buildings. A business center is only a block away and residents felt there was no call for the Laner brothers to spoil the beauty of the boulevard.



Houses in the block stand well back from the street and on a terrace, about five feet high, extending the entire length of the block.

The grocers purchased a residence, tore away its front porch, excavated the terrace and built their stores on the street level and flush with the sidewalk, making the brick structure a part of the once fashionable residence.

Neighbors knew nothing of the plans until work had begun. They remonstrated in vain, then called on the park board. There was no ordinance to prevent the work. The board filed condemnation proceedings, after property owners in the block had agreed to an assessment to pay the cost of condemning the lot.

Attorneys for the grocers filed an injunction, restraining the park board from proceeding with the condemnation measures. The building was finished. Laner brothers established a grocery in one room. The other was rented to a druggist.

The case still is in the courts. Attorneys for the Laner brothers advised them to tear down the sign, which is on park board property, alongside the stores, but they hesitated to do so, and it still stands. It was viewed, on the day erected, by several thousand persons.

The boycott sign which the Kansas City park board caused to be erected near two stores which were built on a boulevard against the wishes of property owners in the block.

In the Old Days Business Wasn't Impossible!

Concluded from page 6

terest was specified in the contract that governed each transaction and was signed at times by as many as 12 witnesses. But the payment of interest was not shown in the ledger account, which was made to balance exactly. This was kept on a separate tablet. The system might be popular in these days of income and excess profits taxes, and suspicious revenue officers. Murashu Sons and other business men long before them doubtless had their own bookkeepers; the matter of accounts was relatively simple. Contracts were not so easy. There was no regular form, and few men were sufficiently expert in the art of writing on soft clay with a sharp stick, in the peculiar wedge-shaped or cuneiform characters, to handle their own correspondence. A guild of notaries took care of this—the early public stenographers.

In other words, in addition to keeping a weather eye on the plain across which an invader might make his appearance, the business man had to carry the bulk of his transactions in his head. The contracts were on file, but looking them up called for a lot of work. Besides, they were difficult to read. Chinese is relatively simple in comparison with ancient Babylonian, and the still more ancient and obscure Sumerian. One sign or character in that writing may have as many as 30 different meanings, depending on the position and context. Knowing them all was an art that kept the highbrows forever on the jump. One expert has made a dictionary of 35,000 words.

But business was done in Babylonia—in the cities of Nippur, Lagash, Erech, Kish and Ur of the Chaldees, to mention but a few—for a known period of 5,000 years. The empire was overwhelmed by foreign conquerors and torn apart by civil war again and again, but it was not until the time of Alexander that it finally dissolved, three centuries B. C. Business was done until the walls of the cities began to shake under the missiles of the invader; it was taken up again when the tumult and the shouting died.

Wherever the land was level enough the Babylonians had canals. Their system in Mesopotamia was the largest and most intricate the world has ever known. It served alike commerce and agriculture, the one with means of transportation and the other with that and also with irrigation. Crops were raised that made the eyes of the cultured and scientific Greeks bulge with astonishment. This system was maintained in spite of civil war. In its early history the country was a region of independent cities, each with its own private and personal king. Quite often one of these kings became ambitious and set out to grab off an adjoining city, or two, or all of them. Since the imperial idea of the final crushing insult to a rival was to "tear down his temple and destroy his wall" all this was rather hard on the canals. But every time a temple was pushed into one of them the Babylonians dug it out again, leveled off the ruins and built a new one. The banks of these canals crisscross the swampy desert of Mesopotamia today. Most of them have been filled up for 2,000 years, but now the British are restoring some of them.

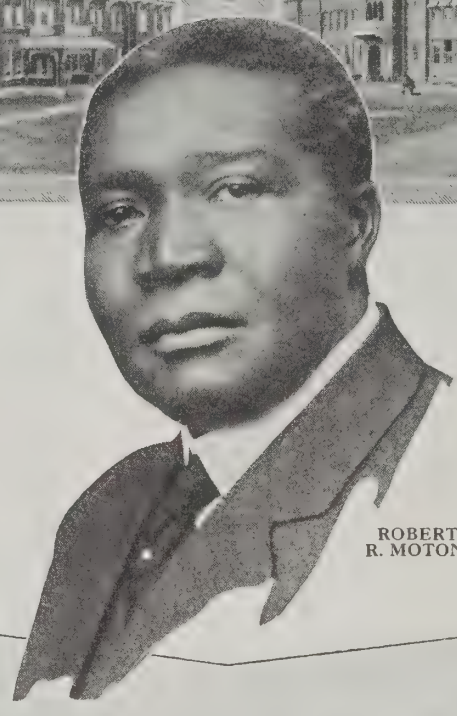
Carts drawn by oxen also were used for transport. Adventurous pioneers of trade made up caravans to go to Egypt, the Mediterranean, the Hellespont, perhaps eastward to China and India. They were to the land what the later Yankee captains of clipper ships became to the sea. Sometimes such an expedition would be gone a year. Records still preserved show that often the merchant made heavy loans from the temple bank or a Damguru, the member bank of the Federal Reserve System. For these he had to pay 40 per cent. Think what he must have charged to show a profit!

Palestine and Egypt were the nearest and, therefore, presumably, the best markets of the Babylonians. The route from Mesopotamia led through the valley of the Megiddah in Palestine. At the narrowest point of this valley the early inhabitants built the city of Beth Shan—now Beisan. If you have read your Bible you will recognize it as the site of King Saul's last battle; the fight in which he was overwhelmed by the Philistines, who nailed his body to the walls. No other spot in the world has known as many separate and distinct battles. The mount above the citadel was a coveted stronghold from the earliest days of military strategy—and the Babylonians knew a thing or two of that gentle art. Beth Shan was destroyed and rebuilt nine times. Its ruins are being excavated today.

At any rate, during the intervals between wars, the Babylonians trekked through this valley to Egypt with carts and chariots, of which the Egyptians were heavy buyers, leather goods, clothing, copper, implements, surgical instruments, jewelry, vanity boxes and hairpins. Any good archeological museum can show you samples, found in the tombs of Egyptian queens—and lesser ladies of greater charm. A tablet in Philadelphia, dated before Abraham, contains a drawing of a combination plow and seeder. It was invented by a Babylonian either as a labor-saving device or because the birds were eating up the seeds when the latter were planted by hand in an open furrow. This plow was made with a hollow post or tube running down to a point just back of the blade that turned the furrow. A man alongside poured the seed into a funnel, so that plowing and seeding were one operation.

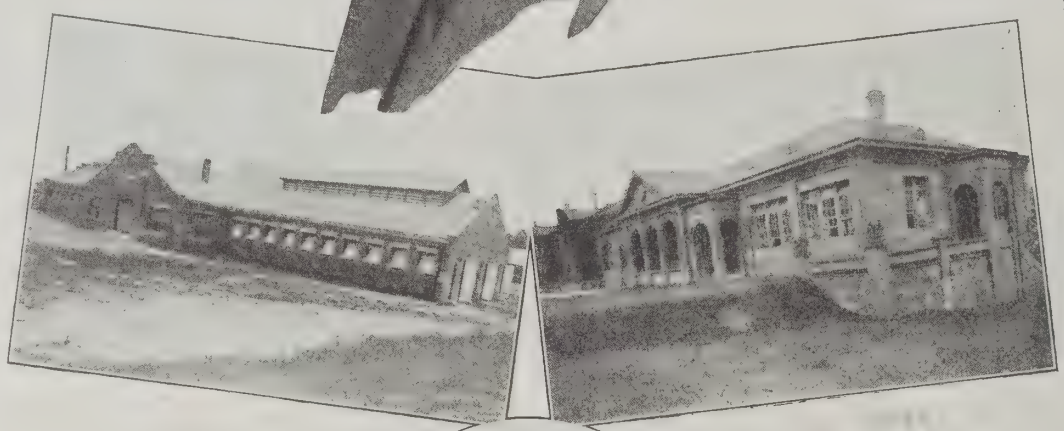
It may be said boastfully by the harassed business man of today that the simple life of ancient Babylonia cannot be compared with the complex civilization of today. But was it simple? Not even the experts who have spent a lifetime in the work care to guess at its limits. Some of them have guessed as to its age. In the Bible it is set forth that the world was created in 4004 B. C. Careful computations made on the basis of contemporary records of clay have carried history back to beyond 5,000 B. C., at which time there was a high degree of culture that must have taken ages to develop. Scientists of climate say there are regions, such as that of Turkestan, where petrified forests have been found, that once may have supported human life.

One of the leading industries must have been the manufacture of millstones. Even in seasons of poor crops these came in handy to drape around the necks of bandits, murderers and other major criminals. The wearer of this quaint collar was then urged into a section of the canal that was over his head, and he became a good Indian. Lesser crimes were punished by mutilation. There is no mention of jails in any of these ancient records. The Babylonians were too busy to fool with prisons when they had canals. They were sticklers for law and order. The first part of that prescription as it is known to the world today came partly from the Mosaic Code. Archeologists find the forerunner of the Mosaic Code in the Code of Hammurabi, a Babylonian ruler of about 2200 B. C., and not long ago the famous Pere Scheil of the Sorbonne, Paris, poring over transcripts of some undeciphered tablets from the Nippur collection, discovered a Sumerian code a thousand years older. These laws protected human life and private property.



Tuskegee Institute Since Booker Washington

Better Understanding Sought by Founder of School Gradually Takes Form



James Hall—girls' dormitory.

The new boys' trades building.

ROBERT R. MOTON

The dairy barn.

The laundry.

The new boys' trades building and the memorial monument to Booker Washington, recently unveiled, in the foreground.

By GUSTAVUS A. STEWARD

WHEN one hears the name of Tuskegee, instantly that other name, equally famous and almost synonymous with the great southern educational institution—the name of Booker Washington, comes to mind. So long was he identified with the school which he established that it is difficult to think of it as under the guidance of any other person. But for nearly seven years now Tuskegee Institute has been directed by Robert Russa Moton, a fellow alumnus and close associate of Booker Washington, both having graduated from Hampton.

As the world already knows what surprising progress the institute made under its founder, and what a powerful influence it exerted through his personality, not only on the South, but on the nation, it is natural that there should arise certain questions regarding the administration of his successor. How has the school developed since his death? How are his ideas being carried out? Is the institute increasing in prestige? Is it helping in the solution of the one great problem which harasses this country, and particularly the South? In short, is Dr. Moton's administration a success or a failure?

To step into the shoes of genius is a perilous venture, and while Dr. Moton undertook no light task when he assumed the principalship of Tuskegee Institute, it can be safely said that under his direction the school has gone steadily forward. This is evident in the progress made both in what may be called the "externals," that is, the plant, the equipment, the courses, and so on, and in the "internals," or the ideals of the institution.

When Dr. Washington died in 1915, he left a plant at Tuskegee unequaled for the purposes. Only those who had visited it could realize its magnitude. There were hundreds of acres of rolling land, whose natural beauty had been enhanced by intelligent landscaping. There were several modern dormitories, steam-heated and electric-lighted by the institute's own thoroughly equipped central power plant. There was a unique water system, supplied by a series of artesian wells. There was a well-lighted, well-ventilated recitation building, a boys' trades building somewhat outgrown, and a girls' trades building similarly crowded. A completely appointed hospital cared for the sick of the institute and of the neighborhood, while an extensive farm endeavored to supply the foodstuffs for the school community. In addition, there were teachers' homes, a large chapel, a huge structure housing two capacious dining rooms, a kitchen and a large auditorium, a primary school building, an administration building, storerooms, bathhouses, barns, mills—in fact, almost every sort of equipment a present-day settlement of about 2,000 souls would need. During the past six years, additional buildings have been erected and several improvements and enlargements of equipment made. The more important of the buildings are: James Hall, a dormitory for girls; a laundry, which has relieved the congestion in the girls' trades building where it was formerly located; the boys' trades building, which replaces the old building destroyed by fire, is complete in every detail, and provides space for the various shops; the dairy barn, sanitary and commodious, replacing an old frame structure that stood inconveniently near the hospital; a health station; and about seven teachers' cottages. Of improvements made, the two outstanding are the installation of automatic stokers in the power plant, which in the first year saved about $48,000 in the fuel bill, and the addition of several new artesian wells, made necessary by the increased consumption of the enlarged plant. The outlay in making these extensions has run close to $1,000,000 during the present administration. The result has been a practical doubling of the running expenses of the school in five years. Incidentally, more than $1,000,000 has been added to endowment.

In the matter of courses offered, many changes have been made, enriching, strengthening and advancing the curriculum. But before they are described, some idea of how Tuskegee's schedule operates is in order. Tuskegee is perhaps the only institution in the world that is four schools in one. Booker Washington's idea was that every boy and girl enrolling there should do some kind of work with the hands. And they all work, the entire 1,800 of them. They work everywhere—on the farm, in the kitchen, the laundry, the shops, the offices. And they do everything, from mending the linen on which they sleep to building the substantial dormitories in which they live. To carry out this everybody-work idea, a three-in-one school was at first adopted. The first school consists of those students who go to their academic classes on Monday, Wednesday and Friday of each week, and to their work or trade classes on alternate days. The second school is made up of those who go to academic classes on Tuesday, Thursday and Saturday, and to their work on alternate days. The third school includes all those students who, being without sufficient means to continue in school, are obliged to work all day every day and to attend academic classes at night, five nights a week. This was the system as it existed at the time of Dr. Washington's death. A fourth school has now been added and comprises all seniors, who attend academic classes five days in the week and work one day, Saturday. For all this work students are paid and their earnings credited toward their board and lodging and other expenses.

Formerly, the academic department which is the department which cares for all purely scholastic instruction, as distinct from the department of mechanical industries, which teaches the trades, consisted of three preparatory years and three advanced, or high-school years. As it then existed its highest class was just about equivalent to the eighth grade of a standard public school. Students completing this course and desiring to enter elsewhere to continue their education found themselves severely handicapped, and were obliged to spend very valuable time making up this deficiency. To meet this condition a fourth high-school year has been added, several required subjects introduced, other subjects given earlier in the course, while a liberal range of electives has been provided, including many of the pre-college studies. The course as it now stands compares favorably with the average high school, and graduates are entering colleges with less difficulty.

In the trades, which have always included practically all the usual mechanical and industrial crafts, the domestic arts and sciences, and farm industries, are now listed courses in auto-mechanics, architectural drawing, photography, business training, home economics, teacher training and nursing. The requirements for entering a trade vary in accordance with the trade selected. For example, a student may begin the study of carpentry with no more academic preparation than is essential to enroll as a student of the institution; to take up a course in printing he must be at least in the first year high-school course; in applied electricity he can enter if he is a student in the highest preparatory year; while in home economics, teacher training, nursing and business training—which embraces two "trades," (1) stenographer and typist and (2) bookkeeper—he must have completed the second year high school. Alabama now requires diplomas of nurses, so that they must have three full years of nurse training before they can graduate. Moreover, formerly a student could graduate from his trade before finishing his academic work, or vice versa. Now no student can get a diploma without finishing his entire course, trade and all. If, for example, he is so far advanced when he enters the institute that he is enrolled in the third or fourth high-school year, he must specialize in his trade until he has completed it up to the point at which he would have arrived had he been attending the institute from the first. This enables him to complete both academic work and trade at the same time and to receive his diploma.

So much for "externals." While these are important, for they furnish the mechanics by which thousands of young people have been and will be developed for useful living in this country, yet one likes to believe that it was the "internals," the spiritual side of Tuskegee which its founder considered transcendent, and which its present principal increasingly emphasizes and emulates.

Booker Washington had three compelling ideas. One was so to co-ordinate the individual—that is, place a trained mind and hand under direction of a sound moral discipline. The second was so to link up the trained individual with his community that the community would benefit by the union. The third was that self-helpful, community-building Negroes, scattered here and there, would belie the traditions of the South and bring about a closer mutual understanding between the races.

It is perhaps in the largest aspect of the Tuskegee idea, that is, in the effort to produce interracial good will, that the greatest, best and most helpful work is being done, and, paradoxically, it is precisely of this phase that the public knows the least. For it is a quiet process. It concerns itself with small groups of the South's better-minded men and women. It is a widespread and growing manifestation of the Tuskegee Spirit. In furthering it, Tuskegee and its principal take a leading part. Officially, it is called the Interracial Commission. It has organized groups in 800 southern counties and has frankly faced the primary cause of the South's trouble in a spirit of determination to cure it. It is succeeding in crystallizing sentiment against the worst evil this country endures, lynching, and no more telling blow has been dealt than that given by a group of southern women, in whose behalf the public has been led to believe mob violence necessary. Said they in their adopted address: "Lynching is the black spot on America's soul. So long as America holds the record for its illegal taking of life, so long as the headlines of foreign papers carry in large letters 'America burns another Negro,' just so long will her shame be world-wide. We have no security unless the law protects us. Mob violence knows no law. As women, as mothers of men, we protest. We condemn every violation of law in the taking of life, *no matter what the crime.*"

Aside from arousing a healthy public opinion, reports from local committees of this interracial commission show concrete achievements: lynchings have been prevented, legal redress for wronged Negroes has been secured, hospital privileges for black nurses granted, better schools planned, and many minor evils ameliorated. Tuskegee is justifying the millions invested there and warrants the thought and care expended upon it by those responsible for its ongoing. For in the more efficient, self-respecting lives it produces, in the interracial accord which it promotes, America is being incalculably enriched.

Smoothing the Rough Places for Aged Parents

By CHARLES HENRY LERRIGO, M. D.

YOU remember Wemmick, of "Great Expectations," who was a hard, stern man of the law in "the city" all day long, but in the evening, at Walworth, was the dutiful son of the Aged Parent. Dickens has presented few characters that draw our sympathy more keenly than Wemmick in his treatment of the deaf old father who "required as much watching as a powder mill." It is a fine thing that so many sons and daughters have this wish to make smooth the rough places in the rather uneven road that old age must travel.

"I wish you would tell me just what help can be given to a man of 80, who has no special ailment but is just losing his hold," writes an inquirer.

"Is it true that men do not live as long as women?" asks another. "I have heard and noticed that there are many more old women than old men and they seem more capable. What can be done to quicken a man 77?"

Yes, it is true that there are more women than men who look on the outbound side of the octogenarian milepost, which is now considered the sign of the old-age boundary. In the 1910 census there were about 30,000 more women than men in the 500,000 persons entitled to speak on "How I managed to pass the mellow age of 80." It is also true that women are generally more capable than men of like age. They simply outwear them, which, you will please note, is a very different thing from wearing them out.

Sometimes one wonders if the dependence of old age makes as strong an appeal to us as it should. It is natural that we should be charmed by the chubby, vacuous face of the tiny babe. But also let us see a charm in the wizened face and pointed chin of old age. There is no meanness of character thus depicted. It is a physiological change of contour due to loss of teeth and absorption of the alveolar process of the jaw, causing the chin to be raised higher in closing the mouth. And the mind may still be active and the heart may still be generous.

Pride Makes Them Silent

OLD age creeps with such stealth that it is often hard for the son or daughter to realize that the sturdy father or the ever-efficient mother has reached the stage of life in which the sturdiness has changed to weakness and the efficiency to dependence. Yet if the grown children are to show their anxiety for the old folks' welfare before the day comes when it is too late, they must be on the watch. Their help must be volunteered, not given on request. The baby who needs care will cry for it. The aged father and mother will not do that. Pride will not let them.

Have you noticed that father doesn't read as much as formerly? He complains that the type is not what it used to be. When he takes up his newspaper he holds it a long distance away. Or it may be held very close, the venerable head dipping down until almost buried.

"I expect I see as well as most people of my age," he replies to your inquiries. "If you do as well as I in your 70's you may be proud of yourself."

Very well. But don't let it stop at that. If you haven't first-class lights in the house, see that you get them. Then see that father's chair is placed so that he will receive the benefit. Don't let him go to a notion store and buy a pair of dollar spectacles. Make an appointment yourself with a first-class oculist and see that his eyes are really fitted.

And mother. She is eating very little. Her teeth are so troublesome. "I don't want any dentist excavating in my mouth," she objects.

Little Things That Mean So Much

SHE would rather carry on with her aching joints, and continue to starve on a half diet than go to a dentist. But it is your business to explain to her that nowadays dentists can do work really painlessly. They can give local anesthetics, they can deaden pain by nerve blocking, they have many devices to remove from dentistry the odium of the dent. But you will very likely have to make the appointment and then see that mother keeps it. Then too, there are excellent aids to hearing among the new inventions.

Food is as important to the old as to the young. The diet of the aged must not be hearty, but should be regular. It is a good thing to have them begin the day with a glass of hot water containing a pinch of salt. Graham gems are good for breakfast. Dairy food, milk, eggs and butter, will be prominent in it. On account of a deficiency of bile, fats are not very well borne, and butter is the most acceptable way to take fat. Meats are not well digested because there is often a deficiency of gastric juice. Coffee and tea should not be withheld if they are a long accustomed part of the diet, unless known to cause nervousness or increased blood pressure. Cocoa and malted milk are usually very acceptable drinks. Malted milk is especially helpful if given as a hot drink midway between meals. Fruits are good, but old persons should not take bulky foods like cabbage, lettuce and spinach, that give a lot of digestive work for very little nourishment.

Toilet becomes a great burden to the aged. One who is feeble should always have help in bathing. The skin becomes sensitive and is easily chafed, so no harsh soaps should be used. Help should always be given in getting in and out of the bath.

An old person's finger and toe nails become brittle and crack easily. A good way to take care of these cracks is to clip the nail evenly and cover the cracked surface with adhesive plaster.

Clothing is even more important to the aged than to the young, but they do not think so. They will makeshift from year to year with clothes that are worn and thin. It is especially important that old persons should have good, warm underclothing for winter. Their bodies generate so little heat that it becomes very important that none of it shall be wasted.

Shoes should be comfortable and roomy. Warm bed slippers should be provided. Rubber heels are helpful to take off the jar of the inelastic step. Very often weakfoot or broken arches cause much pain.

Night clothing and a warm bed both are important. While an old person should sleep in a well-ventilated room it should not be in a cold bed. If the room is cold the bed should always be warmed by artificial heat before use. These old persons do not find sleep such an easy matter. They have no heat to waste in warming up a mass of bedding. Let it be done for them before they go to bed.

"But father doesn't appreciate the things we do for him; he seems suspicious of anything we attempt, and of everyone who offers to do anything."

How to Be Real Sons and Daughters

YES, that may be true. It is one of the misfortunes of advancing age, in no few cases, that it seems to produce an atrophy of the emotions. There seems to be no interest in anything but their own petty affairs. After all, it is not surprising. Let the intellect slip even a little and self-interest may become all in all.

Yes, the aged parents may become suspicious, morose, jealous, unreasonable; and, therefore, if you permit it to be so, actually tiresome. Delusions that the whole world has turned against them are not uncommon. If you can still give cheerful support and comfort you are showing yourself to be a real son or daughter, for only the best stand such a test.

The best way to keep old persons young is to encourage them in enjoying such cheerful companionship and activities as are possible. To return to Wemmick for a moment: there is a rich lesson in the incident in which, with a houseful of company, he honors his old father by asking him to read the newspaper aloud to the assembly.

"I won't offer an apology," said Wemmick, "for he isn't capable of many pleasures—are you, Aged Parent?"

The secret of helping the infirmities of the aged often lies in this simple thing of studying their weaknesses and cultivating opportunities for the pleasures of which they are capable.

A Landlubber on a Whale Hunt in the Arctic

Concluded from page 7

Like a foundering ship the giant bowhead went down by the bow, the big 18-foot flukes narrowly missing the boat. The harpoon lines went out of the buckets as if they were attached to a speeding locomotive.

Then the whaleboat began to race through the water, dragged with her bow so far down that she began to ship brine. All at once the whaleboat stopped. A few seconds later a glistening yellow object floated inertly to the surface. It was the whale, belly upward, dead.

Chains were passed around the body and it was hauled alongside the *Herman* where the cutting stage had been lowered and the work of butchering began.

The head, which contains the whalebone, was cut off and the big strips of blubber chopped away with axes and hoisted on deck to be melted into oil in the "try works" or big boilers. The whale yielded 4,000 pounds of blubber and 2,500 pounds of bone.

Time was when the bone of a big whale was worth $10,000. Now there is little sale for it.

Some years ago Captain Pedersen was only one of the many daring Americans who followed the strange currents through the Bering Straits to the foot of the Aurora Borealis.

Today he is the lone wolf of the whaling pack. The low price of oil and bone has driven the others out but Pedersen combines his whale hunting with fur trading and thus makes a good income.

Early explorers who went through the Northwest passage tell of big whaling fleets anchored off Point Barrow and Herschel Island. Then the winter stillness of Alaskan, Siberian and Canadian Eskimo villages was transformed into the bedlam of an American frontier with lawlessness running rampant, with killings occurring daily and with carousals and whisky trading demoralizing the otherwise well-to-do natives.

But the bottom dropped out of the whalebone market and the historic old whalers became derelicts and their skippers and crews took to coastwise shipping.

Today Captain Pedersen alone yearly carries the American flag into the frigid seas, through the straits to the Arctic Ocean and between icebergs and "pressure ridges" to Point Barrow, Baillie Island, Coronation Gulf, the mouth of the Mackenzie and to Uncle Sam's mystery isle, Wrangel.

Down on the Oakland estuary in San Francisco Bay, where the tall masts of the Alaska packers fleet and the hulls of derelict craft give one the impression of being in a maritime graveyard, I found the *Herman*.

It was on a pleasant April morning that the motor of the schooner began to hum. An uneventful voyage of 2,100 miles brought us to Dutch Harbor and Unalaska where the whaler rigged up her cutting stage, tackle, special masts and whaling tackle.

Here we donned our arctic garb. Masinka boots of sealskin, waterproofed, the soles sewed and crimped by the teeth of native women, slipped over several pairs of socks, and the regular parka or reindeer skin jacket with wolverine hood were put on.

As we rode around the Alaskan peninsula the cold struck us like an icy blast. In June when New York and Chicago were sweltering, the rigging of the *Herman* in the Bering Sea was covered with ice that had to be knocked off.

Steering by the clouds, Captain Pedersen forced his way into several openings in the ice, only to find that they were "pockets" or dead ends. Each time he was compelled to turn back. Even when he put the prow of the motor schooner into a crack and gave it full steam, no headway was gained. He was determined to get through here as the clouds told him of a waterway just beyond.

Dynamite was attached to poles and thrust far under the obstructing cakes where it exploded and tore them into chunks. The sturdy whaler surged forward. If heavy winds had been blowing, blasting would have been impossible as the breach would have closed up instantly. When he stopped for the night, Captain Pedersen "hitched" his ship to an icy bowlder instead of anchoring.

It was off Pt. Hope, Demarcation Point, Herschel Island and the mouth of the Mackenzie River, that the whaler got two big bowheads, the capture of one of which I have already described.

The return trip which began in September was comparatively uneventful.

I left the *Herman* at Nome and returned to civilization by much speedier transportation than that furnished by a motorized whaling schooner.

I can still close my eyes and experience that plunge into the ice-cold ocean from the upset whaleboat.

Crime and the Failure of the American Bar

Concluded from page 10

of lawyers who dare to speak out. Those who have reached the highest eminence in the profession without furnishing their closets with too many skeletons and those who have failed to get anywhere in the law. The first are nearly all on the bench and have lost active contact with actual conditions and the second have no influence, their complaints being laid to envy and spleen.

A good example of the timidity of the bar associations is evidenced in a recent case. A district attorney who has ever been outspoken in his contempt for crooked lawyers, was prosecuting a murder case wherein a young and beautiful woman was being tried for the alleged murder of her lover. Attracted by the notoriety attached to the case, a Jewish lawyer went to the city with the announced intention of taking charge of the defense. The district attorney looked into the antecedents of this attorney and when the latter applied for permission to practice in the local courts the district attorney entered strenuous objection.

He charged that the lawyer in question had the reputation in his home city of being a suborner of perjury and a jury fixer. In support of his allegations he read telegrams and letters from attorneys, including one from the former state's attorney of the city in which the lawyer practiced.

The presiding judge referred the matter to a committee from the local bar association. It was first announced that the committee would hold a public hearing at which the district attorney was to submit his proofs that the applicant was unfit to practice. This public hearing was never held. The committee asked the advice of the local bar association to which the attorney belonged, but it declined to make any recommendation. Finally, the committee decided to admit the visitor under the rule of comity, a courtesy between states.

Although the attorney was admitted he had been unmasked and he threw up the case and left for home, breathing the usual threats of libel suits, which suits—needless to say—never materialized.

The action of the district attorney was a distinct innovation and created consternation among attorneys whose own skirts were not clear and who feared the effect of such a precedent.

That the failure of the bar is largely due to a lack of proper education and the influence of the materialistic spirit of the age is the belief of William Gibbs McAdoo, former Secretary of the Treasury.

In an interview for THE DEARBORN INDEPENDENT Mr. McAdoo, who is now practicing law, said:

"When I studied law in college in the South the law was looked upon as an honored profession which gave great opportunities for public service. We were taught that upon our shoulders was a great responsibility for the public welfare. Statesmanship was perhaps the most important part of our course. The ideals of the profession were as important as the inculcation of the technique of the law.

"Today with law schools turning out lawyers by the thousands much as a business college turns out bookkeepers and stenographers there is small opportunity for the student to imbibe the traditions and ideals that are so necessary to prevent him from becoming a mere money maker and notoriety seeker. A return to the old system of education when the student course embraced a wide range of cultural subjects as well as a thorough course in political history and science would do much to purge the bar of the spirit of materialism that is permeating it."

The Infant of Our Insular Possessions

Who Under a Palm Tree Cares If Virgin Islands' Industry Languishes?

By CARL SCHURZ LOWDEN

DURING one of the voyages to the New World the caravels of Columbus discovered the West Indies, and more. They hove to at the island now known as St. Croix. There the explorer encountered a phenomenon that thrilled him. "I have seen many queer things," he reported to Ferdinand and Isabella, "but none stranger than a tree that bears oysters."

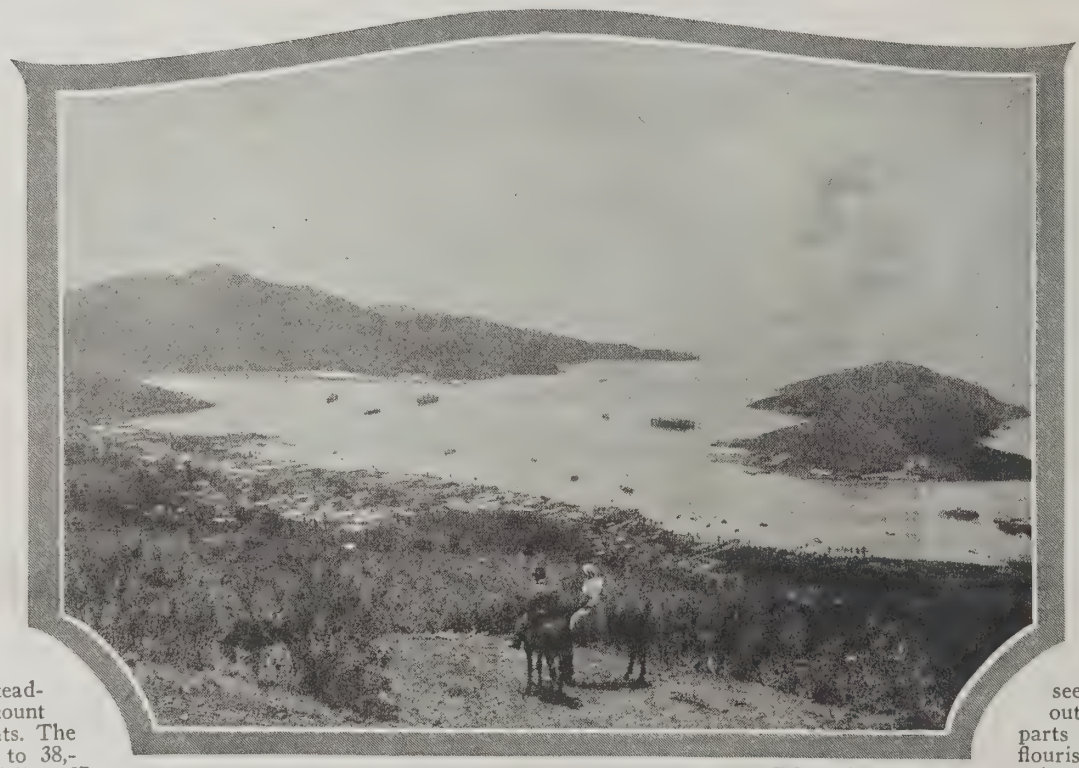
Now, after four and a quarter centuries, the lazy music-loving natives still gather at low tide the oysters from the roots of the mangrove trees, but all comprehend that the mollusks are parasites and not fruit. The explorer displayed an active imagination in the matter of naming the new Spanish possessions, for he called them the "Eleven Thousand Virgins." They had a checkered career. They were held at various times by Spain, England, France, Holland and Denmark. Until the United States bought them in 1917 they were regarded as a part of the West Indies; then, however, a sense of poetic justice led to the order that the "territory hereafter be known as the Virgin Islands."

The efforts of the United States to acquire St. Croix, St. Thomas and St. John began in 1865 when Lincoln advocated such a move and Secretary Seward (who later put through the deal for Alaska) offered $5,000,000. Denmark asked 50 per cent additional for two of the islands, St. John and St. Thomas. The trade failed, as did the negotiations of 1901 and 1910; but in 1917 Secretary Lansing handed a treasury warrant for $25,000,000 to the Danish minister and the transfer was accomplished.

The Virgin Islands comprise a total area of 142 square miles. St. John is the smallest. St. Croix is the largest, wealthiest, most thickly populated and the farthest south. These possessions are in the path of vessels plying between the Atlantic ports of the two American continents. St. Thomas lies 1,444 miles south of New York and 480 miles north of the chief Venezuelan port. The group is the easternmost gateway to the Caribbean Sea.

The population of the islands has waned steadily since 1835 when a count showed 43,178 inhabitants. The number had decreased to 38,231 in 1860; by 1911 it fell to 27,086, and the census of 1920 disclosed a further loss of 1,000. Apparently the native blacks are remnants of a decadent, dying race.

Approximately three-fourths of the people are Negroes; out of the total population probably 20 per cent are of mixed blood. In St. Thomas is a colony of white farmers or "cha-chas" who migrated from the French and Dutch Leeward Islands. They live to themselves, do not intermarry, drink hard, raise cattle and travel in rudely fashioned canoes. They wear picturesque costumes of home-woven straw hats, skin-tight trousers and sky-blue shirts immaculately laundered.



It is supposed that the islands were formerly occupied by the Caribs who made a desperate stand against the Spanish invaders and died rather than submit to their conquerors. At the western end of St. John is a large cliff from which the Caribs are said to have thrown themselves into the sea and suffered death from the fall or become food for the ravenous sharks. The cliff changes color at certain seasons of the year, and the superstitious natives believe it to be inhabited by the ghosts of the Caribs.

Evidences of the departed civilization may be discovered by sharp eyes. Tourists have picked up implements such as stone hatchets and knives, well shaped and bearing curious inscriptions. At the eastern end of St. John is a grotto with two large stone slabs that bear curious carvings. Archeologists have been unable to get any definite meanings from these signs or petroglyphs which the Caribs left behind.

According to current legend, St. Thomas was formerly a favorite abode of cutlass-swinging pirates of the Captain Kidd type. Above the town of Charlotte-Amalia the ruins of Blackbeard's castle may be seen. It is gray and dismal, a landmark of buccaneer days if one has more regard for romance than for truth. As a matter of fact, it was built in 1700 by the government and was named Frederik's Fort. Early in the nineteenth century it became a private residence.

The story of another castle, Blackbeard's, falls down before the truth. John Teach, a pirate, bore the nickname of Blackbeard; but he apparently never lived in the tower-like structure. A wealthy colonist erected it as a residence and thereby aroused the ire of Governor Iverson who protested on the ground that it was "not advantageous to the fort that Baggaert build his house so much higher than the fort, inasmuch as everyone who comes to see him can completely overlook it."

Charlotte-Amalia has the enviable distinction of being the only town on St. Thomas which leads its sister islands in commercial importance. It has a fine harbor, and in former years it was thronged with cargo-laden ships. In the stress of competition, however, the town has lost heavily to San Juan of Porto Rico; so now the glory of Charlotte-Amalia lies in the past rather than the present.

(C) Brown & Dawson

The harbor and city of Charlotte-Amalia, Virgin Islands.

Eighty per cent of the population of the island resides in the town. The inhabitants frequently look toward a signal station where a mast supports a semaphore and balls, for the arrival of every ship and the kind or nationality is thus announced. They gossip enthusiastically about the ships and hopefully speculate when the old days of bustling activity will return.

The traveler in St. Thomas is impressed by the politeness of the people; every other morning he is the recipient of a huge bouquet of exotic blossoms.

"The view from the deck as the ship creeps into the anchorage," one tourist wrote home after he had visited Charlotte-Amalia, "is the most charming in the West Indies. The bay lacks the great sweep of Algiers, but it has the same mountain background, the same glorious blue of sea and sky. The village, blue and orange and yellow and red, recalls some of the coast towns of Italy. The garden walls of the hillside villas shine out dazzlingly white against the luxurious green of the tropical foliage."

Picturesque hills flank the town on three sides. The harbor lies to the south and is guarded by two promontories topped with old forts. The red-tiled roofs of the residences and shops contrast vividly with the grass and the palms. "Magnificent, gem-like, glorious," one wishes to say of it all, but hesitates, fearful lest his enthusiasm make a fool of him.

Even the graves in the cemeteries just outside the town have a color due to the pink conch shells, the chief ornamentation. It is an odd custom made necessary because the rocks of the island are too soft to serve as tombstones. The St. Thomasians, being possessed of real resourcefulness, use the shells as substitutes.

The business of the Virgin Islands centers in Charlotte-Amalia. It may be likened to a big spider receiving products over its radiating web, or to a hub with the contributing industries as spokes of the wheel. Anyhow this triple possession of the United States would be utterly disorganized if the town should vanish overnight.

The commercial metropolis consumes an immense amount of milk and butter each year, also a large amount of beef. St. Croix supplies the bulk of this demand as it is the cattle-raising district of the islands; yet Charlotte-Amalia would go hungry if it depended entirely on home sources. St. Thomas itself has little pasturage.

The waters around St. John and adjacent to St. Thomas contain an abundance of fish. Here the tourist finds the bait lures the fish as soon as it hits the water. The native fishermen take their catch to the market at Charlotte-Amalia.

The manufacture of charcoal on St. John has become a thriving industry to which St. Thomas is a market. The climate gives an excess of heat with the temperature averaging 84 degrees. Consequently, coal-burning is out of favor and charcoal stoves are preferred. The smoke arising from the smouldering pits gives a touch of the picturesque to the St. John landscape, as most of the charcoal is made from the timber on its abandoned estates and carried to market in quaint little sailboats.

The natives fashion hats, mats and baskets from trailing vines found in the forests. They are well made and useful, but there is little sale to be found for them except during the tourist season.

Without doubt the biggest industry in St. John consists of the collecting and selling of bay leaves from the bay trees. If you transplant a bay tree, the chances are a thousand to one it will die. It grows only where it wills. It has not been artificially propagated; if the birds and winds did not distribute the seeds, the tree might die out entirely. On certain parts of St. John the bay tree flourishes, and on similar soil near by the plant is not seen; residents cannot explain why it is so markedly erratic. The amateur leaf-gatherer would pull the leaves directly from the stem. Instead, the natives of St. John break the twigs and later detach the leaves. By this method several sprouts spring up from each break; and the process increases the productiveness without harming the tree. Next the leaves are dumped into copper vats to obtain essential oil by distillation.

St. John does not complete the manufacture but sends the bay oil to St. Thomas, particularly Charlotte-Amalia. There one part of the oil and five hundred of white rum or alcohol are mixed together to form bay rum. A superior quality can be made by distilling the leaves directly in the rum, but this method is too slow and expensive. St. John supplies more than half of the bay rum that the world uses.

St. Croix is able to raise cane, and it does. Sugar is king and labor trouble not a rarity. The planters wish the cane harvested in the usual way but the laborers prefer to work in fields where a fire has damaged the cane. Why? If the burned-over crop is cut within three days most of the juice can be saved; after that time it ferments and becomes valueless. The men take advantage of the situation to demand more pay, and the owner usually complies rather than lose the whole crop.

Each of the three Virgins possesses its own specialty or individuality. St. Thomas has at Charlotte-Amalia one of the best harbors in all the West Indies. The verdant cane fields of St. Croix have made it famous as a sugar-growing land. St. John constitutes the home of the tree whose leaves supply the oil from which the finest bay rum in the world is produced.

A Virgin Island house, typical of the old Danish design, is shown in the oval above. The large picture shows the principal street of Frederiksted.

High-wheeled carts with mules or oxen are favored vehicles in the Virgin Islands.

A $3,000,000 temple is to be erected in Ste. Anne de Beaupre, Quebec, to replace the one destroyed. A monastery costing $500,000 will also be built for the Redemptorist fathers.

New Jersey spends $2,000,000 a year keeping down its mosquitoes.

Bank messengers in Wall Street will be dressed in bright red coats, and have portable safes attached to padlocked belts around their waists. Under this system, it is believed the public will rush to the rescue of any red-coated messenger attacked by robbers.

Mining dumps of South Africa are being worked by improved machinery to recover metals discarded when the gold was being recovered.

The Bolshevik leaders have preserved the great Royal Palace of the Kremlin, of Moscow, almost without change, as a reminder of "the lavish wealth and the pomp and splendor of the old régime."

Gold is to be reduced from the smoke leaving the United States Assay Office in New York City. During the process of reduction much gold dust is lost through the chimney.

Fishermen off the Norwegian Coast are catching more mackerel than has ever been caught in that section. Fishing smacks are loaded to the water's edge with 10,000 mackerel each. They are retailing at two cents each, and in quantities for less than a cent. The fish are unusually large.

Ferrymetal is a new alloy of lead, calcium, barium and small amounts of other constituents. The alloy is practically unoxidizable.

A new copper process makes it possible to weld together iron and steel parts. The copper penetrates into the fine pores of the iron and forms a firm weld.

University professors of Princeton may retire hereafter on half-pay when they reach the age of 55 years. Professors can continue to teach, if they wish to do so, until they are 68 years of age, but after that they are to retire automatically.

Nearly 30,000,000 barrels of flour could be added to our annual output from wheat that pests and disease destroy.

A new gas has been developed for aerial navigation. It is called currenium and costs $100 a thousand cubic feet less than it costs to produce helium. It is non-inflammable and non-explosive and has a lift about the same as pure hydrogen.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

Wireless signals are most easily perceptible and loudest at that point on the earth farthest from the station sending the message.

Supporting piers are now being made of paper in California. These piles are not subject to attack by the teredo. They are 60 feet in length and from 18 to 30 inches in diameter. A square steel cap is fitted over the top to receive the shocks of the pile-driver.

An air-operated hand-pick for miners has been invented by a German. It is used in spaces too small for the swinging pick.

The smallest house in London is opposite Kensington Palace Gardens. It has a six-foot frontage and the ground floor apartment is used as a shop. A sitting room and bedroom are above and a basement kitchen below.

Soda fountains are becoming more popular in Great Britain. Until recently iced drinks and soda fountains were practically unknown outside of London, but they can now be found in most of the provincial cities of the Kingdom.

Smoking among the women of England has increased to such an extent that the railroads have provided special smokers.

Except for 100 miles there is now a paved highway from Los Angeles to Portland, Oregon, a distance of 1,200 miles. In less than three years the Pacific Highway will be completed from the Canadian line to the Mexican border.

Twenty-nine men were murdered last year in the half-mile between the Tombs Prison and police headquarters in New York City and only four men have been convicted for these crimes.

The United States consumes two-thirds of the world's rubber production.

Sea lions, marauders of salmon, are to be fought by the Canadian Government. A patrol steamer left recently from Vancouver, equipped with machine guns to be used against the lions.

The Hudson's Bay Company recently declared a dividend of 45 per cent. In its 252nd year the company pays dividends amounting to nearly half its capital stock. This company is one of the oldest trading corporations in the world.

Argentina beef can be placed on the American market for 12 cents a pound with a good profit to the dealer, according to a New York banker. They are killing cattle there for the sake of the hides and the best beef is selling for seven cents a pound. Cows bring $2 in American money and sheep sell for $1 a head.

Manufacturers in Sweden are making a new type of cut glass, cheaper than plain glass and more beautiful.

Archeologists have found bones believed to be those of Giovanni Boccaccio, the great Italian novelist and poet of the fourteenth century. The bones were found in the house at Certaldo in which he lived.

More than 17,000 school children in Harlem, a borough of New York, populated chiefly by aliens, are addicted to the use of drugs, according to police statistics.

Kenmore, the home of George Washington's sister, is to be preserved as a national shrine.

The recent attempt to scale Mt. Everest required 50 coolies and 350 yaks to carry climbing material.

The greatest food exhibit ever held in the West began recently at the Field Museum in Chicago. Members of the vegetable kingdom present numbered more than 250,000 items.

New Orleans will install the automatic phone system replacing the present manual system.

A dance hall is being erected in Charing Cross road, London, to accommodate 1,600 dancers and 1,000 spectators. Three bands will furnish music and 80 women and 25 men will be engaged to teach dancing.

Radio accessory factories of Canada are running under pressure, with three shifts for each 24 hours. Conditions prevail similar to that in the days of the war when factories were on munition work.

MAKE THIS YOUR JOB!

THE DEARBORN INDEPENDENT is your paper. It is published not for profit, but for service. You believe in this magazine and its aims—that's why you subscribed.

Has it ever occurred to you that your friends and neighbors, your business associates, your fellow workmen would also like to receive THE DEARBORN INDEPENDENT? The more readers we have, the greater is our influence and power for good. Urge them to subscribe. The local Ford dealer will gladly forward any subscriptions you obtain, or you can send them direct.

THE DEARBORN INDEPENDENT has established a name for itself as one of the most fearless, independent and progressive papers published. It should be read by everyone who believes in the maintenance of American institutions and their advancement along sound, progressive lines.

Congress and the Cabinet

CHRONICLER OF THE NEGLECTED TRUTH

Shall Cabinet Members Sit in Congress?

Profound Consequences Have Flown From Policy of Exclusion

By AARON HARDY ULM

"WORDS, words, words," muttered Hamlet in disgust.

If he spoke today he still might say the same about an old discussion recently revived by President Harding. It has to do with whether members of the President's cabinet shall have seats and the right to speak and be questioned on the floor of Congress. But if he knew the full story of that subject he wouldn't be so scornful of words.

Even Shakespeare probably could not have imagined history being much affected by the scratching out of the word "report" from a phrase and the writing into its place the word "prepare." Yet but for that little change President Harding probably would have had no occasion recently to renew the century-and-a-half-old contention that our cabinet ministers, like those of nearly all other countries, should have seats in the national legislative body.

It is an interesting and, I believe, an important story; interesting because it shows how little things can lead to big results and important because those results affect every taxpayer and every citizen who wants to see the government carried on efficiently and soundly.

It begins with the First Congress, though, as shall be seen, some phases of it reach much farther back. When our First Congress met in 1789 funds were the subject of its first thought, for there were none. So it began at once to set up the Treasury Department, which it decreed should be operated by a Secretary of the Treasury. His first duty, the bill said, would be "to digest and *report* plans" for raising public funds.

Constitution Silent

IMMEDIATELY there was objection to the word "report."

"It means," said those who thought there was great danger of somebody becoming the country's king, "that he will have the right to come here in person and make his recommendations. That will be dangerous. Congress must maintain its independence."

They harked back to Montesquieu, the French philosopher, who wrote "The Spirit of the Laws." Everybody then believed what that classical book set forth as the basic principle of the British scheme of representative government. It was the "division of powers" between and the independence of each other of the three basic departments of government, the executive, the legislative and the judicial. Modern students of political science say Montesquieu was wrong in his facts but what he said has had great sway over political thought ever since.

Our Constitution, under which the government was being organized, is silent on the subject of whether cabinet members should have seats in Congress. In fact it makes only passing reference to the heads of the executive departments. It did make a "division of powers" but not an absolute one.

Makers of the Constitution assumed and so wrote in *The Federalist* that members of the cabinet would have the right of the floor in Congress as like officials had had it in the Continental Congress.

However, members of the First Congress who believed in the complete separation and independence of the departments were strong enough to force a compromise on the issue when it first came up for action.

The word "report" was eliminated and when the bill became a law the phrase in which it had appeared read, "to digest and *prepare* plans."

That wasn't a final decision on the subject of whether members of the cabinet should have the privilege of the floor in Congress. In fact, the act in question conceded that right but limited it to the will of Congress. Further on in defining the general duties of the Secretary of the Treasury, the act, which is still the law of the land, said that he "shall make report and give information to either branch of the legislature in person or in writing, as may be required, respecting all matters that may be referred to him by the Senate or House of Representatives or which shall appertain to his office."

Thus when Hamilton became Secretary of the Treasury he felt certain that he would be permitted to appear personally in Congress to present and urge his views regarding the national finances.

Madison's Political Ruse

MEANTIME there had occurred a change in political line-up that was to lead to the change of words noted above, being made the pretext for fixing a precedent. James Madison had been allied with Hamilton; now he was opposed. When a motion was made to invite the Secretary of the Treasury to submit his report on finance, Madison, fearing the power of Hamilton's eloquence, had the motion amended so that the report would have to be submitted "in writing." Hamilton had prepared only notes for an address; but in the five days that were allowed him he drafted the famous long document known as his report on the public credit. Madison's move, according to historians, became the fixed precedent of Congress, despite the fact that it was made for mere strategical reasons.

Washington, accompanied by one of his ministers, appeared in Congress a few times for the purpose of taking part in discussions. And of course he and other Presidents, notably Woodrow Wilson and President Harding, have delivered messages in person to Congress. Occasionally Presidents, once even in Harding's case, have conferred with the Senate on matters like the confirmation of appointments and the ratification of treaties.

NO NEWSPAPER publishes a report of a session of Congress. All give snatches of Congressional news, mostly episodes of sensational type. None gives a daily review of what Congress says and does, such as papers in most cities give council sessions.

Rarely does any publication now present to its readers clear and impartial reviews of particular national questions even when they are prominently to the front. Take the soldiers' bonus bill. How many of our readers have seen more than a sketchy statement of what it contains or more than a partisan interpretation of its meaning? Or the pending tariff bill? Or the question of whether we should or must cancel the debts owed us by European governments? How many of our readers know the practical details of them sufficiently well to form sound opinions on the issues today? For you might be for a bonus per se and yet, if you knew of it in detail, be either for or against the bonus bill. You might favor protection as a principle and yet on full information be against the pending tariff bill. And yet when you look for the facts involved, you find it almost impossible to get them.

The limitations of periodical publication make it impossible for THE DEARBORN INDEPENDENT to give detailed reports of the daily sessions of Congress. But it is not impossible for a publication like this to present the facts involved in important public questions of national import. We propose to attempt it and we should appreciate your telling us how well or how badly we succeed.

We have asked one of our Washington writers to prepare one article a week on some important national question of concern to all the country. His only instruction is to adhere to facts. It is difficult to give facts briefly and clearly without expressing some measure of opinion. But if the facts are set forth impartially that need not interfere with your forming a different opinion on the facts. We may not always agree with the writer's opinion. We believe that there will be no reason for questioning his facts. For his opinion or our opinion or your opinion we care little; what we wish to do is to present the facts.

But the rule made in the First Congress has continued to prevail with regard to cabinet members having anything like a general right to take part in debates on the floor of Congress or even to be questioned in open sessions of either House. All formal communications between them and Congress have been "in writing."

Off hand it would seem that that would be sufficient and that no great importance attached to the issue in question. But it has not been sufficient, as shown by the fact that formal communications have been and are of little consequence in the transactions carried on between Congress and the branches of the executive department.

Operations between them have been made possible rather by informal communications, usually more or less secretive interchanges between members of Congress and officials in the executive department.

If the true story of a typical piece of national legislation could be written the country would be startled by the disclosures made. For it would show that private dickering, jobbery, browbeating, log rolling and patronage figure in both its making and applying far more than do the things that are in the open and of record.

Much of it is owing to the fact that under the practice that has prevailed there is no way by which the legislative and executive departments can deal with each other intelligently and responsibly in the open.

A numbskull may be in the cabinet. All Congress may know it, and yet have no way of demonstrating the fact to the country. They call on him for information "in writing." He has time to let capable assistants prepare it or dodge giving it by evasive methods. He is brought before a Congressional committee; he is able to prepare for it in advance and by many ways dodge making a display of his incapacity.

"At present," Justice Story wrote in 1830, when governmental business was meager and simple, "gross incapacity may be concealed under official forms and ignorance silently escape by shifting labor upon the more intelligent subordinates in office."

Put him on the floor of Congress and make him subject to a battery of questions without notice, make it encumbent on him to defend his department verbally and under the white glare of full publicity and to advocate openly such aids as he may seek from Congress—and the country would know in a month whether the official is a capable one.

Thus those who argue that seats and voices in Congress for cabinet members would mean more to Congress than to the executive department have much of the logic of the proposal on their side. It was that more than anything else which brought about the supremacy of the British House of Commons.

It would tend to eliminate the back-door methods that even the best officials of the government have to resort to frequently to carry on the public business. It would give the floors of the House and Senate a meaning which they have lost. For, excepting recorded votes, no one now regards what happens on the floor of either house as of significance. For legislation is shaped and determined elsewhere, to a great extent in committees but to a greater extent in quarters lying outside the official machinery of law-making.

"No one who has occupied a seat on the floor of either House," wrote the late Senator George H. Pendleton in a report made on the subject in 1881, "no one of those who, year after year, so industriously and faithfully and correctly report the proceedings of the two houses, no frequenter of the lobby or gallery can have failed to discern the influence exerted upon legislation by the visits of the heads of departments to the floors of Congress and the visits of members of Congress to the offices of the departments. It is not necessary to say that influence is dishonest or corrupt, but it is illegitimate; it is exercised in secret by means which an honest public opinion cannot accurately discover and over which it therefore can exercise no just control."

Legislation or "Pork"

IN THE 40 years that have intervened since Senator Pendleton concluded his 20-year fight for a change, the evils he noted have increased even faster than have the volume and complexity of governmental affairs.

And along with that growth Congress has deteriorated both in character of personnel and in prestige, and in prestige regardless of personnel.

Despite Congress' insistence on the technical observance of the "division of powers" set forth in the Constitution, the country has all but ceased to look to Congress for legislation or to hold the law-making body responsible for laws that are passed. It looks to the President and holds him responsible. The public is coming more and more to look on members of Congress as *"getters"* and not *"doers,"* as *agents to rather than representatives in the government.* The writer knows of several Congressional campaigns now being made on the one issue "to get." You will find in copies of the *Congressional Record* of recent date several "Extensions of Remarks" that recite in detail what their authors "got" for their constituents. *In scarcely a single case does one contain any reference to what the member "did" for the country.* While the above may not be the rule, the symptoms they disclose are highly significant.

While the back-door system has exalted the prestige and increased the power of the executive department, it calls for the use of methods which are distasteful to high-minded or strong men. Officials of the executive department too frequently have to resort to lobbying, to dickering, to trading, to pacifying individuals instead of satisfying Congress as a whole, or, through it as a body, making appeal to the country, which they could do if they had seats and voices on the floors of the legislative body.

Thus President Harding and all of his cabinet, many of whom like himself have had long experience in Congress, favor the change. Several other Presidents have favored it. Taft recommended it. Woodrow Wilson, at least in the early days of his political studies, advocated it.

Degradation of House

MANY of our ablest students of political science, like Dr. A. Lawrence Lowell and Professor Henry Jones Ford, say the move would be one of the biggest steps that could be taken in the direction of better national government. In fact they contend that the exclusion of members of the cabinet from Congress, instead of being in harmony with it, really altered the constitutional scheme devised by the fathers. And from that alteration, says Professor Ford, there has flown profound consequences. To it he attributes the "singular degradation that has taken place in the position of the House of Representatives," and declares that the "whole constitutional scheme was turned awry by it."

Of course, members of the cabinet cannot be given votes in Congress nor can members of Congress while such serve in the cabinet, as is the rule in most of the world's governments, the majority of which are grounded in the principle of a "responsible ministry."

But there is no constitutional barrier in the way of giving them seats and voices on the two houses or in requiring their attendance and making them subject to examination in open sessions.

And when it is done you won't often find the floors of the two houses of Congress deserted by 90 per cent of their members as is the case now during perhaps 90 per cent of the time during sessions. Nor will you find the press galleries equally shy of correspondents as similarly is the case now. Nor will you find the newspapers confining their reports of what occurs on the floors of Congress largely to fights and near-homicides between militant members and only to those speeches that are sensational rather than important.

"Point With Pride"—But Don't Ignore Facts!

Money-lenders Have Mortgaged Cities of America for Ten Billions!

THE occasion was a civic celebration pulled off to give a community a chance to brag lustily of itself. After eloquent passages that included "God's Country" and the "Finest People on Earth," the orator of the day waved a hand loftily and exclaimed:

"Look upon these monuments of civic enterprise, these transcendant evidences of community progress!" meaning the city's fine streets, its parks, schools and public buildings.

As the crowd's applause died down a squeaky voice, in the telltale tone of a "crank," came from somewhere in the crowd:

"Yes, and monuments of debt."

Monuments of debt. That is what the average American municipality is as a governmental or business institution today. *There scarcely is one that owns more than an "equity" in the streets, the parks, the waterworks, even the schoolhouses and city halls themselves,* which are so often pointed to with pride. Ownership in greater part more often lies with money-lenders, usually money-lenders at the seats of big finance far away from those evidences of "progress," than with the citizenry that boasts of them.

The debts of villages, towns and cities in America total somewhere around the staggering sum of *ten billion dollars!*

City interest payments are seven times as large as city library costs. In 1919 the interest cost was more than one-third the school cost.

Those of only those municipalities of more than 30,000 population amount in the aggregate to more than *three billion dollars,* or about three times our national debt prior to our entering the recent war.

They have trebled in less than 20 years, during which time there has been an average annual growth of around 10 per cent. The growth during the last three years has been at a rate probably twice as high as the average between 1903-1919, and the rate of growth in the total of municipal debts evidently still is on the upgrade.

Today approximately 12 per cent of all net municipal revenues—that is legitimate city income, which is paid in, and not borrowed—goes for the payment of interest. *Interest now amounts to more than one-half* of the proportion of municipal revenues that are devoted to what the United States Census Bureau classes as "outlays," or investments in permanent improvements, such as paved streets, parks, waterworks and other city-owned enterprises.

Since 1903 the Census Bureau has collected data annually on the finances of all American cities of 30,000 or more population. When the work began there were 146 cities belonging to that class. When the last report was issued, being for 1919, there were 227 such cities.

In 1903 the net indebtedness of those cities was less than one billion dollars. In 1919 it was more than two and one-half billion dollars. Complete statistics would put it beyond three billion dollars.

In 1919, when the cities as a class made a much better than the average showing, *only 117 out of the 227 reported on by the Census Bureau, raised revenues sufficient to meet all governmental costs.*

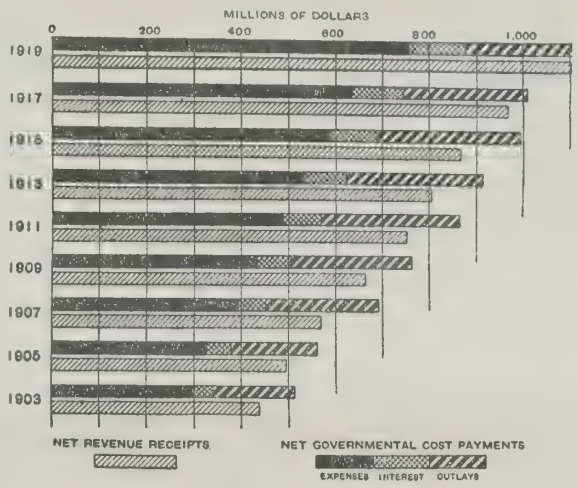
Of those so far reported on for 1920 only 14 show surpluses.

Even in the good year of 1919 four American cities failed to raise revenues sufficient to meet ordinary running expenses and interest.

Of those so far reported on for 1920, 16 show the kind of deficits that violate a law treated as invincible by all accepted schools of political economy.

In fact, the American city as a government or a business long ago ceased to pay its way, and more and more is coming to lean on the extended arm of money-lenders.

Total municipal ownership concerns in the U. S. earn less than municipal interest amounts to.



The underlying cause is the phenomenal and continued increase in the costs of municipal governmental operations. To say that such is all due to waste, or to graft, or to "politics" is to hit far wide of the mark. For the items of cost that have grown most have to do with enterprises of the most commendable kind, namely, sanitation and other protections of the public health, better parks and great extensions of paved streets, playgrounds, libraries and, above all, schools. Glancing over the most recent compilations of the Census Bureau one finds that per capita expenditures on the maintenance and operation of schools doubled—and in many cases more than doubled—in a majority of the cities between 1914 and 1920.

The truth perhaps lies in this: the average city public has been demanding more from its government than it was willing to pay for! And it has been getting it and is getting it now in increasing volume.

Consequently there has been an orgy of spending supported in great part by *the coupon-clipping class who in return get what is tantamount to perpetual liens on both the public and private property of cities.* For the tax-raising power of every city is put in pawn when it sells a bond.

This orgy of spending is proved by figures found in a bulletin, "The Financial Statistics of Cities for 1919," issued by the Bureau of the Census, being a compilation of reports received from all cities of more than 30,000 population, and by subsequent but not as inclusive data made public by the bureau.

The Money-lender's Margin

This graph (from the last U. S. Census Bureau bulletin on the finances of American cities) shows how the coupon clipper's grip is tightening on the average American city. The budget item for interest steadily increases and is now encroaching on that for "outlays" or permanent improvements, though running expenses grow at an increasing rate. The most interesting feature of the illustration, however, is the difference in the lengths of the parallel lines. It will be seen that the total of municipal governmental costs invariably outruns net revenue receipts for cities as a whole. The margin is absorbed by loans. The year 1919 made an unusually good showing for the cities. Since then the money-lender's margin has been growing much more rapidly than in the years prior to 1919.

When in 1903 this work was taken over by the Census Bureau the per capita governmental costs of the 146 cities then within the class that has been studied was $24.64. In 1919 they were $35.58 for the same cities, which shows an increase in costs far beyond growth in population. In 1915 the costs of the Federal Government were only $10.52 per capita and had grown and were growing under peace-time conditions at a much lower rate than those of cities.

The per capita indebtedness of those cities grew even faster than did per capita costs, rising from $44.71 in 1903 to $81.18 in 1919. It is now close to $100.

In 1903 the per capita indebtedness of the Federal Government was only $11.44, or only slightly more than one-fourth as much as that of 146 American cities.

Cities pay more to money-lenders than to teachers, librarians, doctors, engineers and other Workers.

Even though the war caused an increase of more than 2,000 per cent in it, the per capita national debt even now is not much more than twice that of the average American city. And one saving thing can be said about the national debt: it is being reduced.

But in spite of the universality of sinking fund operations only rarely does a city ever make real or permanent reduction in its indebtedness. As soon as one bond issue is amortized, larger ones are issued; alongside the sinking funds are deficits, that sooner or later have to be turned into funded debt.

Such is demonstrated by the increasing per capita burden of interest paid by American cities. In 1919 it was $3.89 against $2.06 in 1903. The 227 cities reported on by the Census Bureau paid out in 1919 the stupendous sum of $156,630,209 for interest alone.

The interest charge, of course, varies widely with different cities. In St. Louis, for example, it absorbed only 3.5 per cent of municipal revenues in 1919. But in *New Orleans 28.7 per cent* went for that purpose and in *New York 23 per cent.* Thus in some cities—and some of the largest and most "enterprising"—approximately one of every $4 of revenues goes to those who hold the "mortgages."

Now let us glance at some of the counter trends. In 1903 when fully 33.3 per cent of all municipal governmental costs were for "outlays," that is, permanent improvements, such as paved streets, school buildings, parks, waterworks, public service enterprise, only 8.3 per cent of revenues went for interest. As the debts grew the percentage of costs credited to "outlays" increased—for a while. Then as the debts became mountainous, the ratio of expenditure for permanent improvements began to decline. In 1919 "outlays" absorbed only 21.1 per cent of all costs, or not quite twice as much as were absorbed by interest.

Thus one may clearly vision the day when the average American city will be paying more to money-lenders than it will be putting into street paving, the erection of school buildings and all public improvements of a permanent nature.

One of the most creditable features of the orgy of spending that lately has characterized the operations of the American city is the increased expenditures on schools. Yet in 1919 the interest cost was more than one-third the school cost.

No recent development in the operations of the average city has been more gratifying to thoughtful people than the evolution of the public library—a product largely of the present century. Yet in 1919 the public libraries received only one-seventh as much of the average city's revenues as were going as interest to the average city's creditors.

The municipally owned public service enterprise is a recent development. It has been the pretext of excuse for contracting hundreds of millions of debt. Generally such enterprises are profitable, because, if for no other reason, they are monopolistic. Yet the total earnings of municipal ownership enterprises in 1919 were *less than the municipal interest bill.* The total of municipal debts is more than five times the value of municipal enterprises.

Of course the bulk of municipal debts are contracted for permanent improvements that generally pass along in some part to posterity, which is thus obligated for part of their costs. And a large portion of permanent improvements are paid for out of current revenues.

But there seems to be no deadline beyond which municipalities may go in contracting debts. And the curious feature of it is that despite the pyramiding of debt and the failure generally to balance budgets, there scarcely is record of a case of a municipality "going broke" or of one's bonds becoming worthless.

There have been a few cases of the fiscal affairs of cities being placed in something like receiverships to protect their creditors but there hardly has been a case of a municipal bond being repudiated. Hence those bonds have proved in fact to be better investments than even the bonds of the National Government; for municipal bonds are fully tax exempt, and they draw higher interest. Their exemption from taxation is one reason for their being in big demand during the last few years, which, in turn, is why they have been issued in larger quantities than ever before.

The total of municipal debts is more than five times the value of municipal enterprises. How much of your tax-money goes for interest?

One can only conjecture as to how the American city apparently can defy the accepted laws of political economy and get away with it—and one wonders how long it can continue and what the end may be.

If the fiscal affairs of the government in Washington followed the policies of the average city, every time a new post office building was erected, or a river dredged, or a harbor deepened some portion of the cost would be met by issuing long-running interest-bearing obligations. Instead of making annual decreases in the national debt—which has been the almost invariable peace-time rule since the government was established—the debt regularly would have grown in size, in peace-time as well as in war-time. The national debt today would probably be around $100,000,000,000 and our fiscal affairs would present a spectacle somewhat like that of the finances of Czecho-Slovakia and Yugo-Slavia. The Panama Canal would have been built with borrowed money alone and we would be paying in interest for it four times as much as we get back in tolls. Such policies when pursued regularly by a national government are pronounced by every political economist to be ruinous. Yet they in principle have been followed by many of the most "enterprising" cities. It isn't the slow-growing, lethargic municipality that has been the most conspicuous participant in the orgy of debt-making and spending which has characterized the conduct of American cities as a class during the last 20 years. The most conspicuous ones are those that have grown phenomenally in population and wealth.

That growth, however, as a rule has been too fast to be healthy either for the cities, as enduring institutions, or for the country which has to support them.

And the country as a whole has to support the cities which in many respects partake of the nature of public service corporations. Up to the point whereby the law of "diminishing returns" restrains them they can place almost any toll they may need to exact upon the general traffic.

Interest eats up one-half your city taxes, and principal eats up three-eighths of the remaining four-eighths.

Thus municipal debts are very much in the nature of national debts; up to limits that haven't been reached at least in many cases the burden entailed by them does not rest solely on the communities that benefit. They rest on all wherever they may be whose life economics are affected by the cities, and that means everybody.

Hence a thorough study of this subject might reveal a decided relation between the reckless spending of borrowed money by cities and the excess urbanization of the country as shown by the last several census reports. Anyway, the huge and growing debts of cities are of concern to people other than those who are members of the communities that "owe" them. This fact is recognized by those states which place limitations on those debts. And it is becoming a matter of tremendous importance, for the interest-bearing public debts of the country closely approach in size the national debt. It is believed that they have doubled since 1910 and the biggest single group of them are those incurred by municipalities. They have been increasing at the rate of about one billion dollars a year and perhaps half of the increase is in municipal debt.

If continued, the offending cities ultimately must meet with disaster or the rest of the country be put in bondage—as was attempted and in part made effective by the Roman Empire—for the support of the cities.

People Are Still the Source of Power

WRITERS who cater to special interests are prone to see danger ahead for our institutions in the machinations of other special interests looking to changes in the laws or the Constitution of the United States.

Though the old "Ship of State" carries a score of patches on her hull already, it is all right as it stands, according to these chronic pharisees of the nation, and any change would be a sacrilege.

The question of Prohibition and its enforcement by no means furnishes all of the inspiration for predictions of dire disaster to follow some proposed change in the Constitution. Here is a wail from a representative of financial interests which offers a good example:

"Two events in the recent convention of the American Federation of Labor should give concern to the intelligent citizens of the United States. One was a speech by a United States Senator attacking decisions of the United States Supreme Court, and the other the enactment of resolutions looking to the amendment of the Constitution."

It does not matter so much what the resolution said. One demanded a national child labor law; another to prohibit legislative or judicial enactment of laws forbidding collective bargaining; the third provided that Congress might overrule a decision of the Supreme Court on a bill declared unconstitutional, on repassage by a two-thirds vote.

These propositions are denounced as an effort to overthrow fundamental principles of our government!

There is just one supreme power in the United States. It is the expressed will of the citizenship of the United States. It was by that will the Constitution became the "bulwark" we brag about, and in it provided the means of amendment. It is a right possessed by any citizen or group of citizens to propose any amendment, whatever its nature, and the man who denies that right or decries the proponents as hostile to the principles of democracy proves himself lacking in a fundamental element of citizenship as well as of common sense.

So far as criticism of Supreme Court decisions is concerned, one should read the philippic of Charles Sumner on the Dred Scott decision.

On the Propaganda Trail

LATE information is to the effect that A. D. Lasker, chairman of the United States Shipping Board, in his rôle of publicity agent for his ship subsidy program, is planning a lecture tour through the West. En tour, Mr. Lasker hopes to convince the farmers how vital it is to their welfare that fifty or seventy-five million dollars more be taken from the public treasury, and turned over to whomsoever the Shipping Board may delight to favor.

The chairman of the Shipping Board, who is an advertising agent by trade, had been quite confident up to a few weeks ago, that the elaborate press agenting of the subsidy would cause its adoption. His advertising program was based on the theory that the way to put over the subsidy was to arouse American patriotism on behalf of a merchant marine, which, in the language of a well-known present-day humorist, Mr. Lasker nicknamed the "American" merchant marine.

Mr. Lasker's publicity program went strong to heavy black-typed headlines setting forth platitudes and patriotic axioms to which everyone can agree. It was the spread-eagle type that might have gone well in the decade subsequent to the Civil War, and might well have carried a picture of Washington or Lincoln—like a five-cent cigar that uses the latter's picture as a guaranty of its worth.

But Mr. Lasker's advertising was singularly short on details. It did not tell just what interests would benefit through the subsidy. He also neglected to lay stress on the fact that the bill proposed in Congress was practically a blank check, authorizing Mr. Lasker and his associates to fill in any name for any sum of money that their little hearts might desire. Not that we are hinting that Mr. Lasker, in filling in those huge checks, would be guided by any except the most altruistic motives.

There was always a chance, however, that one or more of Lasker's friends or acquaintances might try to put something over on him, might try to get some of that easy money, by organizing a good paper ship corporation.

For some reason Congress and the country failed to "fall for" the subsidy advertising. Senator Borah denounced the program as a bonus for special interest. Other members of Congress, even though spurred on by the President's urgings, were reluctant openly to support the measure. A damper was put on the program and its advocates in Congress finally agreed to a postponement of action till a more propitious time.

The written propaganda on behalf of the ship subsidy having failed, what was more natural than that Mr. Lasker should decide that his superbly convincing personality needed but to be displayed widely before an admiring nation to become effective. It will be interesting to note just how he satisfies the curiosity of western farmers as to the identity of the men who will get the subsidy money. And the method whereby he explains to some bone-dry auditor, just why he felt called upon to nullify the Constitution of the United States, will also be worthy of consideration.

Enough Time for the Program?

CABBAGE week is over. Far and wide, no doubt, the great event was celebrated. The delicious incense from its shrine has floated forth upon many benighted mortals who might have passed unawares. The lovers of the toothsome morsel have had their fill.

In company with the dainty corn beef, in the briny ferment of sauerkraut, or in the mystery of the salad, the lordly cabbage has paraded for a whole week down the paths of boarding house menu. No unkind word has been allowed to mar its journey. It was Cabbage Week, so designated by those in the seats of the mighty. What epicurean soul would dare to shiver, what plebeian stomach to turn, at the thought of the splendid vegetable.

Smile week has gone, and we have to smile about it still. Gingham week is past, and sales may now begin. We have had home-coming week, and tree week, and flower week, and apple week, and paint week—in fact every little kind of a week that the advertising manager can think about, and induce a gullible mayor, or governor or somewhat higher to issue a proclamation about.

Nearly all the weeks are pretty well filled, but there should be one left. Just one for a grand dedication. Let's have one week, officially proclaimed, dedicated, consecrated, and set aside. Let's have a week for pure undiluted buncombe.

Here's to Bunk Week.

Nor Is It Over

THESE are bad times for those who follow the paths of regularity, the men who stay with the crowd, the politicians who wear the traces of partisanship easily.

The men nominated for office in the insurgent upsets in the primaries may not fulfill their constituents' dreams of obtaining better government. But they furnish abundant proof that the voters are demanding something new.

Two governors who have been removed from office, a half-dozen insurgents who would not have been allowed to enter the back door of the convention hall a few years ago, and others of non-regular stripe, have been successful.

Lynn W. Frazier, former Non-Partisan League governor who was recalled by the voters of North Dakota, is the regular Republican nominee for United States Senator, vice Porter J. McCumber, regular, defeated.

The Democrats of Texas must choose in a "run-off" primary whether James E. Ferguson, who was impeached and removed as governor, or Earle B. Mayfield, shall be the United States Senator. Mr. Mayfield, though not an avowed Ku Klux Klansman, has not denied affiliation with that organization. Surely those two candidacies furnish a problem for the staid Texans who supported Charles W. Culberson, the defeated Senator. Just to show that they did not care for any rules whatsoever, the Texas voters gave Representative Thomas L. Blanton, of Abilene, a big lead in the first primary, although Republicans and Democrats in the national house have frequently united in declaring Mr. Blanton anathema.

Brookhart, Pinchot, Howell, Beveridge furnish proof of the demand for change. What this galaxy of strangely discordant elements may do when the reins of government are touched by them, is another question. But there may be some new rules in national and state officialdom.

Figureheads and Rubber Stamps

SEVERAL months ago, the collector of the port of New York died. The vacancy has not been filled. The two men elected to perform the solemn duties imposed by the Constitution upon United States Senators have not agreed upon the man needed to handle Uncle Sam's business in the customs district which is the largest in the country in work done and revenue collected.

It is campaign year in New York; hosts of patriotic Republicans in New York feel that their services are just what the country needs: it therefore would be fatal to an ambitious candidate for re-election to pick the wrong man. In the absence of recommendation from the two United States Senators as to the most available, the most astute, the most deserving, and the most influential candidate for the job, the President has refrained from appointing a new collector.

But despite the grave political situation which makes it impossible for the greatest port in the world to have a collector, commerce continues. Vessels clear from New York, and vessels come into the harbor; millions of dollars in revenue are collected and forwarded to the United States Treasury; manifests, and appraisals and reports are made. Nobody outside the circle of pap-hungry aspirants knows there is a vacancy.

Government business goes on. It always does, vacancy or no vacancy, Republican or Democrat. If, tomorrow, the President and Congress should separate from the payroll, the titular head of every executive office under the government, the government business would not be slowed up a particle. But presidents and congressmen are not likely to commit such a political crime as that. When in the course of political events, it becomes wise, a collector will be appointed for the port of New York, but the deputy will go on, as now, doing the work.

Protect Farmers—It Is to Laugh!

THE attempt to make the farmer believe his produce can be increased in price by any tariff on competing imported products, is so shallow it is strange it is persisted in. Still, it must have some effect, or it would not be made the chief argument in support of the present effort by Congress to agree on a bill.

Agriculture produces in excess of home consumption, hence is dependent on the foreign markets for a price. For this reason no tariff can increase the price of farm products here.

On the contrary, tariff schedules as they stand now increase the cost of production, making it harder for the farmer. For instance, the American farmer uses 270,000 tons of potash annually. The total home production was 8,000 tons last year. The bill proposes a tariff of $50 a ton, increasing the cost by $14,000,000.

Again, a proposed tax of $5 a ton on sulphate of ammonia is estimated to cost the farmer another million, while Senator Lodge, of Massachusetts, is insisting on a tariff of $30 a ton on all nitrogenous material manufactured from leather waste, to protect the shoe manufacturers in that by-product, at a further cost of $3,000,000 to agriculture. At the same time, Senator Lodge is insistent on keeping hides on the free list!

Why extend the list? The American farmer has the same competition under protection as under any other system. What he needs is a removal of the handicap of high prices for the things needed in his business.

A Splendid Record

MR. JOHN HOPE, member of Parliament from Berwick, seems to have a 20-year lead for the all-time, all-country parliamentary championship.

Mr. Hope has been a member of the British House of Commons for 22 years. He has been elected as the representative of three separate constituencies, and doubtless there are scores of other British boroughs which would be proud to have him as their representative. And there are more than 400 American Congressional districts, besides bailiwicks in France, Germany, Australia, South America, and elsewhere, whose electorates would like to have his services.

The member from Berwick is just an ordinary type of English citizen. His father was an agriculturist. He was educated at Edinburgh University. He is a member of the Edinburgh Stock Exchange. His recreation is shooting. He belongs to the Reform, National Liberal and Royal Automobile clubs. In every way except one he seems like the other members of Parliament. But his extraordinary difference is:

That in 22 years of service, he has not spoken a single word in parliamentary debate.

Mr. Hope holds to the quaint idea that he has more time to render his constituents service, and performs his parliamentary duties to his country better, through refraining from oratory. We may be doing some member of some far-off legislative body an injustice, in asserting that the Berwick member's record is unsurpassed. If so, we apologize and extend felicitations.

Mr. Ford's Page

IT IS pretty hard to get service out of a certain class of people, unless there is some kind of honor or notoriety that goes along with the service. This is often true in governmental matters. There is no special reason why the officeholding class should be holding office; that is to say, they are no better fitted, and are frequently less fitted than the ordinary run of men upon the street; they are in office because they want to be and enjoy being in office. Prominence is one of their appetites; publicity is one of their passions; they may know it in their hearts that they are inferior, yet they enjoy the feeling that the masses look up to them as superior beings. They like to keep themselves engaged in activities that will keep the gaze of the people toward them. For that reason, work of merit is often neglected; only the sensational and showy wins attention.

Take this principle as it applies to strikes. It does not require a long memory to recall the degrees of prominence and publicity and popularity which can be traced in the evolution of the strike period. It is not so many years ago that the man who was named on every tongue and pictured on every page was the man who had ordered the strike. He was a new appearance in our life. We pictured him as a born leader, as a sort of commander-in-chief of an industrial rebellion, or something of that kind. A halo of romance was round his head. He made speeches. He appeared here and there with surprising suddenness. He gave forth great platitudes. He uttered mighty prophecies and denunciations.

And then he began to fade. When the public discovered that it paid more to be a strike leader than a striker; that the strike leader never went hungry, nor did his wife and children feel any distress or insecurity; that, indeed, he was piling up a nice little pile and preparing to join the so-called "capitalistic" class—when the public discovered that, the strike leader ceased to charm. We had strikes and more of them. But the strike leader lost all his public prominence. If the reader of this will stop and try to recall who ordered the two strikes in progress at this writing, he will find confirmatory evidence of the above.

The personality *behind* the strike is now somewhat concealed. Personalities have worked rather badly in the propaganda for sympathy. You cannot work up much public enthusiasm by printing photographs of strike leaders. The public is too peevish about strikes, the public is becoming too impatient with the whole stupid system, to acclaim the leaders—whether on the side of the bosses or of the men. Both types of leaders are much in question.

So, with the fading out of the strike leader, a new figure rose into popularity—the Strike Settler. For a time in the United States it seemed almost as if a new industry had arisen in our midst—the industry of starting strikes in order to give somebody the chance to settle them. The Strike Starter was in the discard; the Strike Settler became the big sensation. If you wanted to run a man for governor or senator, get up a strike somewhere, and then call him in and let him settle it. You could arrange the strike beforehand, and you could arrange the settlement, too. All your Settler had to do was to walk through his piece, like a play on the stage. The main purpose of the strike was achieved, which is the main purpose of most strikes: to give the men a notion that their officers are alert and on the job; to give the employers an opportunity to maneuver the men into a compromising position with the public; to enable the exploiters to use the strike as an excuse to raise prices; to bring somebody into prominence as a Settler. These are the main purposes of a strike. Nobody really profits from them except the parties behind the scenes. And the American public doesn't like to be told who those people are behind the scenes. Truth is sometimes an unpleasant medicine; that is why the peddlers of sweet-flavored dope flourish in the land.

ONCE it was quite a big thing to start a strike. The hero of the hour was the Strike Starter. That sensation faded and it then became a big thing to "settle a strike." The Strike Settler was the great man. Strikes were even maneuvered that would-be officials could get a start toward fame by settling them. But even that game is now played out. Settling a strike doesn't mean anything; the strike does not remain settled; in the very settlement are often the seeds of a new outbreak. The new service that stands challenging us is the Prevention of Strikes and the Cure of their sources. This summer's strikes were perceived beforehand. They were deliberately permitted to come. Thus no glory will arise from their being settled. The whole question now has been shifted to another plane.

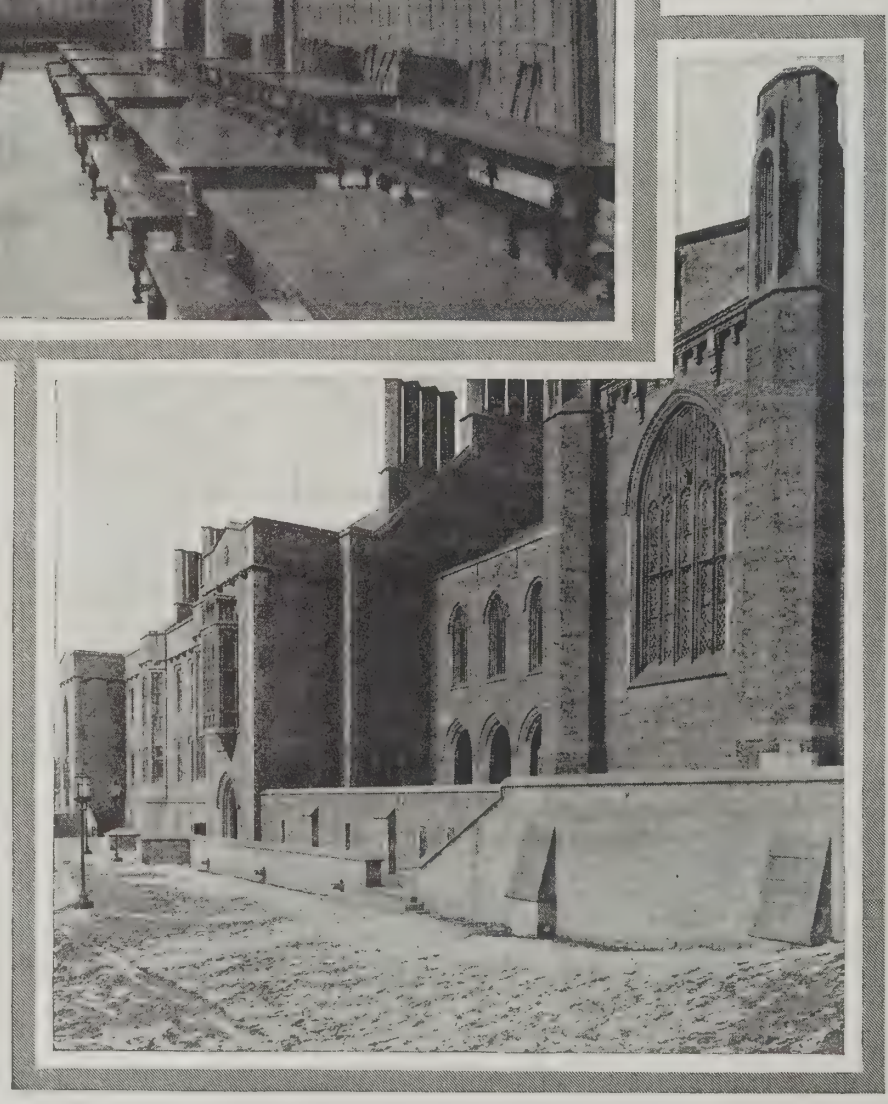
Well, it appears that the day of the Strike Settler is passing away, too. It must be one of the bitterest drops, in the increasing number of bitter drops that are falling into the Administration's cup, that even if it is successful in settling the present strikes, "it will not mean anything." The glory has departed from the Strike Settler, too. It was once possible to save an Administration by dramatically settling a strike; it is possible no longer. When these present strikes are "settled," the personalities involved in the settlement will receive as little attention as have those who "started" the strike. The public mind has spewed both types out.

For the first time in our history it is clear as crystal that we are suffering a condition that was deliberately foreseen and deliberately permitted to come because certain interests regarded it as the last stroke in the program of subjugation which has engaged them for the past five years. The people are as certain of that as they are of anything in their thoughts today. They themselves saw the two strikes coming, they saw the enlistment of a government agency on the employers' side in one of the principal points of controversy, they saw the utter neglect of the government to take any step whatever forestalling the threatened trouble. And it must be said that, having observed the government deliberately permitting the strikes to come, the people now observe without hope, without much interest, certainly with no expectation to applaud it, the feeble effort made at settlement. Even if the Administration should settle the strikes, the people know that it will not mean anything. If there is one thing that has at last seeped through the public mind, the common mind of the plain people, it is this: that nothing whatever is to be expected in these matters from men who know nothing about them at first hand, and who are forced to rely on counsel which is inherently bad.

With the Strike Starter and the Strike Settler worn out, with the impossibility of the selfish notoriety seekers finding any more applause in the old games, the field is open to those who can prevent the increasing trouble and heal the causes of it. There has never been a strike "settled" that way yet. And it is time to begin. The time to deal with any kind of trouble is when you see it a long way off, or when you first learn that it is working underground. The time to begin is even before that, when your own sense of justice and right tells you that *there* or *there* is a condition that should be straightened out before it makes difficulty. We should put our whole industrial system in the shop and overhaul it, part by part, so that it may go without breakdowns. We have had enough warnings to do that; as a matter of good industrial engineering we should have done it without any warning. To let an engine run until it breaks down in the most important time of the year and just at a period when the dependability of that engine is an essential factor in world restoration, is mighty poor intelligence.

The people are beginning to see this. The upheaval of strikes and the false sensationalism of settlements do not stir them at all. Their eyes are fixed on something still more desirable, still more sensible, still more practicable. They are looking for the idea, and for the servants of the idea, that can root out the causes of disaster. That is the period we are now entering through the doors of present strife.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.



A Capital in the Realm of Higher Scholarship

Federation of Colleges Makes University of Toronto Unique on Continent;

Diverse Elements Find Common Meeting Ground in Great Institution

The Great Hall, Hart House, where University of Toronto students dine in Gothic splendor.

Hart House, the magnificent gift of the Massey Foundation to the University of Toronto.

By HECTOR CHARLESWORTH

WITHIN the past 30 years the city of Toronto has grown to be one of the great cities of the continent, a financial, manufacturing and trading center whose interests reach not only all over Canada but to many parts of both hemispheres. Of its material prosperity ample evidence exists in residential districts that for opulence and extent are excelled by no city of the half-million class; and this prosperity is a theme for eloquence whenever its public men are called upon to speak in other cities on both sides of the Atlantic.

But Toronto has one institution which seldom forms the theme of such oratory—an institution but indirectly connected with its latter-day prosperity, though it is a priceless possession—and that is its university.

Remove the university and the savor of individual life which Toronto possesses would largely disappear. For it would cease to be the city in which they have been reared. It has not the ancient traditions that envelop the historic universities of the motherland with a haze of romance; it does not go back so far as American universities like Harvard and Yale; but from the days when English-speaking Canada commenced to mean something to Canadians themselves, and to the world at large, it has been a fountain of intellectual aspiration, a civilizing influence, with an atmosphere all its own.

To define that atmosphere is not easy; but even the casual visitor who gets momentarily in touch with the social life of the city instinctively feels it; for whatever there is of distinction in that social life emanates from the university. Its influence makes itself felt in the minds of the industrial and financial leaders who have built up Toronto's prosperity and who feel it an honor to support the university. Though in later years it has by no means neglected those practical and scientific aspects of education, which are all important for a country in so early a stage of development as Canada, it also represents the spirit of education in its larger sense, as a means whereby the youth of today shall not be the empty-handed heir of the ages, but shall mingle, as it were, in the struggles and triumphs of the human spirit since the beginning of recorded history and poetic utterance.

The University of Toronto is still in its essence, what it was in its beginnings as a fountain of old-world culture and tradition set down on the fringe of a wilderness. When it first came into active being, conditions in many parts of the province of Upper Canada, as Ontario was known until 1867, were not unlike those of the state of Ohio as described in W. D. Howells' graphic novel, "The Leatherwood God"; and it has played a vital part in the development of Canada ever since. It is intimately bound up in the history of Toronto, and it is to the credit of the men who laid the foundations of British institutions in the country of the Great Lakes, and from thence by gradual steps in the vast prairie country of the Canadian West that from the outset they had the idea of establishing university culture in the new-tapped wilderness.

To define the tradition that lies back of the University of Toronto, it is necessary to touch briefly on the conditions under which the Province of Upper Canada, which for a brief period included much of what is now Michigan, came into being. The cession of Canada to Great Britain after Wolfe's victory at Quebec in 1759, brought with it vast and partly unexplored tracts of territory lying on both sides of the Great Lakes, and extending far down the Mississippi Valley. The actual ownership of these tracts was not really settled until many years later; for before Great Britain had really time to take cognizance of her heritage she was involved in the difficulties with the colonies.

The populated region to the east of Montreal then became the Province of Lower Canada and the unpopulated region lying north of the lower lakes became Upper Canada. There were old French trading posts on the Niagara River, the Detroit River and on the north shore of Lake Ontario. One of these posts was Fort Rouille, on the site where Toronto now stands. Because of its land-locked harbor, and easily defended position, it was selected as the seat of government in the new territory. The British Government gave little heed to this beautiful and fertile acquisition until the decade following the cessation of the Revolutionary War. It became necessary then to find homes for those American colonists who had sided with Great Britain and whom several of the states had driven out. In passing, it may be said that one reason the name of George Washington has been held in such high regard in Canada is that he did his best to prevent this policy of spoliation. The Federal power in the United States was at that time too weak to make his protests effective. The United Empire Loyalists, as they came to be known, were made up of business and professional classes of New England and New Jersey; and though the confiscatory policy left them despoiled it did not leave them helpless. New homesteads were found for some in the older colonies of Nova Scotia and New Brunswick; but large numbers were given holdings in the new territory of Upper Canada. In the last decade of the eighteenth century, York, now Toronto, was to all intents and purposes a New England settlement, supplemented by British officials and by enterprising immigrants with a little capital, who presently began to arrive from the British Isles.

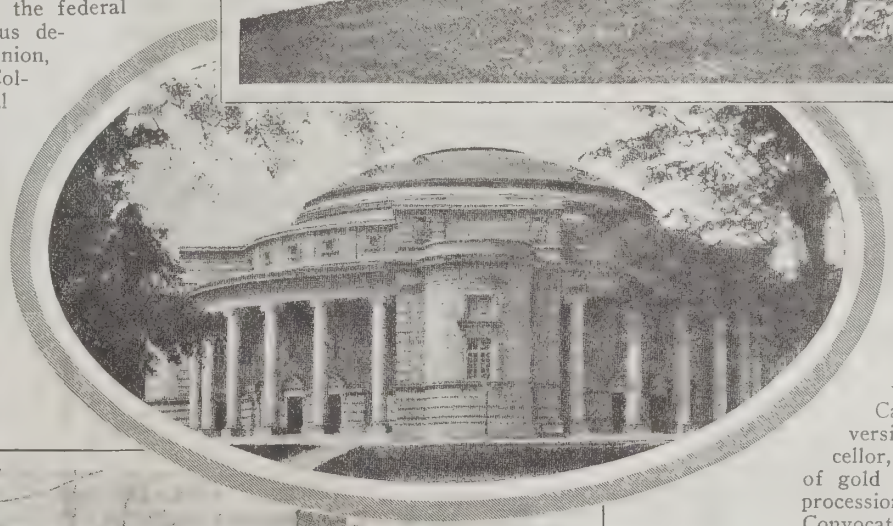
The newcomers at once began to organize the young colony in earnest, and it is evidence of their qualities that higher education was one of their first cares. As early as 1798, the British governor, General Simcoe, recommended, on the advice of his council, an educational plan to be sustained by vast grants of Crown lands in Upper Canada. It provided for the establishment of grammar schools at four points, at Sandwich on the Detroit River; at Newark (now Niagara), at Kingston near the eastern extremity of Lake Ontario, and at Cornwall on the St. Lawrence River; and for a university at York (Toronto). The British Government assented to this recommendation in 1799, and thus the University of Toronto had its documentary beginnings.

Nevertheless, it took more than a governmental edict, even when supported by financial provisions, to make a university. Many events intervened to prevent immediate fruition. There were the Napoleonic wars in Europe which retarded colonization and which had an off-shoot in 1812 in renewed war between Great Britain and the United States, during which the fringe of settlements along the lower lakes became battle fields. The town of York was burned by American troops and in reprisal, British troops burned Washington. It was 1819 before York had risen from its ashes and the world had become so tranquilized that talk of

a university could be revived. Then ensued a different type of conflict to delay matters still further—religious differences.

At that time educational and religious interests coincided in nearly all countries; and the question as to which sect was to control the management of the proposed institution was important. There was a strong party which desired to see the Anglican or Episcopal church established in Canada as in England. This party held that the university should be an institution of the church controlled by the ecclesiastical authorities. On the other hand, the United Empire Loyalists who had come from the American colonies contained many Wesleyans and Baptists; while nonconformity was well represented in the more recent immigration from England, Scotland and Ireland.

The agitation for the abolition at Oxford of religious tests, which made all members of the student body compulsory members of the Church of England, had begun. The high churchmen in the young Canadian colony would have liked to see religious tests in the projected university; but the bulk of the population would have none of this. The savage parochial controversies of that day ended in a disintegration of forces and the establishment of a number of colleges or seminaries by various religious denominations, each drawing government funds. In later years nearly all these colleges have returned and now go to make up the federated colleges which comprise the University of Toronto.



The advocates of a university which should be a home of humanistic education in which all religious differences could be sunk, with sadly diminished resources did succeed in 1827 in obtaining a charter for the "University of King's College," which has since been the pivotal point of the institution. To put an end to controversy, it was provided that no clergyman of any denomination should be eligible to act as a professor. Things moved slowly still; there was a rebellion in the Canadas in 1837 which resulted in a change from the advisory to the responsible form of government. It was 1843 before teaching actually began under the charter significantly enough within the halls of the legislature itself. In 1849, the name of the institution was changed to "The University of Toronto" and in subsequent years when the federal principle was adopted and the various denominational colleges came back into union, the parent stem became University College, operating under the original charter.

This charter retained the very interesting provision, designed to perpetuate University College as the linking and pivotal institution, from which all the affiliated colleges should radiate without compromising their special aims. No ordained clergyman of any denomination may hold a chair in its various faculties. It devotes itself to the teaching of the humanities and the abstract sciences like philosophy and mathematics. Thus it is possible for denominational colleges like St. Michael's, a Roman Catholic seminary; Victoria College, the chief educational institution of the Methodist church; Trinity College, originally a foundation of High Church Episcopalianism; Wycliffe College, devoted to the spread of Low Church ideas; Knox College, a Presbyterian theological establishment; and various other colleges to co-operate on the general lines of higher education. Co-ordination in lectures is attained thereby. In a sense, therefore, University College, housed in the beautiful Norman-Gothic building, erected in 1857, which overlooks what used to be a very large campus, is a clearing house of culture for the whole university. Symbolically, it occupies the central position in the group of affiliated colleges and special faculty buildings which have in the past 30 years grown up. Situated in the very heart of Toronto, they give an ornamental, old-world atmosphere which exercises a strong fascination over the minds of visitors to the city.

The special position of University College and the various denominational interests to be reconciled have led to the adoption of a dual system of government. It is presided over by a principal, the celebrated classical scholar, Professor Maurice Hutton, who holds prestige similar to that of Sir Robert Falconer, president of the federated university. Though an ordained clergyman is debarred from holding the post of principal of University College, the restriction does not apply to office of president of the university and Sir Robert was originally a Presbyterian clergyman. Owing to his tact and personality, he gets along with all the theological colleges with which he has to deal.

The dual system runs all through the system of government, and though it appears complicated and disputes are not unknown, the machinery runs smoothly. The university is both a state and a private institution. Its main factors are state-supported, but some affiliated colleges, like the Toronto Conservatory of Music, for instance, are private foundations. It has a senate which exercises control over the scholastic side of its activities and which is elected by the graduate body, with provision for the representation of every profession. It has also a board of governors, chosen by the government of the province of Ontario, which deals with the financial problems, and with other practical details of management. At one time it was feared that the university's position as a state institution militated against it as the recipient of those private gifts, which have been as vital to many of the great American universities of today as for Oxford in the Middle Ages. But of recent years the wealthy men of Ontario have come to a better realization of the situation and have been generous. The late Sir John Eaton, the great Canadian merchant-manufacturer, was princely in his gifts. A few years ago, Sir Joseph Flavelle and other wealthy philanthropists, built a great clinic institution, the Toronto General Hospital, to bring the medical faculty up to the highest world-status. The Massey Foundation, created by the founder of the greatest agricultural implement industry in Canada, has been lavish and discerning in its gifts; and quite recently the Rockefeller Foundation has come forward with the proffer of a grant—a compliment deeply appreciated by Canadians.

Above is shown a view of University College, central factor in the federated University of Toronto. The building has been in continuous use since 1857. To the left is Convocation Hall, where the important ceremonies of the institution are held.

Knox College, a Presbyterian Institution, affiliated with the University.

I should like to be able to say that all of the many buildings associated with the university are architecturally beautiful, but it would be an exaggeration. Many of the edifices are individually of rare artistic appeal; one or two are frankly ugly. But the incongruity of the general ensemble sometimes arouses hostile criticism. There has been no general plan either in the matter of design or material. Several schools of Gothic are represented, side by side with Grecian Romanesque, Renaissance, and modern American or Richardsonian architecture. There is almost as great a diversity in the matter of materials; contrasts which are especially marked in the newer buildings. Now the modern mind seems instinctively to tend toward uniformity; and we have esthetic critics in Canada who scoff at these contrasts and incongruities. The parent edifice, University College, hallowed by sentiment, is beautiful from every other point of view; and not far from it is Hart House, also in the Norman-Gothic style, an edifice but three or four years old, that is the envy of academicians from various parts of the world. It is the work of Henry Sproatt, an architect whose hand is seen in other university establishments. It was built by the Massey Foundation at lavish cost as a gift to the student body. Its "Great Hall" where the boys dine at low cost is an oak-beamed chamber in the Gothic style that is hardly surpassed for dignity and beauty of style anywhere; and the edifice includes sumptuous clubrooms, gymnasiums, a vast swimming pool and a most finely equipped "little theater." The scope of its activities even includes a printing shop for student publications.

Despite the thoroughly modern character of many of the offshoots that have grown up around the parent stem, the university still retains something of the scholastic atmosphere that gives an inner significance to the very word "university." Its professorial and lecturing body has grown in 30 years from about 80 to 800 or more; and many members of the various faculties come from Oxford and Cambridge and other famous European universities. The June convocation when the chancellor, Sir William Meredith, magnificent in robes of gold and black and attended by beadles, heads a procession across the campus from University College to Convocation Hall followed by scholars in the robes of many universities, is an unforgettable spectacle. I recall one convocation in June of 1917, when the Right Hon., now Earl, Balfour was to receive the honorary degree of LL.D. The sight of Balfour in the pink and scarlet of his office as chancellor of Cambridge University, exchanging scholastic jests with Principal Hutton, in the black and scarlet of Oxford, flanked by nearly 200 professors wearing the gowns and colors of a score or more universities, some crowned with mortar boards, some with the medieval scholar's caps of European colleges, was one never to be forgotten.

The real greatness of the institution lies not merely in the scholars it has sent forth, and they are many, for its sons figure on many a faculty in the United States, and in some of the universities of Great Britain; but in the part it has played as an illuminating factor in the country at large. It takes the boy from the village and the farm and places him in touch with the larger things of life. Nor does it destroy his aptitude for practical affairs, as Oxford and Cambridge are accused of doing. A surprisingly large number of the younger manufacturers and business men of Canada are graduates. Many leading public men of the Canadian Northwest provinces call it their alma mater. Its association with Canadian public life has indeed been long and continuous. The present prime minister of Canada, Hon. W. L. M. King, is one of the university's sons; as was his predecessor, Hon. Arthur Meighen. The best illustration of the close touch it holds with the life of the people, is that fully half of the farmers, who constitute the present provincial government of Ontario, call the university their alma mater.

In a sense, the University of Toronto furnishes a link between the systems of higher education in Europe and in the United States. A university in Great Britain or on the Continent is composed of colleges. In the United States a university is practically a large college, with various departments but a single entity. Toronto in its unique organization of federated and affiliated colleges occupies both sorts of relationships to the students. The adoption of the extension idea so widely used in the United States helps bring the benefits of the great institution home to persons through the Dominion of Canada, persons who otherwise would be denied its privileges entirely. Rural and urban residents alike share in these advantages, and the great university has been brought into intimate touch with phases of life throughout the province.

Prohibition—And the Cellars of Friends

A Tale of Washington Where the Constitution Hangs on the Wall; The Official Dryness Is Frequently Moistened by Private Stocks

By a Washington Observer

AT THE time of writing this article the Eighteenth Amendment has been effective for, exactly 30 months. Prior to that time Washington, D. C., the capital of the United States, had been experiencing a semi-dry, or, rather, a semi-wet régime for an almost equal period. As the chief legislative center of our country, therefore, the District of Columbia had a chance to prepare for prohibition after experiencing a state of conditional alcoholic aridity. This fact alone goes to prove that legislators knew what they were about when the constitutional amendment was submitted.

When it comes to alcoholic subjects, not Congress but many Congressmen are experts, although the same may not be said of their ability in politics. These Congressmen were not like so many babes in the wood, but they were, alcoholically in most cases and non-alcoholically in a few cases, veteran woodsmen, but as things stand today, they seem to be regretful that they ever endeavored to limit their appetites by legislative enactments. They may not say so but they act so. Nor are the Congressmen alone in that.

Virtually Washington is a wet city; a too-wet city; a discriminatorily-wet city. It is so privately and it is so officially. Washington is full of drink—and how it gets there may be no mystery but certainly it's there. Of late President Harding has added his authoritative voice to the singsong that "the law must be obeyed," but the fact is that, by and large, administrative and legislative—and not excluding all of judicial—Washington in general obeys the law and drinks at the "homes of friends."

Of such friends, there are countless ones in every social scale. The new cop will not hesitate to drop in on some one who has a cellar. Any and every household corner is a cellar, for the purpose of storage. To show that he is a good fellow he will invite, sometimes to the chagrin of the involuntary host, a detective to go along.

Taking the other end of the social scale we shall find the official who is willing to be led to alcoholic drink either by a dinner invitation to a home where the cup that cheers is passed around or by "dropping in" on some wealthy man whose stock seems to be everlasting.

These visits, which have an insidious habit of multiplying unexpectedly, are self-moistening, and in most cases are quite unilateral. They are not visits based upon the old-fashioned social code of call for call. The visitors are in the nature of human sponges, capacious or scant, who go about saturating themselves with anything from homemade beer to the rarest sparkling burgundies. The set in which they travel is what determines, generally, the beerage or vintage, as the case may be.

The law permits alcoholic beverages purchased and stocked within one's household prior to the date upon which they were officially outlawed to be served by the host to his friends. Fortunately for the host, the law does not provide that such liquid hospitality must be either preceded or accompanied by solid food, notwithstanding that as expense would go food is a relatively small item. Moreover, food might help to this extent—it would fill stomach space that otherwise would be occupied by John Barleycorn.

Diplomatists Punctilious

BE IT understood that nothing in this article should be taken to mean that every official and every administrative officer and every legislator and every guardian of the public peace belongs to this self-saturating army, but this army is numerous, and too numerous, and those who belong to it will easily recognize themselves. Thus we reach the crux of the argument—that while many officials are avowedly prohibitionists in a legislative sense, the city where they reside goes to some pains to make them forget that the country is dry.

The capital of the United States, therefore, harbors a group of paternalistic gentlemen who are doing their darnedest to protect humanity, within the confines of Continental United States if not beyond the three-mile oceanic limit, from the scourge of alcohol, but do not impose their rule upon themselves. Throughout the country, however, there has been a tendency to consider the diplomatic contingent as the source of liberal liquid hospitality of this kind, but such happens not to be the case. For one thing even imported and duty-free beverages of this kind, delivered within the immune precincts of diplomats, are an expensive item, and the diplomatist who could afford to be liberal in this matter is rare indeed—and moreover is apt to be too punctilious to turn his residence into a tavern. The other thing is that in general the diplomatic contingent has rather cultured drinking tastes and prefers light wines or fine liqueurs to the exclusion of high-kick and quick-acting spirits most in demand.

In general, however, the Washington official who technically obeys the Volstead Law can always irrigate his esophagus by being the friend of a "friend indeed." As there are a few such "friends indeed" that can be found at a time of a friend in need, although not enough to go round, the result is obvious. The legislator or administrative officer who suffers no aridity of the throat cannot be expected to give much thought to the consideration of prohibitory interpretations from a sound legalistic standpoint because, the inner man being satisfied, the urge to delve into delicate matters of this sort does not rouse him. There is no such urge

What does it avail to proclaim prohibition for the nation when a majority of officialdom, either thoughtlessly or with malice aforethought, is not aware that the country is dry because there are a few wealthy and influential friends who preside over cases. We have had, and may continue to have, the spectacle of official Washington—of course officials elsewhere within their respective spheres are not exempted—who solemnly exhort the people of the United States to obey the laws and all the laws. In the same breath they declare that the cynical way with which prominent citizens disregard the prohibition law is to foster contempt for all other laws. But has any such official ever been heard to say that this contempt will be fostered in minds other than those belonging to the common people?

Has there ever risen an authoritative individual in favor of an amendment of the Volstead Act which would prohibit men of wealth to stock up liquors to the extent of hundreds of thousands of dollars in each instance? In Washington there are said to be two such private stocks, and one of them a few months ago figured in the public press as having been tapped through steel doors by enterprising marauders.

Two years ago it was common gossip in certain circles that Washington's most aristocratic bank cleared two checks—each for more than a hundred thousand dollars—drawn to the order of wine agents. Rumors of this kind cannot be expected to instill into the popular mind anything except the suspicion that private stocks of this kind were neither the intent nor the purpose of the one loophole of the Volstead Law. It is preposterous to argue that any one family, no matter how rich, could in the course of a normal lifetime drink up from $200,000 to $500,000 worth of booze, even if it meant sparkling wines.

Not a Drop Except Champagne

IF ANTECEDENTS and precedents—speaking today with January 16, 1920, as the turning point—are a criterion, such a stock could not have lasted until this day, because current Washington reports, even with allowance for exaggeration, indicate voluminous use and regular use.

This story is given for what it is worth, but the writer feels his responsibility to the extent of reporting it here with assurance that the persons imparting the information are trustworthy and participants in the affair, and it has to do with a party given last New Year's eve at a certain house. The élite of Washington society was invited. Not all remained throughout the night. But at 5 a. m. "men and women were drowsing under tables, across chairs, lumbering about 'unvolsteadily,' frowsy and disheveled even beneath their exterior of aristocratic demeanor."

The orders of the lady of the house were that no "hard liquors" should be served at all during the evening. Sparkling wines only were *de rigeur*. At one point a man who felt that champagne was not swiftly effectual to suit him, called for whisky, only to be informed that the orders of the evening could not be transgressed. The butler knew the guest, and the latter was a frequent and popular visitor, so the more insistent the guest became the more smilingly adamantine was the domestic. Even a hint of drawing upon the latter's private stock did not fulfill the thirsty one's desire.

The joke of the thing is this—that inasmuch as guests knew that it would be a wet party none found it necessary to carry "anything on the hip," which in polite society today seems as necessary as one's visiting-card case. Therefore the whisky slave had no way of catering to his appetite. It is not clear if he ordered his automobile to go and fetch it for him at home or whether he actually left to have a whisky party, but in any case there seems no doubt that champagne flowed very freely.

Those who frequented that party may or may not be known. Among them there were dowagers who left the house before the "new year" dancing began after the midnight celebration, and most of those who did so merely carried away the recollection of a frothy entertainment—as all such parties are—after which the younger set held sway.

It requires no ingenuity or perspicacity to realize, irrespective of whether the company was of 40 or of 400, that these were guests outside the limit of the word "friends" as implied by the prohibitive laws. It goes without saying that there were officials or members of such officials' families present. This presence may be condoned, but the imbibing cannot.

So long as these private stocks, even though they come very near being public, after a fashion, continue to exist, a proportion of Washington's official contingent will gravitate toward them. They may mean nothing by becoming moths attracted to alcoholic flames and fumes, for both waft forth, but the official who voted "dry" and the administrative officer who enforces (?) dryness have no business at such gatherings if they partake of forbidden drinks. The utmost concession in this would be the customary wine at meals or the more spiritous drink where sanctioned by culinary habit, but culinary habit is a rank outsider at some of the parties that have been given.

One suspects, moreover, that many private stocks lawfully put away have long since been substituted with ostensibly unlawful stocks. And needless to say, there are homes in any and every big city—but especially in Washington—where the prohibition and police forces would not even dream of submitting to inquiry. There is such a thing as favoritism where there is not such a thing as disinterest.

Otherwise how could it be possible for a prominent official to stock into his house within a year or thereabouts several hundred cases of Scotch whiskies and Gordon gin? A friend of the family actually told the writer that ingress was obstructed by these pyramided cases of foreign importation. The information was vouchsafed by another that every visit meant "one bottle." Socially speaking, from a Washington standpoint, one bottle per visit is no inconsequential measure, because they may run into the score or even hundreds in a short time.

Perhaps related to these stocks of recent origin may be the official item that made its appearance in the newspapers a few months ago, where it died of innocuous desuetude, that customs officers of the United States had been permitting to clear the entry of imported alcoholic beverages of all kinds "upon payment of the legal duty thereon," because "Treasury Department officials never sent out the notice that with the Volstead Act going into effect the customs regulations" became null and void except and where applicable to such beverages lawfully imported for medicinal, industrial or religious purposes.

The writer was asked to participate in the purchase of a shipment of hard drinks in the autumn of 1920. The offer was for a few cases at something like $85 a case, and "several thousand cases were expected." So far as the circumstances indicated at the time, the shipment was essentially a private deal for the sole benefit of consumers—and the offer was made as of one friendly consumer to another. There was a hint about a flat fee of about $20 a case being conditional, and what became of this item, except to say that half of it went to the crew of the carrying ship, was not averred. What seemed evident, and as proved by the official admission later that the custom houses passed all such shipments as theretofore, was that it did not have to be smuggled at the port of entry. Treasury officials "forgot" that there was a Volstead Law and customs officers were not obliged to enforce laws which were not brought officially to their attention.

"What's in a name" was never truer of what a prominent or supposedly influential name means in respect to mysterious shipments addressed to it. It makes no difference how they are labeled as to contents—the only rule is to destroy all marks not countenanced by the prohibition laws. A shipment thus can go into any more or less prominent home—and the police force of the capital can tell some interesting tales about them. But how can a poor cop who has had a difficult time and at peril of his life to make sure of his ill-paid job nose about matters that are identified with a prominent name?

Guilty? Or Prominent?

IT HAS been said that the prohibition forces—that is, the investigating agents—have greater discretion and may with impunity uncover even a funeral casket if there be reason to believe that it contains the "living remains" of John Barleycorn, but somehow the line of least resistance appeals even to these forces and they let well enough alone.

It will be remembered that not very long ago a great fuss was made over the fact that a prominent couple was dining at the most prominent Washington hotel, when the man was arrested by a "lady cop" for pouring out a drink from a hip-flask. If the name was mentioned it was mentioned reverently, from police blotter to police court. No homily forthcame when the dispenser of justice rendered his decision, although the same judge never fails to preach sermons to lesser alcoholic luminaries who have the bad luck of standing before him as prisoners.

And that's just the whole trouble. The poor man's weakness is the rich man's joke. Presidents and attorneys-general and other officials may not realize it, but in whatever they have said so far there is carried the implication that the rich man's stock is being "legitimately" used by those who are privileged to partake of it, although no official, Federal or state or municipal, has thus far established to the satisfaction of the people that those stocks as of today are legitimate according to the strict interpretation of the laws involved. And the people more or less confusedly seem to be aware that something is wrong in all of this, that the laws are unequal, even though in general an attempt is being made to administer them impartially and against all odds.

A feeble voice has been raised two or three times in the House of Representatives against the hypocrisy of a certain official contingent, but the surprising thing is not so much that fellow members laughed the idea to oblivion, but that the Anti-Saloon League, or the organization that has taken its place, has not pounced upon the hint.

As a matter of fact, it is just as well to take cognizance of something here that has failed to be understood in its fullest purport. It has to do with the campaign of 1920. Although prohibition was a secondary issue, numerous voters changed party allegiance in November on the supposition or hope that their ticket would be "liberal" in the interpretation of what constitutes an intoxicating drink. Both presidential candidates straddled the issue, although both declared

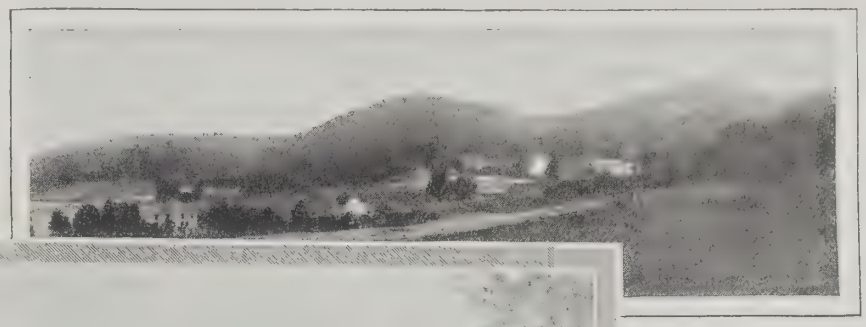
His Sermons in Stones, His Books in Brooks



Charles D. Stewart, Author, Finds Material in Building a Home

By FRED L. HOLMES

"DON'T just read about nature. Go see for yourself. Investigate. That is how I started as a nature writer."

On a little peninsula of land in Pike Lake, Wisconsin, Charles D. Stewart, the author-naturalist who gave this advice, has pounded the hardheads brought down by the glaciers some 60,000 years ago into sizeable stones out of which a house has been builded. Here he does his writing. The morning sun glistens over the little lake and the afternoon breezes lend enchantment to the undulating fields along the drive. Miracle Hill, crowned by a church, dominates the country.

Pilgrims hustle along the weed-fringed roads on Sunday mornings to the shrine of the Carmelite fathers on the hill. The notes of their church bell chime sweet and clear from its summit some 300 feet above the roadside. Automobiles park in the blind valley at the foot of the huge tree-covered mound and through breaks in the foliage, the penitent can be seen making their ascent from one wayside shrine to the next, to the panoramic summit. Down roads, like the lanes of a pasture lot, I motored for a visit with the man who once swayed destinies in labor unions of Chicago, but who had forsaken the noisy city 16 years ago to try his hand at literature.

View of Kettle Country, with Miracle Hill, crowned by church of Carmelite fathers.

Above is the house which Charles D. Stewart, the author (right), built after breaking up 160 loads of stone.

"Do you get lonesome in the country?" I asked.

"There is as much doing on this peninsula of mine as there is in Chicago on its busiest corner," came the quick reply.

"You see more and more the longer you live here. You can hardly keep track of all that is going on. If you own a little piece of the outdoors, the trees are yours, the birds are yours, all the processes of nature taking place in a thousand forms are yours, and you find out that you are in partnership with God. Presently you become an active partner, and you take up a hoe and start to help the business along. After a while you receive dividends in health—and also mentality in a charitable and genial philosophy. You like your friends better.

"As for human association—and I am free to confess that the beauties of nature would be nothing without someone to talk the thing over with—the country contains plenty of interesting people. Gradually it is drawing to itself many of the most interesting minds—people who are too big for the city alone, who fill their place with distinction in the city and yet find their deeper nature calling for the country. A big man in the city, when you get to know him, is usually a man who has a good deal of his mind in the country. A mere agricultural state has societies which cover every sort of intellectual activity, and in the most unexpected places you find men of intellectual achievement who know, and are known to, other interesting men throughout the state. When you have once come in touch with it, you find yourself in what is, really, a large neighborhood of thoughtful and appreciative people; and living out in these small towns and amid these surroundings, they have time for the gift of neighborliness—even in science. A man is not a hermit simply because he lives far out in the country. I have been very lonesome amid the crowds of a city street."

"How do you spend your time?" I asked.

"As a matter of fact, my time spends me, and I am in favor of making the days longer," he replied, as if my question were a little facetious. "As soon as you have a place which you own, even a small place, with a garden and an orchard and an animal or two, there is no more problem as to how to spend your time. And if you have a fair complement of friends, and a few social duties, and a little politics and a number of correspondents, the question finally is, if you are a literary man, how you are even going to get the time to write what you have planned.

"Just now the garden has been waiting three days to have the cultivator run through it. And if it isn't spraying the horse to keep the flies away, it's the squash bugs, or the runners on the strawberries or something else, and all the while I have one or more articles or books under way. After all it is the rush and push that keeps the game interesting. Chicago rush wears you out and puts you into the hospital; but this sort of rush makes you simply tired at night, and continually growing tougher and stronger."

At the house we sat down in a cool room before a fireplace, the stones of which he had chipped and fashioned from the bowlders of the land. As I examined the stones of the hearth he began the story of how with a six-pound sledge and the long rows of stone hedges about his inclosure he had found the true key to science and health.

"I rolled off a rusty-black sort of a one from the fence ledge," he mused. "I worked it around into position for striking. The sledge simply rebounded. Nine, ten, eleven blows and then it fell in two, disclosing a black interior of beautiful mat texture. Diagonally across the face of it was a white stripe as wide as one's finger. And an inch and a half away was a contrasting stripe as straight and fine and parallel as if it had been made on a loom; it was like a gold design in French silk. With its slightly wedged shape,

Fireplace made of stone from glacial rift 60,000 years ago, chiseled into form by Mr. Stewart.

it looked all the world like a dashing four-in-hand tie. It had broken in just such a way as to make the key for the fireplace. Here, then, was good luck indeed — the very necktie of the house all done."

Out of his experiences in breaking stone have come one of the best of his articles and many of his novels have touches that take the reader back to this interesting chapter in Mr. Stewart's life.

"Such rock!" he exclaimed. "Rag-carpets woven in garnet and topaz; petrified oriental rugs; granites in endless designs of Scotch mixture, as if each bowlder were wearing the plaid of its clan; big, uncouth, scabiose, ignorant-looking hardheads that opened with the heart of rose—each one a separate album opening to a sample from a different quarry. I have seen cloven field-stone that deserved a hinge and a gold clasp; I have one in sight now which is such a delicate contrast of faintest rose and mere spiritual green that it is like the first blush of dawn. Imagine smiting a rock until the fragments sting you in the face, and seeing it calmly unfold the two wings of a moth. I have broken into a rock that pleased me so well that I held it in my mind in order to match it; but though I had the pick of 160 loads that summer, I never found another. There is 'individuality' for you."

Among the farmers of the community there was a vague rumor that their author-neighbor was once a labor leader. And sure enough I soon discovered that he had worked for years as a wood-carver, halftone engraver, helped to organize the International Engravers' Union, and for several years was its only paid official.

The business of receiving dues, managing strikes, visiting shops and settling difficulties for the organization did not appeal to him. His greatest interest was in his own craft. He liked the work as an engraver. Twice he tried to shift the office to another, but failed. Then came the Indianapolis meeting which proved the turning point in his life.

"The union had been growing stronger and bigger, when we met at Indianapolis in 1907," continued Mr. Stewart. "There I found a successor to myself who had received training and showed his qualities during the year, and I got him nominated.

"Now, it was just after that meeting when I had been having so much work and so many problems, that I first became a nature student. After that meeting I came home, fell into bed and was unconscious for 48 hours. My wife thought I was asleep; when I kept on sleeping and could not be awakened, she went for the doctor. All of the diseases that I had at that one time seemed difficult to untangle. The doctor said I had typhoid fever—but was suffering from overwork, but at the same time I had awful pains in my back when I breathed—and that was a touch of pleurisy. Whatever it all was, I had it; and thus I had several weeks vacation on my back. A friend in the local union carried on the business office evenings temporarily and they waited for me to get well.

"I became a nature student. I did not know I had an inclination in that direction. But there were spiders outside of the window where I was lying, weaving their webs anew every morning; and I fell to watching them. I suppose I was interested, because I was a mechanic; and a spider is a mechanic and a most ingenious and skilled worker. And so, with nothing else to while away the time, I kept watching and learning the spider's trade. As I grew stronger and could get nearer the window with a glass I went into the details and the secrets of their craft. I was now thoroughly interested in spiders and took notes."

Out of this sick-bed experience in 1907 he wrote an article on "Chicago Spiders," which attracted so much attention that it was later published in book form and is now to be issued in one of the volumes of the Atlantic classics for study in schools and colleges.

A number of articles on animal life followed in the past few years, overturning many of the theories held by naturalists as to the habits, characteristics and eccentricities of bugs and animals. One doctrine marks his investigation work. He is glad to read what others have written on the subject, but he refuses to write until he has made his own independent observations. Merely quoting authority does not suit in nature writing. There can be no advancement without independent investigations, which may result in overturning all previous theories.

The same theory is applied by him to his literary work. Discovery was made that there were approximately 40 allusions in Shakespeare which no writer had ever solved. Without reading the conjectures of other authors, but with the one idea of independent investigation, he set to the task. It was a question between Shakespeare's mind and his own, pure and simple. The book containing his solutions was published by the Yale University Press, under the auspices of the Elizabethan Club of Yale. This was considered a great honor, but still greater was the simultaneous publication of the volume by Oxford, where scholars ever since Shakespeare's time have studied these "cruixes" without final success. Solution came from this self-educated laboring man, who had taken a liking to literature, living on a little farm in a community far from big libraries and the contact with other students.

Born in Zanesville, Ohio, March 18, 1868, Mr. Stewart had a desire to settle in a rugged country. On discovery of the "Kettle Ranges" north of Milwaukee he decided in 1907 to settle there, picked out a location on Pike Lake, and began to break stone for the house.

Radio Through the Eyes of the Patent Office

Names and Incidents Important in Development of New Science

By S. R. WINTERS

WHEN any art or science has progressed with the surprising swiftness of radio-telephony and radio-telegraphy within recent months, it is proper to consider the personalities who have made remarkable achievement possible. The United States Patent Office, the one capable and unbiased authority on inventions and their intrinsic value, is the logical source to consult.

Hence, the title of this article. More than 1,000 letters of patents have been granted since Guglielmo Marconi first transmitted a commercial wireless message. Five names are inseparably identified with radio-communication. These are: Guglielmo Marconi, J. A. Fleming, Lee De Forest, Edwin H. Armstrong and Edwin H. Colpitts. Their respective contributions, in agreement with the order of their names just cited, were: The application of the first complete radio-telegraph set in the transmission of a message by electromagnetic waves; the vacuum-valve detector for receiving wireless communications; the audion tube or bulb for the reception of radio messages; the regenerative feed-back circuit for the audion receiver; and the audion oscillator for generating modulated high-frequency waves.

Of historical interest, and in respect to the claims of friends of the inventor, reference should be made to a patent granted Mahlon Loomis, a dentist of Washington, D. C., which bears the title "Improvement in Telegraphing." The date of its issuance was July 30, 1872—a half a century ago—or 25 years before Guglielmo Marconi accomplished the transmission of a communication in the absence of wires. Undoubtedly this was the earliest patent granted by the United States Patent Office regarding radio-communication. From the viewpoint of Uncle Sam's appraiser of inventions, however, the Loomis discovery was lacking in the essential high-frequency electromagnetic waves. Radio-signaling, obviously, involves the use of some system of generating the Hertzian waves, and for this reason writers of textbooks and radio engineers are prone to discount the invention as disclosed in the Loomis patent, No. 129971. His priority in the direction of radio-communication, however, merits consideration. The claim he advanced for his discovery was: "The utilization of natural electricity from elevated points by connecting the opposite polarity of the celestial and terrestrial bodies of electricity at different points by suitable conductors, and, for telegraphic purposes, relying upon the disturbance produced in the two electro-opposite bodies (of the earth and atmosphere) by an interruption of the continuity of one of the conductors from the electrical body being indicated upon its opposite or corresponding terminus, and thus producing a circuit or communication between the two without an artificial battery or the further use of wires or cables to connect the co-operating stations."

What Hertzian Wave Is

AMONG the earliest of experiments with electro-magnetic waves, without having established their identity, were those conducted in England in 1879, when a Professor Hughes employed a generator of sparks, the device taking the form of a trembler bell. By the use of a telephone receiver and a coil of wire acting as an antenna, he was enabled to produce sounds while pacing to and fro in front of his home. Ridicule of the friends invited to observe the experiments put a damper on his activities. Professor Joseph Henry, of Princeton University, in 1842, indicated that the discharge of a Leyden jar was, under certain conditions, capable of oscillating—that is, the current proceeded first one way and then the other over the circuit connecting the inner and outer coatings of the jar. Sir William Thompson, afterward Lord Kelvin, in 1853, demonstrated mathematically the soundness of this theory. The oscillations of the current from the Leyden jar bear similarity to those employed to produce electromagnetic waves used in radio-telegraphy and telephony. James Clerk-Maxwell, professor of physics at Edinburgh University, in 1865, was responsible for the expressed conclusion that electric oscillations in a circuit produce electric waves in the surrounding space which travel with the velocity of light.

It was, however, in 1888 that the notable scientific stroke of Professor Heinrich Hertz, of Karlsruhe, was accomplished, namely, establishment of the existence of these waves. Hence the use of the term "Hertzian waves," synonymous with "electromagnetic waves." He produced, detected, and measured them. Likewise he indicated that they were polarized and could, not unlike waves of light, be reflected and bent. The instrument employed has been since identified as the "Hertz oscillator." Structurally, it consisted of two flat metallic plates, 16 inches square, each connected to a rod approximately one foot in length and terminating in a small knob. These rods were buttressed end to end with the knobs adjacent and one-quarter of an inch apart. They were connected in a circuit with the secondary winding of an induction coil, thus making it necessary for the current to span this space between the knobs in order to complete the circuit. Within the primary of the coil was placed a make and break unit. Once the primary circuit was broken, these plates became charged and then they discharged back and forth across the gap between the knobs and produced sparks. Each of the latter dispatched a train of electromagnetic waves. The detector of these elusive particles was made possible by a so-called "resonator." This consisted of a metallic wire bent into a hoop, 14 inches in diameter, with its ends separated by a slight gap. The precise dimensions of this hoop-like apparatus, so that it would be in "tune" with the oscillator, was determined by prearranged tests. By installing a piece of sheet zinc, six feet wide and 12 feet high, as a reflector and causing the waves striking the latter to be forced back toward the oscillator in the path of fresh, oncoming, unreflected waves, reinforcing occurred at some points and interference at others. The effect was not dissimilar to the fact that sound waves reinforce or interfere. A shifting of this "resonator" to and fro between the oscillating device and the reflector made it possible to detect these points. The sparking across the tiny gap in the hoop-like device increased until it reached a maximum at the point of greatest reinforcement. Subsequently, the spark expired as the "resonator" attained the point of complete interference. Harmonizing with the modern conception, this German inventor indicated that electromagnetic waves advanced in ever-widening circles. The effect of a rock thrown on a pond of water is a favorite characterization. Similarly, he reasoned that they were capable of casting an electric shadow by a metal plate or screen, comparable to the ability of rays of light throwing a shadow by interposing an opaque object.

Before Marconi's Time

THAT loose iron filings, when subjected to an electric current, would cohere and their resistance fall to an extremely low value—only to have their original resistance restored instantly by tapping them—was a discovery of S. A. Varley, in 1866. He made a lightning arrester from iron filings. A scientist of the Catholic University of Paris inserted iron filings in a glass tube and placed a metal plug in each end, by which the device could be connected in a circuit. The filings would cohere when electric discharges were admitted passage in their neighborhood and the tapping of the tube restored the filings to their original condition. He called his device a "radio-conductor." Sir Oliver Lodge, at a later date, dubbed the invention a "coherer," and in 1893 linked it up with a battery and galvanometer. He was thus enabled to employ it as a detector of electric waves. Professor Popoff, of Kronstadt, in 1895, installed a real radio receiving system for detecting atmospheric electric disturbances. A rod was extended above the roof of a building and its other end connected through a coherer to the earth. The coherer had a relay and battery in its circuit, the former being energized whenever atmospheric discharges passed through the coherer. The relay closed the circuit of a tiny electric trembler bell the clapper of which, on being drawn up, struck the bell, to give a signal of disturbance, and when retracted tapped the coherer to restore it.

"The foregoing shows the preliminary work, the stage setting, for Marconi's masterly act," said Dr. W. A. Kinnan, first assistant commissioner of the United States Patent Office. "The materials with which he was to build had been created. The oscillator, including the key, the interrupter, the transformer, the spark gap apparatus, and the radiating plate; the receiver including the receiving plate, the coherer, the tapper, and galvanometer, had all been created and their use had been indicated. Clerk-Maxwell and Hartz had pointed the way, Branly, Lodge and Popoff had traveled in the direction thus indicated to them and were in 1896-7, standing in the wings of the stage. But the light never fell upon them until Marconi had given commercial telegraphy by Hertzian waves to the world. The glory is justly due this remarkable young Italian."

The patents granted Marconi both in the United States and Great Britain indicate that his first triumph of communicating by electromagnetic waves was accomplished by an arrangement of two metal plates, elevated on poles in the picturesque fashion common to country tavern signs, the transmitting plate being connected through a spark gap to earth. This device consisted of insulated balls that were divorced by small air spaces which could include a vacuum compressed air or gas, or a liquid. To the terminals of the gap the leads from the secondary of an induction coil were connected, the primary winding having the common battery, key and interrupter, connected in its circuit. The interrupter functioned in making and breaking the circuit 100 times a second. The receiving circuit passed from the plate, through the coherer, to the ground. The terminals of the coherer were connected to a relay which controlled the tapper, but in the absence of a bell, a sounder, in parallel to the tapper coil, was employed. Departing from the experience of the vanguard of scientists who supplied him with his working materials, Marconi placed the circuits vertically instead of horizontally, and employed longer waves, more energy, larger radiating and receiving antennas. He also designed an improved coherer. J. A. Fleming, a name that is indelibly written on the roster of names that have contributed substantially to the developments of radio-telegraphy and radio-telephony, discovered that rarified gas was an effective conductor of electric current. The United States Patent Office granted him protective rights to a device bearing striking similarity to an incandescent electric lamp. A metal cylinder surrounded the filament and the invention was employed in detecting wireless waves. He adapted this device to service by using the transformer coupling between the antenna and local circuit, connecting the metal cylinder to one terminal of the secondary winding and the filament to the other. Since, in the use of a device of this sort, the filament, when heated, gives off negative electrons which pass to the cylinder and act to render the space between the filament and the cylinder conductive, current can pass from the cylinder to the filament. The current will not readily pass the other way. Therefore, the Fleming progeny acts as a rectifier, and he dubbed it a "valve."

Audion Credited to De Forest

LEE De FOREST, in 1905, made a notable contribution by introducing the "audion." It is a rectifier and a sensitive detector. It is a modification of the Fleming "valve." A metal plate, placed at one side of the filament, was substituted for the Fleming cylinder, and a third electrode of a perforated or grid-like design placed between the filament and plate. The universal popularity of this device and the reams upon reams of paper already devoted to describing and expatiating the virtues of this rectifier and detector render superfluous any attempts of elaboration in this article. May it be said, however, the modified audion, sometimes styled the thermionic amplifier, is the "heart and soul" of the modern radio outfit.

Edwin H. Armstrong, and his regenerative feedback circuit for the audion receiver, and Edwin H. Colpitts, and his audion oscillator for generating modulated high frequency waves, are inventors of more recent years than the ones previously treated in this manuscript. Already, Armstrong is being heralded as the genius who made broadcasting of music and vocal speech by radio-telephone possible. The invention of Colpitts, for which a patent was granted in 1915, is designed to simplify the mechanism and strengthen the effectiveness of the apparatus required for the production of the modulated oscillations. The device consists of a repeater which acts as a generator of high-frequency oscillations and also modulates these oscillations in accordance with the low frequency signaling impulses to be transmitted.

Prohibition—And the Cellars of Friends

Concluded from page 8

in favor of "obedience to the law." But ask any experienced political necromancer and he will say that prohibition was, to many an individual voter, a much more vital issue than appeared on the surface—and that it will reveal the same tendencies two years hence.

Because of this, it is not too soon to put candidates of all types, parties, and grades on record. It is not a joke to agitate the necessity of making them obey not by indirection but by personal practice the laws that they have together enacted. Of course, there are prominent men in public life who were ever temperate or actually teetotalers, but there are many others—ostensibly too many—who should stand up and be counted in for the practicing of prohibition. Because misunderings are misunderstandings, it is not necessary to make such a law retroactive, and if any public officials failed in obeying the laws that they have enacted they may as well be given the benefit of the doubt, but the present condition of affairs should not be permitted to continue any longer.

But that is not all. Public officials may be friends in all that the word implies of wealthy men who practically have cornered the best available supply of intoxicating drinks, but the time has come when virtually disgraceful conditions should be done away with. For the law that winks at a man holding half a million dollars' worth of drinks that he cannot possibly drink himself is not a prohibition law. It is a license law that favors the rich man to the extent of and the degree to which his wealth, plus his personal habits and intentions, are concerned.

It seems that the time has arrived, now that prohibition has had a chance to work out and reveal its rough spots, that total prohibition should be total—and that it can no more be stretched in favor of the man of means than it can for a moribund merchant marine.

At Victoria, British Columbia, there is a shed which acts as the repository of alcoholic stocks of government ships being operated across the Pacific Ocean by the Admiral Line. Eastward the stock is unloaded, so that the ships proceed to their American destination actually dry, and reload on the westward voyage, with this difference, that between discharge and reloading there are costly losses, borne by American taxpayers, that are excused as breakage, but that are traceable to pilfering and other subtractive schemes of the sort.

Officialdom that connives at these things or that even permits their occurrence by a policy of *laissez faire* is the officialdom that must in turn be held strictly accountable for loose odds and ends of the kind within the shadow of Washington's monuments erected to men who stood for justice and equality and impartiality.

The Volstead Act may or may not be the best thing in the way of corrective laws, and it may or may not be amended or substituted. That is something apart. But the law, either as it stands or as it will be improved, must be incisive and comprehensive and binding—it must be a law and not "local rich man's option." It must provide for a full report, such as that adopted for the income tax, stating the exact amount of all beverages and their source or origin.

A law of this kind would be yielded by Congressmen with very bad grace, and it is for that sole reason that its need becomes intensified. Congress has an erubescent nose, and a fine sense of smell.

It is important, if the people must be convinced that the prohibition laws are sincere and intended as an effort to destroy the drink menace, that they shall realize that their governing and legislating representatives practice what they preach. Until this is the case it is futile to expect the people to take the law seriously, and unfortunately there is room for improvement. Begin with Washington, and let a good job be done of it.

Baldy of Nome "Mushes On" in Last Race

Great Alaskan Husky Most Famous of the Leaders of Dogs

By GEORGE C. HENDERSON

BALDY of Nome has run his last race. It was a race with death and for the first time in his life the great Alaskan sweepstakes racing dog ran "out of the money." The famous husky died the other day at the home of his trainer, Scotty Allan.

Baldy, the great Alaskan husky, famed in song, poetry and literature, was buried under a bench beneath a rose bower in the back yard of a Berkeley, California, home, where the afternoon sun casts long shadows over the green turf. No tombstone marks the place where Baldy finished his last race. No epitaph tells of the exploits of the lion-hearted malemute.

Baldy died of old age. On the day of his demise he appeared to be hungry for affection. He had been bashful and shy around women but on this day he followed Mrs. Allan around. When she stopped her work to stroke the dog's head, the brown eyes of the husky gazed wistfully at her. The stub of a tail wagged listlessly and he quivered like a playful puppy.

Baldy stood on the edge of the lawn like a statue, his muzzle raised, pleading for human comradeship. Vibrant youngsters gathered around, stroking the intelligent head and buffeting the broad shoulders where the thongs of the sled harness had developed muscles like corded steel.

Baldy had never played with children before. He did not know the ways of young America but he stood their rough treatment like a veteran house dog and merely wagged his tail. Scotty Allan came home from work. Baldy confronted him on the steps and growled, a deep-throated, scarcely audible rumble. Scotty cuffed him playfully on the side of the head, spoke to him kindly and walked into the house.

Baldy trotted around to the rear of the house and scratched on the screen, just like any puppy, until he was admitted. As if the husky were a child, Mrs. Allan scolded him but let him in. In the bathroom he found his master shaving. Here the dog crouched at his feet, groveling. Surprised, Scotty stooped and examined the malemute critically. No, Baldy was not ill. His eyes were clear and his breathing regular. Why was he acting so queerly? His old austerity and dignity were gone. At dinner the dog lay by his master's chair, muzzle tucked up against a trouser leg, head buried between forepaws. Nor would he eat the food they placed before him.

Later, Baldy found his master sitting before the fireplace reading. The husky placed his paws on Scotty's knee and tried to nose aside the cold white sheet that hid from him the warmth of kindly eyes.

"Go lie down," said Scotty.

This was the voice that Baldy always obeyed. He knew no other law but this one rule supreme. Listlessly he sprawled by the fireside inert. Night came and with it Baldy refused to move from the fireplace. Scotty bundled him off to the veterinary. The Klondiker stood by silently until his dog fell asleep. Then he went home.

That night Baldy of Nome died in his sleep.

After Scotty Allan had thrown the last shovel of dirt on the grave, he sat upon the steedless sled and for the first time told of how Baldy won the great 420-mile race of 1909 from Nome to Candle on the Arctic slope, getting an $8,000 prize.

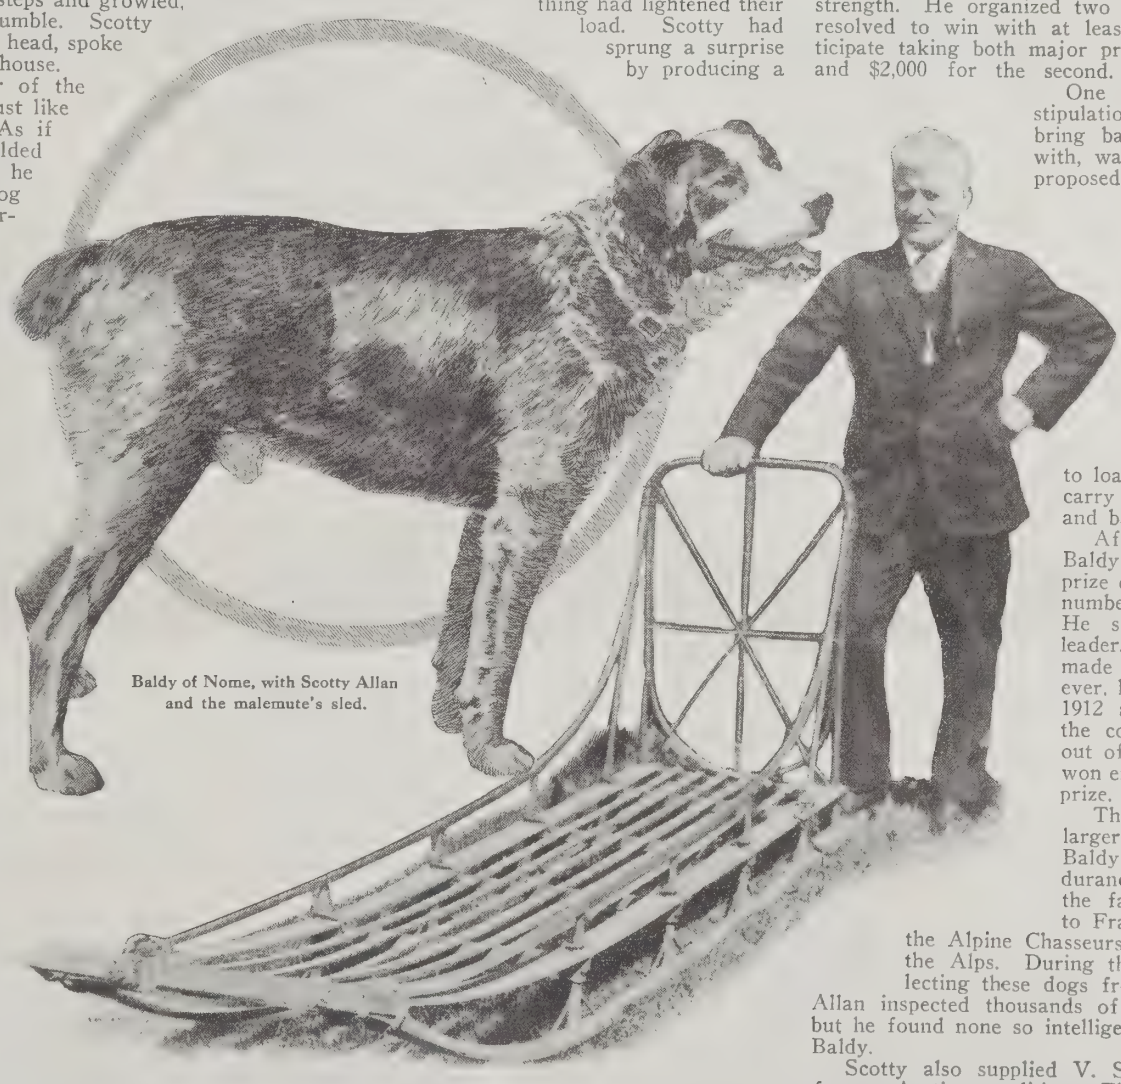
It was in the second year of the classic malemute races. Fourteen teams were entered and Scotty prepared for the battle of his life. A big purse and plenty of glory awaited the winner.

For weeks Scotty fed his eight sled-dogs on fresh meat, mutton and eggs. The regular diet of fish, walrus, baluga whale and cereals had been changed for the time being. It cost money to feed dogs on eggs in Alaska but the Klondiker footed the bill without a murmur.

His highest hopes were placed in Baldy. He had a heart of steel, this husky. No finer dog could have been found to lead his team in the long trek from the Bering over the icebergs, through blizzards, in hip-deep snow, breaking trails in forests and in the deserts of ice.

Every morning Baldy led his team over the white wastes for a 30-mile tryout. The insistent voice of Scotty in his ear caused the great husky to exert himself to the utmost. He felt his responsibility and none disputed his leadership.

The 70-pound sled which the dogs dragged became heavier and heavier as the fast tryouts became longer. Some mornings Scotty drove them 50 miles and toward the end of the run he would stand on the runners instead of trotting behind. The dogs were making from eight to ten miles an hour and it was hard for a man to keep up this pace, even by holding to the sled handles. It seemed that Baldy's teammates traveled all too slow. Yet the whip of the kind-voiced Scotty never fell upon them.



Then came the day of the race. The dogs were lined up, marked and photographed. As every entrant had to bring back the dogs with which he started, this precaution was taken to make sure that no fresh dogs were picked up along the line.

Fourteen entrants waited the crack of the pistol. It took some time to photograph all the teams. Although Scotty had tried to keep the performance of his team secret, the betting was in his favor.

A stiff breeze was blowing off the Bering Sea. The racer knew that a blizzard was at hand. In his heart he felt that it would be impossible to make headway in an Arctic blizzard, yet the races could not be called off. Although the boom days of the Klondike had faded, Nome was still the greatest metropolis of Western Alaska and thousands of people had thronged there for the races. To disappoint these people would not do.

A pistol cracked and his team was off, Baldy leading bravely. It was smooth going on the ice for a while. Sleet and snow then began to beat into the faces of the contestants. The route led up the coast for 47 miles, after which the teams would have to hit into the mountains where snowshoes would be needed.

The blizzard increased in intensity. Scotty could barely see his lead dog. Baldy was facing the blinding gale with shoulders squared and head down. The dogs knew that somehow, something had lightened their load. Scotty had sprung a surprise by producing a sled that weighed only 30 pounds as against the conventional 70-pound vehicle. They appreciated the lighter load by the way they responded to the whip that cracked over their heads but never stung them on the flanks. The advantage put heart into the malemutes.

Baldy of Nome, with Scotty Allan and the malemute's sled.

The roaring storm bore down upon them. Baldy was invisible. Scotty could barely see his wheel dogs. Phantom sleds passed by, indicating that the larger teams of dogs were making faster time against the gale. One by one they shot past and the Klondiker's heart sank.

Finally the gale became so bad that the dogs could barely crawl along. Scotty passed a big team that had given up. The drivers could not find their way in the intense gloom. A little farther on he passed another large outfit.

"I'll have to stop any minute," he thought.

But Baldy kept going on, confidently, without deviating from his course. Something of this certainty was conveyed to Scotty. They passed the last of the racers and had the field all to themselves. Baldy had been over this trail some time before and he never forgot a route over which he had once traveled. The lead dog knew where he was going.

Along the 47 miles of coast, through the soft snow and over jutting ice crags inland to the edge of the timber belt, the skill of the sled dog carried Scotty's sleigh. Scotty rested here for five hours, nursing the feet of his malemutes and regaining lost strength.

Forty-two hours had elapsed when Baldy made his victorious entry into Candle, on the Arctic slope. None of the other teams were in sight. Some time later Scotty's second team also came into Candle, having followed the trail broken by the lion-hearted lead dog. The return trip to Nome was much easier. It was a triumphal entry indeed. A blaring band and a shouting populace greeted the victors. Baldy was a hero. The winners came in 10 hours ahead of the second team.

Allan first saw Baldy when he was a pup, 14 months old. The intelligent eye, fine symmetry of the animal and the broad shoulders told him that here was a fine husky and he bought the dog. He was neither malemute nor husky in the strictest sense of the word. A malemute is the shaggy, wolf-like animal domesticated by the Eskimos. The husky is an Alaskan dog. Baldy had a malemute mother and a foxhound for a father.

It was in 1908 that Scotty bought him. He, together with other prominent men of Nome, had organized the Nome Kennel Club for the purpose of staging the big 400-mile races. These contests later became classic events.

There had been races weekly in Nome for years but never anything so momentous. In those days the sled driver from the Arctic regions was regarded with great interest and was indeed quite a hero.

Scotty began to groom Baldy for the leadership after he had taken second in the first race. Secretly he began work on a light sledge. By using second-growth hickory and rawhide thongs for binding the parts together, he attained elasticity without sacrificing strength. He organized two teams for the 1909 race, resolved to win with at least one. He did not anticipate taking both major prizes, $8,000 for the first and $2,000 for the second.

One of the reasons for the stipulation that each man must bring back the dogs he started with, was to thwart anyone who proposed to drive dogs cruelly, cutting out the exhausted ones from his string. This rule was made for the second race. It eliminated the advantage to the owner of big teams. The wise old heads of the game ran with as few dogs as possible. If a dog was clipped early in the race it was necessary to load him onto the sled and carry him to the Arctic slope and back.

After the 1909 race in which Baldy won so handsomely, the prize dog was victor in a large number of shorter contests. He seemed to be an ideal leader. In 1910 Scotty's team made but third place. However, he came back in 1911 and 1912 as victor again. In all the contests, Baldy never ran out of the money. He always won either first, second or third prize.

There were many stronger, larger and faster dogs than Baldy but none with his endurance and heart of oak. In the fall of 1915, Allan went to France to take 440 dogs to the Alpine Chasseurs to haul ammunition up the Alps. During the time that he was selecting these dogs from all the Arctic north, Allan inspected thousands of malemutes and huskies but he found none so intelligent and so courageous as Baldy.

Scotty also supplied V. Stefansson with 80 dogs for an Arctic expedition. The Klondiker sizes up a dog and passes his judgment on it by looking at the eyes, the feet, the character of the muzzle and above all the breadth of shoulders. Dogs that have been utilized for pulling sleds are overdeveloped in the chest, while their hindquarters are underdeveloped It is in the hindquarters that the husky first succumbs either to fatigue or disease.

"Common-sense methods must be used in training dogs," says Scotty. "You must show appreciation of work well done. You must never ask an animal to do an impossible thing but once you have demanded a reasonable task of it, you must insist upon its accomplishment. Once a husky or a malemute gets the better of you, you have lost your authority.

"Outlaws in a dog pack are known only in fiction. A man can conquer any animal and make him obey. I have never known a case when the dogs would fight among themselves in harness if properly trained and handled."

While Scotty was in France, Baldy remained at Nome. He made no friends but wandered about disconsolately, eating little.

Baldy's last long trek was made from Nome to Juneau, a distance of 1,300 miles, in 1917, after Scotty returned from France. The journey was the longest Mr. Allan ever attempted with a team of huskies.

Baldy was a one-man dog. He never knew any master except Scotty Allan. He obeyed no other voice. He would take food from no other hand.

Where Official Spotlight Misses the Real Actors

Little Known Men in Uncle Sam's Machine Perform Important Work

By J. H. WALTON

THERE has been a demand for "successful" business men in government service. One writer recently said:

"We find here and there men of large ability in governmental office. Our Presidents have mostly been able men and their cabinets have as a whole been well above the average. But when we get into Congress or into the departments of the government we find that the service is more apt to be to the job than to the people."

That statement is far too sweeping and does the real workers in the government service an injustice. Men devoting themselves to the service of the government in lines of special training, go through life without proper recognition or compensation.

It is true that the department and bureau heads, changed with each administration, ofttimes are prone to play politics at the expense of public service. Nevertheless, there is a tremendous amount of work that MUST be done.

A new secretary, appointed by a new President, must have the efficient, well-trained staff of WORKERS who have built up these various bureaus and divisions to look to do the actual work. These workers often leave the service of the country to accept private employment in similar lines at greatly increased compensation. Such men and women are worth even more to the government than they are to the private employer. We should keep them.

There are little known men and women who are "successful." There is not a millionaire among them. They are OUR employes. They work for US. Do we appreciate and understand what they are doing for us?

EARL B. SMITH

IN 1914 the Bureau of Public Roads brought to Washington Earl B. Smith, at that time engaged in testing and investigation work in Philadelphia, Pennsylvania, where he was employed as erecting and testing engineer for the Philadelphia Rapid Transit Company. Mr. Smith has had extensive experience in mechanical engineering and was for nine years assistant professor in charge of the mechanical, hydraulic and strength of materials engineering laboratories at Drexel Institute in Philadelphia. He graduated from the University of Missouri in 1903 with degree of B.S. in mechanical engineering, and in 1905 received the degree of mechanical engineer.

Mr. Smith is now in charge of one of the most important activities of the bureau, the research section. This section conducts all investigations relative to the design of roads and pavements. The major portion of this work is carried on at the experiment station, Arlington, Virginia, shown in the illustration. Many of the instruments and machines used for this particular line of investigation are designed by Mr. Smith and constructed under his personal direction, the latest of which is a photographic impact strain gage, used to determine the impact stress caused by a truck passing over a bridge, or any other compression or tension brought to bear on bridges.

This instrument consists of a metal box about 16 inches long and four inches square in cross-sections. At one end of the box is fixed a conical gage point. At the other end is a similar gage point carried on a rugged pivot, and this movable gage point acts as a lever to operate a very small mirror. Mountings for this mirror are very small and light and have very little inertia. From a small electric lamp contained in an apartment in the box, a beam of light passes through a lens and is focused on the small mirror which in turn reflects the beam of light to a moving photographic film. Any movement of the movable gage point is multiplied 500 to 1,000 times by a corresponding movement of the mirror. The movement thus multiplied is recorded on the photographic film, the latter being operated by means of a small electric motor in one end of the box. As there has as yet been no published description of the instrument nor any drawings or photographs prepared for publication it is impossible to give further details.

"One of our most interesting experiments," said Mr. Smith, speaking of the work being conducted at the Arlington Station, "is that to determine the extent of vertical movements of concrete slabs. The edges of such slabs have been found to curl up and down, depending upon the relative temperatures of their upper and lower surfaces. When the top surface is warmed the edges move downward; when the top surface cools the movement is in the opposite direction. We find that the motion is so responsive to the warmth of the sun that it is possible almost instantly to detect the effect of a passing cloud. The extreme movement observed thus far is about two-tenths of an inch."

In the illustration shown herewith may be seen a device for indicating the extent of the warping of these slabs. The instrument is regulated so that it registers the movement on a ratio of 10 to 1.

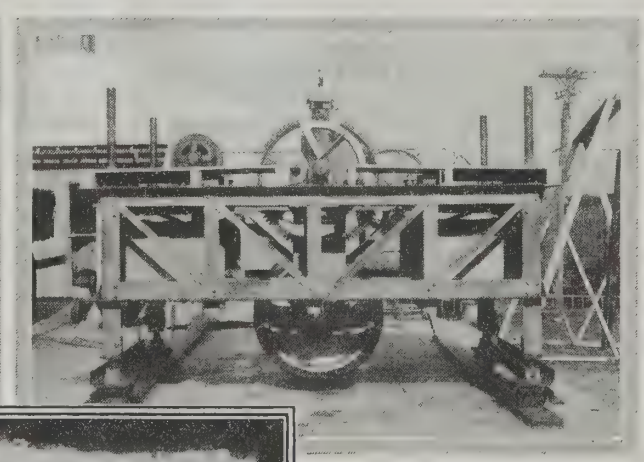
To determine the effect of impact forces on roads of different types and of different supporting strengths, Mr. Smith has designed a portable impact machine which, in action, simulates that of a motor truck. The accompanying figure shows the construction and principles of this machine. It consists essentially of a motor truck wheel which is carried on a heavy supporting frame, which in turn is carried on a heavy truck spring. This constitutes the unsprung weight and it is operated in a vertical motion by means of cams carried on the outside supporting angle-iron frame. The height of drop of the truck wheel may be regulated from 0 to about 6, and from 6 to 10 drops per minute may be obtained. The value of the spring pressure may be varied, and also the total value of the unsprung weight may be changed by the addition of suitable weights. Impacts may be obtained varying in value from 0 to that of a ten-ton truck. In use, this machine is mounted over a particular road surface or test slab to which impact forces are to be applied. The test is made by allowing the unsprung weight to fall a height of one-eighth of an inch 500 times, then raising it three-eighths of an inch more, and allowing the unsprung weight to fall a height of one-half inch for another 500 blows, and so on, increasing the height of fall three-eighths of an inch each time until failure occurs. Careful measurements of the settlement of the slab are taken after each 250 blows. This permits of the drawing of a curve showing the settlement of the slab, due to the different impact forces applied.

"We have constructed a series of 120 slabs," continued Mr. Smith. "These slabs are seven feet square and represent different types of construction, including plain concrete slabs varying in thickness from two to eight inches, and brick pavement construction on concrete bases of different thicknesses. The testing apparatus may be so operated as to reproduce the different loading and equipment conditions of a large variety of trucks. The slabs are hammered by means of this machine in the center, on the corners, and on the sides so as to obtain the relative strength under these different conditions."

The bureau, as well as private engineering concerns, has long felt the need of some means of determining the actual force of impact in pounds. When the truck wheel pounds down on the slab it simulates the action of a truck traveling over a road when it passes over such surface irregularities as waves, pot holes and joints. It has been impossible heretofore to determine with any reasonable degree of accuracy the actual force of this impact in pounds.

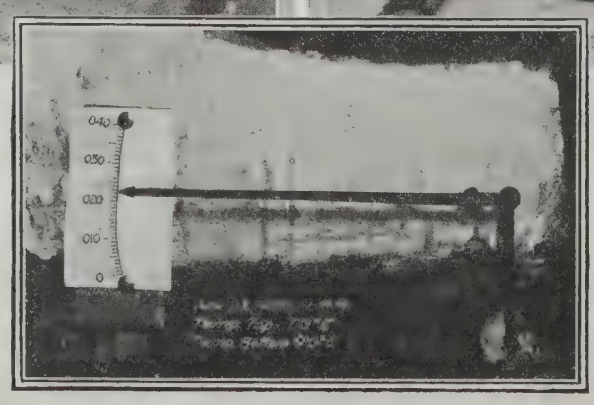
Mr. Smith has designed a delicate instrument to be used for this purpose called the decelerometer. It can be fitted to a truck wheel, a pile-driving hammer or any place where it is desired to determine the actual force of impact. "This little instrument is a great help to us in our experimental work," said Mr. Smith. "We can determine, with the aid of the decelerometer, whether the blow delivered is 10 pounds or 10,000 pounds, with an error of less than five per cent."

Another device used extensively by the bureau in connection with the experimental work is a soil-pressure cell which was designed by Mr. Smith. It has several uses, the principal ones being: 1—the determination of the distribution of concentrated loads through sand fills; 2—the measurement of pressure of concrete against forms; 3—the measurement of the pressures transmitted through road surfaces to subgrades; and 4—the measurement of pressures exerted upon retaining walls.



The measurement of pressures transmitted through granular materials has always been a difficult one, primarily due to the fact that the measuring instrument must be capable of indicating such pressures with but an infinitesimal movement of the instrument itself. The slightest motion of the weighing face disturbs the soil so that the pressure originally existing may be changed considerably at the instant the measurement is made. Any instrument to be successful for this purpose must be capable of measuring pressures with practically no motion and the soil-pressure cell designed by Mr. Smith fulfills this requirement.

"The results of test have convinced the officials of the bureau that the instrument gives thoroughly reliable results in granular materials, such as densely compacted sand, as well as in liquids and semi-liquids. It has also been demonstrated that it is sufficiently rugged to withstand field conditions and it might very readily be applied to obtain useful data on many types of construction," says Mr. Smith.



These are a few of the important instruments and machines Mr. Smith has developed. Can we not truthfully say that he is a "success"? I believe so!

Experimental section at Arlington, Va., where tests are made.

Portable road impact machine, designed by Mr. Smith.

Device for indicating warping of road slabs due to temperature changes.

Temple One Man Dreamed, One Other Built

All Architectures But No Architects Used in California Church

By JOHN L. VON BLON

AT THE foot of Mt. Wilson, on whose summit the world's greatest telescope reveals to mortal knowledge more and more of that which was believed to be the infinite, has been completed one of the most modern and distinctive of all houses of worship. It is Bethany Temple, interdenominational, in the picturesque little city of Sierra Madre, nestled against the mountains of the same name 20 miles north of Los Angeles.

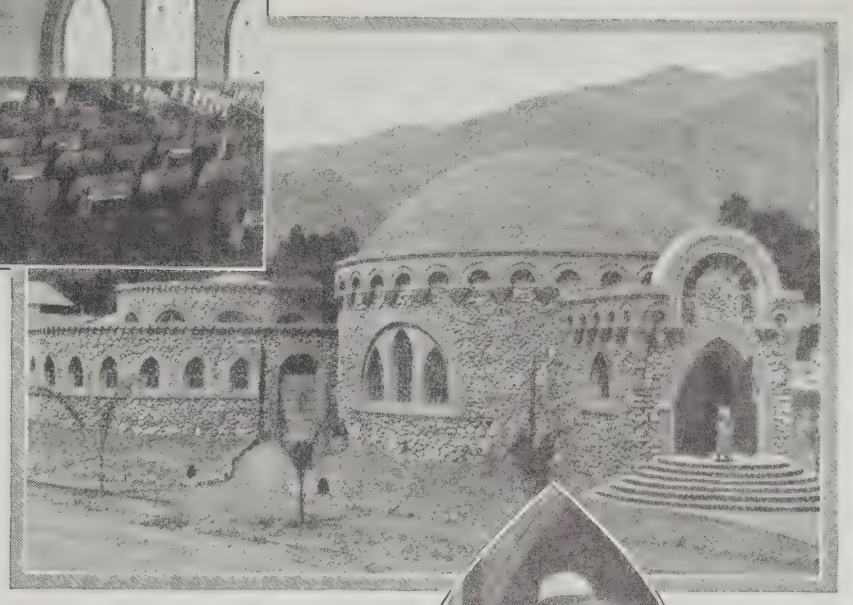
With its sister Christian institutions of Southern California it seeks to augment the spiritual vision as the telescope has enlarged the physical. But, unlike so many others, Bethany is not prosaic. Its brief history is amazing—a story remaining untold because men who achieve such marvels as this sacred edifice are modest and shout not from the housetops of their works. It is an inspired sermon on faith writ in granite.

Auditorium of Bethany Temple, showing rostrum.

Up and down the earth as he went about preaching and teaching the Scriptures, an evangelist studied wayside sanctuaries and grand cathedrals, the while formulating his own ideal and dreaming of the time when he should be regularly conducting services in such a place. That minister was the Rev. Dr. William Henry Rawlings, LL.D., of England. Bethany Temple is his ideal realized, his dream come true. It is his conception, he its pastor. While it embodies the good features found elsewhere, the whole is strikingly original. It is not a copy in any part.

One man—L. D. Cornuelle, of Sierra Madre, a zealous member of the organization, personally placed virtually every bit of material employed, including the more than a thousand tons of rock and cement; and he designed as he went forward, carrying out the minister's suggestions, supplementing with his own, and using only his crude pencil preliminary sketch—no blueprints, no working plans, no specifications of any sort. He makes no pretense to being an architect or a mason, but is merely an ordinary carpenter. But for Mr. Cornuelle, who went to California from Cincinnati a number of years ago, there would be no Bethany Temple today. His labor of love, to which he devoted a year and eight months with a single helper, speaks eloquently. He reared not to make money but to do good.

Mr. Cornuelle's assistant was a worker, too. He made on the spot every concrete brick and hauled to the place all the cement and stones—the latter rolled down from the heights by mountain torrents, polished in the process and deposited in near-by washes. The sand required, of the finest quality, was scooped up in excavating for the basement.



In lieu of the extensive and expensive scaffolding, an old spring wagon was pressed into extraordinary service. And the baptistry, unique as anything else about the "church that's all different," is beneath the pulpit, convenient when needed and out of sight when not in use.

The beginning was made a little more than three years ago. Nobody was asked to become a member or to contribute and no indebtedness was incurred. Thus, as announced in large letters of black concrete set in the gray of the approach, was "Built by Faith in the Living God" a church home that could not be duplicated for less than $50,000; and the adjoining lot has been purchased and a $10,000 parsonage in keeping with the group soon will be under way.

Bethany Temple is a combination of old Greek and Norman architecture, with every late adaptation for comfort. The Greek synagogues, always round, had a peculiarly strong appeal for Dr. Rawlings, as is here manifested. The imposing main entrance, square and charmingly inviting with its spacious vestibule, was inspired by the sixteenth century Palacio das Cortes, monastic, in Lisbon, as were the heavy outer cathedral doors, all iron-studded. The doors and windows throughout are Gothic, the former solid oak and the latter ecclesiastical in that each is a trinity. In the Orient, Dr. Rawlings was also impressed, as is evidenced by the touches throughout. Most notable is the huge, mosque-like dome reminiscent of India, an entrancing silhouette against the lofty purple background at sunset.

There are two connected circular main buildings. Principal is the temple proper, 52 feet in diameter, walls 22 feet to the roof with eight feet cove, making a height of 30 feet. The other is the rotunda Sunday school hall, 57 feet in diameter and 18 feet to the roof, with 16-inch cove. The temple walls are 18 inches thick and those of the rotunda a foot. They are really concrete, with practically the granite only facing, though deeply imbedded and tied to stand indefinitely. No broken rock is used for filling between the small bowlders.

The old wagon played its important part right here. Mr. Cornuelle was determined to eliminate extravagance and waste and figured in terms of pennies. He devised an astonishing economizer. He laid the walls as high as he conveniently could from the ground. Then he fetched the vehicle, made a light, simple portable wooden track in two sections to carry it, and ran the wagon around, putting up the masonry from it. Next came a small scaffold on the rig, from which another five-foot tier was laid; and so progress continued at a satisfactory rate until two more platforms had been superimposed and the job finished. Then the wagon was sold for $5, which forthwith went into the building fund! The scheme isn't patented.

Bethany Temple at Sierra Madre, Calif., in the foreground with rotunda; Sunday school hall to its left.

L. D. CORNUELLE, whose hands, with those of one assistant, built the temple, without aid of plans or blueprints.

DR. WILLIAM HENRY RAWLINGS, whose dream of an ideal house of worship came true.

Similar ingenuity was shown in other directions. When he came to the rostrum arch, in the temple, Mr. Cornuelle discovered that to conform to the general shape it must be curved outward toward the center of the ceiling at the top, 22 inches off plumb. Now anybody knows that a "leaning" arch with a 20-foot span and a heavy weight to support would be dangerously weak. The wise ones insisted that the canny builder was stumped. He smiled and didn't argue. He simply put in an arch from the rear to intersect the other at the center, providing an attractive half-domed alcove for the choir and at the same time making this one of the strongest parts of the structure. The principle is that of the three-legged stool, aptly applied in a new way.

The baptistry, directly under the rostrum, is connected with two dressing rooms, for men and women, respectively, by separate cement stairways. Candidates do not go in or out through the auditorium and the congregation cannot see them except during the rites. They step down the stairs, gradually enter the lukewarm font and move to the center, where the minister conducts the services. The chancel curtains are drawn aside and the baptistry is revealed on the floor level, the heads and shoulders of the candidates visible to the audience. All this innovation is made possible from the fact that the front third of the rostrum floor is easily removable, two men shifting it aside with ease in a minute or two and as readily replacing it.

The temple, seating 300 and utilized for general services, is illuminated from 30 semi-circular niches extending all the way around just below the ceiling, giving, with the stained-glass windows, a pleasing effect by day or by night. These niches are all practical ventilators, invisible flues from the floor to brick shutters which constitute the ornamentation of the cornice. This arrangement has attracted the attention of experts. The air in the temple changes constantly. Heating, when necessary, is by gas radiators connected with the same flues.

There is neither post, pillar nor column in the interior to interfere with seating, view or hearing. Such are the acoustic properties that every word spoken in ordinary conversational tone from the rostrum can be clearly understood in any pew. There is no obstruction and no variation, sound being as evenly distributed as air.

The rotunda Sunday school hall, in which prayer meetings and Bible gatherings are held, is 30 feet in diameter and surrounded by 10 classrooms, the pastor's vestry, a well-appointed kitchen for the benefit of social affairs, and other facilities. Each classroom is open to the center. The wide interior span is supported by a series of 12 arches carried from piers two and a half feet thick, steel re-enforced. Every pier has a flue reaching above the roof to carry out vitiated air or for connection with a heater. For day lighting there are a dozen colored-glass windows in arches of five feet, half-circle radius, concealing electric globes for night use. The rotunda wall extends eight feet above the classrooms. In this hall, as well as in the temple, there is no woodwork, mold and floors being of concrete. There is no fire hazard.

The temple dome alone is of wood, supported by two scissors trusses crossing each other. It is 50 feet across. The rafters were not sawed but bent to form, and each is composed of three one-by-three's nailed together after shaping. One of these staunch rafters is placed every two feet. The dome is covered with asbestos paper, coated with lead, and sanded to match the concrete and stone.

Notice of the art world has been attracted with the result that appropriate decorative treatment of a high order is assured. In the semi-circular pulpit alcove Leonard Borman, Sierra Madre mural artist, will portray the Annunciation—the text "Glory to God in the Highest" outstanding over the soft-tinted setting of the birth of the Christ.

Born in Norfolk but recognized as a Londoner, Dr. Rawlings was educated and ordained at Oxford and has had a broad, active career. With the late Dwight L. Moody, in his day the foremost of evangelists, he preached in nearly every country, and was associated in similar endeavor with the late Lord Redstock. In the Metropolitan, London, he had a congregation of 5,000 and other thousands heard him in Edinburgh Castle. He was rector of West London Tabernacle, was responsible for Farnbrook Tabernacle, and built Mytchett Tabernacle and Cove Chapel. In addition he is author of many theological works and founder of the London *Vanguard* and the *Gospel Witness*. During the war the clergyman worked among British soldiers, looking after the spiritual welfare of thousands, always in close touch with his friend, Marshal Haig. In 1918 he broke down from the nervous strain and came to America and Southern California. A little more than three years ago, at the solicitation of the Los Angeles Bible Institute and request of a number of Sierra Madre people, he went there. A Bible reading and other meetings followed. Dr. and Mrs. Rawlings remained and the religious planting bore fruit—which is Bethany Temple.

"Welcome" is the word on the entrance step of the temple, which always is open to those seeking quiet and rest and prayer. It has become a tourist objective.

This is the story of the granite pile built up from an old spring wagon—conceived by one man and created by another.

From Wheelbarrow to Parliament to Prison

Or the Rise and Fall of Horatio Bottomley, Publisher of "John Bull"; Golden Idol of the Middle Class Talked Beer, But Drank Champagne

By an English Journalist

HORATIO BOTTOMLEY, under sentence of seven years' penal servitude for "converting" trust funds to his own uses and who is appealing against the sentence to the Court of Criminal Appeal, is one of the most remarkable personalities in English public life. We have had our share of notorious offenders who cut a large figure on the national stage owing to the scale of their depredations, the magnificence of their living or the special methods of their crookedness. Such were Whitaker Wright, who 20 years ago committed suicide by taking poison immediately after sentence had been passed on him—the court and police authorities, by the way, have taken and are taking special precautions lest Bottomley should try to follow that example; Jabez Balfour, of the "Liberator" frauds, who ruined many guileless families in the Wesleyan Methodist Connexion; and E. T. Hooley, who is now in prison.

But Bottomley is different. He has been for some years a truly national figure. He has had a greater personal "public" than any single man in this country except Lloyd George. He, the prisoner with a seven years' sentence, won the reputation with masses of English men and English women of being the watchdog of public honesty, and accordingly they intrusted him with many hundreds of thousands of pounds of money.

The Gullible Public

EVEN during the early stages of his recent trial there was always a crowd about the doors of the court to welcome "Good old Bottomley." Some said he paid the crowd, but the suspicion was unnecessary. He is the supreme instance in our history of capacity to gull the English public and of the illimitable capacity of the public to be gulled. For the exposure of his previous misdoings was without effect. The public memory was short and generous and he traded on the fact. He had more lives, in this sense, than the proverbial cat and he clearly does not believe that his career is even yet at an end. To a newspaperman who has interviewed him in prison he said with characteristic unctuousness "I have things yet to do for my country," and it would be rash to say that even now, were he released, he would be unable to find a certain public credulous enough to trust him.

Bottomley's career has fallen into certain distinct periods. He began life in a humble way, pushing a street barrow, it is said. Thence he went into the printing trade but found his first congenial province in company-promoting. He was associated with a long line of companies which, one after another, went into voluntary liquidation. The failure of one seemed to be no barrier to the obtaining of more capital for the next, and when finally this stage of Bottomley's life came to an end the capital which had been subscribed by the public to these highly unfortunate companies is said to have been 18,000,000 pounds sterling. As early as 1893 he had been accused in courts of conspiracy to defraud but was acquitted. In 1906 he was declared by one of the judges of the high court to have been guilty of a breach of trust. He was twice adjudged bankrupt (the second time in 1912). In almost all legal proceedings he was his own counsel.

In law, Bottomley was not a particularly brilliant advocate. He knew the passions and prejudices on which he played, but that was about all. He sometimes obtained real legal assistance in the preparation of cases, in which he cornered the limelight of court advocacy. But all in all he was not very efficient, although he sometimes got the credit for efficiency. On his first appearance in court for his own defense he had been complimented by Mr. Justice Hawkins on his ability. When Mr. Justice Salter sentenced him to seven years' imprisonment, he, too, referred to the skill which he had shown as advocate.

A Race-Track Devotee

WHEN Bottomley's company-promoting ended in bankruptcy in 1906 he forsook the financial operations of "the City" and became the editor and chief writer in the weekly paper, *John Bull*. He not only edited and wrote in this paper; he *was* "John Bull" and his personality soon acquired for it a very large circulation. He had various qualities which have always appealed to the masses of the English people, and others he simulated. He shared, or affected to share, their tastes and prejudices. As has been said of him, *he talked beer though he drank champagne*. He was a devotee of the turf, a sport which has deep roots in the English race, and he could speak with authority, for he owned and ran horses.

In his paper he was always the bluff, outspoken, and strong man seeking to expose wrong and protect the simple and weak against the crookedness of an evil world. And this went down very well, even before the war. "Have you seen what *John Bull* says about it?" was a frequent question when there was scent of some new scandal. When the war came, it was an opportunity for the honest *John Bull*, personified in Bottomley, to help his brothers through the great ordeal. He made the most of it and asked for their confidence first and their money afterward. He got both, too, in abundant measure.

Bottomley was super-patriotic. He helped the recruiting cause with religious fervor, speaking continually all over the country and filling the largest halls with ease. He wrote in his paper in the pontifical style which with a certain public passes for authority and knowledge. He would write: "I give Mr. Asquith seven days" to carry out some *John Bull* policy, and on another occasion, "I heard a voice from Heaven saying to me, 'write!'" In the days of a great war there is mismanagement in plenty and there is always, and with a certain amount of popular ground, suspicion of the fumbling and inefficiency of those in authority, the politicians and, still more, the lawyer-politicians.

The men in the trenches and their families at home were ready enough with criticism of the blunders they knew of and the others they suspected. It was Bottomley's cue to exploit all the prevailing prejudices and suspicions to the utmost.

He did some useful work undoubtedly and the "dear lads" in the trenches, as he called them to the last, read *John Bull* freely and readily accepted Bottomley for the honest, blunt, business-man critic and guide that he proclaimed himself to be. After he had been sent to prison he asserted that Earl Haig had once asked him to "take the salute" when he paid one of his visits to the front. Certainly there was a feeling among masses of people that Bottomley, whatever his dubious past, had got hold of the stick by the right end in matters concerning the management of the war. He was in Parliament at the time and even succeeded in forming a little "Independent" party of his own. He wrote articles couched in the loftiest moral tone for the Sunday press and it was said that he was paid 250 pounds an article.

Patriotism for Revenue

BUT Bottomley could not long be satisfied with the pure milk of patriotism. He longed to be again at financial enterprises, rendered more exciting both for himself and for the British public which he knew so well by the spice of gambling which he introduced into his new ventures. He, therefore, devised a series of Bond clubs, War Loan, Victory Bond and Thrift Prize Bond clubs. His readers were invited to put their money into government securities with the chance also of drawing a prize. He cunningly played on the double inducement of patriotic service and the gambling instinct.

When the English law interfered with his operations as being a lottery, he transferred his dealings into French war bonds and at the same time the books of the clubs were transferred to Paris. More than 500,000 pounds sterling were subscribed and went into Bottomley's hands. He had the sole charge and control of the money; unfortunately for him the courts declared that he was in the position of a trustee and bound, therefore, by all the legal obligations of trusteeship, which are extremely strict and the violation of which is severely punishable in law. It is for the misappropriations of these funds that he has received his sentence of seven years.

It was only four years ago that Bottomley was in the heydey of his popularity. The King received him at Buckingham Palace, an event which was reported and commented upon in the press. He went to the front, and addressed the soldiers, being escorted from place to place by high ranking generals. He was invited by the government to address the munition workers at Glasgow. At the time of demobilization, when unrest was rife among the returned soldiers, Bottomley was called upon to save the day by addressing the malcontents, and induce them to follow the ways of peace.

A situation which was, indeed, curious occurred early in 1919 when Bottomley was asked to serve on the Court Martial Commission. This was presided over by Mr. Justice Darling who as judge had tried the case of Bottomley against Greaney, and had sat in two other court proceedings when the evidence was all unfavorable to the editor. Another prominent member of the Court Martial Commission was Lord Hugh Cecil, an aristocrat of the first water and one of the few leaders of British politics against whom almost nothing is said. At this period Bottomley claims to have been offered a privy councilorship.

The fatal error which Bottomley made seems to have been a criticism of Lord Alverstone, long Lord Chief Justice of England, after the latter's death. The article which stirred the deep resentment of Lord Alverstone's friends was published in 1921. It charged Lord Alverstone had been involved in a motor accident, and had ignored the claim of the poor victims for damages. The victims wrote Bottomley and he sought to get the Lord Chief Justice to make some settlement. An item of five pounds in the claim was denied by Lord Alverstone and paid by Bottomley, for which subsequently Bottomley received a check from the jurist. Bottomley, declaiming on Lord Alverstone's meanness, swore to keep the check uncashed, and later reproduced it. The particular incident which gave rise to the Alverstone article had happened years previous to 1921, and Bottomley claimed that a hostile charge given by Alverstone in a case against him (Bottomley) in a subsequent case, was due to this fight for the poor people. Bottomley's knowledge or suspicions regarding corruption in high places during the war, and his attack on Alverstone, occasioned general belief that he was planning similar assaults on the reputations of other prominent British statesmen, living and dead. Fear may have had a bit to do with the determination to prosecute Bottomley after these many years.

Framed Bogus Action

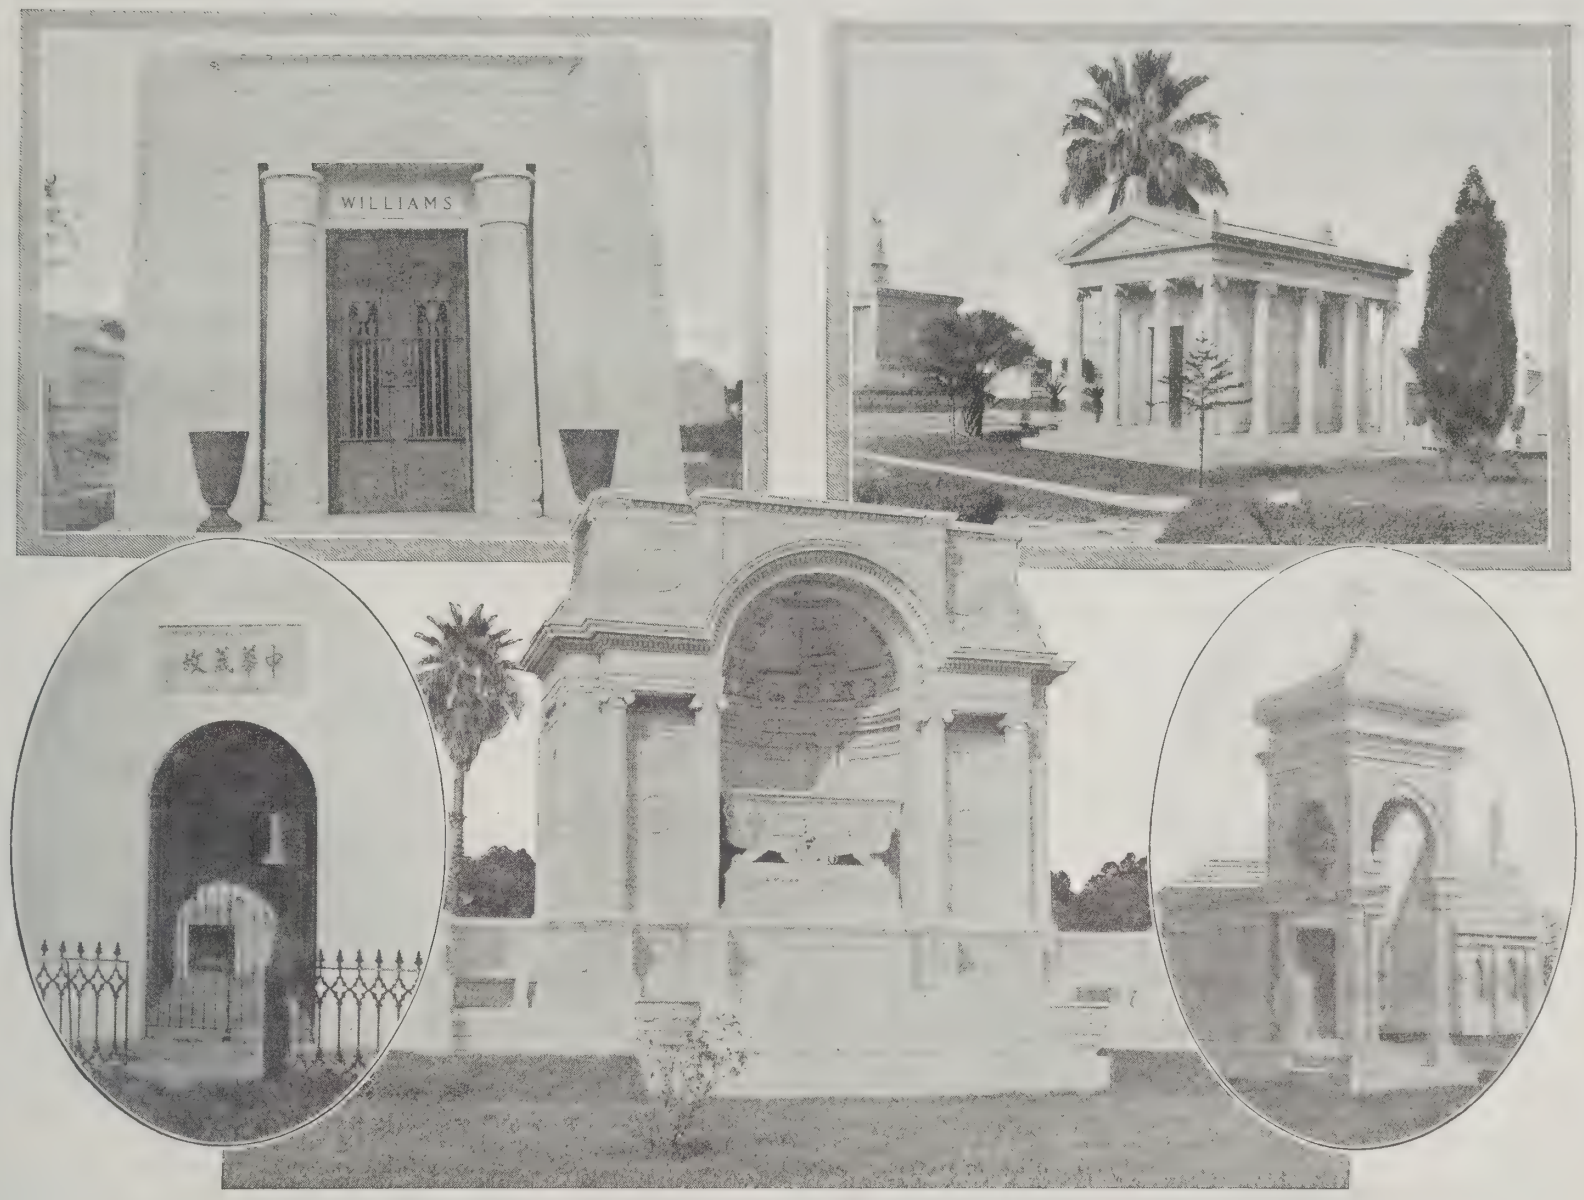
OTHER very serious charges had been made against him during recent court proceedings when he prosecuted for criminal libel one of his former assistants, Bigland. Bigland, who was acquitted, asserted that when an action was brought which might have proved that one of Bottomley's prize competitions was fraudulent, Bottomley induced him to bribe the principal witness to disappear from the case. Bottomley did not go into the witness box to deny this.

Bottomley brought suit against a man named Greaney, a suit which he prosecuted with the utmost seriousness. He charged the defendant with being the publisher of a pamphlet issued some time previously, entitled "Horatio Bottomley Exposed." Greaney humbly "confessed," and Bottomley magnanimously agreed to a nominal judgment of 500 pounds.

The fact of the matter was that the alleged libel for which Bottomley had sued, had been published by another person altogether. This publication was simply copied, Greaney's name placed upon it, and Greaney was sued in the bogus case. Subsequently Bigland testified that Bottomley had paid him to introduce Greaney, with whom for a consideration he framed the fake action. The purpose was to induce the public to believe that the original exposure was false. Bottomley, according to Bigland, paid the entire expenses of the case, and paid Greaney in addition for sitting in as dummy defendant.

Bottomley did not deny this accusation either. He had long proceeded on the principle that it was most profitable to ignore the charges made against him as much as possible. But the attacks of Bigland and journals like *Truth* (on which he served over a dozen writs for libel) finally drove him into the courts—a fatal step, for once he was in the courts the truth began to come out and he could not escape.

Middle Class Always



WHAT was the secret of Bottomley? He had considerable ability, he was a good speaker and he could furnish a plausible presentment of the bluff frank Englishman who is grateful to those who distrust cleverness and rhetoric in high places. He was a gambler and knew how much a "chance" appeals to the average man. Above all, he had colossal self-assurance, which was fairly justified. He had a tremendous belief in the short memory and the simple trustfulness of the public and was confident that by means of unlimited audacity and persistent indifference to exposure he could always find a great public that would accept him and his schemes.

No estimate of Bottomley is possible except for a person who understands the middle-class Briton. Bottomley was middle class. But *he also understood the middle-class Briton*. He understood the credulity, the cupidity, the ignorance, the prejudice, which animate his fellows. He had the enthusiasm of middle classism, for persecuting the unpopular, for assailing the minority. When pacifism was unpopular, Bottomley's inveighings were the bitterest; when a wave of fear and hatred for Mormonism swept the narrow confines of Britain, Bottomley was the loudest in denunciation; conscientious objectors, irresponsible persons who committed disgusting crimes, unnamed profits—these and countless others who could not defend themselves, he assailed with the wildest vituperation.

No one ever had so profound a contempt for the intelligence of the people, witness the smug hypocrisy of the interview that he gave in prison, which nevertheless, as he knows, may find a sympathetic audience. "It is only their kindness that wounds," said Bottomley of the prison officials, who "kept their eyes averted" because "they did not want to look on me and my misery." Bottomley is "fortified by the faith that he will regain the paradise of honor and love in the public mind." He has done too much injury to wish that he had the chance again.

Ornate Cemetery Where Horses Once Raced

Pique Over Club Affront Gave New Orleans Place for Handsome Tombs

Examples of architecture in various New Orleans cemeteries, famed for the handsomely designed tombs. Egyptian, Roman, Renaissance, Chinese and Gothic are among the designs borrowed from.

By FRANK LAWRASON

CURIOSITY, springing from a variety of causes, sends thousands of tourists annually to visit the famous tombs of New Orleans. Some are drawn by the desire to study the quaint architecture, borrowed from all periods of history. But more have their interest aroused by the story of the impulse that caused the laying out of the newest and handsomest of all the city's cemeteries.

Metairie Cemetery is famed throughout the studious portion of the world for the tombs of Egyptian, Greek, Renaissance and Mooresque types. But idle curiosity is more easily stirred by the fact that this ornate burying ground owes its existence to the fact that a certain little group of rich men, who once ran the famous Louisiana Lottery, were denied membership to Jockey Club. The cemetery is built on a plan that follows the curve of a half-mile track where the great horses of the decade following the Civil War battled for supremacy.

There are many unusual tombs in this cemetery, but none more so than a small replica of the main hall of an Irish Castle. Here, too, is the quaintly designed tomb of the Chinese, officially known as Cypress Grove No. 1, but always called "The Firemen's Cemetery."

In the years following the war when there was enough recovery from its effects to give the people leisure for sports, the Metairie Jockey Club established its track on the outskirts of the city. It was the gathering place for sportsmen from all over the South and occasionally horses were brought from the East to compete for the heavy purses. While admittance to the races was in no way limited, admission to the jockey club was a wholly different matter.

The Orleanians who operated the Louisiana Lottery were the wealthiest, the most powerful politically, and the most prominent socially in the city, though their number included some who never attained any great general popularity. The lottery itself was so conducted that no question of the honesty of its drawings was ever raised, despite the fact that from its first day it had strong opposition. One of the men directly concerned in its operation suggested to members of the Metairie Jockey Club that he would appreciate election to the club. The answer was not to his liking. While not generally popular, he had so many good qualities that his friends were as brothers.

The rejected citizen gathered his friends together and they made an agreement to turn the Metairie Race Track into a cemetery. Whenever a share of stock was for sale, they bought it. When they had a majority, about 40 years ago, they organized the present Metairie Cemetery Association, wrecked the race track and erected their family tombs in the new burial ground. All that is left of the famous race track, where Lexington and Lecompte fought out the great match race of the past generation, is the curves that suggest it.

The Metairie is the newest of the New Orleans cemeteries and perhaps for that reason attracts most attention from visitors. It is immediately across a road from the country club golf links. Near by are others as interesting to persons who care to walk through them. "Cypress Grove No. 1," the Firemen's Cemetery, with its many handsome tombs is the best known of these.

Guests of the New Orleans Country Club who go to play on the golf links hardly ever fail to become interested in Metairie, which is just across the road from the links. Having seen it, their interest in New Orleans cemeteries usually suggests a visit to the firemen's "Cypress Grove No. 1." There are thousands of persons in New Orleans who know this burial ground only as "the Firemen's" and some who identify it among the seven with entrances within 1,000 feet as "the one with the Chinese tomb."

In the almost forgotten days when the volunteer firemen's association was a powerful political force and some of its companies were social clubs, the association established this burial ground. But for the rejection of the lottery king's application for membership in the jockey club this and not the Metairie would be the chief center of interest in the vicinity. While all creeds are represented in the Christian cemeteries of New Orleans, only one of them has a Chinese tomb and that is the Firemen's.

The Chinese do not bury their dead in foreign countries as do the other residents. Their tomb is a temporary resting place for bodies that are sent to China at regular intervals. The interior of the tomb duplicates the form of tomb known as "the ovens," which name comes from the suggestion of the individual resting places to the closed doorways of the bakers' oven. The fireplace in the tomb is used to burn prayers written on red paper. The small chambers in which the dead Chinese rest for a while bear no names. They are merely numbered for identification. At the close of the brief ceremonies, a relative or a close friend of the departed hands each person present a piece of maple sugar and several coins, wrapped together in red paper.

An interesting detail of the cemeteries is the number of iron tombs. Built of pure metal, they last as long as stone and marble. Far down in the Belize, an abandoned settlement on the Mississippi River that was once the pilot's village, an iron tomb stands undamaged by the dampness despite the wreck wrought by dynamite when thieves sought the gold ornaments of men and women long dead.

Only the Jews in New Orleans have cemeteries restricted to persons of one religious faith. They are recognized at once by their fixed form of entrance, a small building with double doors. With this exception, no distinctions are made as to the faith of families who seek to buy plots for their family tombs. The Jews bury in the ground, as do a few Christians; but the raised tomb or a place in the tiers known locally as "the ovens" is the usual thing for an Orleanian. This preference of a majority of the Jews is a tradition from centuries when they were excluded from the Christian burial places. They are not excluded in New Orleans and have not been for at least two generations.

Orleanians do not look upon their cemeteries as some others do their churchyards. They visit them frequently in good weather. Iron chairs and benches are provided for the older members of the family.

BRIEFLY TOLD

In 60 years Negroes in the United States have acquired 22,000,000 acres of land, as working farmers, and not as speculators. They own 600,000 homes and 45,000 churches and operate 78 banks, 100 insurance companies, besides 70,000 business enterprises of various kinds, with a capital of $150,000,000. Illiteracy has been reduced to 26 per cent, due to the fact that there are more than 400 normal schools and colleges for Negro teachers.

Savannah, Georgia, lays claim to the youngest woman—or girl—lawyer in the United States. She has just passed her seventeenth birthday and but recently passed the state bar examination and was admitted to practice. Under the laws of Georgia there is no age limit for persons admitted to the practice of law.

The alleged sale of titles and honors is being discussed by the British House of Commons. For a long time Lloyd George has been charged with exchanging titles for large contributions to party funds.

New York City has formed a "Welcome Stranger Committee," to assist visitors in seeing the city and to dispel the rumor that the metropolis is reserved and cold toward newcomers.

One of the largest men alive recently left Hungary for his fatherland, Siberia, to assist his parents in farm work. He is 34 years of age, nine feet three inches tall and weighs 458 pounds. He consumes more than four times as much food as the average person.

A new invention in the shape of an electric bundle tier has just appeared that will speed up parcel departments. The machine ties a strong square knot, cuts the cord and throws the bundle to one side.

The cast-off horns of deer, elk and moose which annually fall off are gathered in the forests of the Northwest and manufactured into napkin rings, umbrella and knife handles.

Ladybugs congregate after the first frost in the Rocky Mountains, entering rocky crevasses where they become dormant. The bugs are then gathered and put into boxes until early spring, when they are sold to orchardists to prey upon aphis and other plant life.

A new anti-bandit gun weighs nine and one-half pounds. It fires 1,000 shells a minute and has an accurate range of 1,500 feet.

A new airplane muffler has been perfected in Europe which does not reduce the efficiency of the motor. Silent flying has now become a fact after 18 years of effort by engineers.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

The director of the mint has been authorized to coin one hundred thousand 50-cent pieces in commemoration of the 100th anniversary of the birth of President Rutherford B. Hayes.

Orange groves in California are protected from the frosts by operating large fans on 20-foot towers.

Plastic wood is a collodion preparation made with very fine wood meal and of the consistency of putty. It is claimed to be waterproof, will set hard and can be turned with a lathe. Nails can be driven into the dried material without cracking it.

The Canton Christian College of South China is importing American domestic animals and numerous plants and fruit and nut trees in an effort to improve the agricultural situation in that section.

Boston has the largest pier in the world devoted exclusively to the fish business. It is 1,200 feet long, 300 feet wide, and is paved with brick and concrete in such a manner that it can be cleaned easily by flushing with water. It cost $3,000,000 and 80 vessels can discharge their cargoes at once.

The Bubonic plague which usually breaks out in China during June, made its appearance in April this year. Thousands in the interior districts have died.

What is believed to be the thickest seam of black coal discovered in the world is being exploited in Queensland, Australia. The seam is entirely free from clay bands and is 93 feet thick in places. The mine is 280 miles from the nearest seaport.

The sting of a bee caused the driver of an automobile near Cincinnati to lose control of the car with the result that it plunged over an eight-foot embankment and overturned, pinning its occupants underneath. One woman died.

A Nevada aviator, en route from Buffalo, New York, to Nome, Alaska, was forced to land at Niggerhead Flat, on Seven-mile River, 75 miles from Dawson, because of engine trouble. His airplane descended into the midst of a herd of caribou, one of which the aviator killed for food. The plane, partially wrecked, was abandoned, the aviator proceeding by steamer to Fairbanks.

The inhabitants of Gomera, one of the Canary Islands, use a system of whistling signals for conveying bits of news and information over considerable distances with great rapidity. According to reports this system dates back hundreds of years.

Several cities in Norway own and operate their film theaters and devote the profits to cultural enterprises for the people's enjoyment and benefit. Christiania's profit from this source for 1921 was $350,000 and this sum has been allotted to a studio building, a people's theater, a concert hall, a music pavilion and to the advancement of natural sciences.

At an auction sale President Harding's picture brought $46 against $26 for that of former President Wilson. The sale was held in Staunton, Virginia, the birthplace of Mr. Wilson.

The population of France is dwindling at the rate of 200,000 yearly.

Australian states are opening millions of acres to settlers. Victoria proposes to throw open 1,250,000 acres of northwestern land. At the same time railway extensions in progress in the state will make provision for 500 other farms. Queensland will open up 1,000,000 acres of crown land and construct the Dawson River irrigation works which will be one of the largest in the world.

Special delivery stamps in use in the United States are to be made in a new design which will substitute a motor cycle for the bicycle at present in the design.

Legacies amounting to 5,000,000 francs were left to various French scientific organizations by the will of the late Prince Albert of Monaco. Among them were the following: A million francs each to the French Academy of Science, the Academy of Medicine, the Institute of Paleontology in Paris and the Oceanographical Institute. A million francs was also left to the Oceanographical Museum at Monaco.

MAKE THIS YOUR JOB!

THE DEARBORN INDEPENDENT is your paper. It is published not for profit, but for service. You believe in this magazine and its aims—that's why you subscribed.

Has it ever occurred to you that your friends and neighbors, your business associates, your fellow workmen would also like to receive THE DEARBORN INDEPENDENT? The more readers we have, the greater is our influence and power for good. Urge them to subscribe. The local Ford dealer will gladly forward any subscriptions you obtain, or you can send them direct.

THE DEARBORN INDEPENDENT has established a name for itself as one of the most fearless, independent and progressive papers published. It should be read by everyone who believes in the maintenance of American institutions and their advancement along sound, progressive lines.

Money Standard Descends From Barbarian Fetish for Yellow Metal

By J. V. NASH

LAST summer I received in the mail one morning a copy of a beautifully illustrated periodical containing many interesting articles intended to "boost" the industries of Chicago. The magazine, it seemed, was published by a large downtown bank, through its publicity department, headed by a well-known local advertising man. My attention was particularly arrested by a statement of the purposes which it was stated the magazine was working to achieve. Prominent among these purposes was, so it said, the establishment of habits of Thrift, "as one of the most important lessons taught by the war."

Now, I happened to know that the bank which was financing this house organ made a specialty of underwriting industrial and commercial enterprises. In the circumstances, I could not but wonder how a bank with such a clientele could benefit itself or its customers by crying up the desirability of "thrift," the ultimate result of which would be to curtail demand for the products of the enterprises which it was financing.

I contemplated writing a letter to the heads of the bank, pointing out the fallacy of this thrift propaganda, but fearing that it might be regarded as gratuitous meddling in the bank's affairs, I hesitated. Meanwhile, apparently, the thrift propaganda was doing its deadly work. One morning last January, when the bank employes reported for duty after the New Year's holiday, they found the heavy iron doors closed, placards posted up, and policemen stationed outside. This bank, for more than 35 years counted among the leading financial institutions in the city, had been forced out of business by the insolvency of some of the commercial enterprises which it was backing and whose "paper" had become a liability.

So, then, it is very evident that "thrift" is not the cure for the economic disease which is afflicting this country.

Although the area of the United States is 30 times greater than that of the British Isles, the population of the United States is only a little more than twice the population of those Isles. If the United States were as well populated as these two small islands (which are by no means crowded) it would have more than ONE BILLION AND A THIRD inhabitants! Texas alone, with only 4,000,000, contains more than twice the area of the United Kingdom. It will therefore be seen that Texas could support the entire present population of the United States without undue crowding.

Something surely must be radically wrong when only 105,000,000 of us, scattered through 48 great states, find it so difficult to get enough to eat, and we have so many millions of unemployed headed toward pauperism, that Congress has been compelled to put up the bars against further immigration from abroad.

If we ask our professional economists the reason for this anomalous state of affairs, they shake their heads and talk learnedly about the law of supply and demand, about business cycles, about the balance of trade, about foreign markets, and about the disturbed conditions in Russia and the Near East! But none of these explains the fact that men are unable to earn a livelihood in a country which has a physical and economic capacity for the support of 30 times its present population, and, with intensive cultivation, perhaps one hundred times.

Last year we had the greatest corn and wheat crop on record; in many of the western states the farmers were obliged to burn their corn for fuel, because they could not sell it. In near-by cities thousands of needy families were suffering want, yet they could not buy the corn and the wheat because they had no money. Great stocks of manufactured products likewise have lain rotting in warehouses. The stocks could not be sold, because there was a scarcity of money among the consumers.

It would appear, then, to one who has not acquired mental strabismus by poring over books of economic theory, that the simple reason for the industrial stagnation, for the unemployment, and for the damming up of the stream of wealth which should flow unhampered from producer to consumer and from consumer back to producer (for everyone is a producer in one place and a consumer in another) is LACK OF MONEY; that is, the want of an adequate supply of a medium of exchange.

The key to the whole situation seems to lie in the fact that in this, the third decade of the twentieth century, we still insist that there shall be no lawfully recognized basis for our medium of exchange except a certain metal of little intrinsic worth, valued chiefly because of its gaudy yellow color (a blind man could not distinguish it from copper or tin) which made it attractive to primitive man back in the days of barbarism. When civilization began, there being but small use for money, gold admirably served the needs of the ancient community as a circulating medium. In small circular disks these coins passed from hand to hand, just as among the Indians wampum, among African tribes strings of glass beads, and among the South Sea Islanders pretty sea-shells have been and in some places still are used as a medium of exchange.

The other day I happened to be visiting a great museum of natural history. In the section devoted to exhibits illustrating the life of savage tribes in the South Sea Islands, I noticed some necklaces. One of them was of particular interest. Strung together on a string, which evidently had been worn around the neck of some cannibal chief, there were sea-shells, colored beads, and two or three United States five-dollar gold pieces, bearing dates of half a century ago. It was a distinct shock to see coins bearing the proud inscription "United States of America" in so debased an environment, and with a feeling of humiliation and disgust I turned away from the exhibit. But, after all, strung around the neck of a naked savage, American gold coins perform a real and tangible service by giving esthetic satisfaction to the wearer and the beholders. In our more enlightened and civilized country they are hidden away in the safety vaults of banks, and when they change owners they are transported in strong boxes by armed guards from place to place, and never see the light of day except when being furtively counted behind locks and bolts!

As the division of labor and the growing complexity of our industrial organization have rendered barter obsolete, a medium of exchange in adequate quantities, representing a real value, becomes more and more imperative. Yet we still cling like savages to our little disks of glittering metal, or bits of paper which give title to them. This we call "the gold standard," a term which has acquired a very solemn and portentous importance in all our economic and political discussions. We are assured that "the gold standard" is the foundation of our prosperity, and that if we let go of it for an instant we would all be plunged into the depths of economic anarchy.

The constantly increasing inadequacy of gold as the basis of our medium of exchange lies in the fact that the supply of it is limited and is incapable of multiplication. Modern physical science, however, through its discovery of the electronic basis of matter, with the hydrogen atom as the parent of all the elements, may yet lead to the artificial production of gold. But if gold could be manufactured in unlimited quantities, its value would vanish, since it serves none of the elemental needs of society.

The scarcity of gold is, then, the determining factor in its value. *Only while it remains scarce will it retain sufficient value to make its use as a medium of exchange possible, and conversely, while it retains its usefulness as a medium of exchange there will never be enough of it to go round.* This is a vicious circle from which there is no escape!

If gold becomes more plentiful, its value declines; therefore it takes more of it to buy a bushel of wheat, and we say that prices have gone up! Yet since we have more gold, we think that we must be more prosperous. The fact that we overlook is that gold does not and cannot have an independent value. The value of gold is fundamentally a barter value like that of any other commodity. To be valuable it must be extremely s c a r c e, much scarcer than wheat or corn, and then it is so scarce that there is not enough to exchange for all the wheat and corn; so the grain is burned on the farms and the children starve in the cities.

If the amount of gold expanded in an even ratio with the increase of population, its value should remain constant, because the supply would maintain the same relativity to the demand. But as a matter of fact, the world's supply of gold is constantly becoming relatively less. *The supply of gold is constantly diminishing in relation to the population.* When the ore once has been extracted from the mine, the mine is exhausted and has to be abandoned. The famous Cripple Creek mine in Colorado, once one of the chief sources of the world's gold supply, is now largely a memory. The great gold mines of the ancient world, likewise, have been barren for centuries. Their very location is now a matter of conjecture. In 1849-50 the greatest gold deposits known to recent history were uncovered in California and Australia; there was a mad rush to both countries—thousands of adventurers perishing en route—and the richest portions of the fields were soon stripped bare.

But even the vast quantities of gold taken from California and Australia served but as a temporary stop-gap in the growing demand for gold, which soon became more pressing than before. The most remote and desolate recesses of the earth's surface have been combed by prospectors and geologists in the search for new deposits. In 1897 gold was discovered in the frozen wilds of Alaska, just beneath the arctic circle. Again there was a frenzied rush, with great loss of life, to the gold fields, and in a few years the bulk of the deposits had been carted away on dog sleds. In the 25 years since then, no new fields of any great importance have been discovered.

The world's stock of gold suffers a constant diminution by loss and attrition. Coins passing from hand to hand and in counting are gradually worn thin by abrasion, and after they have lost a certain weight no longer pass current. Ships carrying cargoes of bullion are lost at sea. Again, gold is constantly being used in the arts for gilding and plating; the gilding and plating are eventually rubbed away by handling and the gold is dissipated beyond any possibility of recovery.

When speaking reverentially of "the gold standard," it is well to remember that there is nothing intrinsically sacrosanct about gold. It is by no means the rarest, nor in the opinion of many, the most beautiful of the metals. The exquisite metal known as platinum, which is much more highly prized in the arts and sciences than gold, is also of considerably greater scarcity. But because its discovery has been subsequent to the development of civilization, and it was unknown to primitive barbarism, platinum has not become an economic fetish and we have had no agitation for a "platinum standard" as the basis of a sound currency.

According to a recent estimate, the world's gold supply is valued at about $9,000,000,000. The total yield of the mines of the United States, from the first records of 1792 to the close of the year 1916, has been 185,226,085 fine ounces, valued at $3,828,957,200. In 1916 the output was 4,479,056 ounces, valued at $92,950,300. In 1920 the value of the output amounted to only $49,509,400.

On December 31, 1919, the amount of money in the United States was as follows: gold, $2.708,862,000; silver, $543,510,000; paper, $4,377,057,000; total, $7,629,429,000. The per capita distribution was thus: gold, $25.01; silver, $5.02; paper, $40.42; total, $70.45.

In other words, if the entire stock of lawful money in the United States were distributed equally among the population, each individual would be worth only $70.45. Of course, it is not so distributed.

The figures for the world on the same date were as follows: Gold, $7,594,557,000; silver, $1,335,233,000; paper, $51,415,440,000; total, $60,345,230,000. And the per capita distribution: Gold, $4.75; silver, .78; paper, $32.20; total, $37.53.

On the other hand, the total *wealth* of the United States was estimated in 1912 at $187.739 000,000, or a per capita of $1,965. It is therefore evident that only *one-thirtieth of the wealth of the country could be liquidated in money* at any given time, even if none of the money was hoarded in stockings and strong boxes and it all was in circulation. Is it any wonder that we suffer periodically from the nightmare of panics

(Concluded on page 14)

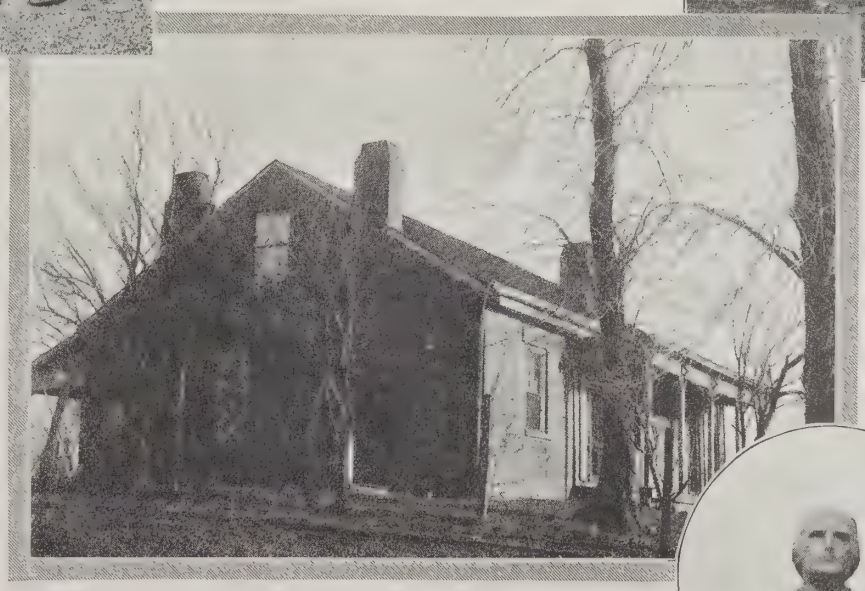
Where Eliza Caught the Underground Railroad

Ripley, Ohio, Haunted by Stories of Days of the Runaway Slaves

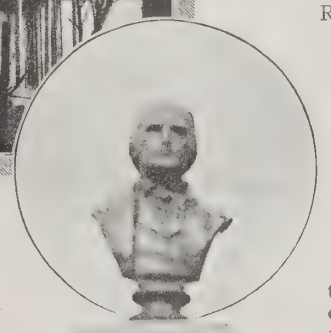
By HARRY E. BARNET

TALK in Ripley, Ohio, turns naturally to the Underground Railroad because the town was one of the chief terminals. This system aided and transported fugitive slaves through free territory, and into Canada. It had in it all of the fascinating features of picturesque outlawry—the matching wits with crafty and rapacious man trackers, for instance; the appeal of piracy, and the lure of smuggling—since its business was carried on in violation of laws, and in defiance of enforcement agencies. Patrols pursued fugitive convoys, and frequently battled for the fugitives before they reached foreign soil.

General traffic was established about the time of the Revolutionary War. It was developed to huge proportions, and the system continued to the outbreak of the Civil War. Sincere Abolitionists, men and women, considered slavery unjust and oppressive and the Underground Railroad was their method of combat. It afforded an emotional outlet, a philanthropic undertaking, under the glamour of what was considered by the Abolitionists to be a sort of a humane and holy insurrection, and by the slave owners to be an invasion of vested and property rights.



The Underground Railroad was characteristic of small communities and sparsely settled localities. Ripley is a small town on the north bank of the Ohio River, about 40 miles upstream from Cincinnati. The Ohio and Kentucky shores form rugged highlands and they were heavily timbered. Forests on the broken surface were reasonably safe fugitive coverts. The Ohio River was a comparatively safe route for fugitives from the southeast, who reached the stream above Ripley, if they floated by night, and hid in the shore growth by day. A gap in the hills behind the town is a gateway to the north.



About 1803, Abolitionists commenced to settle amid these natural advantages. Ripley became the objective for fleeing slaves. There was spectacular preaching of Abolitionist principles. This culminated in a split in the most prominent church, and the erection of a second church by members who withdrew. The roar and bitterness divided the community for years. The upshot was intense resentment on the south side of the river. Attempts were made to burn Ripley; there were scores of invasions, and countless affrays.

Some persons who witnessed this commotion when children still live there. Bronze tablets commemorating particular events, and a monument overlooking the river landing, are prods to recollections. Consequently, talk is mainly of the Underground Railroad.

Until 1831 the Underground Railroad was nameless. Then Tice Davids, a slave, made a dash out of Kentucky. He was followed by one of the patrols. When he reached the river opposite Ripley, the patrol was at his heels. Davids plunged into the stream and began to swim. The patrol was delayed hunting a skiff. But he did not lose sight of the fugitive. The latter landed a few minutes ahead of his pursuer, ran through the town to a hill immediately back of it, and disappeared in a thicket halfway up the slope. He was picked up and forwarded to Canada. The patrol failed to find a trace of him.

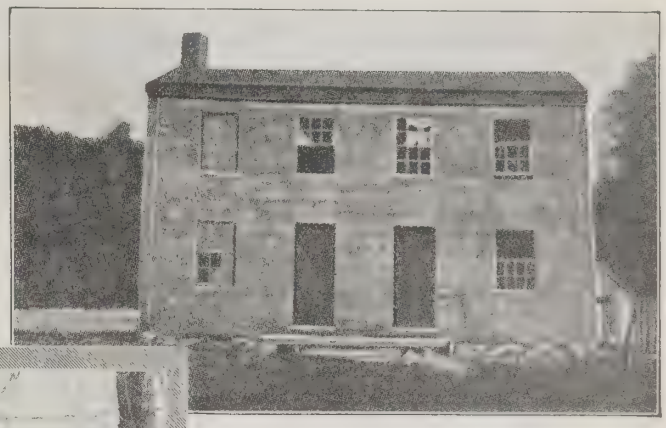
"That Negro must have gone off on an underground railroad," he said.

Above—One of the "originals" of Uncle Tom. Below—The Rankin House, where Harriet Beecher Stowe is said to have gathered material for the Eliza story. To the right, a reproduction of a bronze bust of John Rankin.

This remark stuck. Later came the common misapprehension that the Underground Railroad was a series of tunnels or underground passageways. As a matter of fact, the majority of its routes, from Ripley to the lakes, were zigzag and secluded byways. Some use was made of open roads. Between 1840 and 1850, when traffic was heaviest, fugitives with light-colored skins were occasionally blackened with burned cork, provided with forged slave passes, and forwarded on steam lines. But for the most part, transportation was by wagons, covered with canvas over hickory bows. The ends were pulled together in the center with cords. Fugitives sat on straw in this moving shelter. Some wagon beds were made with false bottoms, and with drawers along the sides and ends, in which fugitives were stretched full length. Tinware and peddlers' plunder were piled over these hiding places. Loads of hay sometimes concealed eight and ten black men, women and children. Stations were isolated homes, and homes in small communities, where "passengers" were cared for and hidden from pursuing patrols until they could be transferred to another "conductor."

Secrecy was the important thing. Laws were drastic, and pursuers were ruthless. While Abolitionists sometimes let their judgment slip in trying to make converts, it was seldom that men and women actually operating the Underground Railroad were known outside their own neighborhoods. Even there a good many of them were unsuspected. Their comings and goings were almost entirely at night. The amount of sleep lost by these people during the life of the system aggregates millions of hours. They had to earn their living, and contribute toward the expenses of the enterprise—there were no wages paid. By day, "passengers" were concealed in caves, thickets, and strawstacks, and in holes about the size of a coffin, built alongside chimneys, for instance, in homes, and in cupboards with false backs, because fugitive slave-hunting patrols frequently searched all the houses in a neighborhood over the protests of those who lived in them. Laws prohibited giving shelter or aid of any kind to a fugitive. Of late years it is a common occurrence for these hiding places to be discovered when old houses along the routes are razed.

The story of this system is the vaguest chapter in American history. Prior to 1850, some records were kept, but the provisions of the Fugitive Slave Law became so drastic that practically every record was destroyed. No others were made. They would have been incriminating evidence. Reminiscences, about all there is to go on, are few. Those who operated the Underground Railroad were taciturn. Even after the system was discontinued they had little to say. With some exceptions, men who knew most about it died before historians began to inquire.



This vagueness, however, has the most spectacular, and probably the best-known heroine in American historical fiction—Eliza, of "Uncle Tom's Cabin."

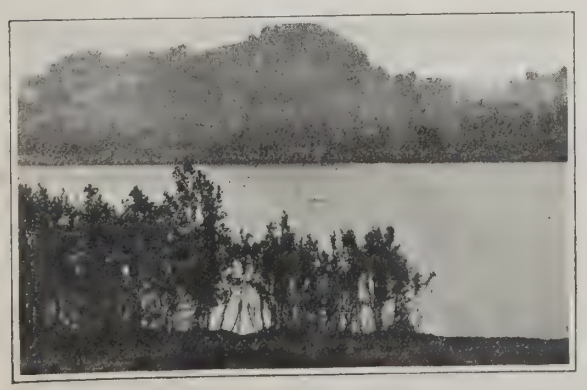
"No one knows her real name, and no one knows exactly where she came from," is the story in Ripley. "But along in the '40's—no one knows even a closer date—Eliza escaped one night with her child from somewhere back in the Kentucky hills. Possibly not very far back, because she couldn't run any great distance with a child in her arms. Eliza came to a house on the Kentucky side of the river, just above Ripley, near Stony Point. The people in this house were not anti-slavery people, but they took her in.

"It was winter, and there was deep snow on the ground. There had been a season of very cold weather before that, and the Ohio River had been solidly frozen over. That night a thaw set in, with a light rain. The river was rising. Over the ice was an inch or more of water.

"Pursuers were close behind. They searched the houses in that locality and finally came to the one she was in. The people of the house were frightened. If she were found it meant a fight, or entanglement with the law. Eliza and her child were pushed out of the back door before the pursuers entered the front one.

"She struck for the river shore, and took a rail off of the fence with her. The ice was rotten, and about to break up, but she started across with her child in her arms. She broke through several times, but saved herself by throwing the rail across the hole as she went down, and pulling herself out of the water. She landed exhausted on the Ohio side, at the upper part of Ripley. But she made her way to the Rankin house on the hill, where she was cared for, and taken away that night. Nothing was ever heard about her after that time.

Eliza House, South Ripley, Ohio.



"The pursuers spent the night on the Kentucky shore. Before morning the river broke, and it was filled with floating cakes of ice. At daylight, Eliza was tracked from the house to the river bank by her footprints in the snow. The pursuers secured a skiff, and crossed to Ripley to look for her. They were standing at the corner of Front and Main streets, when a man who lived on the river bank in the upper part of Ripley came by, carrying a child's red woolen hood in his hand. Some inquiry was made of him, and he said he found the hood on the river bank. One of the pursuers, probably a member of the family from which Eliza escaped, identified the hood as belonging to a child of his family—Eliza had taken it for her child, and lost it. They decided that she crossed on the floating ice and that was the beginning of the myth about Eliza crossing on heaving chunks of ice."

When Harriet Beecher Stowe was collecting material for "Uncle Tom's Cabin," she visited Ripley, and the Rankins. She heard the "Eliza story," with the addition of the details of the slave girl's condition when she reached the house. It was the base for the thrilling description in the book. A part was written in the Rankin parlor.

But there were 23 ports of entry for fugitive slaves along the Ohio River. When the stream was frozen over, hundreds of slaves escaped by crossing on the ice. Consequently, each of these ports of entry had a "crossing the ice" story, and after "Uncle Tom's Cabin" appeared some of them claimed their stories furnished the base of the "Eliza" episode.

John Rankin is one of the outstanding figures in the general history of the Underground Railroad. He

(*Concluded on page 14*)

Where Eliza crossed the ice; looking across the Ohio River toward Kentucky shore at point where escaped slaves entered free territory.

Looking from the Rankin house, down the gap which began the Underground Railroad; thousands of slaves took this route to liberty.

Here Is Some Sound Money Sense

THOMAS R. MARSHALL, who retained his good humor through eight years as Vice-President, has recently returned from a tour of Europe. In Washington, he called at the White House and told of his trip.

In his stories there is ground for reflection by the American public.

For one thing, Mr. Marshall said that he had just received a report of the last year's operations of his 100-acre farm in Indiana. His net profit was $2.36.

The former Vice-President was at a loss to understand the financial tangle in Europe. The people were working and there was plenty of crops, but money was a mystery. Mr. Marshall went to the bank to cash a check; the cashier had not heard the exchange rate for an hour and called on the telephone to get it; Mr. Marshall made 50 marks by the precaution. Mr. Marshall contracted one day for an umbrella at 60,000 kronen or $2.50. He returned two days later, and found that meantime the article had fallen to a value equivalent to $1.83.

From Mr. Marshall's 100 acres in Indiana to the printing press money of Europe seems a long way but there is something that bridges it. That is the plenitude of crops, with the futility of money to exchange them. Presumably, Mr. Marshall's farm was planted in a reasonable manner, yet it failed of a profit. In Europe, Mr. Marshall reports plenty but it fails of distribution sufficiently to provide for the wants of all.

We hear despairing pleas for help for Europe. From Wall Street, learned financiers give out statement after statement to show that we must go to the aid of Europe. Earl Balfour recently invited a rebuff from this country by a suggestion of cancellation of the war debts owed to us. France is constantly suggesting, almost demanding, debt cancellation. Russia wants financial aid.

Except for a comparatively few pleas for real help for remote impoverished districts, these pleas from and on behalf of Europe are purely *financial pleas*. Europe, already gorged to its fill with its excess supply of so-called money, wants more of our kind of money, *the supply of which is too limited here to permit adequate returns to agricultural enterprises.* Wall Street financial interests, bubbling over with sympathy for stricken Europe, would like to take over the proposition of marketing debt refunding bonds, on which they would collect a handsome commission, and which the public would "absorb."

Financial systems in Europe and in the United States are inadequate. In lands of plenty there is want. For production there is little return. *Financial interests profit hugely by the inadequacy of money, and fight bitterly any attempt to disturb the financial currents.* It lies with those who do not profit from the money-tangle, the producers and the consumers, to compel the revision of the money system.

Three Per Cent Clause on Theaters

NEWS dispatches chronicle an understanding between the Shubert and Erlanger theater interests to bar from the stage all objectionable racial jests. Offensive racial references in stories, dialogs, jokes or songs will hereafter be forbidden.

Under the "offensive racial reference" ban, the Irishman will hear no more of Paddy's pig. The proud descendants of Roman patricians will no longer be shamed by references to the Black Hand. Presumably the sensibilities of Russian Bolsheviki will not be wounded by having their principles masked behind untrimmed beards. Jewish demands to ban allusions to fire insurance and pawnbroking are to be acquiesced in. Ole, the Swede, and Kaiser Bill jests will be barred in deference to the Scandinavian and German objections.

Thus far the theater operators have shown no desire to put an end to portrayals of members of the Protestant clergy as sanctimonious hypocrites. Nor is there interdict against continued ridicule of domestic virtue nor of the prohibition clause of the Constitution of the United States.

Some eastern correspondents, in sending forth the information relative to the Shubert-Erlanger agreement, suggested that perhaps a better stage might be constituted, if actors were chosen according to racial extraction. Instead of being 90 per cent New York East Side, they suggest that the actors be divided as are immigrants under the three per cent immigration law. Much good would doubtless be done were this idea carried out, but it won't be. The influences in control of the theater will continue to foist alien actors and alien ideas on the country.

The Crazy-Quilt Tariff

WE ARE going to have a new tariff law. Just when we shall have it is doubtful. Passage of the measure by both houses of Congress by no means presages its early operation.

The bill must be considered in conference, and conference promises to be a long-drawn-out affair.

Purely for political reasons, the Democratic members of Congress are eager that the law become effective soon. They reason that it will be unpopular and will react in their favor at the November election.

Similarly, for political reasons only, the Republican members are eager to have passage assured early enough to permit the special interests favored by the tariff to express their approval in November. But the Republicans are also determined that this passage shall not be so soon, that the general consumer public will have an opportunity to pass judgment at the same election. The Republicans know that the early operation of a tariff law is almost certain to be irritating.

The matter of the date of final passage, therefore, becomes of supreme political importance. Whatever doubt may be entertained on the efforts of Congress to frame tariff rates scientifically, there can be none regarding the determination of the political leaders to fix scientifically a date of final passage which will afford the maximum political advantage.

In many ways the 1922 tariff law will be the most remarkable ever passed—remarkable in that scarcely anyone endeavors to excuse it to the American people. Politicians know that the reasons they formerly gave for high tariff votes have lost their force. Considered calmly, the tariff law which will govern the country is nothing more nor less than a crazy-quilt. It is a shameless repayment of political debts to special interests. Bad as previous tariffs have been, this latest is a brazen defiance of even political expediency. It is a nail in the coffin of the administration and the party and the whole political system under which such things are possible. Maybe that is why the tariff is coming now—to hasten the end of all such farces.

Start Growing Trees

SEVERAL states have made commendable progress on reforestation plans. But the country as a whole is laggard on this fundamentally wise project. There is also too little co-ordination and collaboration between the states on scientific reforestation.

The practical denuding of the north central states of the great forests which covered them a century ago was an offense against real economy which cannot be forgiven. But it is within the power of the nation to restore forests sufficiently to avert the tree famine which threatens the country. Within a comparatively few years, continental United States will be almost timberless.

The vandalism with which lumbering operations were carried on a half century ago prevented the natural growth of the young trees, which, useless for timber then, would have afforded a continuing supply thereafter. But it is too late to regret the waste and cruelty of those days. The necessity now is for positive action toward a general reforestation plan.

Some states continue the stupid policy of taxing standing timber upon the same basis as growing yearly crops, thereby placing a penalty upon the public-spirited landowner who attempts reforestation on his own initiative. A sane co-operation between the states upon taxation and practical reforestation problems would seem of such patent necessity, that the wonder is that nothing along that line has been done.

Reforestation, purely as an antidote to a timber famine, would afford ample grounds for national action on a large scale. But reforestation means more. In the upper Mississippi and Missouri valleys, the re-establishment of the forests would lessen the flood hazard vastly. The saving in flood losses within a score of years would practically cover the cost of reforestation. Longer delay in this fundamental proposition should not be tolerated.

A Hughes Doctrine?

NEARLY 100 years ago, John Quincy Adams, as Secretary of State, penned the document which as the Monroe Doctrine has exercised a lasting effect on world affairs.

Now as Secretary of State, under the present administration, Charles Evans Hughes is to represent the United States as visitor-extraordinary at the Brazil Centennial.

The country has warm confidence in Mr. Hughes' ability to felicitate our neighbor republic. But there is opportunity for even more than the formal phrases of diplomacy. There is opportunity for enunciation of such a doctrine of good will as may tranquilize permanently the relations between us and our southern neighbors.

North Americans have always been serenely self-satisfied over the benevolence of their attitude toward South Americans. We are so certain that there is nothing selfish in our aims toward the South American republics, that it never enters our heads that other ideas may be entertained by the objects of our benevolence.

But it is becoming apparent that our complacent views are not always accepted at face value. Even from Cuba and Porto Rico have come murmurings of discontent over our patronage and our rule. The efforts of our bankers to get the finances of other countries in their palms have afforded fruitful sources of irritation.

But most aggravating of all to our neighbors has been our attitude. We have tried to be Big Brothers, and complacently dole out from our wisdom bits of unsought advice. Little Brothers are notably resentful of the condescension of their elders. Nations, like individuals, are intolerant of unsought advice, and abundantly confident of their own ability to regulate their affairs.

If we can convince our southern neighbors of the real unselfishness of our aims, if we can prohibit our bankers from meddling with their ticklish finances, and if most of all we can replace the Big and Little Brother attitude by that of Friend, perhaps our relations with other republics will approach the correct one.

Mr. Hughes has a wonderful opportunity to establish once for all a diplomatic relationship, based upon the cordial, smiling, open-minded handshake of friend with friend. It is as equals that we must seek the good will of our friends to the south. The slightest touch of patronage would be fatal.

The Secretary of State demonstrated his qualities in the Armament Conference. He gained the good will of South Americans in the Tacna-Arica negotiations. The country will await with hope the result of his mission to Brazil. Perhaps we may have a Hughes doctrine.

The Rise of Czars in the U. S.

WHAT has become of the old-fashioned American insistence on democracy, on the right and ability of the many to govern themselves? It was not more than a few score years ago that the very terms king, emperor and czar were anathema.

And now we have Czar Landis of baseball, Czar Hays of the movies, and Czar Thomas of the theaters, and the end is not yet. As far as Judge Landis is concerned, there seems to be no doubt that he czars with vengeance. There is some question whether Will H. Hays' czardom is vocal or operative, and considerable doubt whether Mr. Thomas will be able to inflict much absolutism upon the theater men. But the power of these new czars is beside the question; the point is this: the name is popular and the prerogatives the "czar" would perform if he performed them are popular.

Real Americans are not prone to favor absolutism. They have abundant though unassuming confidence in their ability to govern themselves and conduct themselves decently while they are governing. That confidence existed in 1776. It existed even comparatively recently. But now persons living in America are submitting without protest, even eagerly, to the absolute decrees of one man.

The only explanation is that the populace has become adulterated. Today's residents in America include the old stock who knew they could govern themselves fairly and honestly, and a newer stock that can't. The old and dominant stock has been roused as never before by the trend of affairs in this country. They have demanded reform so loudly that their representatives have been placed in charge of reform. Landis, Hays and Thomas are of the old straight stock and they have been called in to control the movies, the theater and baseball, three fields which a certain other stock conspicuously befouled. It remains to be seen whether these men are reformers or "fronts." The American will submit to dictation as long as he is the dictator, but dictators for concealed groups will be found to be the last phase of those groups' will to power.

Mr. Ford's Page

IN READING the European press we frequently come upon the headlines, "Our Debt to America," "What We Owe to America," and similar titles. The first reaction on seeing these words is a wisp of grateful feeling. To think that anywhere in the world there are those who esteem us highly enough to consider themselves in our debt, is very pleasant. We ourselves are conscious of an unexpressed feeling among us that we have not been regarded with special admiration or gratitude by our sister nations. The headlines, therefore, at first sight, give us a pleasurable half moment.

But upon reading further we find that Europe has no thought of a sentimental debt, and certainly no thought of welling gratitude toward us—much as the official speeches of calculating statesmen would try to give the contrary opinion. Every newspaper article headed as above, discusses money, nothing but money. As we read the articles we learn that America—that is, the United States—is seen in the rôle of a troublesome creditor, concerning whom the general attitude is anything but pleasant, and hardly respectful.

In common with the rest of the world, our American people are kept in a constant state of misinformation concerning their own business. A part of their business is their relationship with their nation-neighbors on either side of the sea; yet it is most conservatively true that we are allowed to know less about those relations than anything else. We are told, of course (as all the nations are told), that we are fully informed. But now that they know how they were treated even worse than the Germans in the matter of information during the war, now that they know how they were victimized by concealment and propagandized by manufactured falsehoods from beginning to end of the war, the people have reluctantly found it necessary to look for confirmation before they accept public announcements.

The fact is, we are badly regarded abroad. But on this page that statement is not made with the usual purpose. The purpose is not to give information, nor to stir resentment against those whom we may think ought to be "grateful": the first is the purpose of the publicist and the second is the purpose of the agents of hostility.

To tell Americans that their name and their nation are disliked abroad is not enough; to tell only that much of the truth is as bad as to tell an untruth. The fact itself rouses resentment and imperceptibly enlarges the ground for future misunderstanding and grudges. What ought to be told is the *why* of the dislike and *who* caused it.

WHEN nations dislike each other, as more and more the recently allied nations are doing now, it is not due to anything the people have done or planned; it is due to something that has been done in their name by men who had no orders to do it. Between the nations are the internationalists. Contrary to the indication of their name, they are not engaged in cementing the nations together but in driving them farther apart. They have stolen a name that enables them to operate under false pretenses. They are the sowers of misunderstanding and dissension. They are the explanation of all that confuses and surprises the plain people of all the countries. Once they are seen and understood in a world-wide understanding, the time of trouble is past. The people shall know the truth then, and the truth shall make them free.

The common people of all the nations awake in wonder when they hear how they are regarded abroad. What have they done to merit dislike? What have they done to rouse hatred? What have they done to cause suspicion? They ask themselves these questions and their conscience absolves them. They have done nothing amiss. They have conspired against no one. But tempers can be roused in them and things can be done in their name that portend disaster.

What the people do not understand is that, for the groups behind the governments, the last war was a business matter. People resented being told that, because they knew that they regarded the war as an infinitely higher experience than a mere business matter. And for them it was. The spirituality of the principles at stake rose to such a height of power that it would have destroyed the cunning behind the war if it had been permitted to grow; but it was nipped just as it became threatening to the forces of darkness, and was forced back into a bitter reaction. That is the cause of the sense of futility that holds the minds of the people today. But the fact that the war was a business matter led to transactions which the people would never have approved. It led to terms that the generosity of the plain man's mind would have scorned. The plain man could fight in the name of his country, but he could have no control whatever over the other things that were done in his name. When he emerged from the war he found himself compromised, nationally, in a hundred ways, and out of the stupid mess all that he can see is misunderstanding and possible future struggles.

That is how it was done—not by the people, but in the name of the people, by groups who knew exactly what they wanted and what they were doing to get it. The people are thus blamed not only for something that they did not do, but for something that they would not do, for something that entirely misrepresents what they think ought to be done. And when the misunderstandings thus created grow strong enough to break out into war again, the men who caused the misunderstanding will simply step aside and let the people fight it out. Thus, in their innocence, in their simple-hearted belief that official men are good men and that official intentions are good intentions, the people are led from pillar to post. They are made responsible for attitudes that they have never dreamed of, and they are made to bear the blame for actions which they cannot even understand. It is a fearful network of evil that has been spun around the people by the weavers of darkness, and the rending of it will be light work when once the people clearly perceive.

There are men abroad now in the name of the United States proposing, without any authority from the government or people of the United States, things which the people would never perform if they could prevent them. These men are financiers. They are not statesmen (save as statesmanship has become a clerkship in international finance), they are not humanists, they are not even nationalists. They love no country. One of them has borne citizenship in at least three countries in his lifetime. They have nothing to stand upon but money, they have nothing to recommend them but money, they have nothing to work with but money. And even this money is not their own, it is the money focused upon them by the big banks and the small banks all over the world, the money of the people themselves. That is the indictment that condemns the present international financial system, that it uses the money of the people to bind the people.

Without love, without pity, even without responsibility, these influences shuttle back and forth across the world, spawning their tricks, using the press, dominating parliaments and privy counsels, getting the heirs of thrones into their debt, even fastening superstitious beliefs upon the church to further their ends, suppressing and destroying the men who have eyes to see and hearts courageous enough to speak, and setting nation against nation. There are men who hope for wrecks at sea that they might enrich themselves with the water-soaked spoil. It is hard for the honest hearts of the common people to believe it, and perhaps their knowledge of it or belief is not necessary to its correction—but there are men who hope for national wrecks and world wrecks too that they may enrich themselves with the blood-stained spoils.

In every nation the propaganda of international distrust is now being worked. It is true that the peoples are being estranged from each other, it is true that they are becoming suspicious of each other. Let each nation, let Americans, too, acknowledge that they are disliked. But let us ask who made us disliked, who did the things that made us disliked. Let every nation make similar examination in its own race, and then the secrets not only of war but the secret of peace also will be out.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Voices Divine, Old-Time Tunes and Broadway

Sweet Singers of Minnesota Enter Wilderness of Jazz, and Behold!

By EARL CHRISTMAS

The building above is St. Olaf College's Conservatory of Music.

FROM a small college out in the Northwest, there has come a benison of song. New York music critics spoke of the St. Olaf Choir when it made its first appearance there two years ago. To New York, the music center of the country, had come a revelation in the art of choral singing, and from a little Minnesota town!

This year the choir made another visit to New York, and the music lovers came out in numbers. The Metropolitan Opera House was filled. Again, if we are to believe the critics, the concert was an artistic triumph. Said H. E. Krehbiel, of the New York *Tribune*: "We shall enjoy no such choral treat till the choir comes to us again." Deems Taylor of the *World* wrote, "The only criticism heard during the evening was voiced by a neighbor who thought they were too perfect to be human."

Everywhere, during a tour of some 30 cities in the East, the choir met with the same reception. Three thousand persons heard the concert at Toledo. The number was as great at many of the other concerts. In virtually every city the choir found a capacity house. On a tour of five weeks, it sang before 60,000 persons.

And it sang only sacred music, chiefly Lutheran. It sang the old chorals, songs dating back, some of them, to the fourteenth century, stirring hymns of the Reformation, and the music of Bach, Peter Schren and Gretchaninoff. In these days of jazz music, it is worth while to note that large crowds will buy tickets to hear from a choir the hymns of Luther to the music of Mendelssohn and Grieg.

The St. Olaf Choir sings without accompaniment and from memory. It uses not even a tuning fork. With no cue for the pitch, it starts with a full, clear chord, exactly on the pitch, and never deviates from it in the least. How it gets the key, is always a marvel to the audiences.

The freshness of the blended voices, the beauty of tone and the spiritual feeling expressed by the youthful singers invariably are noted by musical authorities. Only the Mendelssohn Choir of Toronto and the Bach Choir of Bethlehem, Pennsylvania, among recent organizations, have been compared with it. Some critics have declared it without an equal.

The Allentown, Pennsylvania, papers report an interesting incident of the recent tour of the St. Olaf Choir. After the concert at that place, Dr. J. Fred Wolle, leader of the justly famous Bach Choir, met F. Melius Christiansen, the director of the St. Olaf Choir, and in his enthusiasm said:

"I have never heard nor read of a choir that can do what this choir does. It goes so far beyond all others, it leaves one speechless. Its precision, and unanimity, intonation and freshness are overwhelming."

Yet the members of this choir are only ordinary young men and women. Before going to St. Olaf they had little or no voice training. Many are not specializing in music at all and have had no training except that of the rehearsals.

In fact, St. Olaf College is not a musical school at all. It is a liberal arts college, supported by the Norwegian Lutheran Church. True, it has a department of music, but this represents only a small part of the work of the college.

Indeed, if you were to journey out to Northfield, Minnesota, and ask to see the conservatory of music at St. Olaf College, as many do after hearing its choir, some one would point out a small, two-story, frame building which looks like a residence of 40 years ago.

"There it is," you would be told. Jocularly, the students call it "Agony Hall." This building, the oldest on the campus, is the only music building St. Olaf College possesses. The choir rehearses in the chapel.

Not more than 60 or 70 students major in music. There are only 880 students in the whole college. Perhaps not more than 200 take any music instruction, even as a side line.

Every year the choir loses from 30 to 40 per cent of its members through graduation and other causes. New voices must be found to fill the ranks. Yet year after year, out in this average middle-western college, the director is able to turn out a choir of uniform excellence, a choir that has won national recognition.

The St. Olaf Choir, whose triumphs are proof that there still is hope for the things that are fine. To the right is F. Melius Christiansen, the man responsible for the choir's remarkable achievements.

For 20 years, the St. Olaf Choir has been giving concerts through the Middle West, reviving interest in the fine old chorals of the early Protestant church. In 1915 it went to Norway, sang before the King and Queen, made a long tour of the Scandinavian countries, and came back showered with praise. Two years ago, it made the first extended trip to the East, and there was hailed by many as "a benediction in song."

The St. Olaf College Band and Dr. Lars W. Boe, president of the college.

Now, when the sons and daughters of farmers, of small-town merchants —just the average American folk—can be welded into an organization which sings like that, it is worthy of note. Indeed, St. Olaf College has done a significant thing. In a remarkable degree it has developed music as a means of the spiritual expression of its students. Meanwhile, it has revealed that splendid artistic results may be obtained from a gruop of average young folks.

In another respect, St. Olaf's experience is significant. It has shown that the people appreciate the better class of music. That may sound unusual in these days, but when 60 000 people pay to hear concerts of sacred music in a brief tour of five weeks, there yet is hope.

When a tour of the East was suggested two years ago, there was doubt about the wisdom of the undertaking. However, a group of men who believed in the work of the choir agreed to act as guarantors. The trip cost the guarantors just $10,000. But they were not alarmed.

On the second tour of the East this year, the choir not only made enough to pay back the $10,000 but put $12.000 in a building fund for a music hall.

Dr. Lars W. Boe, president of St. Olaf College, drew this interesting conclusion from the success of the choir:

"It has been said that the public is crazy about jazz music. The last few years have been filled with froth and jazz. But in spite of all this, the response we have obtained with the choir shows that the people appreciate the better things when they get a chance to hear them.

"Right down at the bottom, there is a demand among the American people for the best. They want the real thing. They have put up with the jazz entertainment only because no one has had the courage to give them something better. The reception accorded the choir is a standing protest to jazz.

"You know, we have been accustomed to look to New York for our music and entertainment. Yet there are latent possibilities in every community that are simply astounding if any man of courage and vision will go out and develop them. There are tremendous possibilities in our people all over the country. Invariably, they respond to the better things.

"The choir shows too the possibilities in our young people. The members are only such as you might find in any college or almost any community. It shows what can be done if there is a concentration of mind and a leader with vision.

"There has been a tendency of college singing organizations to appeal to the public on the basis of jazz. Now many are going over to classical and religious music. In other words, they are taking the glee out of the college glee club.

"Jazz is being carried along now only on its own inertia. It seems that the war produced a kind of froth on the surface that found expressions in this great craze for jazz music. But there is a decided reaction, and in a few years I expect to see it all gone."

Credit for the choir's accomplishments President Boe gives largely to Professor Christiansen, whose personality and musical talents fit him well for the task of directing the choir. Besides conducting the choir, he is a composer of note.

Members of the choir usually all are of Norwegian descent and of the same religious faith. Virile, vigorous singing of the old Lutheran hymns is a tradition at St. Olaf. All these things help the director in getting united effort. But Professor Christiansen insists such a choir could be developed in any college or any group of young people of average attainments.

Many have asked how Professor Christiansen obtains his unusual results. The answer, of course, is Christiansen. But one thing does stand out. He insists that his students must live the things they sing. If they can't live them, they can't sing them. He keeps pounding away at that. Your song must be the expression of your own inner life.

President Boe explained the purpose of this teaching and the place of music at St. Olaf.

"We have not cultivated singing as an art, but as a means of spiritual and intellectual expression," he said. "Art, in its highest conception, after all, must have a purpose outside of itself.

"The thing that makes the life of the average man so poor is that he has so few means of expressing himself. Every man has dreams and as-

Highbrows of Our Mills and Factories

Bryn Mawr's Summer-School Plans Work Out Successfully

By WILLIAM A. MCGARRY

WHEN Kipling wrote that "the Colonel's lady and Judy O'Grady are sisters under the skin," he was thinking, doubtless, of social distinctions swept aside in moments of intense human emotion. In that event the aphorism was intended to puncture the pretense that claims superiority over the common people for those born to wealth and luxury. It had no reference to the greater gulf between mental workers and the men and women who live by the labor of their hands. But leaders of a certain section of America's "intellectual aristocracy" are now demonstrating that it applies there, too, and with equal force.

In the classic halls of Bryn Mawr College working women are studying psychology, economics, music, literature and other so-called highbrow subjects. These same women are those who have toiled in sweatshops and telephone exchanges, in paper mills and laundries, in soap and cigaret and automobile factories. At the end of the summer they will be back at their machines and desks and work benches, living, some of them, in dingy boarding houses, but "sisters under the skin" nevertheless, of girls born to wealth and social position, sisters in the sense that much of the class hostility due to misunderstanding will have disappeared.

Nowhere else is there a school where the students are more eager to learn than at Bryn Mawr, the summer school for women workers in industry. The teachers, most of whom have had classes in other great American colleges, are the authority for that statement. It is a thirst for knowledge, too, that works both ways, for the women know from personal and intimate experience conditions in a dozen industries that teachers know only from books and surveys. The result is that nowhere else can a teacher get so much first-hand, practical information from his pupils.

If Bryn Mawr graduates and teachers who organized the school believed that they were doing a favor for working women and getting nothing in return but the warm glow of philanthrophy, experience has changed it. Bryn Mawr has learned as much as the workers. Women of the shops and factories are showing that they can think, and that even those who have been deprived of the advantage of early education are doing things to solve industrial and social problems that are well worth the study of the educators.

The school was started in 1921 by Miss M. Carey Thomas, now president emeritus of Bryn Mawr College. It was the result of a life given to the study of higher education for women. The college administration, the faculty and the alumnae joined. They sought the aid of Miss Mary Anderson, director of the Women's Bureau of the Federal Department of Labor, who furnished a list of names of women workers in industry from which appointments were made to a joint administrative committee.

When the school opened the college administration was in control of the joint committee. Everyone interested in the project knew that the experiment would be regarded by organized labor as a test of organized education's sincerity. How that test was met is explained by a description of the present controlling organization, and the changes that have taken place in it. The worker-students today have virtually equal voice with the college on any question that may be brought up. They have equal representation on the joint administrative committee, strong representation on the council, which meets once a week, and their own system of student self-government.

The spirit of co-operation thus brought about is the real foundation of the summer school. It permeates all the activities of the students. In the opinion of educators and of the workers it is essential to the success of the movement to give working people access to the heavily endowed colleges and universities. Radicals among labor leaders, and even some of the conservatives, have criticized colleges, calling them centers of propaganda for the rich. It happens that education is an expensive commodity, the rate of cost increasing with the progress of the student. Somebody had to pay for the great expansion of colleges in recent years, and since the government failed to do so the funds came from wealthy men. That fact made plausible to some minds the charge of the radicals that the colleges were "subsidized" to present nothing but the arguments of the employer, and unquestionably that was true in some cases The public has been made familiar with them by the disputes between professors and trustees aired in the newspapers. Occasionally the argument over academic freedom has penetrated even to politics.

Outwardly, Bryn Mawr was open to that form of criticism. It is a college for "highbrows" and generally they have been the daughters of men of some wealth. Learning has been the great requirement, rather than social position. Bryn Mawr has been called "the last stronghold of pure scholarship." But the mere fact that it is heavily endowed from privately contributed funds made it only natural that organized labor should be suspicious when the plan for the summer school was announced, and should scrutinize the administration. The contention was to be expected that the whole purpose of the school was to furnish counter propaganda against labor doctrines.

Knowing that, Bryn Mawr took steps in the very beginning to prevent it by removing from the minds of workers the last vestige of doubt as to any suggestion of control by wealth. The original organization was set up merely to put the project into operation. Even in that form it was so successful that had no changes been made it could have gone on. Students and outside union leaders represented on the joint committee were consulted from time to time, and as a result the present form of organization was established for the present year.

As it stands now the joint committee consists of eight representatives of the college, appointed by the directors; eight representatives of women in industry, elected by the first-year graduates of the summer school; seven representatives of the Bryn Mawr Alumnae Association, graduates of the regular school year; seven representatives of the summer school alumnae; two members of the summer school faculty, and one Bryn Mawr undergraduate.

Above—Industrial workers' group. Below—Telephone operators' group studying at the summer school.

The function of that committee is to represent the board of directors of Bryn Mawr College. At the beginning of this summer's term the committee turned the ground and buildings over to the council, an organization formed to direct the actual operation of the school. The council has 15 members. Six are students of the summer school, two are tutors and two are instructors, all elected by the students. The five others are named by the joint committee. They consist of the director, the assistant director, who is a labor representative; the executive secretary, the social adviser and the publicity secretary. Thus it will be seen that the students have direct control. It is limited only by the fact in event of a disagreement the director may suspend action of the council until the matter is submitted to the joint committee.

But even the representation on those bodies does not measure the full extent of student control. The women also elect their representatives to the committees on health, hall management and social activities. Last year they had representatives sitting with the faculty to consider purely academic questions. It should be said that the regular Bryn Mawr faculty decided it would be better to bring in outside teachers for the summer school, and they are recruited from other colleges. Most of them have had previous experience in adult education.

The same democratic ideas were carried out in the selection of students. There was no effort to pick women who had had unusual advantages. Entrance requirements were and are a common school education or its equivalent, ability to read and write English, good health and a sound physical condition. The students were selected by district committees composed of Bryn Mawr graduates and women workers, from among "women working with the tools of their trade, and not in any supervisory capacity." The purpose of the school was outlined as follows:

"The object of the school is to offer young women of character and ability a fuller special education and an opportunity to study liberal subjects in order that they may widen their influence in the industrial world, help in the social reconstruction and increase the happiness and usefulness of their own lives."

In its first year the school had 82 students, including a leaders' group of 10 women who had had supervisory experience in industry. This year 100 students were admitted, of whom 13 comprise the leaders' group. Eleven nationalities are represented and 21 distinct industries, with a preponderance of textile and garment workers. The age limits for admission are 18 to 35 years. Some of the women started working when mere children, and all have put more time into work than they were able to devote to school.

None of the students had had experience in an institution of collegiate standing, although most of them had made various efforts to educate themselves. Therefore, they had no idea of how much time should be devoted to study when all of one's time is available for that purpose. In industry many had worked the 12-hour day in the years prior to the inauguration of the eight-hour standard now recognized by most industries. They learned with some surprise that the Bryn Mawr limit for students of the regular college year is 15 hours of classroom work in any one week. That standard has been fixed as a result of long experience, and compares with similar standards in other colleges. It seemed ridiculously inadequate to the women workers. They had not learned that after a lecture or discussion the most brilliant mind needs a little time to digest the information obtained.

As a result instructors and teachers are kept on the jump. When one for any reason fails to keep a lecture appointment he is likely to find the group of workers sitting on his doorstep, waiting to find out why, when he returns. No matter what the hour, they are then ready to go on with the prescribed study. The normal college student accepts such an accident as a welcome and unexpected vacation, and as a rule the burden of making up any lost time is left as far as may be to the instructor. But the summer-school women take their studies seriously.

At almost any hour of the day the visitor to Bryn Mawr may find groups of students gathered in shady corners of the campus, in animated discussion. Generally there is an instructor present. Always there is a tutor and one or more college girls, undergraduates of the regular school year. So thoroughly have these children of wealth gained the confidence of the working women that class consciousness and suspicion have disappeared. Lectures are discussed quite frankly from the points of view of the worker and of the employer. There is no talk of radicalism. Both sides have developed a tolerance for the opinions of others that is perhaps the greatest achievement of the summer school. All that is particularly valuable since in the nature of things the women of both regular and summer-school courses are potential group leaders. The working women will play active parts in trade unions and in politics, and what they have learned will be of inestimable value to them and to their associates.

Bryn Mawr summarizes the results as follows:

"Viewed from every angle, it is agreed by all who participated in it that the first summer of the school was a success. The undoubted intellectual development of the students during the two months in itself would have made the experiment worth while. Added to this, an asset almost equal in importance from the students' point of view, was the contact between different groups and the broadening of mental horizons."

Something About New York's "Water Cure"

Search for Unconstitutional Liquor a Disappointing Errand

By a Metropolitan Observer

ONE of the stock phrases about prohibition and New York is that the average New Yorker refused to take the then impending law seriously because "it could not be done."

That is not true. New York City is about as dry as any other community of the United States. But this must be understood to mean the New York of the real New Yorkers, those who have their homes in this huge city and are not sojourning for indefinite periods for the sake of merely being identified with its life.

The New Yorkers' New York is a magic city. It exists even though it is difficult to describe. There has gone forth to a credulous world that New York means the Great White Way, now a misnomer, or some of those numbered streets evasively classified as Thirties, Forties and Fifties, or both. The New Yorkers' New York is alike unto the Parisians' Paris. In either case these real cities are discoverable only by the serious traveler and the thoughtful passer-by.

There are many unrelated hodgepodge districts within the city proper that are commonly considered New York when they are not New York at all. For what happens in these respective districts New York takes the blame or praise, but as there is more of the former than of the latter, the layman draws conclusions that are off-color. One hears of "wet Broadway" and of "humid Sixth avenue" and of "dewy Forty-second street." One hears about the barrels of "religious wine" flowing around Hester street, or the beer that can be found in Teutonic neighborhoods on Second and Third avenues, or the alleged Chianti of Mulberry street or the imitation St. Julien to be had at French restaurants just as one hears about the "perfect coffee" that one may obtain at Brazilian coffee houses run by Greeks, perhaps, who know nothing about South American geography.

The Eyewink Fiction

THERE is a fiction abroad in the land that the mere eyewink, if accompanied by the *savoir faire* that characterizes the man about town and which stewards and waiters regard as the *sine qua non* of safety, Volsteadily speaking, will be the magic wand that produces any and every drink, but the fact is that in real New York one can wink until doomsday and fail to get anything more than Croton water. Water is the regulation metropolitan drink; it is the American drink of the average American. In this respect New York is United States.

The wink, of course, is metaphorical. No such thing is needed. No honest-to-goodness waiter would know what to do with it. He might think that the patron's eye suffered from a turned eyelash. At such places where drinks are purveyed one must ask what is wanted even if it is not seen anywhere around. Whether it will forthcome depends upon the impression that the patron created upon taking his place. And after that he will be sold, if the sale follows, what is called a drink, under many guises and disguises. These transactions—which take place daily by the hundred thousand—are like art purchases; the price may be too high or fraud may be practiced.

Such transactions, however, are really not intended to transfer good and rare intoxicating beverages to the first caller therefor, no matter the consideration involved, but rather to produce "local color." The gay dog and the chap who likes to appear as the experienced and blasé man about town would be disappointed if he did not get this mental prismatic effect, especially if he wishes to show off, as usually happens to be the case. It is either the friend from the "old home town" or it is the girl of the hour. In any event he likes to expand with the consciousness of being a superior person, who knows the ropes, who snaps his fingers at the idea that there is such a thing as forbidden fruit.

Advertising the Trade

NEW YORK being a commercial town, New York sells this local color to all comers, indiscriminately. It may be color with a kick, but it is not the sort of drink that a sensible man would care to have after having tasted it once. The method may vary—and the methods are innumerable. It may be a "confidential" address; it may be a password; it may be the introduction to a "waiter with a mole under his left eye" who answers to the name of Antoine and "controls his own special supply"; it may be a signed card by a known patron. In general, however, it's a most ridiculous sort of interchange, in which the bibulous one cuts the most ridiculous figure.

"Booze must be sold or there wouldn't be so many arrests every day," a citizen of a near-by state was observing recently.

Booze *is* sold, no one can deny that. One cannot sell booze these hectic days and then palm off colored water. Man's nefarious ingenuity has devised various ways of extracting ethyl alcohol from all kinds of substances, even methyl alcohol, and it is this raw and sometimes dangerous stuff that is supposed to be the cornerstone of New York's current metropolitan life. As a matter of fact, every arrest of the kind for violation of the prohibition laws, being duly recorded in the newspapers, is merely a free advertisement, and a valuable advertisement, because usually it is accompanied by such valuable analytical information that the fluid —whatever it might be—was "real stuff." It has to be or the charge would not hold.

So that is exploding theory No. 1, that to get a drink in New York one must be an elect of the elect. The chief morning newspaper gives this information to 500,000 persons daily. Every such address and name is a source of future supply for those who desire to be supplied.

The real New Yorker, however, fails to get in on the ground floor of these ventures, and, to be just, it is doubted if any New Yorker worthy of the name is even identified with the sale of this booze. He may be irritated because of the bad name that is given to his home town, but in the end if he has a sense of humor he must laugh. It's what makes his city what it is.

The real New Yorker, moreover, has no need to go to the theaters and other places of entertainment—not often. So the constant plaint about the high cost of first nights and the like is of no consequence to him. By walking from Fiftieth street at Broadway, then turning westward at Forty-second street as far as Eighth avenue, or even a wee bit farther, he can get all the free entertainment he can stand. If he feels like more, however, he can extend his pilgrimage as far as Thirty-seventh street around Broadway, and he has covered about all of "wild" New York there is.

Of course, there is the quarter—the "naughty" quarter, blandly known as the Village, prefixed by Greenwich, but this is another bit of local color that is an imitation of the neighborhood of Boulevard Sebastopol and Boulevard St. Michel, the main arteries of the once flourishing but now decadent Latin Quarter of the French capital. The Village is a fraud through and through in the sense of naughtiness, but the fraud is aided by the premeditated "artistic effects" of candlelight or shaded incandescents of low wattage, for the Village thrives upon such pallid effects as the White Way thrives upon the glaring, chromatogenous and often inharmonious illumination. So the diner after sensations gets something served on a coffee-and-ash-stained cover that is dubbed a tablecloth, marks left thereon by the geniuses that are supposed to frequent those eating places.

But be it the Great White Way or the Village, one cannot be insensible to the almost painful exertions of otherwise sane human beings—sane when they left their home town—to appear as mysterious revelers in the forbidden pastimes. One may go into an ornate but harmless soda emporium on the east side of Broadway between Thirty-ninth and Forty-second street to see what? An able-bodied man acting as host to a pair of noisy flappers, he drinking or eating, or drink-eating, rather, a concoction before which he would have paused, with all of youth's carelessness and courage, some 40 years before, and actually appear to be enjoying it. It isn't the drink—it's the vicinage that counts. It's Broadway.

Telling the Folks at Home

TO THE folks back home he will afterward speak about "drinks" and "the life," and thus aid his listeners to formulate wrong deductions. It's the sort of tale that foolish tourists take back.

As a rule, however, the places that are truly the ones where high-life abounds are very few indeed; they are fewer by many than the number that existed 10 years ago, before the Becker-Rosenthal affair snuffed out the rough spots, and even then these places were anything but numerous. With an average of 300,000 visitors every day, and if only one in a hundred had a penchant for wild oats, it would mean 3,000—and New York today has no organized facilities to cater to that many peccable-minded. The latter must do their share in attaining their object, and if this is done New York will furnish little more in the way of diversion than any other town.

What the metropolis will furnish that no other city in the country can furnish is a greater variety of anything. And because it furnishes variety it also furnishes good quality as well as bad. The traveler who cheerfully permitted himself to be robbed by Parisians on the supposition that he was having a good time is the prototype of the American who cheerfully pays all that New York asks of the visitor, for after all New York can sell no local color to the New Yorker. The New Yorker will in turn permit himself to be robbed in Paris, but not by a New Yorker in his native habitat. The New Yorker at home is like any other townsman at home. He is wise; he is careful; he is good.

With an unusually large proportion of very rich or very well-to-do inhabitants the metropolis is, inevitably, doing what all other towns are trying to do about the booze traffic. For every conviction there are two home-brewers. In the main, the municipality does not regard the prohibition law seriously. It goes through all the motions but the results are infinitesimal.

With Canada to the north 12 hours, with Cuba or the Bahamas away a hundred hours, and with England five days away, and trains and ships arriving every day from those points, it goes without saying that contraband booze should form a principal item of illegitimate business. One can get it anywhere. But to repeat, it is not the New Yorker who predominates in demanding such booze, but the visitor or the alleged New Yorker.

A visiting newspaperman from Ohio wrote a story some time ago in which he alleged that Fifth Avenue was the principal consumer of high-priced liquor. By Fifth Avenue he meant, naturally, the residents of the million-dollar mansions that line that famous thoroughfare north of Fifty-seventh street. But those homes in truth do not figure in the defeat of the Volstead law. In the most cases, to begin with, they are monuments to the success of past generations of hard-working Americans, and in most cases, too, they are literally mausoleums, since they are boarded up. The only vestige of life is the caretaker's dog. The owners, quite likely, are aging or aged survivors of the New York of a generation ago, and one cannot blame them if they cannot bring themselves to live in the city that, outwardly, bears little resemblance to the town of the late nineties.

Those homes, therefore, have become houses. They disappear one by one. They have no relation to the life of today, and therefore are not involved in bootlegging transactions. In every probability every such home has a cellar—the kind of cellar that cultured families knew how to maintain—retaining their liquid stocks as they were left in years gone by.

Where these families of yesteryear are represented by the so-called younger generation the picture is different. New York is no longer the social center that it was once, since most of the social duties are discharged in hotels and restaurants, and if they are inhabited at all, they are "estate" homes that have little in common with the predilections of their present owners.

The wealthy booze-buying element of New York does not linger in the city. It retains a residence here, whether it be a small apartment or a 50-room house, but the real habitat is somewhere out in the country, usually up the Hudson somewhere. But as gregariousness in the country is prevented by the distance between homes, club life settles all problems and eliminates all difficulties. Thus the clubs of this kind are those that may provide responsible bootleggers a stupendous profit in return for services, but the most liberal estimate would hardly justify the assertion that New York's rich people are the chief consumers.

Among the Needleworkers

IN FACT, more booze is being dealt with in the so-called neighborhoods where a certain type of sleek needle-trades manufacturers abide than is purveyed elsewhere. The men who are identified with banking in Wall Street, in the same measure, are much more dry than are the stockbrokers. It is a problem in relativity, not in comparisons.

In May, Scotch whisky, which somehow seems to be the whisky most in demand, was quoted in New York City at much lower prices than in Washington and in Albany. Supply exceeded the demand. A number of reasons contributed to this sluggishness, the chief of which was that quality had dwindled, and any price was too high for colored water. Thus the New Yorker of means, being on the defensive, refused to buy booze that was sold at local-color prices. And when the gratuitous critic from out of town says of the New Yorkers that they are the most credulous and gullible people on earth he has in mind the resident who passes as a New Yorker but is not one. The New Yorker is about as foolish as the Chicagoan and the San Franciscan, and that said all is said.

Sherry at $10 a gallon in tins, 12 per cent claret at $5 a gallon, imported Italian vermouth at $3 a bottle (not the dealcoholized kind) and a good cognac at $9 a "fifth"—those are some of the items that the experienced purchaser will pay for genuine products. But it goes without saying that a 300 to 400 per cent increase involved in those prices since 1918 is something that causes any sane man to pause. The stuff at those prices is not worth it. It is not worth it even as medicine.

Oiling Wheels of Commerce

SOCIABILITY, therefore, is not alcoholic—not in New York. If it is, it is so on about the ratio of Denver or Cleveland. In only one sense New York draws upon the booze supply to a greater extent, and that happens in the commercial world, where purchases or sales depend upon the final touch, as it were, at the end of a perfect business day. Yet it is not because the New Yorker is anxious to bestow booze that this happens, but the out-of-town visitor rather expects it. It's second nature to arrive from anywhere and expect the first New Yorker you meet to set them up. In fact, a buyer from one of the big southern department stores said that the New Yorker who hasn't got a bottle is shy on something, and accordingly his goods must suffer equally. It's an extreme opinion—but it has been voiced. And this being so the New Yorker must protect himself.

It's the same thing when the New Yorker goes a-visiting. Unless he is sure of calling upon persons who don't give a picayune if booze keeps or not, he must fortify himself with a supply—no matter how infinitesimal—just for moral effect. What? Just arrived from the "big burg" and nothing on the hip? It would be tantamount to having left his samples behind. "The wettest town" in the States and not a drop? It would be unthinkable. That's what outside public opinion thinks of New York. But to repeat—that outside opinion-holding public pays for it in ratio to its New York purchases.

If New York is not dry it is wet for these reasons. The marvel is that it is not wetter.

Let's tour the town to see what it yields.

One stops at a prominent hotel. The guest has registered from Missoula. He lingers as he fusses about the change for the bellboy, but he hearkens, too. There is tension on the former's part and there is a

Emerson Hough—Historian of the Far West

A Case Where Discharge From Job Spelled Success

By FRED L. HOLMES

IF THERE was ever a man who learned the literary art in the school of hard knocks, it was Emerson Hough, of Chicago, now nationally known as an author and novelist. His father wanted him to be a lawyer and educated him for the profession. He went to New Mexico and located 80 miles west of Socorro in the mountain region between the Rio Grande and the Pecos rivers. His father failed in business and with the absence of an income at law Mr. Hough went to writing. When an offer came to represent a publication and write out-of-door stories at $15 a week, minus the office rent, he felt that at last he had "arrived."

At the age of 40 years he was discharged from his job. That made him a success. Now he has 29 books to his record, some ranking among the best sellers. He believes that if he had been cashiered 10 years earlier he would have done still better. His out-of-door writings have made him an authority on wild life in America.

"Sometimes I wonder if I ever slept under one roof 30 nights consecutively," he remarked recently. Then a smile, reminiscent, triumphant, wreathed his face.

"My story is one of many disappointments and discouragements," he added. "I have received $1,000 for a story no longer than an article I once wrote for $10."

Emerson Hough is today 66 years of age. He is of medium height, his hair and mustache white, features regular, broad of shoulder and big of torso. One can easily visualize the man who years ago hunted big game in the remote corners of America. His hobby is the out-of-doors and wild life.

"Twenty years from now the wild life will be practically exterminated east of the Mississippi River," said Mr. Hough. "The frontiers have been pushed back until today there are few remote spots in America and wild life has few refuges. Every movement to save wild life and wild-life refuges, to save striking beauty spots for state and national parks has been fought by greed. Greed is still wolfishly watching its opportunities to commercialize these beauty spots. Witness the recent effort to erect a big dam adjacent to Yellowstone Park and to ruin one of the most beautiful sections of that park. We must be on our guard to conserve the national parks already created, and we must establish as parks other beautiful spots that are in danger of being destroyed. We must establish wild life refuges throughout the country. If we do not, the wild life of today will meet the fate of the pigeon and the buffalo."

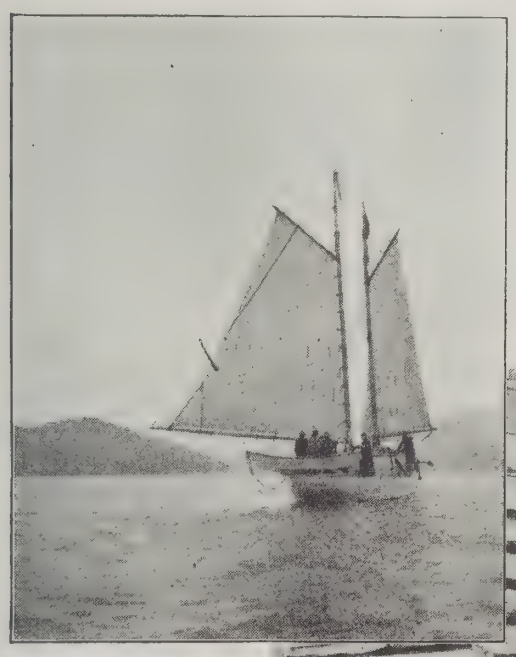
It was the picture of the West when he was a young lawyer in a half cow town and half mining camp that has filled his mind with historic pageants from which many of his novels have come. In the rough, pioneer life of New Mexico he received his most vivid impressions.

"It was then I began to love and understand the great West properly," he said. "We had a rough little town where we always went armed. My law practice did not amount to very much—I was always going bear-hunting instead of reading law—but I really was admitted to the bar at Lincoln, the county seat of Lincoln County, New Mexico, under old Judge Warren Bristol, who was then holding the first court of Lincoln County. "I could write a volume about the curious incidents of those old days of law on the frontier. I was then located on the field of the activities of the bandit, Billy the Kid, and his gang. Pat Garrett, the sheriff, who killed the Kid, was a great friend of mine. Twenty-three years after I had left White Oaks, New Mexico, I went down to El Paso, and Pat Garrett and I got a rig and traveled over the old scenes. We stood at the grave of Billy the Kid at Fort Sumner, and saw the ruins of the old adobe house in which Pat killed the Kid.

EMERSON HOUGH,
Captain in the Officers' Reserve Corps.

"Many and many a tale of actual desperadoism I could tell from personal experiences. At the time I was practicing law, I was all the time trying to break into print. The old *American Field,* printed by Dr. N. Rowe, published a series of stories of mine called 'Southwestern Sketches.' I suppose this was the first literary work with which I really can be credited, except a little sporting sketch for *Forest and Stream* in 1881."

Mr. Hough worked on a "society journal" in Des Moines, Iowa, at one time. Again he did odds and ends and collected bad debts on the Sandusky *Register,* Sandusky, Ohio. These were bitter, unremunerative days. Then he tried to do some work for the sporting papers. In 1889, he took the Chicago office for *Field and Stream,* of New York, at a salary of $15 a week. Meantime he was supporting his family in Iowa. Sometimes he was able to eat two meals a day, often only one. He sent his salary home to his people one week and kept it the next, "and never was in debt and always had a dime or so in my pocket." Later this office salary was doubled and things came a little easier.



"I began to do special work for the daily papers now and more or less regularly wrote for the old McClure-Phillips Syndicate," he said. "These boys were pretty much broke all the time. They paid me $5 a column—when they paid it—which was always 90 days or so overdue.

"As I knew a good deal about sporting matters, I began to be considered somewhat of an authority on field sports in the West. For the McClure Syndicate I did humorous stuff, at a time when I was sadder than I have ever been since in my life. Thus I broke into the game little by little, and with the hardest of hard knocks, without any training."

An intimate knowledge of the newspaper office in these trying days is disclaimed by Mr. Hough. He declares he knew nothing about the inside of a newspaper until he was 50 years old. He has always been a special writer. He pictures himself as starting life with "very small equipment—a university education perfectly good and perfectly worthless."

Supplementing the special articles, he wrote a book, "The Singing Mouse," published in 1895, and then the "Story of the Cowboy," which was really his first success as a book author. The cowboy story struck the fancy of Theo-

Making Canada Safe for the Canadians

Dominion Needs Population But Is Sensible Enough to Select Its Immigrants

By A. R. PINCI

CANADA is a country that has learned her patriotic A B C's at the beginning of her normal national greatness. Pretty as such phrases must sound for publicity purposes, making "Canada safe for democracy" or making "Canada safe for the world," they would be discordant in the Dominion as they are discordant in the United States. Canada wants to make herself safe for the Canadians.

Canada needs an increase of population. But Canada seems to have made up her mind that she is not a refuge, not an asylum, not a place to "hang one's hat." She is combating, even before it has started, but not any sooner than it seemed necessary, the idea that Canada indiscriminately owes the world a living. As a nation that has had to pay dearly of her treasure and her blood to maintain her independence in the face of militarism, she is now ready to sacrifice maximum national growth, measured in terms of numerical citizenship, by denying hospitality to overwilling guests. In other words, Canada has nipped in the bud that tendency that based once upon the generously logical has developed into the maudlin sentimental.

To do so the Canadian people—because it is the voice of the Canadians that is being heard upon the subject—the Dominion has frowned upon individuals or organizations whose favorite singsong is to keep open house. As a result it is a rare thing indeed to hear anywhere in Canada the kind of suggestions that one hears so insistently in the United States—that it is un-Canadian to be selective.

All this, too, in spite of the tremendous need of adding to the population—a population that numerically small is performing economic miracles for the sake of a posterity that is imperiled at this time by the backwash of the recent war.

Desire American Immigrants

SO PARTICULAR is Canada about the kind of settlers she wants that efforts are actually being made to induce residents and even citizens of the United States to emigrate there. Colonel J. S. Dennis, chief commissioner of the department of colonization and development of the Canadian Pacific Railway, whose efforts are said to be the model of those adopted by the federal department of immigration and colonization at Ottawa, said: "We must, naturally, look for the larger proportion of our agricultural colonists from the United States, where there is a large agricultural population, and draw from where the conditions of climate, agricultural methods, currency, weights and measures and other conditions are similar to those existing in Canada, and where, under existing conditions today, prices for farm lands being high, and the value of the farm products being low, there is a marked disposition on the part of the people, particularly in the Middle West, to emigrate."

Canada is handling the immigration problem seriously, and it is the purpose of this article to show how seriously. The government of Quebec recently announced an aggressive campaign to "attract colonists from the New England states." An agent has been sent, or will be sent, to deliver lectures and try to persuade French-Canadians, of whom there are thousands upon thousands in those states, to return to their native province and take up farms.

The provincial government intends to adopt an attractive and liberal policy to aid these settlers. On each lot settled by a colonist the government will clear 15 acres of land and provide a house and barn. While such a policy would be decried in the United States as petty graft on a large scale, no matter upon how sound an economic structure the plan were based, the Canadian idea is to impress upon desirable settlers that they are going "home." Canada somehow seems to have sensed what has not been so thoroughly appreciated in the United States—that there is a vast difference between the immigrant who thinks of North America as a place to live, or as *home*.

Minds and Bodies

THE Dominion, of course, needs the body of the settler and needs the physical body in its best sense, but the Canadian captains of industry and progressive government officials realize it is well-nigh useless to make a collection of mere bodies without their accompanying minds. That is why so much stress is laid on the matter of home and homesteading. That is why the Ottawa authorities are so distinctly pleased because the interesting sequel to the movement some time ago of Mennonite settlers from Western Canada to the United States has occurred in the form of an appeal to enable those prodigal children to return to Saskatchewan. The appeal was received during the middle of June at the Department of Immigration and Colonization from a former settler at Ernfold, who wrote from Millry, Alabama. He said in part:

"We would like to hear from you if it would be possible for your government to help us out here; I mean if it would be possible to loan us money to get back to our farms again. We cannot stay here as we are in such a bad shape now that we do not know what will become of us, so I pray you to help us out. My intentions never were to leave Canada, but I was talked up to do so and I am very sorry that I did."

Needless to say, there has been an attempt to read in Canada's desire to recruit immigration from points in the United States as an "unfriendly" policy, especially at a time when this country is anxious to retain the best alien population and at the same time prevent undesirables from coming here. Looked at from its best sociological aspect, however, the Canadian attitude leaves nothing to desire. At the present time, for instance, there are 600 United States factories that have full branch establishments in Canada, representing a capital investment of more than $400,000,000 and providing employment for 87,000 persons.

American farmers emigrating to Canada are, to all intents and purposes, so many "branch establishments" of American agriculture. As, to a certain extent, it is easier for the United States than for Canada to attract expert agriculturists, the loss of such settlers is not permanent, and moreover their settling in Canada merely assures the development of a nearly perfect nation to the north; perfect economically as well as politically, a no mean outlook for the time that the two countries may have cause to look to each other for their mutual extrication from the world's troubles.

Take the case of Mr. C. R. Asay. He belonged in Iowa. He is now a resident of Hanley, Saskatchewan. Iowa is one of the American states that is noted for its level-headed productive citizens. I don't know what caused Mr. Asay to move to Canada, but undoubtedly his must have been good reasons, and in saying this I mean in no sense uncomplimentary to the country he left behind. It would be within reason to assume that regarding himself in the same light of any other business man, he moved his business to a place where it would yield greater profit.

Well, Hanley is nearer to Minneapolis than is Washington, D. C. A sovereign hard-fisted Iowan transplanted to Saskatchewan can be a good example of Americanism, especially at a time when North Americanism seems much more plausible and certainly much more dependable than the unfruitful Pan-Americanism. One nice thing about Mr. Asay is that he believes in defending his good judgment, and he believes in doing so in black and white. So no sooner had he arrived at his new home than he wrote to Mr. A. E. Pilkie, Dominion government agent at Des Moines, as follows:

"We have arrived at Hanley all O. K. The car came through from Des Moines in four days. You must have done something to rush it along as it arrived two days before we expected it.

"Everything is in fine shape. We have had four inches of rain this week. How is that for a dry climate?"

One can appreciate Mr. Asay's pleasure at getting his household goods so promptly. Not only does it make him realize that the combined interest of the Canadian authorities and transportation systems are with him to make him feel at home, but that after all he is within four days' freight distance from his old home. And to appreciate what this means it is well to ask any New Yorker moving from Greenwich Village to Yorkville or Harlem if he can get his household goods moved in four days without getting something like an act of Congress and a dozen official introductions to the expressman.

Becoming Canadians

THE departure of the Iowan from the United States may be, in a way, a loss, but who can foretell what such emigration will mean 50 or 100 years hence, when the infusion of this new blood throughout Canada shall have accomplished its scope? At this time his appearance into Canada means a greater gain than his disappearance from Iowa is a loss, because the economic value of countless Asays in their new abode to those in America who have taken their place is beyond computation. In this respect Canada's policy can be better understood in its potential North American aspect—and that is why it is just as well to be shy of inspired criticisms that are purely detrimental without being logical or constructive.

Reduced to three words, Canada's urgent need today is "Colonize and Develop." Canada is awakening to the fact, however, that a policy of colonization may be unsatisfactory unless by colonization is meant something more than the mere forming of centers of population. As the editor of a Halifax newspaper stated, "the agitation in favor of registering all persons born in Canada as Canadians rather than as of the nationality of their parents is growing in power and favor. There is nothing very convincing in the argument that English, Scotch, Welsh and Irish descendants would not want to lose the distinction of their origin. There is, in fact, no census record that could make that clear unless the different groups married only in their own race. The moment they begin to intermarry their progeny ceases to be English, Scottish, Welsh or Irish, and becomes British. Their children, if born in this country, are properly Canadians."

The perpetuation of native distinctions is a continual source of trouble, misunderstanding and irritation. There is really no reason why Quebec should be considered a French-Canadian province, when it is inherently Canadian and nothing but Canadian. The French language is about the only remaining characteristic bequeathed by the forefathers that were the original settlers from France, and it looks as if the overwhelming potency of English as the North American common tongue will in due time smother the other, since it seems that no nation can be bilingual.

Quebecans point with pride to their French lineage, and they have every reason to be proud of it, yet it is clear that their French quality would become secondary as soon as they emigrated from France. In this case they have become Canadians, the more so because they have been obliged to learn English by the exigencies of their new environment. Hyphenation of language, therefore, is something that time itself will adjust, but officially hyphenation of nativity is a bad custom. It emphasizes distinctions that do not belong there.

The Canadian policy in behalf of immigration is essentially Canadian, and every emigrant to Canada virtually abandons there and then, upon admission, all previous distinctions and qualifications. That clinging to one's native traits is not conducive to the highest type of adopted citizenship is well proved in the United States in the case of certain nationalities that fail to attain it successfully until the second or third generation and those that racially fail to attain it at all, regardless of dissembling names and habits.

Canada's authorities are well aware that these have been and still are painful incidents in the national life of the United States and are, therefore, endeavoring to avoid them. So far, of course, hyphenation has been no trouble to Canada, but a weak or unsound immigration policy would easily lead to the disaster that could not happen as things are now.

As part of the British nation, not so much politically as ethnically, Canada's goal is to acquire the greatest possible number of new residents from England and Ireland. On the other hand, only about one in 12 British citizens can be classified as agricultural, and Canada is not ready to take over any unusual number of even British citizens without some knowledge of agriculture. The war has had the effect of diminishing the number of men and women that once would have normally gravitated into domestic service, for which the demand is greater than the supply, and this, too, at a time when England is about to look forward to the emigration of a few millions of her people.

Seek Agriculturists

HERE we have an unusual picture. It is well to comprehend its scope. For it means that Canada, a vast and wealthy nation, in a sense a colony of the kingdom, actually closes her doors to citizens who may be industrially unassimilable, and this is quite a commentary upon the manner in which our northern neighbor regards her duty in comparison to the still free and easy, if presently numerically restricted, policy of the United States.

When Canada actually agitates the point of cooperative action between Ottawa and London to evolve some scheme under which prospective young emigrants of non-rural type shall be fitted for agricultural life in Canada by some preliminary training at home, together with final assistance to enable them to establish themselves as farmers after this training has been obtained, it is impossible to doubt that the Dominion's plans and policies in the matter are far stricter than is imagined.

The dominion officials have realized, however, that it is very easy to misunderstand or to be misunderstood in applying restrictions of any sort, at destination more so than at the source, and in order to preclude annoyance many plans have been decided upon to obtain maximum results in minimum time.

What and how Canada does this, despite the limited means at her disposal as compared to the United States, is interesting to learn.

Canada maintains several emigration offices abroad, the chief one being located in London. The superintendent of emigration for Canada, J. Obed Smith, stated in the latest report to the minister of immigration and colonization at Ottawa, that intending emigrants, by their more intelligent and exhaustive inquiries, reveal a greater acceptability for the Dominion, and because of that the questioning habit of intending emigrants is cultivated to the utmost so that no one "shall go to Canada without being fully advised on all details."

Restricting and Soliciting

INQUIRIES in France and Switzerland are within the jurisdiction of the general commissioner for Canada in Paris, subject to review by the London office, if necessary, but all other correspondence from all continental countries, allied, neutral, is dealt with at first hand in London. The very necessary inspection of continental emigrants at the ports of Antwerp and Havre alone "have disclosed," Superintendent Smith declares, "conditions which in my various reports to the department make it clear that this operation has resulted in preventing very large numbers of undesirable continentals from taking passage to Canada with a mere chance of being admitted."

Yet it would be senseless to restrict without a corresponding activity to solicit, and Canada is doing both. For instance, under the jurisdiction of the London office, a large exhibition motor-wagon was constructed and placed on the road, to travel along the agricultural areas of England. It is in charge of an officer of Canadian residence and experience, travels from village to village and from school to school, and even stops at the hedgeways *to discuss Canada with men at work in the fields.* "We are carrying Canada to the classes Canada calls for." Trailing a man to his lair and then talking to him, in terms that he can understand, of a better lair is unquestionably a better system than that of waiting for men to call on their own account, for the simple reason that it is one thing to find a desirable prospect at work and talk to him sympathetically then, and another to talk to a man who *says he works.* To understand what this means it is merely necessary to realize that men who are planning to emigrate to Canada or the United States claim vocations that are not their true ones.

Special agents are employed for the purpose of interviewing, especially in provincial towns, booking agents, and these visits are not intended as investigations but

A Mountain Memorial to Theodore Roosevelt

Thousands of Miles of Nature to Be Dedicated to Nature-lover

By HARRY H. DUNN

THE United States Government, at the suggestion of one of the states, is preparing to establish one of the most magnificent, if not, indeed, the grandest, monuments ever set up to the memory of any man. By a bill which has been passed by the Senate, and which is now in the House of Representatives, there is to be set apart forever as a memorial to Theodore Roosevelt, more than 1,000 square miles of the loftiest mountain peaks, the headwaters of five of the most beautiful rivers, nearly 90 per cent of all the oldest and largest trees that remain on this earth, and the greatest and most varied wild-flower gardens ever planted by the hand of Nature.

Mount Whitney, highest mountain in United States outside of Alaska, 14,501 feet high.

This tract, which lies almost on the crest of the New World, is located on the summit and the western slope of the Sierra Nevada, in California, about 100 miles southeast of Yosemite National Park, and 150 miles south and east of San Francisco. It takes the form of an expansion of the present Sequoia National Park, established in 1891. Motor stage lines to Visalia make access to the new Roosevelt-Sequoia National Park, as the memorial is to be called, comparatively easy. In this area, covering a space equal to that occupied by 35 townships, there will be no roads, according to present plans, and no hotels, save such as are already established in the forest of the largest redwoods in the world, some of them 3,000 years old, in the original Sequoia National Park. Trails will be constructed throughout the Roosevelt monument. The man or woman who goes to see its beauties must travel on horseback and must camp out when night falls. In other words, this section of the "Alps of America" is to be kept in its pristine loveliness and its primeval wildness, for the edification and education of those to whom the original beauties of America appeal as they did to Theodore Roosevelt.

The new park was first suggested by John Muir in 1901. The park lies along the crest of the Sierra Nevada for a distance of approximately 60 miles. Its width ranges from 15 to 40 miles.

Within its boundaries it contains 10 of the higher peaks of the United States, all more than 14,000 feet in height, and one, Mount Whitney, 14,501 feet high, the loftiest mountain top in the continent, with the exception of Alaska. It contains the headwaters of the Middle and South Forks of the Kings River, one of whose valleys is as beautiful as that of the Merced River, better known as Yosemite Valley, and of the two forks of the Kaweah River, as well as of the Kern River. Into these streams flow, through the park, a dozen tributaries, each one with its own canyons, valleys and meadows, while the Kern River dashes through a stone-walled gorge which has many of the beauties of the Grand Canyon in miniature.

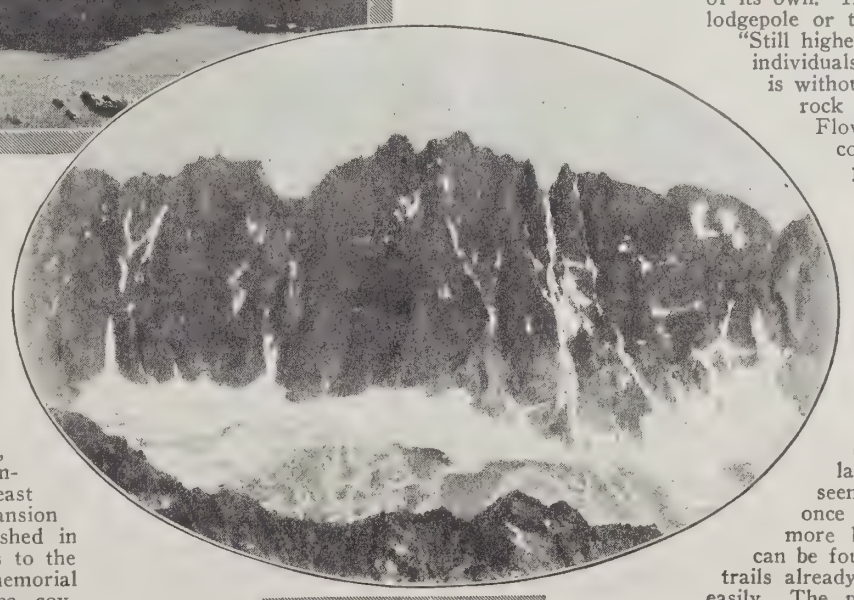
Lakes dot this mountain fastness thickly; wild animal and bird life is abundant, and in the waters of the upper Kern lives the golden trout, native to these streams, and found nowhere else in the world. In one meadow, on the South Fork of the Kings River, botanical experts have found growing one of the greatest collections of wild blossoming plants ever assembled.

Francis P. Farquhar, of San Francisco, who has walked alone and with companions from end to end of this great tract, who has climbed many of the peaks within it, and who acts as spokesman for the Sierra Club in meetings with officials of the government seeking to fix the boundaries and arrange for the opening of this memorial park, gave me the following description of this reservation:

"The proposed Roosevelt-Sequoia National Park is an enlargement of the existing Sequoia Park, to include 1,000 square miles additional. The Sequoia National Park was established in 1890 to preserve the magnificent forest, containing the giant sequoias, sugar pines and firs.

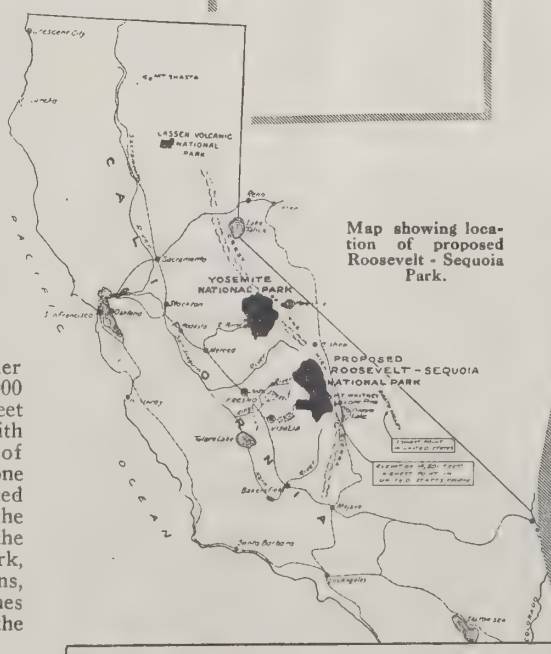
Thanks to the foresight of the nation, that forest now stands safe for future generations. But it is apparent that not enough has been set aside, and for many years the idea has been urged that the boundaries be enlarged. The act of enlargement has, for one reason or another, been deferred in Congress. The way now seems clear.

"The general appearance of this wonderful country has been so well described that there is scarcely necessity to more than refer. John Muir's portraits of the lakes of the high Sierra, the splendid coniferous forests, and, above all, the ice-wrought cirques, gorges and canyons, are masterpieces of outdoor literature. Altitude is always a matter of first concern wherever one may go throughout this region. Within the boundaries of the Roosevelt-Sequoia National Park there is an extreme range of altitude of 12,000 feet, extending from about 2,500 feet above sea level, to the summit of Mount Whitney, at 14,501 feet. The larger part of the area is in the higher altitude.



"Lowest is the sub-forest area, where dense chaparral covers the steep slopes of the canyons. There is only a little of this type within the park boundaries. It is not attractive to camp in, but is an excellent winter range for deer, and is important as a border protection. A little higher are found the bottoms of the great canyons of the main rivers. The floor of the South Fork of Kings River Canyon indeed greatly resembles the Yosemite Valley. The canyon of the Middle Fork of Kings River, however, is not so level and is narrower. The Kern River Canyon is long and narrow, and has but a few wide-open spaces.

"Next in altitude lies the main forest belt. This is acknowledged to be the most splendid coniferous forest in the world. Here stand the sequoia, the sugar pine, largest of all pine trees; the red fir, and many others of both pine and fir families. The boundaries of the new park extend into this great forest belt at two points. Above the main forest belt are the high forested plateaus, where the timber is distinctly inferior in size and proportions, but not without a rugged charm of its own. Here flourish the western white pine, the lodgepole or tamarack pine and the foxtail pines.



"Still higher lies a region where trees are scattered individuals. For the most part, this high country is without timber and is characterized by granite rock and alpine meadows of tufted grass. Flowers grow profusely in the meadows, conies and marmots whistle from the rock-piles, and butterflies float gently in the all-pervading light from the blue Sierra sky. Up through this high meadow land, one comes upon a little chain of lakes, and finds in the early season that the upper ones are still frozen, or covered with snow. Beyond, stand the high walls of cirques, or the ridges of the divides; while still above, tower the granite peaks, whose fluted sides, jagged buttresses, and glistening snowfields crown the Sierra.

"It is not a region for automobile or wagon roads; it is not a region for large hotels or crowded camps; it can be seen and enjoyed only on its own terms, but once these terms are accepted, no happier or more beautifully interesting camping grounds can be found. Throughout most of its area, good trails already extend, and others can be added very easily. The park is conveniently reached from the main highways, but inside travel in true Sierra fashion is by horses, mules and burros.

"Nowhere is there better trout fishing, but comparatively little game. Deer frequent the lower forests and the meadows, and there are a few bears, an abundance of the smaller mammals, especially rodents, and a number of interesting birds, including the tiny leucosticte, which nests as high as 14,000 feet, and the water ouzel, made famous by John Muir.

North Palisade, at very crest of Sierra.

Map showing location of proposed Roosevelt - Sequoia Park.

Cloudy Canyon in the valley of Roaring River. To the left is shown Simpson Meadow in the Middle Fork of the Kings River in the proposed Roosevelt-Sequoia National Park.

"Mount Whitney is easily climbed and has been ascended even by women and children. Near by, however, are peaks which try the most experienced mountaineer. More than 14,000 are North Palisade, Mount Russell, Mount Sill, Split Mountain, Middle Palisade, Mount Langley, Mount Muir, Mount Tyndall and Mount Barnard.

How Wall Street Feeds on Country Banks

Manufactured "Securities" Exchanged for Trust and Savings Funds

By CHARLES ALBERT COLLMAN

FREDERICK D. UNDERWOOD, president of the Erie Railroad, is a man of powerful physique. He has a bluff, hearty manner, and among railway men he is probably the most popular executive in the United States.

"F. D.," as he is more generally known, one day experienced the most unpleasant shock of his life. The bankers for the Erie, without consulting him, had spent $12,000,000 of the road's money in buying and loading upon the Erie the Cincinnati, Hamilton & Dayton, a railroad combination 3,689 miles in extent, which represented a mileage greater than that of the entire Erie system.

I happened to be the bearer of this unexpected news to the president of the Erie. He could not conceal his consternation and chagrin. Pacing his office floor for a few moments, he then exclaimed: "Well, I'm not going to say anything about it. No, I'll have nothing to say." But his tone implied that he was going to have a lot to say. And as the end will show, he did.

But the bankers for the Erie dominated the Erie board, and their action was merely another example of the small consideration given by Wall Street financiers to their railroad executives.

The "C. H. & D." had been bought from a financial group known as the Hollins Syndicate, the head of which was Harry B. Hollins. Associated with him was Eugene Zimmerman, better known from the fact that his daughter married the Duke of Manchester. Among other members of the coterie were the heads of several bond houses, and some experts in coal and railway enterprises in the Middle West. These men, in gaining control of a group of transportation lines, merely intended to make money, and that was all there was to it, so far as their intentions were concerned.

Securities But Not Secure

THE Hollins Syndicate is one of the classic examples illustrating *how Wall Street financiers produce the goods they sell.* For it shows that *one of the chief industries in Wall Street's banking parlors is the manufacture of institutional securities*—that is, *stock* and *bond* issues intended to be exchanged for the *cash deposited by the public in savings banks* and trust companies. The variety of such securities is legion, and they are made attractive by all kinds of speculative inducements. They may consist of common, preferred or prior preferred stocks, short-term notes, debenture, collateral trust, income, consolidated or convertible bonds.

Once having sponsored such issues, the banks and bond houses send out their forces of expert salesmen to dispose of the bulk of the securities to the "country banks," for whose benefit they were manufactured. For it is a significant fact that New York savings banks are not permitted to invest in collateral of the above-mentioned nature. The savings bank laws of New York, because of past experiences with Wall Street securities, have been made more restrictive than those of most other states.

Wall Street financiers, when they start out upon a campaign such as I am about to describe, generally seize upon a property of genuine merit, around which they then weave a deceptive financial web of elaborate proportions. The property selected in this instance was a small but important railway of great value. This short line had already been the prey of two financiers of a previous generation known as Ives and Stayner, of almost forgotten memory. Their financial operations had landed "Napoleon" Ives and his partner in prison.

The Hollins Syndicate, then, having acquired control of the road, a second syndicate was formed to buy up six subsidiary lines, whose securities were guaranteed by the C. H. & D. A third syndicate was now organized to buy the Pere Marquette Railroad, commanding the territory from Bay View, Michigan, to Detroit, and from Grand Rapids to Buffalo. This road was at once leased for 999 years to the C. H. & D., which was made to guarantee dividends on $16,000,000 common and $12,000,000 preferred stocks of the Pere Marquette. A fourth syndicate acquired the Toledo Railway & Terminal Company, a belt line railway, and its $3,650,000 bonds were guaranteed jointly by the C. H. & D. and Pere Marquette. A fifth syndicate was then formed for the purchase of the Chicago, Cincinnati & Louisville, a 264-mile line from Cincinnati to Hammond, Indiana. This was a newly constructed road, with wooden bridges and an unseasoned roadbed. It was sold to the Pere Marquette, and the $3,500,000 bonds representing its purchase price were guaranteed jointly by the latter road and the C. H. & D. A sixth and a seventh syndicate were created for the purchase of supplies and equipment.

A railroad combination had thus been created, extending over 3,698 miles, reaching from the Great Lakes to Cincinnati, touching Buffalo on the east, Detroit and Bay City to the north, and Springfield, Illinois, Chicago and Milwaukee on the west. The Great Central Route, as its organizers now called it, was a formidable and imposing proposition on paper, but physically, it was a weak and purposeless jumble of unimportant railroads.

The guaranties to which the Pere Marquette and C. H. & D. had been committed, were burdensome and a menace to their solvency. Hugely inflated bond issues had been authorized. The C. H. & D. had issued one for $25,000,000, followed by another for $50,000,000. On behalf of the Pere Marquette, a refunding mortgage for $60,000,000 had been authorized. Fifteen million dollars in collateral gold notes were also put out.

The collateral trust issues were of a most insecure and dangerous character. They were in effect, bonds secured only by deposits of stocks of the various lines. The stock capitalization and bonded debt of the Great Central Route, assumed by this time the inflated figure of more than $183,000,000 in outstanding obligations.

However, so complicated had been the ramifications of the Hollins Syndicate, that the unsound nature of the security issues was not at that time discernible. A great selling campaign was begun by the C. H. & D. financiers, who cleverly circulated confidential tips to the effect that all the stocks, notes and bonds would soon enhance greatly in value because a secret contract existed whereby the Erie Railroad System had pledged itself to buy the Great Central Route.

The collateral gold notes became especially popular in Wall Street among investors. One half of this issue was sold abroad, and a large amount of the notes was disposed of to members of the British royal family by an international Wall Street bond house. The collateral trust, consolidated and refunding bonds were less favorably regarded. But expert bond salesmen, trained in the plausible ways of their craft, were started through New England and the Middle West to unload the securities on country financial institutions. A large proportion of the bonds was disposed of, therefore, to savings banks, trust companies and individuals known to be in possession of funds for investment.

The profits of the members of the C. H. & D. ring were enormous. Every syndicate participant became a millionaire. One Middle West railway expert for the first time in his career a massed $1,500,000. A banker, interested in some of the underwritings, said to this man: "My dear sir, no man living deserves to make a million and a half dollars as quickly as you did. Get out of the game while you're ahead of it. Quit business, go to Europe, enjoy yourself for the rest of your life."

But the railway expert refused to listen to this well-meant advice. Bitten by the fever of high finance, he opened a bond house in the financial district, and joined in the profitable game of selling C. H. & D. securities to country banks.

While passing through Broad street one day, I met an elated C. H. & D. financier, who confided to me that the Hollins Syndicate had just concluded its final deal with the firm of J. P. Morgan & Company for the sale of the Great Central Route to the Erie Railroad for $12,000,000. It was this information, as mentioned before, that I carried to Mr. Underwood, president of the Erie, who at that time was totally unaware of the transaction.

The first action of the Erie directors was to send Mr. Underwood with his official staff, over the lines of the Cincinnati, Hamilton & Dayton combination, on a tour of inspection. He was to report on the nature of his observations at the succeeding board meeting.

The momentous day of the meeting arrived, and the Erie directors assembled in the board room. There were at that time on the Erie directorate, two figures eminently prominent in the life of Wall Street. One was the elder Morgan, always a domineering personality in finance; the other was Edward H. Harriman, head of the Union Pacific, keen in mind and wit.

A Man's Wrath

MR. UNDERWOOD presented the report on his survey of the C. H. & D. He pointed out the weaknesses of the various lines, the ruinous nature of their contracts and guaranties, and their tremendous over-capitalization. He showed that while the funded debt of the C. H. & D. had been increased more than $25,000,000, without an increase in actual values, and the fixed charges had been raised more than $1,578,000 annually, the cash assets of the C. H. & D. and the Pere Marquette amounted to only $100,000. He stated it bluntly as his opinion, that the acquisition of the Great Central Route would prove a calamity to the Erie System.

F. D.'s words fell like a thunderbolt on the ears of the assembled directors. A silence ensued for a few moments. It was broken by the incisive words of Mr. Harriman, who instantly supported the attitude of Mr. Underwood. He unhesitatingly stated his belief that misrepresentations must have been made with regard to the true conditions of the C. H. & D. property, and sarcastically referred to the large commission which the Morgan firm was making out of the deal.

The elder Morgan's temper always had been an uncertain quantity, and Harriman's caustic words stung him into instant fury. He struck the board table with his fist, and rose from his chair. "All right, gentlemen," he exclaimed, "there's been enough criticism. I'll dispense with my so-called 'immense commission.' We'll call this transaction off. I'll annul the deal, and take the C. H. & D. off the Erie's hands myself. I'll personally assume the $12,000,000 obligations."

So saying, the great financier stalked from the board room in a towering rage.

Morgan was always bold, resourceful, never at a loss or afraid to face a situation. His action in personally assuming the tremendous dangers and burdens of the C. H. & D. lines was, to say the least, magnificent. The sensational episode won him still greater popularity in the Street. In fact, it was generally understood that he had been led into the deal merely through his friendship for Harry B. Hollins.

But Mr. Morgan was no philanthropist. He had no intention of expiating the speculative crimes of others. His wrath fell upon the syndicate managers of the C., H. & D. Exactly four days later, he threw the 3,698 miles of railroad into bankruptcy.

The unscrambling of this great railroad omelet proved a disastrous affair to all concerned. Morgan placed his own men in charge of affairs. They repudiated every contract and guaranty that had been made by the syndicate rings. They notified the C. H. & D. interests that they had violated the Ohio state laws in leasing the Pere Marquette, and promptly broke the 999-year lease. They notified the Pere Marquette group that their acquisition of the Chicago, Cincinnati & Louisville had been contrary to law, and cancelled its purchase. They rescinded and renounced every agreement that had been made.

Eventually the interest was defaulted on the once popular collateral gold notes, the collateral trust, consolidated and refunding bonds. Now ensued a series of those depressing scenes which occur periodically in Wall Street when bond issues are defaulted. Protective committees were organized, ostensibly to protect the investors. Delegations of disturbed representatives of savings banks and trust companies in New England and the Middle West traveled to Wall Street to discuss the situation. To their consternation, they found that the best that could be done for them and their discredited bond investments was *to reduce the collateral to possession.* That ominous phrase meant, in other words, that instead of being owners of bonds, they owned stocks in a variety of smaller railway lines whose value at that period was a matter for serious concern.

Some of the security issues of the C. H. & D. Syndicate were rendered entirely valueless. Several bond and stock brokerage concerns, which had participated in the numerous syndicates, went bankrupt. Among them was that of the Middle West railway expert, who had refused to travel abroad with his $1,500,000 profits. His bones were picked clean by the harpies of the Street. *But the real and actual loss of this financial debauch fell upon the persons who had deposited their money in the country institutions that had been unwise enough to invest in the speculative securities of a Wall Street gamble.* In other words, the public paid the cost.

Safeguarding Savings

SUCH was the history of Wall Street's management of corporate enterprises at that time and period. And such is its history today, despite all the changes the years have brought.

That the country is awakening to a realization of the danger in reckless investments of savings bank funds, is proved by recent amendments to the savings bank laws of many states. During the last few years, banking institutions, in New England especially, have suffered unfortunate experiences through having invested large amounts of their depositors' funds in railroad and industrial stocks of little value, from which they derived no income.

Maine, for instance, permits the investment of savings bank funds in railroad stocks within certain limits. New Hampshire permits such investments in "the dividend-paying capital stock of steam railroads which, in each of the five years preceding such investment shall have paid dividends at the rate of not less than four per cent per annum on the class of stock in question, and all other classes of stock of prior preference." This state, however, altered its savings bank investment laws in 1921, by reducing the amount of railroad, public utility and industrial stocks that a savings bank may hold, *from 25 per cent to 10 per cent.* In Rhode Island, also, public savings may be placed in stocks, with certain restrictions. It is noticeable that many of the western states, including Iowa and North Dakota, very sensibly prohibit such investments.

A compilation made of the stock investments of the country's savings banks and trust companies, reveals a remarkable state of affairs, and discloses the extent to which Wall Street feeds upon the deposits in such institutions. Close upon $45,000,000 of *public savings in so-called country institutions,* are at present invested in stocks of steam railroads, industrial and public utility companies. Some of these stocks are of excellent character. They represent the capital of well-managed corporations, and have long dividend-paying records.

But by far the greater part of country bank investments in New York have been placed in shares which are merely the playthings of speculators on the New York Stock Exchange. Large numbers of these stocks have no investment value whatever. The equities behind them are of a most uncertain character. Many have never paid dividends, and never will. The money that injudiciously has been placed in securities of this class is dead capital, and earns not a penny for its depositors.

The following table shows the results of the compilation:

Stocks in Savings Banks		
Railroad issues	$15,134,800	
Industrial & public utility	5,166,700	
Total in savings banks		$20,301,500
Stocks in Trust Companies		
Railroad issues	$14,942,300	
Industrial and public utility	9,203,400	
Total in trust companies		$24,145,700
Total in country savings banks and trust companies		$44,447,200

"He's Great," Children Say of Art Director

By GRACE E. POLK

DUDLEY CRAFTS WATSON

DUDLEY CRAFTS WATSON is director of the Milwaukee Art Institute. He is also head of the extension department of the Minneapolis Institute of Arts. He has sketched over half of Europe and won awards with the results of his sketching. He has taken classes into Southern Spain and into Northern Africa. He lectures with equal facility on home furnishing and Greek sculptures; on the Gothic period and Roman architecture; on water color and batiking; on anything that has a connection, near or remote, with the field of Art; and half the towns of the Midwest, whose Main streets have had uneasy stirrings toward an appreciation of the beautiful, have listened gleefully to Mr. Watson, laughed at him and "tea-ed" him.

For all these things Dudley Crafts Watson is known up and down the states which the Mississippi calls its own. But when the recording angel takes out the Doomsday Book to write briefly the final epitome—not of these things will it be written. In that final catalog of achievement may be expected something like this: here is the man who started 500,000 children to liking art.

Everyone knows that an art museum is scarcely a favorite stamping ground for children. With the cosmopolitan curiosity characteristic of childhood, they do look in on picture galleries now and then, but with that tendency of theirs, equally characteristic, of seeing all things and holding fast by the bad, if left to their own devices, they shortly hurry away from Art to a wild movie, or a wilder vaudeville. Since Dudley Crafts Watson began to talk to Minneapolis school children about Art, a new thing has been noted. Half the people who come to the Institute of Arts on Saturdays and other days that are not holidays are children. They come alone, and they really look at things. The school children of Minneapolis, the youngsters of a dozen nationalities and all walks of life have suddenly become interested in "pictures and things."

Of course, the significant thing about this is that these very children who are swarming the galleries today will be, in 20 or 30 years from now, the men and women who will determine what the civic life of Minneapolis shall be. Repeat this in Milwaukee, where it has long been going on, and in a score of other towns and cities of the Mid-west and the influence that it may have on the future of American art becomes apparent. "Train up a child in the way he should go, and when he is old he will not depart from it." If they do depart from it, 50, 75, even 90 per cent, there is still a valuable residue left with which to combat what has long been one of Europe's most bitter criticisms of America that "in getting and spending we lay waste our lives" and the finer things of life find little sympathy with us.

Just why Art, as administered by Dudley Crafts Watson, becomes so interesting to children it would be hard to say. Perhaps it is because he encourages individuality. "Do you like Mr. Watson?" one clear-eyed high-school student was asked. "Oh, you bet," he answered. "He's great every minute." "And what do you get from him that you never got from anyone else?"

"He put up a model for us, and he told us to draw it, any way at all, just go ahead and draw, and we did. And then he came around and showed each one of us how the way we had handled the lines reflected our personality—you know, showed our individuality. Nobody ever did just that before, and it started us to thinking." Perhaps his hold on the children is because he's such a good show in himself. The old "ten-twenty-thirts" have nothing on Dudley Crafts Watson in holding an audience of children. He can come into a room where they are waiting their fate with bored resignation, and five minutes later every child in the room is on tiptoe with excitement. He isn't a dreamy, "highbrow" lecturer. With him art ties itself up with things modern and commonplace. He may begin his art talk with an illustrated dissertation on milking machines; the slang of the day has a firm advocate in him, and when he mysteriously whisks out yard after yard of batiked (self-batiked) silks from his pockets, the thought comes naturally that if Art ever failed, conjuring might afford him an equally profitable career. But with all these "stunts" he eventually gets back to Art, and always leaves something that was not a part of the children when they came.

Whether any of these thousands ever become artists, is a different thing. It doesn't matter. What we do need is an appreciation of art by all, to make more possible its creation by the talented few.

Mr. Watson talking to Minneapolis school children at the Minneapolis Institute of Arts.

Making Canada Safe for the Canadians

Concluded from page 10

rather as mutual talks. As Mr. Smith says, "when decisions are difficult for those of us who are constantly in touch with changing conditions and changing regulations, it is not surprising that the difficulty is much enlarged for booking agents who have to rely upon periodical circulars without the added advantage of other detailed information that becomes available to departmental officials between the publication of one circular and another. Booking agents being undoubtedly of great value and the constant allies of this emigration service, it is our bounden duty to assist them in their work in every way possible.

"No service of the Canadian Government can begin to produce anything like the results in the building up of information of the huge natural resources that would follow the work of this department if an extension of its propaganda materialized. In other words, if Canada wants to settle the Dominion with a large number of desirable people she must give more attention to that branch of public work than to any other."

Canada believes in advertising, but advertising that is explicit and to the point. All of her activities of this kind are based upon an adequate use of space in periodicals best adapted for the purpose. Canada advertises fertile lands and maximum comfort and independence as would a real estate company, with this exception, that Canada's endorsement is a bond. Canada is not looking for profits but for results, even though the latter may imply, and should imply, the former, too.

The Canadian theory, and I believe it is our theory too, is that every settler is worth $1,000 to the country.

The American emigrants to Canada last year were chiefly those who were going upon land which they had purchased or proposed to buy. It was found that the number of those desiring to buy was greatly increased over previous years.

According to figures which I obtained at Ottawa recently, 29,345 persons emigrated to Canada from the United States during the fiscal year ending March 31, 1922. The highest number was in 1913, when 139,009 went to Canada. About 26 per cent of American immigrants made entry for homesteads in Western Canada. From July 1, 1900 to March 31, 1922, Canada absorbed 1,396,853 immigrants from the United States. Within an almost corresponding period (July 1, 1899 to June 30, 1921) British North America—as classified by the United States Immigration Service—yielded 995,446 persons.

It will be seen that in a generation Canada actually absorbed 401,407 American immigrants, a quota that certainly need not be alarming and that, in fact, does not indicate any unusual migratory current. Nor is that all. American residents of Canada, whether or not they intend to naturalize themselves, are consumers of American products, whether manufactured in the United States or by Canadian branches of American houses. In this respect, therefore, inter-North American migration does not represent gains and losses such as we are wont to associate with movements of this sort under the general category of immigration.

This fact alone justifies the suggestion advanced in a recent article that Canada and the United States should pool, so to speak, their immigration policies and to that extent obliterate the boundary. There can be no such thing as an unassimilable American citizen in Canada or an unassimilable Canadian citizen in the United States. But presuming that there might be, the exceptions would be so few as certainly to warrant the deflection of countless inspectors of both countries to more vital ports of entry.

One of Canada's interesting and undoubtedly successful endeavors, from an advertising standpoint, is that known as the Exhibition Branch, actively engaged in the preparation and installation of exhibits in numerous centers in the United States and Great Britain. In this country exhibits were installed at 24 state fairs, lasting from 12 to 21 days. The maximum attendance was 1,150,000 at the Texas State Fair in Dallas and the smallest of 65,000 at the Missouri State Fair held in Sedalia. In England many exhibits have been placed, with more being planned as conditions warrant.

There has been a report that no less than 10,000 demobilized war-service women were anxious to go to Canada to enter housework. These hostels, in addition to being reception homes for girls arriving in Halifax, St. John, Montreal, Toronto, Winnipeg, Regina, Calgary and Vancouver, serve also as clubhouses and homes. The placing of such women as went to the hostels is done in co-operation with the women's division of the employment service of Canada.

The latter division suggested a system of emigration permits to be granted to all unaccompanied women desirous of going to Canada, upon assurance of good health and satisfactory purpose. Under this system, 7,724 women went to Canada; 4,169 went to join relatives or to be married; 2,459 went to assured positions in factory work or housework, and the others were actually houseworkers. There is a card record of these girls, and fully 90 per cent are said to be satisfactory in every way.

Naturally the movement of women by the hundreds every month meant the devising of new plans for their care in transit. Until August, 1920, women not accompanied by their families went to Canada in charge of Dominion government women officers. But to supply such officers permanently for all vessels traveling between Canada and England was impossible, and so the steamship companies decided upon "ship's conductresses." The Canadian Pacific Ocean Services have women of high character and ability for the purpose, while the Cunard and White Star lines use chief stewardesses.

Last, but not least, in this connection, is Canada's special attention to juvenile immigration. More than 50 years have passed since the necessity for effort on behalf of the thousands of poor and neglected children of the British kingdom claimed the attention of well-disposed and worthy individuals to attempt by some action the reclamation and salvation of the thousands who should grow up in surroundings and under conditions that tended to foster and develop many of the worst forms of depravity.

The first organized party of juveniles arrived at Quebec in 1869, and since that remote day parties have been brought to Canada almost without interruption, to settle in the agricultural districts of the older provinces.

The children undergo special training and instruction in such subjects as are essential to qualify them for respectable citizenship and useful service abroad. Besides their elementary schooling, there is instruction in useful trades for the boys and girls. The course of training embraces periods of from one to five years. In certain institutions migration "is held before the children as a certificate of their personal merit and health."

Where Eliza Caught the Underground Railroad

Concluded from page 3

was a Tennessee minister, who preached Abolitionism in and around his home there, until, in the early 1830's he was forced to move. He wound up in Ripley, and began preaching. In a short time he was manager of the system. Rankin was a dictatorial and aggressive man. He never lost a fugitive. His forcefulness is clear enough on the face of the bronze bust of the man, which surmounts his grave in the Ripley cemetery.

The "Rankin house," known the world over, is a two-story brick structure, in excellent condition, built on the sheer edge of a hill, 400 feet above low water mark in the Ohio River. To the left is the deep gap that is the northern gateway through the hills. Behind and to the right of the house is a rolling plateau. Before is the town, the river, and the Kentucky hills, whose tops are about on a level with the Rankin house. Nine miles of the twists and turns of the river are in plain view, as well as several miles of the country, back in Kentucky.

This was the objective of escaping slaves from and through Kentucky. Few fugitives from Louisiana and the Far South came this way. The majority of them went to Mexico, and into the Florida and Louisiana swamps. Dismal Swamp, was a favored retreat. Several generations of fugitives were born, lived, and died in it; patrols systematically hunted Negroes there. By day the Rankin House was in plain sight of fugitives concealed in the Kentucky hills. When they came down to the river to cross it at night they were guided by a brilliant light from the window on the second floor. This light burned from sundown to dawn every night.

For years a steady stream of fugitives—house servants and field hands, the docile and the unruly—was brought across the river in skiffs, and landed at night on the Ripley shore. Hundreds came alone. The most of them were armed with long knives, used for cutting corn—they could get hold of few other weapons. But the knives were effective enough in hand-to-hand fighting, and the fugitives were desperate. Practically all were destitute. The men of Ripley were constantly paying for quantities of cloth; the women were kept busy cutting it, and making it into clothing.

From the river, the fugitives were taken to the Rankin house, clothed and fed, and generally sent on without delay. It was too prominent a station to risk holding them long. While Rankin was at the head of the Underground Railroad there were plenty of clashes with pursuing patrols, but no serious affrays. When the risk was too great to send fugitives from the house, they were hidden in a closet. Rankin was an experimenter. At one time his experiments were with bees, hived in this closet. There is no way to estimate the number of fugitives who for several days at a time shared it with the bees.

There were other men, white and colored, prominent with Rankin in the operation of the Ripley station. John Parker was one of them, and a romantic figure. He was a very light-colored slave, who secreted himself in the hull of an upriver steamboat at New Orleans. During the trip he was without food. The boat's wheel splashed water against the end of the craft. Occasionally it trickled through, and by lying on his back with his mouth open to catch the drops, Parker managed to keep alive. He left the boat at Louisville, where he passed as a bearded Cuban, and made money enough there to start a foundry at Ripley. He was one of the town's successful business men. Probably the last man living of the Rankin group is Lindsey Jackson. He was born free in Ripley, and was closely associated with his leader.

The organization, however, was not a formal one. Its operations were necessarily and purposely mysterious. There were no titles until steam railroads were built, when their terminology was used—president, station keepers, conductors—to mystify the public.

How Wall Street Feeds on Country Banks

Concluded from page 12

Many millions of these stocks have value only to their owners as representing the controlling ownership of corporations. As investments they are meaningless. Scores of these railroad and industrial issues are at the present time being manipulated on the Stock Exchange by gambling pools. It is of great advantage to these speculators to have large amounts of such shares lying in the vaults of savings banks and trust companies, for it means that so much stock has been taken out of the market, and the lessened floating supply in Wall Street enables the gamblers the more easily to swing the quotations up or down.

Savings banks and trust companies outside of New York have placed millions in shares of the Boston & Maine Railroad, whose affairs became tangled up in the old New Haven scandal. Dividends on all its stock issues were passed in 1921, and on the common stock none have been paid since 1913. These institutions have placed their depositors' money in shares of the Erie, which has never paid a common stock dividend, and its huge burden of bonded debt holds out no promise of such payment in the near future; in shares of the Maine Central, which road has earned deficits since 1918. Country banks have invested in Wabash shares, which has never paid dividends on the common, and none on the preferred, since 1918; in Chicago & Great Western shares, which has never paid any return on the common and none on its preferred for the last few years; in shares of the Chicago & Eastern Illinois, which has paid no dividends since 1913.

The first or even second mortgage bonds of the roads just mentioned would seem to be suitable investments for savings institutions. Most of these roads are important arteries of commerce, and deserving of financial backing. But the placing of public savings in their stocks, is of no benefit to the roads in question, impoverishes bank funds, and encourages the mania for stock gambling in the financial district.

Month after month, state and municipal bond issues from all sections of the country are being underwritten and sold by Wall Street banks and bond houses. They are a medium by which wealthy men invest their surplus funds and escape the payment of taxes. *Yet the states, counties and municipalities throughout the country could easily save the expensive underwriting commissions they pay Wall Street in this manner.*

A previous article has shown that the major wealth of the United States rests in the control of its country banking institutions. The country national banks show resources aggregating 82 per cent of the national banking assets of the United States. Yet these country banks deposit many hundreds of millions of their surplus funds annually with Wall Street banks. Now as we have seen, the savings banks and trust companies of the country invest further millions of their surplus funds in stocks of Wall Street corporations, many of which are dead investments, and earn no return on their capital.

The surplus funds which the national banks of the country deposit in Wall Street, are almost wholly utilized in making call loans to speculative brokers. The country savings banks and trust companies, which tie up their funds in stocks of little value, merely facilitate the gambling operations.

It is evident that the country does not have to go to Wall Street to borrow money on its state, municipal, school district or drainage bonds. Its banking institutions may soon realize that they can find better use for their surplus money in home industries, the development of their own localities, the investment in farm loan bonds, and the like.

And if the country banks went on strike, the activities of the rings, pools and syndicates, whose unhealthy effects are periodically felt country-wide, would soon be suspended for lack of surplus money with which to carry on the game.

The Golden Dam to the Stream of Prosperity

Concluded from page 2

and insolvency when the amount of money in proportion to the amount of wealth stands in the ratio of 1 to 30?

The rapid increase in the real wealth, as distinguished from the money in the country, is strikingly illustrated by the following figures:

Year	Population (In Millions)	Wealth (In Millions of Dollars)
1890	63.1	65,037
1900	77.3	88,517
1904	83.8	107,104
1912	96.9	187,739

Between 1890 and 1912 the total wealth of the country increased threefold. *But there was no proportionate increase in the amount of gold.* It is true that since the war a great deal of foreign gold has accumulated in the United States, but in the 10 years since 1912 the wealth of the country has taken another enormous stride, thus more than offsetting this increase in the gold supply.

Bearing in mind the slender gold supply upon which we are struggling to conduct our domestic business and our foreign commerce, let us glance at the production of 10 staple crops for a single year. *When we realize that these crops cannot be moved without money, it will begin to be clear why the farmers burn their corn and the planters in the South cannot sell their cotton, while thousands of men, women and children in our great cities are hungry and scantily clad:*

Crop	1920 Harvest	Value
Corn, bushels	3,232,367,000	$2,189,721,000
Wheat, bushels	787,128,000	1,135,806,000
Oats, bushels	1,526,065,000	719,782,000
Cotton, bales	12,987,000	914,590,000
Hay, tons	91,193,000	1,613,896,000
Rye, bushels	69,318,000	88,609,000
Barley, bushels	202,024,000	142,931,000
Buckwheat, bushels	13,789,000	17,797,000
Potatoes, bushels	430,458,000	500,974,000
Tobacco, pounds	1,508,064,000	318,359,000

The enormous volume of foreign trade is indicated by the figures on exports and imports, which for the United States in 1920 were as follows: Imports, $5,279,398,211; exports, $8,228,759,748.

Yet the United States, the greatest business nation in the world, still clings, with an almost religious devotion, to "the gold standard," and endeavors to handle this stupendous commerce through a medium of exchange whose scarcity insures stagnation at the outset.

Of course, this business simply could not be carried by the small stock of gold in actual existence, and so we have the enormous fabrication of paper money and credit, a sort of ghostly gold, supposedly redeemable in the metal, but which is issued in quantities many times in excess of the gold reserves. Then, when a time of general liquidation arrives and business men seek to redeem this artificial money and to convert real wealth into its equivalent in money, there is not enough gold to go round. The bubble is pricked, a great financial "crash" occurs, hard times descend upon the country, business enterprises go bankrupt (there were 22,000 commercial failures in the United States in 1921), and millions of able-bodied men are unemployed and starving in a country teeming with real wealth but financially "broke."

The stream of prosperity is dammed by this sinister bar of gold, and until this bar is broken down we shall continue to have hard times, bankruptcies, and unemployment, with the grim specter of starvation stalking through the land while crops sufficient to feed the whole world lie rotting on the ground.

How long will the American people allow this scandalous and inexcusable condition to continue? But continue it will, and become increasingly unbearable, so long as we bow down to this fetish of "the gold standard." Surely the time must come soon when the American people will refuse to remain longer in this hideous bondage, when they will rise in their might and overthrow this idol of economic superstition. Then the golden dam will disappear as by magic and the river of national wealth will flow unhampered through the parched fields, hard times and unemployment will disappear, and the country will become, as it should be, the happy home of fifty—yea, one hundred—times its present population.

And it can be done.

Emerson Hough—Historian of the Far West

Concluded from page 9

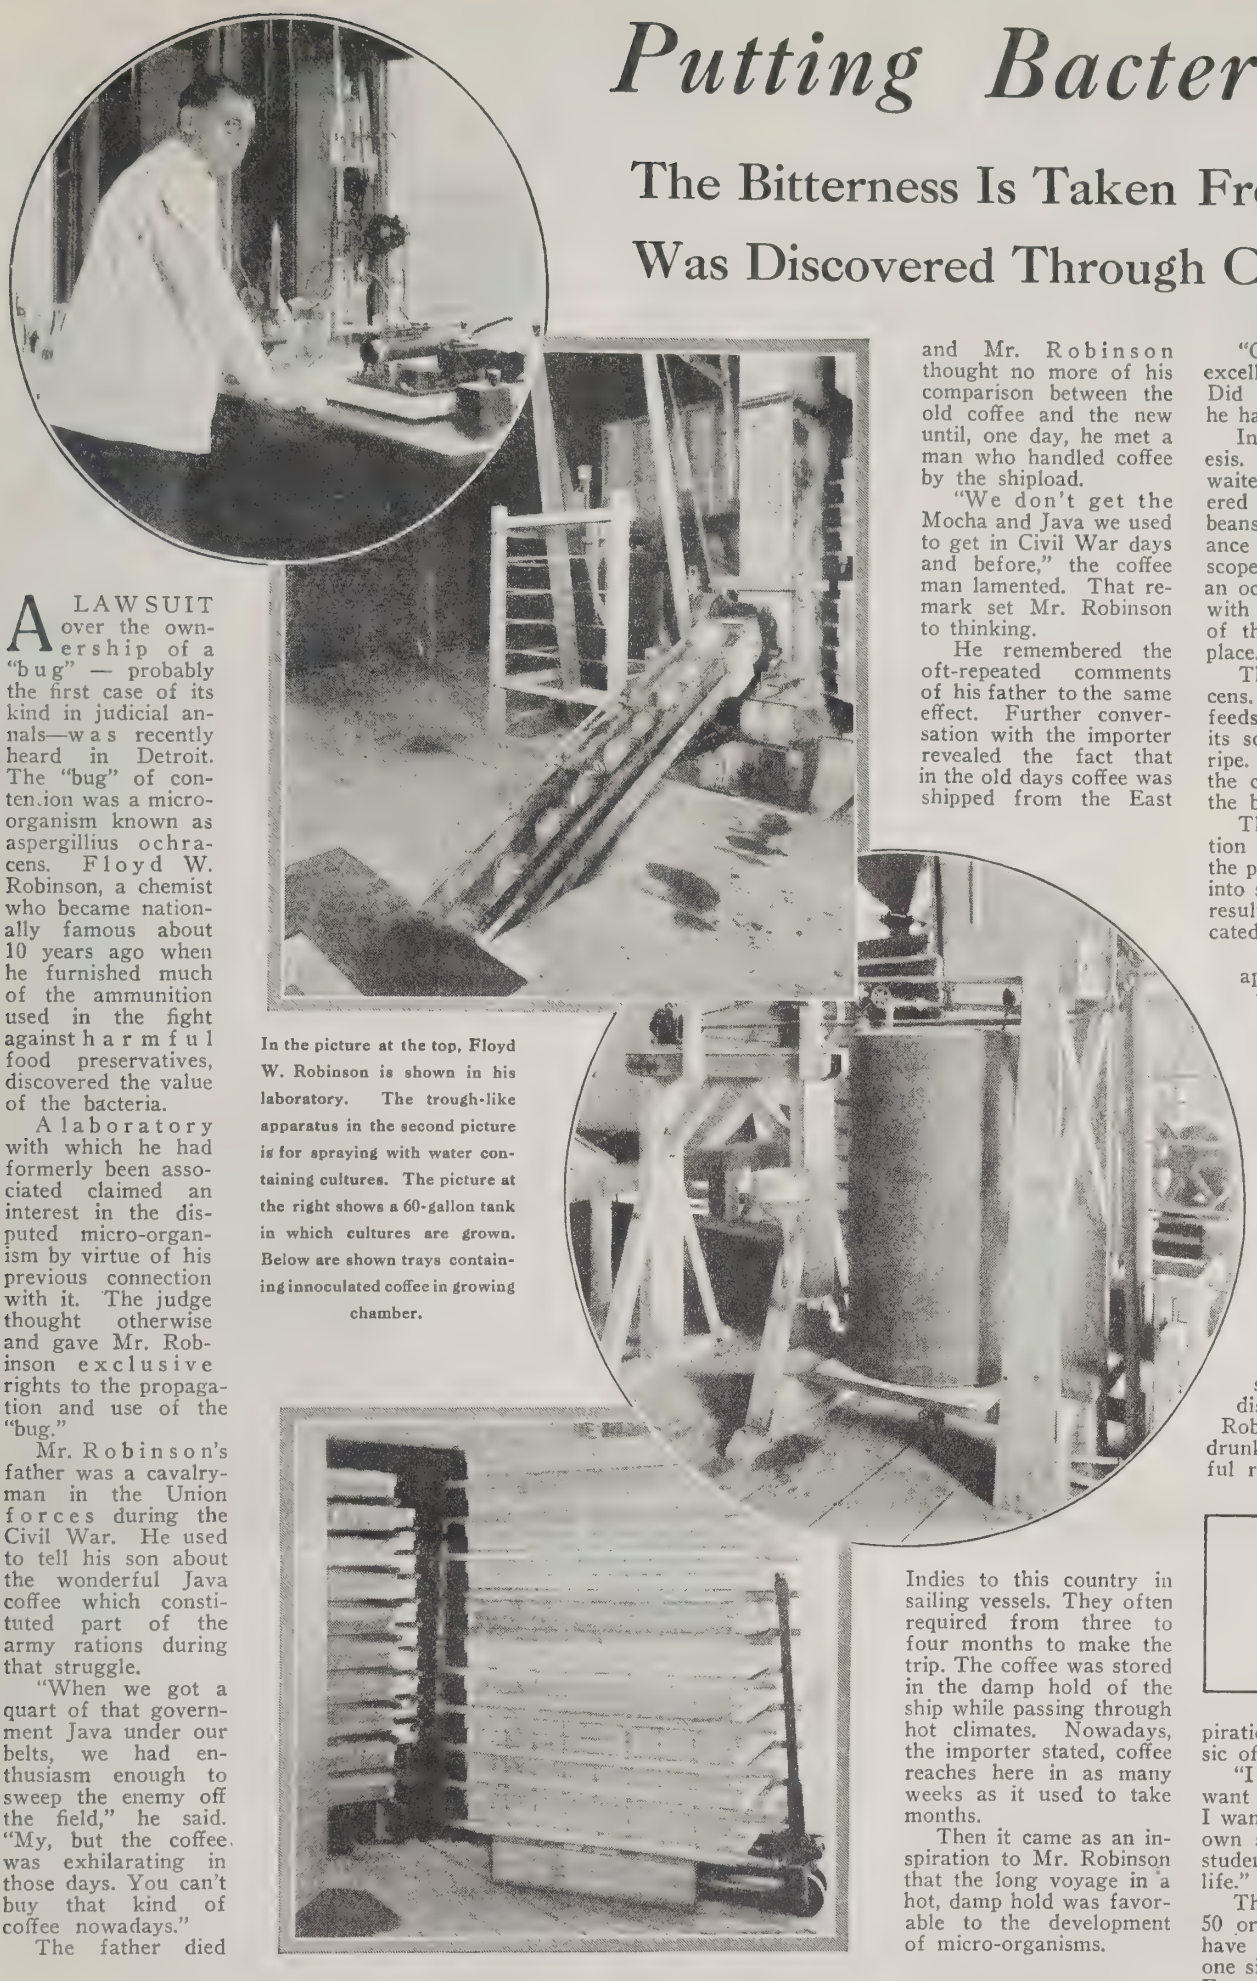
dore Roosevelt and he wrote to the author an exuberant letter of praise saying, "I always wanted to write this book myself. Now, thank God, it's done, better than I could have done it." Mr. Hough says that this is the first praise he had ever received in his life and he treasures this letter above all of his other possessions.

"My first novel was 'The Girl of the Halfway House,'" said Mr. Hough. "It did not go very well, although it had a modest sale. Then my taste for historical subjects began to push me."

Dictating direct to the machine in his office during the daytime, or penciling it after 10 o'clock at night, Mr. Hough wrote "The Mississippi Bubble" which brought national recognition. He had five copies of the manuscript made and sent them out to the leading publishers. To his consternation, two replied by telegraph and the others accepted by letter. One company offered $5,000 advance against royalties and got the contract.

"Of course this was more money than there was in the whole world, and more than I had ever seen," he interpolated. "It seems quite natural that I took that offer in preference to any of the others.

"When I was working on 'The Mississippi Bubble' I was still engaged by *Forest and Stream*. When the book began to attract attention they figured out that I certainly could not be a good newspaperman, or I could not have written 'The Mississippi Bubble.' So they fired me. I presume I was the worst scared man in the world at the time, married, and with no visible means of support beyond that ancient ambition to write. Now I can truthfully say that I wish the *Forest and Stream* had fired me 10 years earlier. I could have paid them three times the salary they ever paid me.



"Well, now, I began to write in earnest and to my surprise to make a very good living at it. Magazines began to take my stories. I began to sell short stories, then serials.

"Books grow by themselves. I don't know that I ever had one experience alone which caused me to write a book, unless it was my meeting James Alexander Burns, a Cumberland Highlander of Kentucky, who was founding a Baptist college, in Clay County, in the feud district. Around him and his life I wrote my novel, 'The Way Out.' A strange people, and the only Americans we have now in America, one might say. Of course, when we write fiction we do not draw actually from life. I wrote one story for the *American Magazine* on those people. It brought Oneida Baptist Institute more than $45,000 in contributions."

The workshop of Mr. Hough at Chicago is a mixture of modern business appliances, Indian junk and out-of-door curios. The latter have been gathered in travels from one end of the continent to the other.

Putting Bacteria to Work

The Bitterness Is Taken From Coffee by "Bugs"; Was Discovered Through Chemist's Experiments

In the picture at the top, Floyd W. Robinson is shown in his laboratory. The trough-like apparatus in the second picture is for spraying with water containing cultures. The picture at the right shows a 60-gallon tank in which cultures are grown. Below are shown trays containing innoculated coffee in growing chamber.

A LAWSUIT over the ownership of a "bug" — probably the first case of its kind in judicial annals—was recently heard in Detroit. The "bug" of contention was a micro-organism known as aspergillius ochracens. Floyd W. Robinson, a chemist who became nationally famous about 10 years ago when he furnished much of the ammunition used in the fight against harmful food preservatives, discovered the value of the bacteria.

A laboratory with which he had formerly been associated claimed an interest in the disputed micro-organism by virtue of his previous connection with it. The judge thought otherwise and gave Mr. Robinson exclusive rights to the propagation and use of the "bug."

Mr. Robinson's father was a cavalryman in the Union forces during the Civil War. He used to tell his son about the wonderful Java coffee which constituted part of the army rations during that struggle.

"When we got a quart of that government Java under our belts, we had enthusiasm enough to sweep the enemy off the field," he said. "My, but the coffee was exhilarating in those days. You can't buy that kind of coffee nowadays."

The father died and Mr. Robinson thought no more of his comparison between the old coffee and the new until, one day, he met a man who handled coffee by the shipload.

"We don't get the Mocha and Java we used to get in Civil War days and before," the coffee man lamented. That remark set Mr. Robinson to thinking.

He remembered the oft-repeated comments of his father to the same effect. Further conversation with the importer revealed the fact that in the old days coffee was shipped from the East Indies to this country in sailing vessels. They often required from three to four months to make the trip. The coffee was stored in the damp hold of the ship while passing through hot climates. Nowadays, the importer stated, coffee reaches here in as many weeks as it used to take months.

Then it came as an inspiration to Mr. Robinson that the long voyage in a hot, damp hold was favorable to the development of micro-organisms.

"Can it be that bacteria were responsible for the excellencies of old-fashioned Java?" he asked himself. Did micro-organisms impart to it the peculiar flavor he had heard so highly praised?

In 1917, Mr. Robinson began to work on this hypothesis. He placed coffee in a warm, damp room and waited for developments. In several days, he discovered a covering of minute-stemmed moss on the green beans. The eye could detect no change in the appearance of the coffee but when examined under the microscope, it was seen that the coffee was overgrown with an ocher-colored vegetation. It looked like hedge-balls with long, single roots. A musty odor and a softening of the bean also indicated that a change was taking place.

The "bug" was identified as the aspergillius ochracens. It digs its roots deep into the coffee bean and feeds upon the tannic acid which gives the coffee bean its sour or bitter taste. Coffee when imported is not ripe. The bacteria, it was found, artificially ripened the coffee, broke down the hard cellulose, and fed on the bitter acids.

The caffeine which produces the harmless exhilaration derived from drinking coffee was left intact by the process then worked out. The starch was converted into sugar, the harmful elements were eaten up and the results obtained 50 years ago by accident were duplicated with scientific exactitude.

When Mr. Robinson was sure of his ground, he applied for a patent. The claims allowed him cover the application of micro-organisms for the improvement of food products, very broad claims indeed. But Mr. Robinson says he is interested only in exploiting the micro-organic world in connection with coffee and is ready to encourage any other investigator who cares to apply the theory to other things.

"By harnessing bacteria, as it were, we shall be able to ripen fruit artificially," explained Mr. Robinson. "The grower could ship green grapes to the market centers, for example, and they would be ripened in the warehouses, as needed, by my method. The sourness would be turned into sweet sugar and the flavor would be made equal to that of naturally ripened fruit."

Coffee which has been cultured possesses a heavier body because the bacteria make it more soluble. The fibrous parts are transformed so they dissolve readily in water. Cultured coffee, says Mr. Robinson, will again be like the thick, oily beverage drunk in Civil War days to give "pep" without a harmful reaction.

Voices Divine, Old-Time Tunes and Broadway

Concluded from page 6

pirations, but too often no way to express them. Music offers one opportunity.

"I don't want St. Olaf to be a music school. I want just enough music to give color to college life. I want a student to have appreciation of music for his own satisfaction. I'd like to arrange it so that every student would get enough music to express his own life."

The students of St. Olaf College sing, not just the 50 or 60 in the choir. From the earliest days there have been singing organizations in the college. Every one sings. Perhaps it is a chapel service, or the annual Foundation Day program. Every soul joins in the full force of song that goes up from Manitou Heights.

Then there is a St. Olaf Band. As long ago as 1906, it made a tour of Norway. Before and since that time it has made many tours of the West. Indeed, for most of the 47 years of its existence, St. Olaf has been spreading the gospel of good music through its surrounding territory.

Every spring there is a festival of music. Many come from other states, and large numbers from the Twin Cities. There for two days they listen to the St. Olaf singers. No newfangled songs, just the old hymns that come from the heart.

"One farmer this year drove all the way from Eastern Wisconsin," President Boe said. "He said he wanted to hear the old hymns, sung as they should be. Many of the old hymns have become almost a part of life. You haven't an idea what an appeal they have until you see the people at these festivals.

"The public will respond to these things. We give a Shakespeare play every spring, make our own costumes and everything. We charge just enough to cover the expense. Now, they say that the people will not stand for Shakespeare. Yet we had an attendance of 2,000 for the 'Merchant of Venice' this year.

St. Olaf College has a small endowment, but draws its chief support from a yearly appropriation from the Norwegian Lutheran Church of America. It is located on a beautiful natural site on a hill overlooking the town of Northfield and the Cannon River. Perhaps the location has been conducive to song. Anyhow, the St. Olaf choristers have sung their way into the hearts of the public.

Something About New York's "Water Cure"

Concluded from page 8

cynical apathy on the latter's part that is not effaced by the courteous smile. The guest is disappointed because the departed one suggested no drink. The scene is repeated later in the dining room.

Of course, if one bellboy or one waiter or one taxi driver has favored guest, patron and fare, it is taken for granted that every bellboy and every waiter and every taxi driver is a bootlegger. Bootlegging is one of the evils of the hotel business today, but it is not a serious evil. Sooner or later it comes home to roost, and hotel managers ferret out the contrabandists.

But the Missoula man is not satisfied. He goes into one of the formerly famous restaurants near Times Square. It's a 50 to one chance that he finds a waiter who can "produce" or who will. As happened to the writer in most cases while investigating this, what the unsuspecting patron usually gets is what he doesn't want; that is, an unending tirade against the prohibition laws, until in self-defense he must pay the check and leave.

The next day the visitor, dryer than ever, and by now utterly convinced that New York is the most overadvertised place in all the world, sees a foreign restaurant. The Missoula man gets down to the business of dining. Coffee? He shakes his head at every suggestion of the waiter, who hovers over him. Tea? Milk? Near bear? Ginger ale? The Montana visitor feels hopeless and looks it. But in due time a telepathic sense acquaints him of the fact that the glazed brown teapot at the adjoining table exhales a peculiar odor—an un-tea-like odor, and avid nostrils proceed to analyze it. He looks up and the waiter beams eloquently.

"What is *that?*" asks the diner.

"Er—a specialty of the house, sir, yes, sir. Er—"

"Bring me some."

What does it mean? It means that he is served with a short pint of homemade wine, called claret by some and white wine by others, of a hybrid color and an even more hybrid taste, both of which lose, from a palatable standpoint, by having to be the taken from a thick coffee cup—and if there's anything more unpalatable than wine, even bad wine, from a vessel that bears a close resemblance to a shaving mug, it has not been found. For this he is charged $1,25 or even $1.50.

Two or three experiences of this sort will cure any man of the drinking habit. He begins to realize that it's one thing to want a drink but it's wholly another to be made a fool of. So he passes by, as he is about to depart, the opportunity of buying some "real old Sherwood" for the insignificant price of $11. He goes back to Missoula feeling that the drink game at present is like loaded dice.

Somewhere in New York City there are undoubtedly caches where once legitimate booze is safely concealed, but in the same measure there are, at various places on the continent, gold and petroleum deposits. It is, therefore, safer to stick to the home town. New York is impossible.

BRIEFLY TOLD

An edict forbidding the reading of all Anatole France's works by adherents of the Catholic church has been issued by the congregation of the Holy Office of Rome.

California has the record ratio of 4.61 persons per motor vehicle.

Snake-bite is now treated with a serum similar to the anti-tetanus serum. A snake farm in operation in Brazil furnishes the poison or venom which is diluted with sugar of milk and injected into mules and other animals. The vaccine obtained from the treated animal is said to be an absolute antidote against the poison of the particular snake from which the venom was drawn.

The blue whale is the largest creature alive today.

In all Great Britain during 1921 the right of naturalization was extended to only 1,053 persons. The right was revoked in the cases of 16 persons, one of whom was the former knight, Edgar Speyer, now of New York.

A London newspaper states that analyses of the prohibition violations in New York City showed 75 per cent of the violators to be foreign-born. Native-born and Anglo-Saxons were found to be law-abiding.

"Speckboom" is an African plant with large, succulent leaves which has been transplanted with success to the waste lands of California to provide pastures for cattle and sheep.

Every foreign tourist putting up for 24 hours in Munich, Germany, is taxed 750 marks. A week's stay costs 1,250 marks and the tax for a month is 2,000 marks.

The unusual and unprecedented coolness of Alaska's big volcanoes is puzzling scientists, who fear the quiet may be the forerunner of a tremendous eruption such as blew off the entire peak of Mount Katmai eight years ago.

A musical burglar has been looting the homes of exclusive Chicago residences of thousands of dollars' worth of jewels and money, after first lulling the suspicions of neighbors by his rare piano playing. A score from "Rigoletto" at one place, and pleasing portion from "La Traviata" and "Il Trovatore," marked the thefts.

Hollywood, California, has a community chorus. More than 1,500 persons gather weekly for group singing and to hear in short programs the great artists and musicians of the country. Hollywood has a philharmonic orchestra playing six nights out of the seven in the Bowl, a natural amphitheater in the hills.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

After printing a weekly serial from the Bible for three months, the Topeka *State Journal* finds this to be the most successful feature the paper has ever published. Inquiries and comment concerning it have come to the editors from every state in the Union, and from numerous foreign countries. Following the lead of the *Journal*, several other Kansas papers are also publishing the Bible. Publication of the Bible by the *Journal* was undertaken at the suggestion of Dr. Charles M. Sheldon, author of "In His Steps." Each installment consists of about 3,000 words, the Weymouth text of the New Testament being used.

Larkspur is a poisonous plant often causing sudden death to cattle, but horses eat it with no resultant illness. The owners of grazing herds in the National Forest Reserves of Washington must take this into consideration when accept[ing] allotments for the year's grazing.

Ysleta, Texas, is the oldest town in the Un[ited] States, according to tradition. It is believed [the] town was founded in 1540 by Don Franc[isco] Vasquez Coronado, a Spanish explorer. [This] would make it 25 years older than St. August[ine], Florida, the oldest town of authentic record.

In 1877, Thomas A. Edison spoke into [the] first model phonograph speaking mouthp[iece] "Mary had a little lamb—." Upon examinat[ion] he found indentations on the tinfoil record. [He] replaced the record, turned the crank and [then] from the cylinder came a thin voice but w[ith] a word of the recitation missing. Thus w[as] the phonograph.

Records at Genoa and the diary of [Columbus] indicate that the entire cost of discoverin[g] ica was only $7,250.

Pupils of the Lewis Peak school, 25 miles east of Walla Walla, Washington, are studying hard while most school children of the country are enjoying their vacation. The weather is so cold and the snow so deep in winter that school is not feasible in that district and it is then that the children have their vacation, which they spend at hunting and trapping in a region infested with deer, bear and coyotes.

More than six million families own their homes in the United States.

A movie of the capture of a sperm whale has been taken. The whaling vessel not only put irons into a dozen, all of which was filmed, but incidentally dispatched a 100-barrel whale. A replica of the films is to be preserved in the archives of the Old Dartmouth Historical Society of Massachusetts.

The coldest spot in the world is in Washington, D. C., where 515 degrees below zero was registered in the laboratory of the Bureau of Mines where scientists are trying to liquify helium gas.

The New York Public Library is experimenting with a method to preserve newspaper files for future use in centuries to come. Japanese paper, which is transparent, is pasted on every page, rendering the page impervious to the agencies that destroy newsprint. Thus protected they will last indefinitely and constant handling gives no evidence of wear.

The new gold rush to Oatman, Arizona, discloses the fact that the old-time prospector and his burro have disappeared to be replaced by miners in automobiles bringing their families with them. They stake their claims, harness the engine of the auto up to a diamond drill and proceed to prove up the property.

Boy Scouts in the United States now number nearly a half million, and during the past year more than 18,000 new members have been added. Nearly 600 boys have become "Eagle Scouts," the high rank of scoutdom.

The hurdy-gurdy grinders of New York City rent their pianos by the day. These pianos are stored in a warehouse and the people who rent them are up at dawn, for the first to arrive are the first to be permitted to get the best instruments, and the latest tunes. They rarely make more than $3 a day and must pay $2 a day rental for the instrument.

A machine has recently been invented that automatically cuts and dips ice cream bars. The machine has a capacity of nearly 12,000 bars in eight hours.

MAKE THIS YOUR JOB!

THE DEARBORN INDEPENDENT is your paper. It is published not for profit, but for service. You believe in this magazine and its aims—that's why you subscribed.

Has it ever occurred to you that your friends and neighbors, your business associates, your fellow workmen would also like to receive THE DEARBORN INDEPENDENT? The more readers we have, the greater is our influence and power for good. Urge them to subscribe. The local Ford dealer will gladly forward any subscriptions you obtain, or you can send them direct.

THE DEARBORN INDEPENDENT has established a name for itself as one of the most fearless, independent and progressive papers published. It should be read by everyone who believes in the maintenance of American institutions and their advancement along sound, progressive lines.

MUST WE LEARN BY ANOTHER WAR?

A Face-to-Face, Fearless,

Straight and Informed

Judgment of Present

Condition of Affairs

CHRONICLER OF THE NEGLECTED TRUTH

Honestly!—Must We Learn by Another War?

Here Is an Essay Without Bunk—a Face-to-Face Fearless, Straight and Informed Judgment of the Present State of Affairs

A few governments are trying to go back to normalcy, but they aren't making any noticeable progress?
In some respects, our own is taking the lead. We have already given birth to a coal war and a railroad war with the usual result: nobody in the country has reaped the slightest benefit.
We have lowered wages and then wondered why the workers didn't buy our goods. By concerted effort we have "brought labor to its knees," utterly ignoring the fact that it is an impossible position in which to do any work. Pretty soon we hope to erect such a tariff wall that all competing nations will be kept as poor as we can keep them: then we shall send our salesmen abroad to tempt them to buy our goods with the money which they haven't got.
Altogether it looks as if the world were in for quite a spell of poverty and peace: but if by some miracle, it can get on its feet, then we shall have prosperity and war.

By CHARLES W. WOOD

MR. LLOYD GEORGE recently burst forth with a new idea. He made an appeal to the churches to prevent another war. The governments, he implied, have about reached their limit in this respect: it is up to the churches now. But just how he expects the churches to go about the job of abolishing war he did not quite make clear. It seems to be up to me to explain that.

It's just like this. The governments, having failed, appeal to the churches. If the churches get sufficiently stirred up on the matter, they will appeal to the governments. That ought to keep England at peace for weeks and weeks; and Mr. Lloyd George might be re-elected on the slogan that "He kept us out of war."

The only thing that might possibly be trumped up in objection is that war isn't prevented that way. That, of course, is splitting hairs. It is as though we were aboard a train for San Francisco and we all appealed to the conductor to let us off at New York. The conductor, if he were a good fellow, would surely aim to please. He couldn't exactly guarantee to get us to New York; for the train, he knows, is going in the other direction: but if we would all get together and pray and agitate, don't you think he would sympathize with us? There's nothing like harmony in these matters. It would be a good idea to hold a convention at Denver and give him a vote of confidence for keeping us out of San Francisco.

Nobody Wants It—Everybody Gets It

ANOTHER idea would be to take a train going the other way: but that again would be splitting hairs. To be very, very serious about it, which way is the world going today—toward war or peace? I am not asking which way we want to go, but which way are we going? And if we are headed toward war, should we hold a meeting and pass resolutions, or should we get aboard another train?

Which way are *you* headed? Once again, I know you *want* peace: but I am not asking about your wishes, I am asking about your position. Nobody wants war, not even the munition manufacturers. They will be content if there is only sufficient danger of war at every moment so that everybody can be depended upon to arm to the teeth. A few wild men in officers' regalia here and there may believe that humanity was created for them to butcher; but most of the military men know that war is hell. The main difference between them and us is that they don't just see how it can be avoided, and hence, accept it more or less cynically, while we don't see how it can be avoided but shrink from it more or less hysterically.

If we once understood what war is, it ought to help us some in solving the problem. At any rate, it ought not to hurt us. And war is not at all the thing we have been thinking it was. Wars are born, not made. War is not an Act of Congress. Congress *declares* war much as the county clerk registers a birth certificate; but every one knows that there is a vast difference between writing out a birth certificate and bringing forth a child. Society gives birth to war because society is pregnant with war. And as long as the conditions which breed war obtain, anything we say, even to the extent of declaring the child illegitimate, isn't going to make any very important difference.

"Prosperity" Plus "Peace" Equals War

IF WE once understand this, it might be possible to get some data as to whether we are doing anything to prevent war. Out of what conditions was the Great War bred? It happened that an old paranoiac named William Hohenzollern registered its birth in a more or less insane ecstasy; but it is endowing him with powers which no individual ever possessed to say that he made the war.

The war came because the conditions that obtained prior to 1914 were conditions that breed war. They were not necessarily conditions that made people think they wanted war. They were, however, conditions that made war inevitable. When war is inevitable, it comes: you can't get around that. And when it comes, those who didn't want it are apt to be the hardest fighters.

What were the conditions? In the first place, there was a degree of material prosperity which the nations had never attained before. Prosperity doesn't necessarily breed war but it is one of the conditions which are generally considered necessary before the most efficient fighting can be done. The nations aren't fighting to any great extent just now. They can't. They are worn out, sick, prostrated with poverty. But with the hatred that exists throughout Europe today, such peace as there is seems to depend very much upon this prostration. If Germany were prosperous and powerful, does anybody believe that she would not strike back at France? If France were prosperous and powerful, does anybody believe that she would not use that power to render Germany helpless? This is a condition which may be called Peace: but add prosperity to it and its name is War.

This was the "Peace and Prosperity" which obtained throughout the world in 1914. It was war in disguise. To return to that condition would be to resume war: and, since we have learned infinitely more about killing now than we knew in 1918, to an infinitely more horrible war than the one we thought we ended then.

But prosperity alone does not produce war. If war were simply a matter of stirring up bad feeling, prosperity would have a tendency to prevent it. A man who is hungry is much more apt to fight than one who is well fed. The fact remains, however, that we must have wealth to have modern war. Hunger and poverty produce distemper but distemper alone hasn't much fighting power. Distemper, of course, is needed in war: but once get a war and we can depend upon it that we won't run short of distemper.

What, then, besides prosperity, is needed to give birth to war? One might answer a number of things, but they can all be lumped in one. Greed, selfishness, ignorance—they are all admissible terms but too frequently used to have any definite meaning. The one thing needful to produce war is the idea that it would be to our advantage to hinder the progress of some competitor.

Practically everybody held that idea prior to 1914. The Socialists got around it by saying that we should have no competitors, and the Christians got around it by saying that we ought to be good to them. International socialism, therefore, and the world-wide Church of Christ, the Prince of Peace, were regarded quite generally as mighty bulwarks against war. The way they both fell down was simply a fright. Everybody seems to have noticed it except Lloyd George.

But they didn't want war. Get that straight. A few were willing to go to prison to declare their opposition to it. But the war didn't mind. As long as there was a general belief that one competitor might get ahead by ruining another, war was only a matter of when we could get prepared for it.

Has that belief changed? Are we not still riding on the same train, regardless of our hopes and prayers that we won't reach our destination?

From Tariff Wars to Poison Gas

"MY IDEA of honesty," a famous American once said to me, "is not the usual idea. I claim that you are never thoroughly honest until you know that you can't put anything crooked across."

I confess it astonished me. The more I thought about it, the more I realized how psychologically correct he was. Let us once imagine that the crooked way is best, if we were not too saintly to take it, and our subconscious will soon be conspiring with our optic nerves to make crooked things look straight. The world has suffered mightily from the communion of such saints. Only when we thoroughly understand that salvation depends on seeing things straight, are we apt to quit the job of kidding ourselves. We may have the best intentions in the world, but only when we know that we can't go to New York on the train for San Francisco will we run a ghost of a show of arriving in New York. Only when we know that we can't get ahead by injuring a competitor will we take the first step toward preventing war.

Germany, England, France, Italy and the United States were all prosperous in 1914. But each nation was suspicious of every other nation's prosperity and we did what we could, through tariffs and trade agreements and alliances, to defend ourselves from the prosperity of any particularly dangerous competitor. It was only a step from those weapons to guns and poison gas. All the competitors are crippled now and nobody is prospering because of it. To be sure, we got the bulk of the world's gold; but for some reason or other, the cursed stuff isn't making us rich. If we could only see the point, we might get on the other train and ride toward peace. But what are we trying to do instead?

"Back to normalcy!" Back to the conditions that produced the war! Back to Bunk! Back to the good old recipes for success! Back to the idea that we can get ahead by crippling the other fellow!

Strange, by the way, that this is called "competition"; and if anybody opposes it, he is told that the instinct to compete is deep in the human soul—what about competitive athletics and all that? Yes, what about it? What about an athletic hero who supposed the way to win was to bang the other runner in the shins? He wouldn't have to do it, mind you. Let him only suppose that that is the way to win the race, let him adjust his training to that idea, and what kind of a runner would he make?

As an answer to the question where are we going now, I should say that we don't seem to be going anywhere very fast. A few governments are trying to go back to normalcy, but they aren't making any noticeable progress. In some respects, our own is taking the lead. We have already given birth to a coal war and a railroad war with the usual result: nobody in the country has reaped the slightest benefit. We have lowered wages and then wondered why the workers didn't buy our goods. By concerted effort we have "brought labor to its knees," utterly ignoring the fact that that is an impossible position in which to do any work. Pretty soon we hope to erect such a tariff wall that all competing nations will be kept as poor as we can keep them: then we shall send our salesmen abroad to tempt them to buy our goods with the money which they haven't got. Altogether it looks as if the world were in for quite a spell of poverty and peace: but if by some miracle, it can get on its feet, then we shall have prosperity and war.

The last war was not so successful as to make this prospect alluring. It hardly made good on its platform pledges. It didn't preserve civilization. It didn't end war. It didn't make the world safe for democracy. It did, in a way, bring about the freedom of the seas—for our merchant marine is largely in harbor and the seas can do as they please for all of that—but all in all, considering the trouble and expense involved, the war wasn't a huge success.

The "Class Struggle" Nonsense

UNLESS it has taught us this one lesson: that it is impossible to succeed by stopping the other fellow. The governments haven't learned it, but that should not make us pessimistic: government is about the last thing on earth to learn anything. A few employers in America have learned it: and they are the only employers in the country today whose success is notable. A great many workers have learned it: and there is a strong tendency on the part of the workers, in the unions and out, to realize that they have much more important work to do than simply fighting their employers. Even "seizing the means of production" is not so alluring as it was once. The Communists did that in Russia and they are now doing their best to pass them back: not because they have lost their belief in Communism but because they couldn't operate the equipment which they seized.

American engineers are certainly getting the New Idea fast. I personally know scores of them who have quit thinking in the old terms altogether. The one purpose of industry, they are now saying, is service: and many of them are working with the labor movement to build up the industrial structures for the greatest possible service all around, to build industry on practical, industrial lines, instead of depending upon the "class struggle" as the motive power of the labor movement.

Dimly the Dawn Appears

MOST interesting to me is the situation in China; not that superficial, so-called modern China, where officials are forever leading armies against each other to accomplish God knows what, but the great, calm, cultured and thinking China which few foreigners except the missionaries ever really see. In this China, the World War is largely looked upon as the collapse of Western Civilization—a demonstration that society cannot progress perpetually along those lines without coming to catastrophe. They, too, are calling for American engineers to come over and build a better society—not the machinery of exploitation which business has brought to the coast cities so far, but a high-power, scientific, industrial system whose sole motive shall be service.

These things are not apparent on the surface as yet. Superficially the world is in the old order still. Examine the governments and the international conferences, and the official conventions of labor, capital and the church, and you will look in vain for evidence that the New Order is here. But a lot of people, individually and in little groups, are beginning to see: and as they see, they act. They are beginning to pile on to the other train. It is too early, it seems to me, to say whether we will have to have another war to make the demonstration general, but the very presence of this New Idea makes pessimism impossible. There is more light on earth today than there ever was before. In a little while we shall know the truth, and the truth shall set us free.

Five-Minute Test to Shatter Einstein Claim?

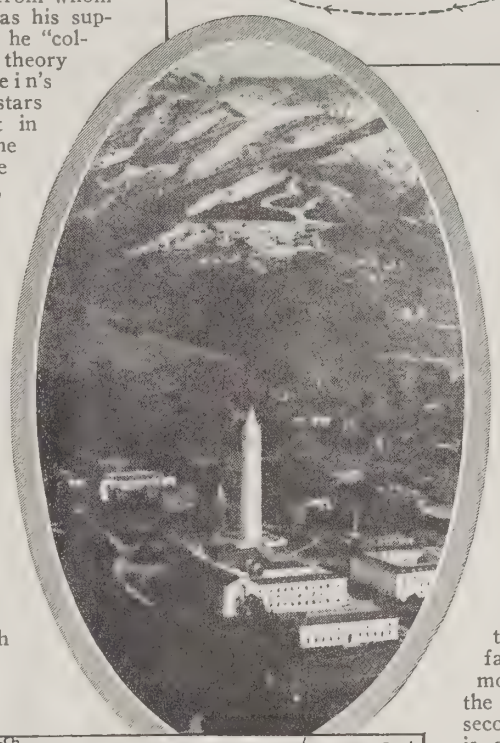
Scientists, on Australian Beach, Will Do Much Toward Ending Dispute

TRAVELING by steamer nearly a third of the way around the world, and then back again, for a five-minute look at the sun and at the stars beyond it, astronomers of the University of California are preparing to subject the "Einstein Theory" to its most severe test. On this five minutes of rapid work with telescopes and stellar cameras, will depend their faith in the theory of relativity, propounded by earlier scientists and given to the world by Einstein. This is the most important attempt to explore the physical organization of the universe. When these astronomers, under the direction of Dr. W. W. Campbell, director of the Lick Observatory of the University of California, at Mt. Hamilton, finish their observations, their photographs and their calculations, astronomers believe that we shall be appreciably nearer to understanding the universe.

The test will be made September 21, at Ninety-Mile Beach, an isolated spot, on the northwestern coast of Australia, the place in all the world at which there are the fewest clouds, the least rain and the clearest atmosphere during September. The occasion is a total eclipse of the sun on that date, an eclipse whose narrow path begins to be visible in Abyssinia, extends easterly across the Maldive Islands, over Christmas Island, across Australia, and ends in New Zealand. The duration of the total eclipse will be longest at this point. Even there it will last only five minutes and 18 seconds. The altitude of the sun at this point will be the highest, approximately 58 degrees, and the weather for more than a score of Septembers has been rainless and cloudless. A British party, bent on the same investigation, is to go to Christmas Island, where weather conditions are not so favorable, because it considered Ninety-Mile Beach "hopelessly inaccessible."

The only way in which Ninety-Mile Beach ordinarily could be reached is by steamer from San Francisco to Perth-Freemantle, on the southwest corner of Australia, thence by a small coasting steamer of uncertain schedule some hundreds of miles to Broome, on the northwest coast, and thence by chartered launch or schooner, 200 miles farther to the desert destination chosen for the observation. Australian astronomers, however, as soon as Dr. Campbell communicated regarding the University of California expedition, obtained from the Australian Government a naval vessel which will meet the American astronomers at Perth-Freemantle, convey them to Ninety-Mile Beach, wait for their experiments, and bring them back to the port. With this transportation at their command, the university authorities organized the largest and most completely equipped astronomical expedition which ever left the United States.

It was found that a series of night observations of certain very distant stars, the positions of all of which are obscured by the sun in the daytime, was necessary. Accordingly, Dr. R. J. Trumpler, assistant astronomer at Lick Observatory, with the first section of the expedition, left San Francisco March 31 for Tahiti, to remain for nine weeks, making night observations and photographs, Tahiti being in very nearly the same latitude as Ninety-Mile Beach.



The last section of the expedition sailed on the steamer *Tahiti* from San Francisco July 7. In the party were Dr. W. W. Campbell, director of Lick Observatory, who heads the expedition; Mrs. Campbell, and Dr. Joseph H. Moore, associate astronomer at Lick Observatory. The second section, consisting of seven tons of instruments and supplies, left San Francisco for Sydney, Australia, June 13. The first and second sections united at Sydney late in July, and proceeded to Perth-Freemantle. In addition to the observers from the University of California Lick Observatory on Mt. Hamilton, the government astronomer of New Zealand, Dr. Adams; Professor Ross, of the University of Southern Australia, and Astronomer Hosking, of the Melbourne Observatory, will accompany the party.

Messages from Dr. Trumpler indicate that his photography of the Einstein group of stars has been a complete success and that all material necessary for comparisons and comparative measurements has been obtained. Dr. Campbell, prior to his departure from San Francisco, stated that about four months would be required in calculations, after the return of the expedition, before any accurate or detailed results could be announced.

The expedition will observe the very minute displacement of certain stars predicted by Einstein, and, before him, by the men from whom he took his theory—or, as his supporters say, from whom he "collected and collated the theory of relativity." Einstein's claim is that several stars located near that point in the sky occupied by the sun at the time of the coming total eclipse, will appear not to be exactly in their normal places, but will seem to be moved away from the sun, as if they had been repelled by it. The amount of this displacement, according to Einstein, will be 1.7 seconds, so minute a distance that, were the sides of an angle of this size extended for two miles, they would be only approximately one-half an inch apart at that point. Observations, to be of value, of course, must be much more accurate.

Outline map of Australia, showing point from which truth about Einstein theory is to be sought in stars. Dotted line shows route astronomers will take to reach this point. To the left is a view of the University of California after the first fall of snow in 20 years.

Map of route taken by University of California astronomers who will observe total eclipse of the sun.

Lick Observatory of the University of California.

The idea of the displacement of these stars is closely connected with the law of gravity, and the known corollary that a dropped body falls 16 feet the first second, 48 feet the next second, 80 feet the third second, and so on, increasing its speed by 32 feet each succeeding second, until it hits the earth. This law is true whether the body be a bullet dropped from a height, or fired from the highest-powered rifle. Leaving the muzzle of the rifle, the bullet immediately begins to fall 16 feet in the first second, and continues dropping with the 32-foot increase every second. The greater speed of the fired rifle ball, of course, keeps it in the air longer. This result is allowed for in the sighting of rifles, and the law can be exemplified on rifle ranges because their distances are within the measuring power of man.

Inasmuch as all objects, of whatever material known to man, "fall" to the earth unless supported by some sustaining influence, the relativity theory holds rays of light similarly are attracted to bodies of greater mass, such as the sun, the earth or the planets, and thus "bent" out of their true courses. That is to say, the theory of relativity likens the ray of light to a bullet, fired at tremendous speed from a rifle, and claims that if we throw a ray of light, no matter how small or how large, in any direction, that light falls to the earth at the same speed with which the celebrated apple fell on Sir Isaac Newton's distinguished head. If this is true, the rays of light from the stars, directed toward the earth and passing the sun, are deflected by the sun, in proportion to its mass.

The question which arises is, how to measure the alleged falling of these rays of light, since light travels at the rate of 186,000 miles a second. In other words, a ray of light starting from the earth would travel three-quarters of the distance to the moon before it had fallen 16 feet. It would be far beyond the moon before it had fallen the 48 feet which the theory of relativity says it falls, in the second second of its journey. If this theory is proved true, down on the lonely desert beach in Northwestern Australia, we shall know—for the first time—that light has weight.

The old axiom that "weight is a measure of gravity" enters into this theory, and into this investigation. What we weigh depends not only on our own size and mass, but on the mass of the body on which we are. The object which weighs, say 300 pounds, on earth, would weigh only 50 pounds, or one-sixth as much, on the moon, that planet having only one-sixth the mass of our earth. The 200-pound man, though he appears to be a "big fellow" to most of us, is a mere Tom Thumb in weight on this earth, compared to what he would weigh on the sun, which has 27 times the mass of the earth. If this 200-pound man could be transported to the sun, he probably could not stand erect, quite probably, indeed, his limbs would not support him, since he would weigh, measured by our scales, 5,400 pounds, or more than two and one-half tons.

Now, by the same law of gravitation, the apple which fell 16 feet in the first second, would fall only one-sixth as far on the moon, or less than three feet. But the man who wanted to drop an apple so that it should be in the air one second on the sun, would have to ride in a balloon, or airplane, 432 feet above the surface of the sun. If he wanted it to remain in the air two seconds he would have to increase this distance by 1,296 feet, so that he would need to rise to a height of nearly a third of a mile. The theory, then, is that rays of light emanating from luminous bodies beyond the sun, and passing the sun on their way to the earth, are attracted by the sun, bent out of their true courses, as it were. To test this theory it is necessary to do two things: First, to obtain the exact position of such a luminous body, or of several of them, beyond the sun, when the sun is in another part of the heavens, as at night; and, second, to take their positions again, when the sun is in front of them. The first thing can be done on almost any clear night. Dr. Trumpler has gone to Tahiti, as reported above, to make these observations and records at the same latitude as the one at which the second thing will be done.

But that second observation can be made only when the sun is in its position in front of these luminous bodies, and when the light of the sun is not shining, else the light of the other stars cannot be seen by man. Hence, the observation must be made when the sun is in total eclipse. To minimize the chance of error, the observing will be done with cameras attached to the telescopes. The same cameras and the same telescopes which Dr. Trumpler used at Tahiti will be used again at Ninety-Mile Beach. The plates after development will be studied under powerful microscopes.

The Bugaboo of Seniority

AT THIS writing the settlement of the railway strike seems to hinge on "seniority." In railway circles this term describes the system by which men advance according to their time in service. The next oldest man, in point of employment, is promoted to a desirable vacancy. The next oldest man is not always the best fitted, and thus railroading has suffered from a system which was originally intended to bring about fairness in such matters.

In the strike, however, it takes on a new meaning. Railway managers decreed that strikers lost all their rights; if they returned to work they should return as new employes. Managers said it was not fair to discharge or supersede men who had come in to help in an emergency. The strikers, on their side, said they would never return until the rule of seniority was restored giving all the strikers all of their previous rights. Each side stood stubbornly for its respective contention until President Harding asked them to settle the strike, leaving the matter of seniority in abeyance for the present.

The fair mind will see the force of both positions, because the fair mind will assume that everything is straight all down the line. But the facts dispose of seniority as a strike problem. The so-called strike breakers brought in by the railroads are not mechanics and quit their jobs as soon as peace is declared. The railroads are paying more than twice the usual wages to their strike breakers. Any railroad manager will tell you that he has more trouble with his strike breakers than with his regular men. One railroad has had two strikes among its strike breakers—but it was not reported in the newspapers.

When the strike is settled, wages will go back to the previous scale. That is, the strike breakers will be cut from the $10 they are now receiving, to about $4. Of course, they will not stand for it. They are not seeking steady jobs. They are not, as a rule, of the class that has families to support. They are the mercenary troops, so to speak, the mobile army of labor trouble, and most of them are in the employ of agencies that are in that kind of business.

It is quite plain, therefore, that once the regular men go back to work the problem of seniority is automatically solved, as far as the strike breakers are concerned. They are not interested in orderly industrial procedure. They will not be there to contest their "rights." They will be scattered among their various tenderloins waiting for the next strike to break out, and some of them will be employed as agents in various industries to provoke strikes and thus make business for the strike-breaking agencies.

But, even so, the real problem of seniority will remain. And it is this problem which will continue to face the railroad men until it is settled right. It can only be settled right where the basic wage is just, where men can earn a decent livelihood whatever their degree of employment. Which is only to say once more that all our industrial difficulties are patiently waiting their solution in an order of justice and humanity which shall permeate every kind of work.

Mr. Henning Is Right

HAVING failed to break down the too few immigration restrictions with pleas to sympathy, the time-worn appeal to selfish interest is being attempted through powerful business institutions.

The increase in production has brought a scarcity of labor in some quarters, and corresponding demands for higher wages. The suggestion therefore is made to repeal the three per cent law to permit the hordes from Southeastern Europe to enter.

The interests constantly at work on behalf of the undesirable aliens believe that powerful manufacturers have more influence with Congress than have the great mass of real Americans who are seldom aroused from their state of inarticulate unobtrusiveness. They hope by waving the flag of cheap labor before influential manufacturers that Congress may be induced to open wide again the doors.

E. J. Henning, assistant secretary of commerce, who has been most active in safeguarding the country against the undesirables, in an address in New York, gave voice to some facts regarding the cheap labor fallacy which deserve general attention.

"If you have labor that will do fairly well for a year or two or five, but thereafter goes on the shelf, into the poorhouse, the home for feeble-minded, the jail, the cost of that individual to the community will be greater than any asset he may have produced," said Mr. Henning. "When you talk of filling the country with cheap labor, largely because it is mentally not capable of reaching a high stage, you are overloading your business, you are putting on an overhead that you cannot shake off for centuries to come, because the same people will reproduce their like.

"The cheapest labor in the world is the labor that is educated to the equivalent of a high school, has learned a trade, that is patriotic, and that has citizenship in the country. The man who is married and owns a home and is rearing a family, and who takes an active part in government, will ultimately be your cheapest labor, instead of the ignorant, illiterate labor which big business often says we need in this country to compete with the world."

Days That Are Gone Forever

WHEN you read or hear of the return in time to the standards of 1914, or any other date prior to the World War, set the man down as a tool or a fool. The standard then prevailing cannot come again without the greatest loss ever suffered by the American people, and the American people have suffered and are suffering beyond all precedent.

Wages and prices in 1914 were higher than in any preceding year. They were at the peak of peace-time progress from the time of the last previous deflation period, and but for the great European conflict that evolution would have continued until the rise in wages and price had made further production of gold unprofitable. This climax was hastened by the war, which had carried the standard of prices to a figure more than double that of 1914 when the peak was reached.

The attempt to force a return to "normalcy," to the pre-war basis, resulted in a most disastrous business depression. It is criminal to consider any further attempt in that direction. Hence the bald statement that he who urges it by tongue or pen is either tool or fool.

Every debt in the United States, national, state, city, township, village, school district or special assessment district, every private debt, every purchase of real property, has been contracted for in the period of highest wages and prices. Taxes of all kinds have been levied on the same standard. These debts and taxes were to be paid in dollars worth less in purchasing power than at any time in the history of the country. These debts represented but one-half the number of days' work, one-half the given measure of production, the same number of dollars would have represented in 1914. They should be paid in dollars bought by production and days' work, hence if it were possible to return, or go in that direction, the debts and taxes would be increased in the only means of payment—the product of field, factory and human toil.

This is exactly the object of the International Money Trust, represented openly in this country by the Federal Reserve System. This is the object of the drive to lower wages among industries organized to resist, for, with these broken down, industrial slavery is accomplished to a greater degree than has ever been before possible. Agriculture was hit first, because it was unorganized, and had accepted the "easy way" of borrowing. Forced liquidation wiped agriculture from the resisting force and weakened industry and commerce, which are dependent on agriculture as a basic industry. The forcing down of wages in the face of a continuous rise in foodstuff prices for a year, brought about the industrial contests now made an excuse for squeezing the public, and every line of causation may be traced to the same vicious Money Trust.

The economist who realizes this, and every thorough student, must be forced to the same conclusion, is a tool, while the man who carries the same idea into publicity without intent is a fool.

The standards of 1914 are gone forever; just as each succeeding standard has taken the place of a former one since the world began. Another standard will succeed the present, but should not, in equity, until present obligations are redeemed.

Credit had usurped the place of money in business transactions, and the country was in a fair way of clearing away the brush of money debt when credit and money both were deflated in 1920. We must remove the power of the Trust and the temptation to use it.

The Refreshment of Honest Print

HERE in the United States, Bolshevism has been traced directly to the door of certain bankers, who are either buying immunity from assassins, or financing for racial or business reasons the downfall of huge sections of humanity. The facts are well enough known, as is also the capitalistic control of nation-wide strikes. But a new birth of honor will have to come to the American Nation before facts can find publicity through the ordinary channels. We are at a loss in this country, first for an investigating press, and then for a press honest enough to print the results of investigation. Our so-called "liberal" press in the United States is a blind. Most of the "liberal" magazines are financed by the class they are supposed to be attacking. A threatened lawsuit against a very "liberal" New York magazine disclosed that one of its financial backers was a Jewish capitalist who has since been mentioned for the control of the Federal financial system. This man smoothed the trouble over and prevented exposure to himself.

Knowing the backing of the "liberal" magazines, it is impossible to recommend most of them. But it is hoped that through them the people may be given an answer to the enigma of an alien capitalistic class financing what seems to be a revolt against the capitalistic class. The answer is, of course, that it is not *their* capital that is jeopardized; *their* capital is rather enhanced by revolt.

In Great Britain they are more fortunate. Gilbert K. Chesterton edits an honest magazine, *The New Witness*. In England, as here, "Liberal" is only a party name used by paid partisans. Truth-tellers are still another class. The distinction is made vivid by acquaintance with Chesterton's little weekly, *The New Witness*. Another London weekly, *The New Age*, is entitled to praise for honesty. Here is part of a recent editorial from *The New Age*:

> ". . . . France cannot, without changing her financial system, avoid bankruptcy. At the same time she cannot change her financial system, because the international financial dictatorship will not let her. Here we have the key to the situation, not only of France, but of all the world that accepts a financial system imposed on it by the ring of private financiers. *Actually* there is no bankruptcy, in the strict economic sense, in France or, for the matter of that, in Germany either. *Actually*, equally, neither England nor America is poor or unable to forego or to pay debts. The *actual* wealth of all these countries is immeasurable. But owing to the idiocy which allows this actual wealth to be measured by money *over which a few private individuals have complete control*, any one of these countries, though actually wealthy, can be declared and made bankrupt at the discretion of Wall Street, Threadneedle Street, and the Banks of France and Germany. But so long as this 'super-Communist' dictatorship of the civilized world continues, anarchy is always next door to us; not a single nation can do as its people please; and one is no more responsible for any given situation than another. We agree that the French policy appears to be that of a lunatic; so, too, do the policies of the other countries of Europe and America. But the initial cause lies not in the details, but in the plan; and the plan, we repeat, is imposed by the existing financial system which itself is the work of arch-lunatics."

If you don't get that the first time, read it again; it has a world of good sense in it.

Get Your Hair Nets Early

THE snip-snip-snipping in ten thousand shops has come to an end.

We are just in receipt of an official fashion-communique in which it is formally stated that the tresses but a few weeks ago so proudly shorn are to be permitted to straggle untrimmed in the months to come.

Fashion's edicts (those made known, we suppose, by the arbiters of Lower Broadway) decree the return of skirts lowered to within two inches of the ground. The incongruity of short locks and long dresses being so manifest, and nearly every retailer being stocked up, yuh know Mawruss, with knee-length styles, why, of course, the hair must come down along with what is known in Brooklyn and the Bronx as the "skoit."

When Lower Broadway gets back from Atlantic City, and the nation's barbers have returned, their aching arms relieved by a month in a rest-camp on the slopes of the Adirondacks, the good work of mulcting American men and American women through the cry, "It's the style this season!" no doubt will proceed apace. Certainly nothing we can write is going to have any effect, we'll concede.

But—think of the horror of the transition period. It will be Woman's Clowning Glory this Autumn.

Mr. Ford's Page

A CASUAL remark on this page, to the effect that "seeing through" a wrong thing was equivalent to boring it through with holes and destroying it, has brought inquiries as to just how that could be. People want to know how "seeing through" a wrong thing destroys it. They want to know what the actual act of "seeing through" has to do with the thing itself. The inquirers were asking what power is exerted for the destruction of a wrong, by the fact that at last it is seen through.

What irks people nowadays is the apparent slowness with which reforms come. Men say, "They tell us we are on the eve of this or that: how long does this eve last, anyway?" They expect to wake up in a new world next morning. Well, they do, and they will continue to. We have been living since 1914 amid colossal changes, but how few have gained a perspective, a point of sufficient detachment, to see how colossal it all is! Worlds are being switched out from under us every little while, and new worlds switched in, and when all the transfers are made we shall find that—in say a period of 20 years—we have packed a transformation that ordinarily would have consumed five centuries. We move faster nowadays. Ideas and principles mature faster. Action follows more rapidly upon enlightenment. Progress is just gaining its first momentum.

All this is proved by the very impatience of those who complain that we are kept too long "on the eve" of change. Their very protest testifies to a feeling that the good *could* be brought along with greater speed. Men are conscious that things now can happen within a lifetime that ordinarily would have had to span half a dozen generations. That feeling is of itself significant.

There are two other elements to be considered alongside what has just been said. First, this sense of expectancy has been created by those who have "seen through" the things that must go. It is a compelling fact that when one once "sees through" a principle of good, it is like seeing one of the ribs of the universe—one instinctively knows that it is eternal. We never really know what good is, we never really believe in good, we never really get faith in the reality of goodness, until we see how absolutely it belongs to the whole natural fiber of things—until we see it as the Law, and not as some unnatural exterior morality imposed arbitrarily. When one thus "sees through" the good, one simply knows with invincible knowledge that the good is the thing that will remain.

And, contrariwise, when one "sees through" any evil system, one is immediately conscious that *that thing is doomed.* Its end is marked on it for any eye to see. And it is going soon, for the act of "seeing through" a wrong thing by any considerable number of people is prophetic of its destruction. People who "see" know that the end is near, and they occasionally say so, and thus others, who but dimly see, take hope again, and it is these who ask, "how soon?"

Then, the second element to be noticed is this: just about the time that wrong things are being "seen through," they seem to take on new life. It is not always possible to be exactly accurate about this, but the truth is somewhere between these two points (a) that to the newly understanding and appraising mind, the activity of evil systems may seem to be greater than before because they are only now being clearly seen, or (b) that evil systems actually do take on feverish life just before their destined fall. There is probably a great deal in the second suggestion. An evil system is usually extremely successful and dominant and insolent just before it falls. All its poison is heading up in the fever of death, and this fever is mistaken for vitality and power. Evil always ripens strikingly before it rots. The ripening is preparation for the decay.

NO BAD system can survive the process known as "seeing through it." To do this to it is like putting a hole through it. Honest understanding eyes bore through a wrong system like hot irons, honeycombing it with weakening tunnels. To "see through" anything is to let light and lightning into it: the action of insight is inevitably destructive of evil systems. What hidden and mysterious force may be connected with the process of "seeing through" a thing, we do not know, but it is beyond question that penetration by the understanding mind sounds the doom of all dishonest or distress-causing systems. People want to fight against them, make speeches against them, vote against them, but the most destructive work that can be wrought upon evil systems is just to "see through" them—understand them.

But it is this appearance that weighs hard on the hope and patience of those who are looking for a change. You attack and expose an evil group of men and you see them immediately afterward more successful in grabbing place and power than apparently they were before. You think, therefore, that evil is entrenched. Oh, no. Place and power are the gallows and the rope by which that gang is to be destroyed. You see an evil system pursued by a few poor honest men who "see through" it, and you see that system turn and crush them and even make the people laugh at them and regard them as ridiculous dupes. "What hope is there," you cry, "for truth?" Wait!—that evil system never was in such danger as when it attacked and drove out the truth-seers. It was the first break, the first fissure, the forerunner of collapse. Even an evil system might live longer if it at least showed common civility to its opponents; but it never conceives that policy; its arrogance is roused, and that stirs up the long accumulating poison within its system, and its end is near. "Whom the gods would destroy they first make mad."

Thus there are three elements existing at once: the certainty of those who "see through" the evil thing that it is doomed; the anxious expectancy of those who look for the doom to fall, and, with both of these, the apparent increase in the evil thing itself. These are all parts of the same moral situation, all aspects of the same process of change.

But the "seeing through" an evil thing is the most potent factor in its destruction. Every time anyone "sees through" it, it receives a wound. Whatever the system may be, it is established either in knowledge or ignorance. It is obvious that a good system can only exist on a foundation of knowledge; the people who establish it must know its goodness. It is equally obvious that an evil system can only exist on ignorance. Faulty as all of us are as individuals, readily as most of us would yield to the temptation of partaking of the benefits of an evil system (as participants in the profits of a usurious bank, for example—if the people mulcted were business men!) it is yet true that, collectively, we are against any system which works hardship or any form of injustice upon the people. If it exists and flourishes, it is because we have not yet "seen through it."

Now, because it is upon such a basis that an evil system exists, it is easy to see how the very act of "seeing through" riddles the basis. The more people "see through" it, the more it is riddled. Teach a thousand people a day to see through it, and you have made 365,000 such holes in it in a year. One by one men withdraw their moral support. One by one they take out of the evil system their belief in it.

And when the time comes that the people say with one voice, *"This is wrong!"* the end is come. The shout itself is mingled with the crash of the falling edifice. Things occur in this world as simply as that.

If anyone wants to help, let him "see through." Many people are lazy, they will not think, and evil systems prey on that laziness. It is ground for suspicion when any system discourages the people from trying to understand it. A man can help his generation by trying to understand things. He should try to understand money. He should try to understand the solemn farce of politics. Every time he understands a greedy or a tricky thing, he shoots a hole through it: nothing is so destructive of evil as the boring eyes that "see through." We know that things are wrong, we should try to understand where they are wrong. It is the hardest work we can do—this trying to understand matters—and that is why so few do it; but it is the most rewarding work after all.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Finishing What Jackson Began 105 Years Ago

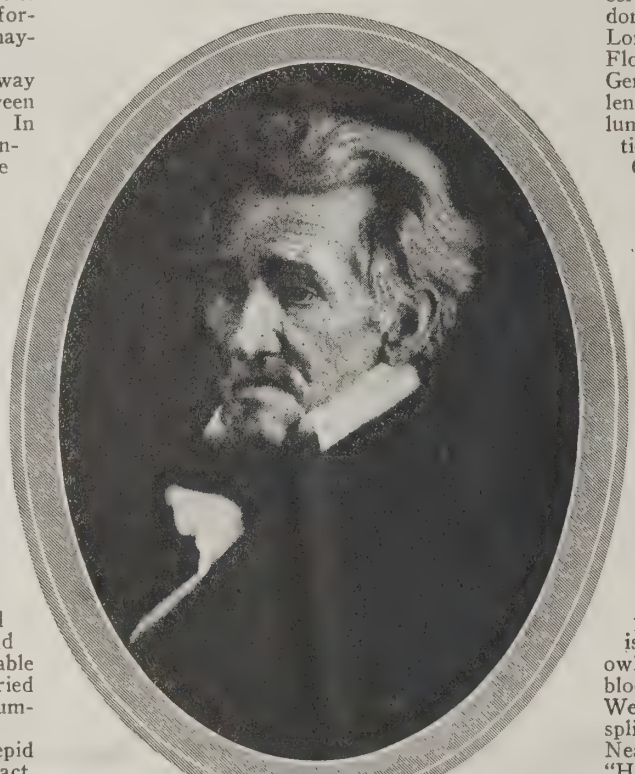
Most Historic Highway to Connect Great Lakes Region With Central South

By LITTELL MCCLUNG

IF THE spirits of those who have passed on find any interest and satisfaction in earthly progress and accomplishment, then the soul of General Andrew Jackson, "Old Hickory," must glow in pride of fulfillment—after long waiting—on looking down upon the new visible line of communication between Chicago and New Orleans. Nearing completion is the Jackson Highway, a road-building project begun by General Jackson more than a century ago.

It seems strange—among a people boasting rapid development—that a helpful, needed highway from the Great Lakes to the Gulf region, the southern reaches of which were started in 1816, should not be finished in 1922. But such is a fact. Yet all along the 1,100-mile route interest has been stimulated and work has progressed to a point from which completion within the coming year is an easy possibility. Bearing the name of the patriot who projected it, and leading to and through the scenes of his efforts to develop virgin territory and his vigorous and victorious exploits—first against the Indians and later against a foreign foe—it will be the most historic, and, mayhap, the most useful highway in America.

The real beginning of the Jackson Highway took place in 1805 by means of a treaty between the United States and the Cherokee Indians. In those days of unsurveyed forests and dense undergrowth, traffic necessarily was carried on the rivers; the streams were the lines of communication for the delivery of supplies from established white settlements to the more precarious abodes of the pioneers who had pushed farther south and southwest through the forests. The great Tennessee River on the north and the smaller Tombigbee in Mississippi and Alabama to the southwest were two such streams. And the Indian treaty of 1805 resulted in blazing a trail from the Harpeth River, near Nashville, Tennessee, straight across the Tennessee River and Valley and on to the Tombigbee River at Columbus, Mississippi. This direct from-river-to-river route, through vast hardwood forests and down almost into the long-leaf yellow pine region, was opened in 1808. Along it went supplies and troops for the Indian wars in lower Alabama and Northern Florida. Several years later General Jackson was pushing westward from Florida to meet the British at Mobile and New Orleans. The trail then proved invaluable because ammunition and equipment were carried to him down the Tombigbee River from Columbus, Mississippi.



Although known in history as an intrepid fighter, General Jackson, at heart and in fact, was a constructionist, a developer. Roads, bridges, homes—he wanted to see them built through the wilderness, and he helped to build them. And when he returned from the Battle of New Orleans to his native Tennessee he asked the War Department to construct a permanent road over the Indian Wars trail and to project it to within reach of New Orleans.

So in 1816 Congress appropriated $10,000 to start the work. It was "Old Hickory's" belief that soldiers, when not engaged in fighting, should be employed in useful work. And so this road-building was done largely by troops. It began in 1817 and was completed in 1820. It was necessarily a crude, although direct, road from Madisonville, Louisiana, on Lake Pontchartrain north of New Orleans, to Columbia, Tennessee. (A road already had been established between Columbia and Nashville.) This interesting short account of the work was given in the Louisiana *Advertiser* in 1824:

"There were on an average 300 men continuously employed on the work, including sawyers, carpenters, blacksmiths, and so on, who were amply furnished with oxen, traveling forges and all tools and implements necessary to its perfect execution. Thirty-five neat and substantial bridges, each measuring from 60 to 200 feet, were erected, and 2,000 feet of causeway laid. On a calculation of the pay, provisions and clothing for the soldiery thus engaged, and making a moderate allowance for the deterioration and loss of public property, we find that the general government disbursed on this occasion $300,000."

The era of early wars having ended and white settlements having gained an independent foothold in Alabama, Mississippi and Louisiana, but little record is kept of the subsequent value of this long-distance route. Later came the railways and the non-use of dirt thoroughfares for long journeys.

The Jackson Highway might have passed into history and even oblivion had it not been for Dr. James Milner, of Florence, Alabama. General Jackson had helped to lay out Florence, founded in 1818 contemporaneously with the building of the road, and which became the home of General John Coffee, who, as second in command, shared the glories of victory with "Old Hickory." Dr. Milner is somewhat of an historian and about 10 years ago he started talking of a new Jackson Highway, connecting the Great Lakes and the Gulf Coast and taking, from Nashville south, the original route so that it would be a permanent memorial to Jackson's services to his country. But while the sentiment of memorial aroused the first response in the Tennessee Valley, Dr. Milner's purpose was also practical and utilitarian. He felt that the Central South should be opened up and revealed to the Central West by direct line and that the old

"OLD HICKORY"

Jackson Road was the line. He believed that northern people should know and see something of the but-little-developed mineral resources of Tennessee and Northern Alabama and the solid, splendid agricultural possibilities of Mississippi and Louisiana. It was his contention also that such a highway, while bringing in new people and new capital, would be a chain to which counties all along could attach links, thus bringing permanent highway facilities to many isolated rural sections.

Other citizens of Florence took a hand and this interest spread through Alabama and Tennessee and then farther south into Mississippi and Louisiana and northward through Western Kentucky and into Indiana and Illinois. There was considerable controversy over the route, some maintaining it should deviate from the original direct survey so as to include more towns and cities. But the originators of the project held to the plan of making it a memorial in fact as well as in name and bringing benefits to remote rural regions rather than to a few towns. Their arguments finally prevailed.

The northern section—that between Nashville and Chicago—is, of course, without historical significance so far as the name of Jackson is concerned. Not a great deal of work remains to be done either north or south of the Ohio River. Long ago the Tennessee River was bridged at Florence—just a short distance east of where General Jackson's horses once swam this turbulent stream. The Tombigbee is bridged at Columbus, Mississippi, and the Leaf River at Hattiesburg. The Pearl River, northeast of New Orleans, is a water barrier yet to be overcome.

One of the most important, and possibly the most interesting link in the entire route is now being hard-surfaced—that across the famed Muscle Shoals District. Here the highway crosses Florence bridge over the Tennessee River. But there will also be a loop of several miles, going east from Florence and over the top of the to-be-completed Wilson Dam—at a somewhat dizzy height above the river-bed. The driveway atop the dam and beside the giant power house on the south bank of the river will be about 40 feet wide.

Through Indiana, Kentucky, Tennessee, Alabama, Mississippi and Louisiana, the Jackson Highway will present an almost complete panorama of the life and agrarian activities and possibilities of America. Coming south and out of a section of the Corn Belt, the traveler will enter the blue-grass pastures of Western Kentucky where the eye is charmed by inviting rural homes, deep meadowlands, purebred Herefords and Shorthorns, and blooded horses. Then—into the hill country of Western Tennessee, with its cotton and corn, the split-bottom chair and the "kivvered" wagon. Near Nashville he will see the wonderfully lovely "Hermitage," resting place of "Old Hickory." Thence to Columbia, old home of President Polk, and then through the rich phosphate fields around Mt. Pleasant, Tennessee. From here into Northern Alabama and the Muscle Shoals District where the past is revealed in remarkable contrast to the present—old homes and plantations in proximity to vast potential hydro-electric power and coming electro-chemical industries; the home and burial place of General Coffee almost under high-tension transmission lines; the Indian Mound at Florence, that was ancient before the time of Columbus, and just opposite a great plant for the fixation of atmospheric nitrogen! The courthouse at Florence marks the intersection of the Jackson Highway and the Lee Highway—a transcontinental route swinging into Northern Alabama from Virginia and Eastern Tennessee and going westward along the north bank of the Tennessee River and on to the Pacific Coast.

At Russellville, just south of the Tennessee River, the visitor will pass through the richest brown hematite ore region in the South. Through Central Mississippi he will see the Old South merging into the New—large cotton plantations turning in marked measure to diversified farming; alfalfa and lespedeza pastures supporting dairy cows, beef cattle and hogs.

The Jackson Highway passes through the territory over which Union and Confederate soldiers battled during the four years of the war between the states. Forces of Grant and Sherman, Albert Sidney Johnson and Beauregard clashed repeatedly throughout Kentucky and Tennessee. Scenes of historic battles dot the highway. On the last lap of the journey the tourist or home-seeker will pass through the wonderful long-leaf yellow pine region of the Gulf Coast—great trees straight as arrows in deep, open forests into which one can look for considerable distances. Here the atmosphere is laden with lung-clearing, health-gaining ozone from numberless evergreen needles of the forest; here, as in Jackson's time, the winds play in strange, perpetual symphonies through the pines.

Line of the Jackson Highway

FROM Chicago down the South Side boulevards to Hammond, Indiana; to Crown Point, Rensselaer, Lafayette, Frankfort, Lebanon, Indianapolis, Franklin, Edinburg, Columbus, Seymour, Brownstown, Salem, New Albany;

Across the Ohio River and into Kentucky at Louisville; thence to Bardstown, Hogenville, Glasgow (a few miles southeast of Mammoth Cave), Scottsville;

Into Tennessee to Gallatin, Nashville, Franklin, Columbia, Mt. Pleasant, Lawrenceburg;

Into Alabama to Florence, Sheffield and Tuscumbia (the Tri-Cities), to Russellville, Hamilton;

Into Mississippi to Columbus, Brookville, Macon, Meridian, Laurel, Ellisville, Hattiesburg, Poplarville;

Into Louisiana to Covington, slightly north of Lake Pontchartrain; thence southeastward around the lake to the Mobile-New Orleans Highway (the ancient Indian and Spanish Trail); thence across the Rigolets (arm of the lake) into New Orleans. Or, directly across the lake by ferryboat from just below Covington. Total length of the Jackson Highway nearly 1,100 miles.

From Lakes to Heart of Dixie Thro' Historic Spots

Jackson Highway, Affording Splendid Route Into Central South, to Be Finished in 1923

Above—Close view of "The Hermitage," last abode and resting place of "Old Hickory." Circle—Cedar drive into "The Hermitage," near Nashville; last home of General Andrew Jackson. The cedars leading to the home and completely surrounding it make a driveway the exact form of a violin; the soul of the designer was attuned to the harmonies of the woodlands. Below—Courthouse at Florence, Alabama, at the intersection of the transcontinental Lee Highway and the Jackson Highway.

Oval—Log cabin near Nashville in which "Old Hickory" lived for some time after his return to Tennessee from the Battle of New Orleans. Below—Florence bridge over the Tennessee River just east of where General Jackson's horses once swam the stream. The near end of the bridge is close to a counterfeiters' cave used by lawless coin-makers upward of a century ago. The far end is about one-half a mile from an ancient Indian mound.

America Once More Is About to Pack Up

That Bugaboo—Moving—Which Takes Hold Annually in Every City

By THOMAS J. MALONE

ITINERANT America will soon take the road for its September turnover. In every town and city, families will gather their household possessions and move—move from one tenement, flat building, apartment house, hotel, duplex or single dwelling to another tenement, flat building, apartment house, hotel, duplex or single dwelling.

There will be foreboding, dread, loathing, worry, work, weariness, alarm, chagrin, disappointment, connected with the process. Supplies of newspaper, excelsior, burlap and cord must be assembled, fragile goods must be protected, heavy weights shifted. Furniture will be scuffed and dishes broken. Tempers will be strained, bitter words spoken, tears shed. Muscles will ache. Nails and knuckles will suffer. Many a housewife, having directed the moving, will be laid up for a week or more afterward.

But there is a brighter aspect of the picture. The business of moving household goods has been developed, particularly in the larger cities, to such an extent that danger of damage to the goods has been largely reduced and the horrors of the actual moving, as affecting owners, ameliorated.

For years it has been customary for newspapers and magazines to break out in spring and fall with articles on moving in which the man who does the job—loads, hauls and unloads, and often packs the goods at the beginning—is the butt of joke and barb and satire. To be funny at his expense has been quite the thing—at his obtuseness, ignorance, perverseness, his profound aptitude for bungling and general all-round cussedness. Nearly all these articles have told the story from the point of view of a family being moved, tending, for the most part, to give the moving man a bad name.

The Van Man's Story

ARE van men always late? The customary magazine article says so. Are they all heavy-footed, double-thumbed burlies who see no difference between a clothes wringer and a porcelain vase? You would think so from what you find in print.

Yet throughout the country, in every community that has men definitely engaged in the household goods "transfer" industry, the transfer man will be found earnestly striving to give what customers ask and pay for, and proud of his service. Let a representative moving man speak for himself and his fellows.

This man might be one you know in Yonkers, Terre Haute or Wichita. It happens that he lives in a Middle Western city of 400,000. He has worked up in 30 years from teamster on a van to owner of a half-million-dollar business; his men call him "Sam." His hobby is the theater and he knows Shakespeare by the yard.

"I am a mover, storer and shipper of household goods," Sam Hodson began, when invited to represent. "I may be the man who put the dent in your mahogany table-top, dropped your prized mirror or contributed the indelible heel mark to your costly rug. You see I'm honest about this but, unlike Othello, who persisted in speaking of 'most disastrous chances, of moving accidents by flood and field,' not boastful.

"On the other hand, I am more probably the man—give my due—who moved you in a time of stress, of unusual excitement and concern, with smoothness and dispatch, without damage to goods, and with a forethought that made things lighter for you, minimized the bugaboo of moving and led you to say to the main office the next time you ordered a van, 'Be sure to send that man with the red hair.'

"The men with the vans are the ones that most people come in touch with, so it is they who do most toward giving the business its reputation, good or bad. No doubt some van men are slow in showing up at the place expecting them and are in too much of a hurry after they arrive; are inconsiderate, impatient of direction, surly, boorish, unpleasant, bungling. But there are few such, comparatively, and they do not last long in the business. They never get beyond the initial or 'helper' stage. You never find a man sent out in charge of a van to be that kind of fellow. If a 'helper' proves unduly nervous or careless, given to doing damage, he is let go or assigned to less important work.

Men Are All Skilled

"IN THE larger organizations, at least, where system prevails and men are picked and trained, the men who go to your house—and I ask you to measure this against your own experience—do not, on the whole, do the numskull thing, but sincerely aim to oblige, give real service, have a feeling for what they handle, realizing its significance to the family, and enter into the spirit of the undertaking."

Why do folks move? To answer this, the moving man drew on a fund of intimate knowledge of the reasons actuating the nomads, for they often talk freely to the van men during the process, telling details of family motives and history.

Also, how does the moving industry today differ from that of a generation or so ago, and just how is moving done these days?

"Why do folks move? It's in the blood," said the spokesman of the industry. "Man's a natural mover, with spring and fall his times of greatest unrest; still there's a good deal of moving in a large city all the year round. Of course, the country over, mostly, September 1 and May 1 are the 'moving days,' though the week before and the week after each date figure up strong because it's impossible to move in a single day all the families that want to be moved.

"The September moving is always heavier than the May, as much as 15 to 20 per cent, we find. Yet I'm going to predict right now that next September 1 will be an unusually light moving day throughout the United States. No, I've no way of knowing that there'll be bad weather that day to slow up operations nor that a large number of vans or of van men will be laid up for repairs. It won't be a Sunday, either. I simply state a fact, though.

"And why so sure about it? Look at your calendar. You've guessed it already. September 1 will be a Friday, and folks are superstitious. Experience of transfer men everywhere in this land that admits it is the home of the brave discloses the same story—many people will not move on Friday.

"But to go back to the specific reasons that lead folks to move. There's the chronic flat dweller, for instance. Some will live only in new buildings, in apartments not occupied before. They change every year or two, preferring the upheaval of moving to the inconvenience of living through a repair and redecorating ordeal where they are.

"This kind prepares to flit just as soon as the blue tint in the bathroom becomes sooted, the floor leaves the baseboards in the living room, the plaster begins to sift from the cracked ceiling over the wall bed or roaches show up in the cupboards. I don't blame them, for one. If folks must live in apartments, they're entitled to have them fresh and clean. It's different in your own home, for there you can become attached even to cracks and discolorations, if not to roaches; they're yours, anyhow.

"While changes in size of families, increases or decreases, have much to do with it, a sober aspiration or pet whim is often at the bottom of the moving. People want a larger living room, or a better arrangement of rooms, or better light, or a sleeping porch, or a sun parlor, or a fireplace. Or they want a choicer neighborhood, or to be near friends, or away from friends, or near church or school, or to get away from dogs or cats or parrots or barns or automobiles. Or—well, there are scores of other reasons, I dare say valid enough, and most of them illustrating that characteristic hankering of the American people to better their condition.

"Again, there are cases, sometimes pathetic ones, where the move, because of a reverse in fortune, is due to necessity of curtailment and represents a backward step.

"Then, too, in a class by themselves, are the adventure-loving folk who enjoy moving for its own sake, find a thrill in it, like new faces, new surroundings, new contacts, reactions, complications. It provides them a new crop of listeners for their favorite stories, with whom to go over, as new, their ills, burdens, prejudices, preferences and hopes."

Industry Is Motorized

WE ARE so much used to covered vans, rubber-tired and motor-driven, with padded sides, side pockets for mirrors and pictures, paper and cloth slip-covers, burlap and other protectives, that the evolution of the moving industry from casual beginnings may have missed many of us. We are likely to forget how a man with a dray and team moved us in the eighties, putting the goods on just as he found them and giving scant attention to such details as draping a blanket over the center table or chugging folded newspapers between the kitchen stove and parts of the best room bedstead. As for assuming any responsibility for the condition of the goods when delivered, that was something seldom if ever thought of. Folks moved distinctly at their own risk in those days. Any man who started in the business 30 years ago and stuck to it, like Sam Hodson, has seen all the changes. His story ran on.

"When I began, any one with a wagon and a team would move household goods. If running a regular dray business, he might take a house goods job as an incident in the day's work, not making a specialty of it. If he needed a helper, he'd pick up the first husky at a street corner—'anybody with a broad back.' Few men actively in the business then had more than a few thousands invested in it, anywhere in the country. Today there are concerns in our largest centers with a million or more in plant and equipment.

"The most notable advance in the industry in recent years has been the replacing of the horse-drawn by motorized equipment. Teams are still used, and are often more economical for the customer for short hauls, but, even so, people more and more ask for the auto van. Perhaps they feel there is more 'class' in being moved by automobile and that it has a certain value in introducing them to the new neighborhood. Besides, it may be expressive of the prevailing demand for speed regardless of cost.

"Airplane service will be the next step. I expect to see the day, and that not so far off, when loaded vans and even freight cars will be transported by air. Chicago to San Francisco service will be as ordinary as a milk delivery. When that time comes, we shall have to do something to discourage, at the take-off, the small boy who now runs alongside the van with his inevitable 'Give me a ride, Mister?'"

This was getting around to the actual how of moving as seen through the eyes of the van boss.

While most transfer companies employ expert packers who will go to the customer's address and prepare goods for hauling, in lieu of this, which costs money, careful packing by the home folks is welcomed by van men. It makes goods easier to handle and reduces the likelihood of complaints. There are, however, careless, shiftless families who make no preparation for moving. The van arrives to find them still in bed, or at breakfast. Beds and bedding are taken out, "as is," and dishes go into the van unwashed.

Owners often decline to intrust prized belongings to the van and carry them themselves—afoot, in street car, by automobile. One may see Jennie with the shade of the floor lamp, dad with the bird cage, Ben with the goldfish, though the van men will say, if asked, that there is no need of that. With proper pride in their adequacy, intrepid vansters will take on many things that may require special looking after, as dogs, cats and plants. A well-filled goldfish bowl the driver will put on the cab floor between his feet, thus having a sort of spirit level to warn him when the going is too rough.

According to the moving man, the human element is the most important factor in building up a transfer business.

"I've come to believe," he went on, "that we get in this world, no matter what we do for a living or with whom we associate, about the kind of treatment that we invite. I have said that we usually send a reliable type of man to customers' homes. Now our men are instructed to be polite and considerate at all times, in all circumstances, regardless of what provocation to be otherwise. Yet, being human, they sometimes fall short of that high standard, I suppose. On the other hand, if the family they serve is not haughty, domineering, super-critical, suspicious of their every move, as some families are, but treats them as human beings, they will respond in kind. The lamb loved Mary so because Mary loved the lamb, you know—though I'm not saying that the average van man is so very lamblike."

Just One Right Way to Load

IT SEEMS there is one right way and there are a dozen and more wrong ways for loading a van. Your trained van captain knows the right way, though it may differ with every new assortment of goods. The van is more or less standardized in America, as to both shape and capacity, and perhaps three-fourths of the possessions of the average family of five or six persons can be anticipated. Yet no two lots will be put into the van alike. The old-timer had something to say on this, too.

"The man in charge of the van always walks through the house or apartment, sizing up the goods, before he starts to load. He then knows what he has to deal with and determines in what order to handle it with a view to economy of space, riding of the load, and so on. Practice has made him somewhat of an expert in solid geometry, and his offhand estimates of cubic contents are surprisingly accurate.

"Lots of folks try to tell the men how to load, what piece to put in here and what there. That's a mistake. Getting the goods of a six-room house or flat into a van, and placing them so they will haul right, is a problem for an expert.

Sometimes, though, things go wrong in the moving; dishes are broken or the day bed butts the newel post. Then come complaints and claims. The wise company is said to invite them, to do its utmost to satisfy the complaining customer.

In every transfer office one may gather tales of typical complaints. Some of the complaints are justified, some are not. There's the one of the missing casters. A woman's voice is on the telephone and from its tone one knows there is blood in her eye.

Of Course, the Casters Are Found!

"I AM Mrs. Cranberry," she says. "You moved me this morning to 1325 Buell street. I want to tell you that the casters of my four-poster are missing, and I know one of the van men has them. I saw him put them in his pocket. Seems to me you could get honest men to work for you—and what he'd want with the casters alone, I can't see. Or maybe he means to come back for the bed."

"Have you searched carefully?" she is asked. "Are you sure they are missing?"

"Of course I have," witheringly. "You don't suppose I'd be calling you if I wasn't sure?"

Mrs. Cranberry is told that a check will be made with the men when they come in at the close of the day, and she will be called.

It is so made.

"Sure, I remember it," says Hank, the coal stove balancer. "I did put them casters in my pocket; always do when I find they've been left on the bed legs. Later I got some string and tied them to one of the slats of that same bed. Tell her to look for them there."

Mrs. Cranberry finds the casters.

All sorts of things are reported "lost" in the same way—rugs, cutlery, pictures, garden tools, what not.

As far as possible, according to testimony when they get together in such conventions as that of the American Warehousemen's Association, transfer men strive to satisfy customers who claim damages, by replacing or restoring rather than by cash payments. They replace casters and screws, have new legs or rungs milled and scratched surfaces scraped, filled and repolished. Many of them employ expert finishers whom they send out to the homes to fix up damaged furniture "good as new." A finisher often goes further, resurfacing some piece not complained about but needing it, doing it for good measure and to show the company's attitude. This is an insidious way of winning feminine approval.

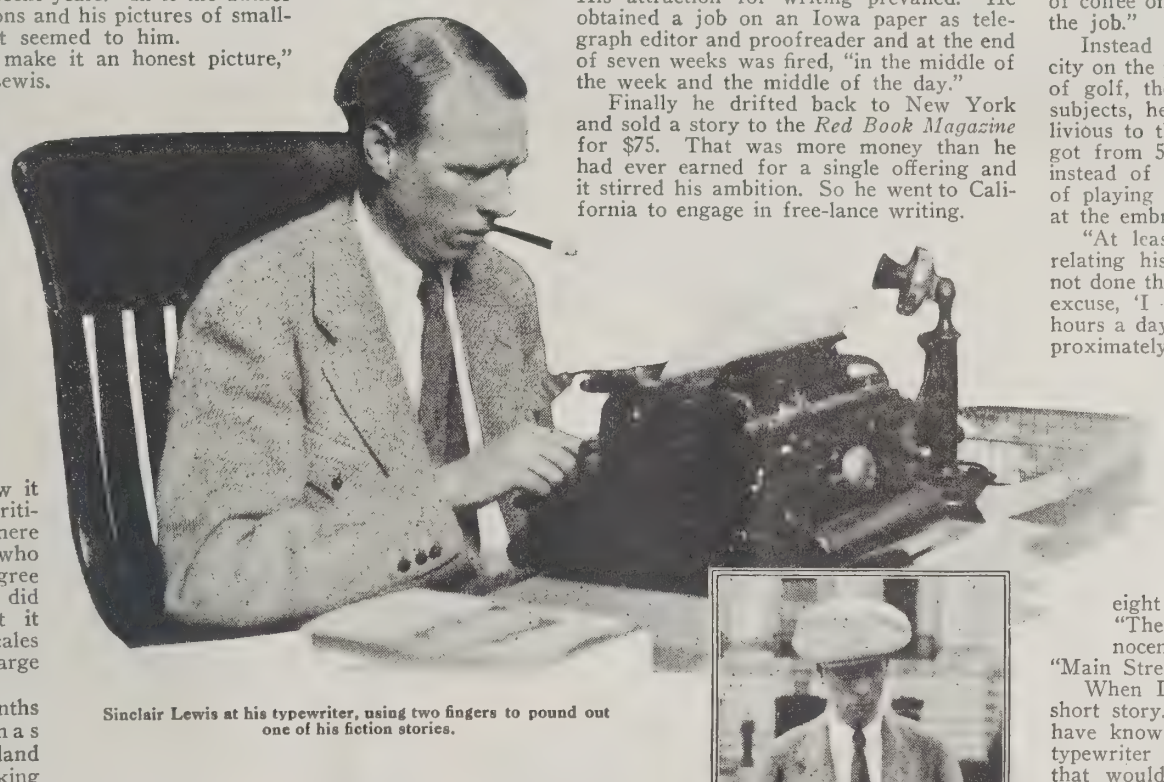
"Despite all this," says Sam Hodson, "the average housewife, when moving day dawns, is in the mood to say, with Brutus at Philippi:

"'O! that a man might know the end of this day's business, ere it come.'"

Impatient With Those Who "Find No Time"

Sinclair Lewis Has Written His Novels in Ordinarily "Wasted" Hours

By FRED L. HOLMES



"IT TAKES hard work, native ability and a little luck thrown in to make a man particularly successful in any undertaking. There is an element of 'luck' in everything we do. You may write something that is behind the time. It is not a success because it is old. You may write something that is so far ahead of the time that people will think you are a fanatic. If you have the luck to have the right idea at the right time you make a success."

Sinclair Lewis, noted author of "Main Street" which for 12 months stood at the top of the list of best sellers, was moralizing on the successes of the world. This tall, angular young man—37 years old—who looks more like the sporting writer on a metropolitan paper than he does like one of the heralded present-day authors, believes that with every success in the world hard work and luck are two elements that are inseparable. "Main Street" was one of the marked literary successes of recent years. In it the author gave his reactions and his pictures of small-town life as it seemed to him.

"I tried to make it an honest picture," declared Mr. Lewis.

"Did you think when you wrote the book that it would be such a success?" I asked as I looked over a statement from publishers which showed that nearly 400,000 had been sold.

"Hardly," came the reply with a smile. "I knew it would evoke criticism. I knew there were many who would disagree with me, but I did not think that it would tip the scales with such large sales."

Sinclair Lewis at his typewriter, using two fingers to pound out one of his fiction stories.

For 18 months Mr. Lewis has been in England and Italy working on a new book. He likes a change of environment and generally rents a house in some city which strikes his fancy and settles down to his writing.

"I like to get on neighborly terms with people," continued Mr. Lewis. "I like to be real sociable and know even the man in the corner grocery store well. Life in a hotel for more than a few days has few attractions. You have to live in a town awhile, buy groceries and milk and have a butcher bill to have some sense of feeling for it. In the past eight years I have made my home in Minneapolis, St. Paul, New York, California, Cape Cod, South Cornwall, England, and now in Madison, Wisconsin."

Mr. Lewis is intensely American. A friend of his tells the story that while he was in Cornwall, a conjurer was giving an entertainment and the rabbit was somewhat slow in coming out of his hat, whereupon the conjurer remarked:

"She's rather late, as America was in coming into the war."

The laughter of the audience over this barbed jest brought Mr. Lewis to his feet and the audience was told at some length why America was late in coming into the war, but what she accomplished once she entered. Before Mr. Lewis had finished, the conjurer looked as scared as the rabbit and the audience learned that the American viewpoint of the war could not be juggled with the British viewpoint. All of which shows that one of the characteristics of the author is his positiveness, anywhere and any time.

Unlike "Main Street," which pictured Gopher Prairie, the new novel, "Babbitt," is the story of a man—rather than a city or a town—an ordinary, nice sort of a fellow, what he does and what he thinks, in a city of 300,000 inhabitants.

According to Mr. Lewis there is no mysticism about writing novels. It takes hard work, ability and the right theme. Seven books by the same author had been published before he struck on "Main Street." Neither was there anything peculiar to his environment that would spell literary success.

"I was born in Sauk Center, a Minnesota village," continued Mr. Lewis, "a genuine prairie town, ringed round with wheat fields broken by slough and oak-rimmed lakes, with the autumn flight of ducks from Canada as its most exotic feature. My boyhood was alarmingly normal, mid-western, American—my father the prosperous pioneer doctor, whose diversions were hunting and travel; my school, the public school, with no peculiarly inspired teachers; my sports, aside from huge amounts of totally unsystemized reading of everything from dime novels and Ned books and casual sentimental novels to translations of Homer, were the typical occupations of such a boy; swimming in the creek, hunting rabbits, playing pom-pom-pullaway under the arc light in the evening. There was not much work—a few evening chores, of the wood-box filling sort."

When there was nothing else to do as a boy he hung around the country newspaper office at Sauk Center, now a town of some 3,000 inhabitants situated on the shores of Sauk Lake, Minnesota, and finally he obtained a job while still in high school—sticking type, reporting, cleaning type, folding newspapers and sometimes helping in making the deliveries.

"I don't know how I got the inspiration to go East and become irregular, abnormal, happy and otherwise literary," he commented.

At Yale, where he graduated in 1907, he wrote for the students' literary magazine and worked for a time on the New Haven *Courier and Journal.*

After graduation he wavered as to whether he should continue in the newspaper field or become a teacher. His attraction for writing prevailed. He obtained a job on an Iowa paper as telegraph editor and proofreader and at the end of seven weeks was fired, "in the middle of the week and the middle of the day."

Finally he drifted back to New York and sold a story to the *Red Book Magazine* for $75. That was more money than he had ever earned for a single offering and it stirred his ambition. So he went to California to engage in free-lance writing.

"I did get in a few savingly unliterary hikes, however," he declared half - reminiscently. "During college I made two cattle-boat trips to England; on one of them I landed in England with only 15 cents and stayed alive by borrowing $3 from a fellow cattleman, which lasted until the boat returned. Again I wandered down to Panama, going steerage, returning stowaway, and in between failing to get a job on the Panama railroad. A year and a half I spent in California, part of it reporting, part trying vainly to free lance, sharing a bungalow at Carmel with William Rose Benet, now a noted editor and author of that charming novel, 'First Person Singular.'

The author of "Main Street," which has sold to 360,000 copies, motors over the United States to get a look at each state's scenery.

"We had three rooms in a portable cottage and swept the floors if we did not scrub them. I tried to write short stories but after finding myself in debt for $400 I went to San Francisco and got a job on the *Bulletin* which I held for three months. Then I was fired. I got a job on the Associated Press which I held for two months and was again fired for incompetency. There are most uninteresting reasons for firing a man. But all of the men who have fired me have since become my close personal friends. No longer do I look upon them as the 'big boss' of the office."

Out of a job, Sinclair Lewis drifted back to Washington, D. C., where he became "managing editor, office boy and circulation manager" of a magazine for teaching the deaf. He smilingly commented that there was only one other employe, the editor, "who acted as my associate."

Later he obtained a job in New York for $12.50 a week, was promoted after three months to $15 a week, and at the end of a year to $17.50 a week. He became the assistant editor on *Adventure* and later went with the *Publishers' Newspaper Syndicate.*

For two years he was on the editorial staff of George H. Doran, book publishers. When he tired of this routine life he went back to his old vocation as a free-lance writer.

With those who prattle with such excuses, "I can't find time" or "I am too tired," Mr. Lewis has no patience. He found time to write one of his novels while riding on New York railroad trains, after allowing eight minutes every morning for the reading of the daily newspaper. One hour a day will produce results.

"I decided I would not have time for being tired, instead of not having time for writing," Mr. Lewis declared. "I wrote practically all of a novel on trains, and the rest of it I wrote at times when I didn't have time to write. In the morning, after the furnace had been fed, but the kitchen stove was warm, I got in most of an hour of writing—with the drain board of the kitchen as my desk. Between adjectives I made a cup of coffee on the gas range. I wanted to concentrate on the job."

Instead of talking with fellow passengers into the city on the prospects of the weather, the wholesomeness of golf, the power of Tammany, and a dozen other subjects, he pulled out a roll of copy paper and oblivious to the crowding and pushing in the jolting car got from 50 to 500 words done. When he felt tired, instead of loafing in the evening, he worked; instead of playing golf Saturday afternoon, he scribbled away at the embryo novel.

"At least I have learned this," he commented in relating his time-saving experiments. "When I have not done the things I wanted to do, I may not use as an excuse, 'I can't find time.' I have and you have 24 hours a day. And that is, as far as I can find out, approximately the same amount of daily time that was granted to Michaelangelo, Pasteur, Shakespeare and Ty Cobb."

Then, like Arthur Brisbane, who is always preaching how every one can get a liberal education on the time that each person wastes, Mr. Lewis pointed out that if a man found time to write only 25 words a day and kept it up, in 12 years he would have written a full-length novel.

Scores of short stories have followed as the result in the past eight years. His eight best-known books are: "Our Mr. Wrenn," "The Trail of the Hawk," "The Job," "The Innocents," "Free Air," "Hike and the Aeroplane," "Main Street" and "Babbitt."

When I called upon Mr. Lewis he was busy at a short story. Like 90 per cent of the newspapermen I have known, he sat at a desk hammering away at a typewriter using just two fingers and going at a rate that would do credit to some of the touch system stenographers.

"Do you do all your writing with a typewriter?" was asked.

"Never use a pencil," came the reply between puffs on a cigaret. "I have been using a typewriter this way for more than 20 years. But the method you use to write, whether by pencil, pen or typewriter, has nothing to do with a person's ability to produce fiction, any more than the color of the paper or the size of the desk. There are no rules for writing except work.

"I have no patience with many intelligent people who complain because their writings do not sell. I had less sympathy for them after I had worked as an editor of a magazine for a time than I had before. I try to discourage every young author, and if he refuses to be discouraged there probably is something in him.

"There are many people in the world who can write good waybills, or good business letters. They think the world is against them because after three or four months of practice they do not become a success as fictionists. It takes practice, application, and ability to become a writer. Some people will work three or four hours a day on literature and at the end of the year complain if they are not reaping rewards.

"There is no other profession in the world where amateurs hope to attain the heights so quickly as in writing. Take a boy who wants to become a physician. He will spend four years in college and two years additional in a medical school, one year as an interne in a hospital and then he is lucky after he has been out 10 years if he has a sufficient practice to be self-supporting and successful.

"Yet some clerk spending a few hours a day for a year complains when he is not successful at writing, when in most other professions it takes years. It even takes more than a year to become a good shoemaker.

"Just because a man can whittle a stick well is no reason to think he would be a good surgeon. Writing is a profession which takes years and much practice, even if you have the innate ability. A man may be a good mathematician and would never be an author any more than a good astronomer might be a good surgeon. You must be fitted for the profession by instincts and inherent ability."

There is a breeziness and swinging mid-western attitude about Sinclair Lewis. He boasts with Thomas Jefferson the possession of red hair. Tall, almost ungainly, but a pleasant, jovial, humorous fellow, he settles back in the chair back of his desk, curling one of his spider-like legs in the braces of the furniture, and starts a fund of stories and experiences that would delight an audience anywhere.

"All fiction is based on an experience in one's life carried on imaginatively," declared Mr. Lewis. "I never go searching for plots. I settle down in some quiet city and start to work. Soon I find I have more ideas than I can write; more work than I can do. Then I am happy."

The "Age of Water" Follows the Age of Wine

How the Waterworks Engineer Is Responsible for Prohibition

By MORGAN D. E. HITE

IN THE course of an intensive study covering the general development of the dwelling house all over the world, I have had occasion to observe the particular phases connected with the supply of water for human consumption. Seeing therein that the matter has a bearing on the momentous prohibition question which agitates the minds of good people and others in America, and thinking that perhaps a presentation of an underlying truth may be of some help both to those who oppose prohibition and those who seek to enforce the law, I have asked THE DEARBORN INDEPENDENT to publish this brief historical study of the matter.

On all public questions there is much nonsense printed on all sides, due to lack of knowledge by spokesmen for and against. If the historical basis for some of our revolutionary issues were comprehended there would be less irresponsible talk and more specific attacks or defenses made. There are very good reasons for everything that happens, if we did but know.

Briefly stated, the question goes back to water supply for human use. In ancient times, and as far back as history records, the juice of the grape (as Omar phrases it) has been the chief liquid nourishment of human beings. In modern times, especially in America, the juice of the grape reached a decadent period, and has descended to playing the part of a mere beverage. From being the necessary liquid nourishment of the human race, wine and allied products finally declined to a point where they were partaken of by mankind as a pleasure and form of entertainment rather than as a vitally necessary food. Water—pure water—was the usurper that had displaced the juice of the grape from its original high position.

Plenty of Water—But Unsafe!

HOW did this happen? And where was all the pure water before man discovered it? Is it possible that wine was the only drinkable in those far-off times? Yes, that is it exactly. Wine was the only *safe* drinkable. There was plenty of water always, as there is now, but much of it was unsafe to drink, and the human race had recourse to grapes and other fruits and their juices. The discovery of wine-making and the later discovery of ale and beer-making solved the problem of a permanent liquid supply wherein the juices of the vine could be put in storage for consumption as needed. Because death lurked in some of the water deposited by nature, the ancient races of people in their ignorance and fear of the unknown turned to the wild grapes for their juices instead, and to fruits and herbs.

The cultivation of wine grapes flourishes best in certain parts of the globe, for the grape does not grow luxuriantly everywhere, and it is among the races and nations located in the vineyards of the world that the development of wines has reached its highest point. Among the peoples situated in parts of the world where vineyards were not practicable the invention of a substitute was necessary, and thus from cereals was evolved beer and ale, and no doubt in the course of this evolution whisky came out of the process one day instead of the expected lighter product. Whisky then took its place along with the others, but not being a necessary part of man's nourishment it has never occupied as important a place as wines and beers. In the earlier times, in proportion as the water supply of a country was inferior, scarce or polluted, as in the desert regions and the southerly parts of the world, the use of wine as the daily liquid refreshment was greater, while in the countries and among the peoples of more northerly climes and where the water supply was purer and less deadly and more certain in all seasons, as among the Teutonic races and the American Indians, the manufacture of wine was less frequent, and more water was used. Thus the world in its early history was divided by natural means into two kinds of people, just as is modern America today: those who prefer wine and those who prefer water.

Where Water Is Frowned on

THE old quips concerning the "Kentucky Colonels" who knew of no use for water were therefore not altogether figments of imagination. They had millions of prototypes. Even today there are many parts of Europe where water is almost never partaken of, and wines or cereal liquids are used as the common drink for all, with perhaps goat's milk (and sometimes donkey's milk) for babies.

This condition is found largely in those parts of the globe classed by us Americans as "backward" in sanitary science, and among people who have little knowledge or regard for sanitation in the "American" sense. The two things, as I will show, go hand in hand—*the less sanitation among people the more wine they consume.* I am referring, of course, not to America but to those "backward" races and nations where because of lack of adequate sanitary safeguards the water supply is still unsafe for drinking purposes and the product of the vine is the common beverage. Great, sanitary America has advanced far beyond that stage of civilization, and water is safe here for anybody to drink, so that it was but natural that as water increased in cheapness and purity it became a greater necessity than its wine and beer substitutes, or, in other words, wine and beer became less necessary and have consequently taken a secondary position in relation to water.

This is true perhaps of but one nation in the world, and the cause of it lies largely with the waterworks engineer. Every great good carries some compensating evil in its train, and as water became safe for human consumption at all times and places in the United States, the law has made it unsafe for products of the grape and the cornfield. Had we not thought so much of personal hygiene and sanitation and municipal water supply, perhaps we would yet be a nation free of that Prohibition Amendment to our Constitution.

It is only Americans, in consequence, who through familiarity with the good qualities of water, have a natural respect for water as a drink. The grape was not very prevalent in nor indigenous to this country, which somewhat prevented the wine habit from fastening itself firmly on the first colonials. Particularly true is this absence of the grape in the section now called the Middle West, and particularly true is it that prohibition as an ideal has had its greatest force in and from that part of the United States. In the grape-growing states, as California, Ohio and New York and the parts of the nation touched in early days by the Spanish and the French, the influence of vintages is still pronounced, and in Latin Louisiana wine was until recent years almost the sole liquid refreshment among the Creole families. Red "Claret" was consumed by Creole and American families in enormous quantities, and this condition in New Orleans was very pronounced until the year 1909 when the first filtered and purified water was turned into the city water mains, on the completion of a great filtration and water purification plant in that city. The decline of claret consumption was remarkable after that event, for pure and crystal clear water was to be had freely and in any quantity by all.

The material advancement of New Orleans city has been co-ordinate with the installation of a pure water supply. Its former record for "backwardness," insanitation and pestilence—which go hand in hand with lack of water supply—was coincident with its great period of wine and vintage consumption. The writer as a boy remembers the horrid taste, the discoloration and green slime left in a cup by the unfiltered, unpurified river water furnished by the ancient water monopoly. To drink river water—and water from the great Mississippi at that—was something for even a child to rebel at and something to nauseate the strongest stomach, so the real drinking water supply was obtained from wooden tanks called cisterns attached to each house and which received the rain water from the roofs.

Good Water—Wine Unsought

IN FACT this water was collected as much for cooking purposes and as a "soft" water for washing women's hair and for face washing, as for drinking purposes. Baths were taken in the "city water," a liquid mud that discouraged rather than encouraged baths, and when a real quenching of thirst was desired it was wine from one of the *two thousand* corner stores, or beer, that was used instead of water. The milk supply was as poor as the water supply, and as hazardous, and babies and children partook freely of beer and claret wine; in addition, large quantities of coffee were consumed. Of all drinkables water was of the least consequence to New Orleans, and this condition saw no amelioration until the water supply was put on a safe basis.

As to which is the best for human consumption, the most nourishing and quenching for human thirst, water or wine, I leave to others to determine. I am only showing the connection between absence of a good water supply and wine drinking, and why when a community or nation has so ordered its affairs as to make sure of an adequate and perfectly pure and safe supply of water, it ceases thereupon to be primarily a wine or beer-drinking community or nation, and thenceforth water takes a paramount position. And where the evils which go in the train of wine and beer and whisky drinking theretofore may have been deemed inevitable consequences, and concomitant with the necessity of the use of wine for liquid nourishment and daily use by the people, these evils take on a different aspect when once it has been demonstrated that wine is not essential and that water has come to take its place. The evils which had before been tolerated as necessary are now looked upon critically and with growing disapprobation, until in time the evils appear to outweigh the good of the wine, so that it and all similar substances are abolished or restricted by law.

Whisky Habit-Forming

THIS has been the sequence of events in America, and made easier because, except in a few places touched by wine-drinking peoples, America had no wine tradition behind it, and as a new country was less in thrall to artificial liquid products, except whisky, than any other nation.

The reasons for the great American predilection for whisky may be readily found in the logical statement which has preceded this. America already, and always, had a plentiful supply of wholesome water, and neither wine nor beer were indigenous or essential, and therefore had not become habitual; but whisky is a habit-forming substance and the Americans took to it much as the Chinese took to opium, an alien product to them as whisky was to America in its beginning. New Orleans and other wine-drinking communities, on the other hand, never took to whisky drinking to the extent that it existed elsewhere. The scientist and sanitarian and the waterworks engineer have taken water and made it available for 10 cents a thousand gallons! Wine, beer, whisky, have gone the road of bankruptcy (official if not actual) because of the cheap competition of water for public favor. But this only in enlightened America. In France, in Italy, in the Near East, in the Mediterranean countries, and among "backward" peoples where the sanitarian and the waterworks engineer are unheard of, water is still of inferior grade and of fearsome memory with the inhabitants, and safety for them lies in their pure, unsullied juice of the grape.

It is surprising that even with all the favorable environment here stated, Americans so readily and so soon decided to make water the sole official liquid nourishment of their country. This is more surprising than the vast amount of opposition which has arisen in this country to the prohibition act and the widespread violations of the law and tolerant attitude of public, police, enforcement officers and judges toward alleged violators. This opposition is the result of ingrained inheritance and disinclination for water. It is not a moral question at all. It is a biological question, and it has become an issue in the United States because the conditions were right for a test of water as the principal liquid diet, through the fact that the United States was the first nation to bring the development of its water supply to a high and thorough degree of perfection and plenitude.

His Idea of "Personal Liberty"

IN OTHER words, the nation with the best water supply would, according to the laws of logic, be the first nation to reduce the drinking of wine to a secondary position. But in spite of this there remains a portion of the population hollerin' for relief from prohibitory laws. They are not ready, according to their inherited instincts, to look upon water as the sole drinkable. They crave the liquid diet of their ancestors. It is too soon for a people so briefly removed from their wine-drinking progenitors to consider water in the same light as does the sanitarian and waterworks engineer. These latter are products of the present day. But the Middle West population takes readily to prohibition because they have always been water drinkers, that is, the preponderance of liquid diet consumed by them for generations has of necessity been water, and they no doubt have grown accustomed to it and look upon water as a matter of course.

The irreconcilables have not yet learned the lesson of modern science, that water in this country has been decreed safe for internal use, and in abundance at give-away prices. And it is going to be only as the distrust and distaste of water subsides and fear gives away to appreciation of what pure water means, that other substitutes upon which mankind has for so long depended will cease to be or seem to be so necessary to the human system or to "personal liberty."

This question of personal liberty as it is heard from the lips of the average American is no more than a rudimentary survival of the feeling anciently held in the breast of humans that if they were barred from drinking wine or beer they would die a fearful death from drinking water, more often than not polluted. But this feeling today is cloaked behind the words "personal liberty," and has no more reality than the rudimentary tail at the base of the spine of each man has a reality or similarity to the tail which early mankind is said to have had.

Course Held Inevitable

IT IS feared that wines must go from each blessed land that the sanitary engineer shall invade, and that as the waterworks engineer gets a foothold in some benighted part of the world he will do so at the expense of the local drinkables. To this extent Americans are to be congratulated, that they have done their prohibition early, faced it, and fought it out, more or less scientifically. And though there has been a lot of nonsense and some criminality, we have the consolation of knowing that other countries have yet to face their music—when the waterworks man comes to them. But until he does come to them, they should and will stick to wine and other such admirable substitutes for water.

For wine is a substitute and nothing more. Thus and no faster will scientific prohibition spread over the globe, just so fast and no faster can prohibition in its varying degrees of strictness be applied either in the United States or in other countries. Any program that does not take the scientific basis of the use of wine and water into consideration cannot make headway, and useless strife will be the only outcome.

Nature must take its course. It has taken a natural course in the United States, an inevitable course, and prohibition is not only a fact but a scientific evolution behind which there is no going. But the extent of its realization is limited by the further detailed scientific considerations which have been sketched here.

We are entering the first stages of what in the further annals of the human race when they come to be written will be called the Age of Water, just as we have heretofore had the Ages of Stone, Bronze and Iron. We of today may have the thrill of observing a great epochal movement of the human race, as it now enters definitely into a new stage of its evolution, marking for our generation to see one of the great periodic permanent steps of the race as it grows, another of the irretrievable advances made by human intelligence in its inexorable conquest of nature, in this case the assuring for mankind of a pure water supply, as vital and as necessary as it has been little thought of, and marking the end of the vine and the cereal as the source of man's liquid diet.

Facts! Facts! Facts—Where Can We Get Them?

Propaganda—Distortion, Suppression. Falsification—Imperils Country

Why Were the Facts on the Sinking of the Lusitania Suppressed?

By A. C. LAUT

This is the first of two articles.

SHORTLY after the termination of the war, the New York editor of a newspaper, which had been a consistent backer of the Wilson Administration throughout the eight years of that régime, made a powerful plea in a public address for the unshackling of the press from propaganda, whether that invisible propaganda were in the suppression of facts, the distortion of facts, or the deliberate dispersion of falsehoods.

And with the fervor of an old-time revival meeting all the press of America uttered a loud amen.

The readers remarked cynically: "Didn't we tell you all news had been doped for these last years? You can't believe a word you read nowadays in the papers."

Within one month, both President Harding and Secretary Hughes voiced the popular demand for freedom from propaganda in our thinking. Mr. Hughes pointed out to a graduating class in a university that while a sense of responsibility and reticence in regard to the national feelings of other countries must be observed in international negotiations, a representative government can function only when the voters, who elect that government, are in possession of the facts of the case. He did not, though he might well, add that the facts *must not* be colored by foreign propaganda, and the medium through which they pass to the public must not be "doped" by political considerations.

The President of the United States, the Secretary of State, and a foremost New York editor—all saying the same thing; and the public acclaiming agreement. What does it imply?

And Magazines Are Suffering

"WHERE are the magazines and famous writers of yesteryear?" asked an editor of a famous magazine, who had come back from war work. "Twenty years ago and down to 10 years ago, the magazines of the United States were in the heyday of their glory. Writers' names were household words. Why are those writers not writing today? Why have they taken to the more strenuous and less remunerative work of the lecture platform? Where are they?"

"They are—not," answered one of the newer editors. "You can't get them. They are not writing any more—."

"And yet they are not dead," persisted the former editor. "Why aren't they writing as they did 10 years ago, and 20 years ago?"

"Because," spoke up a writer, who used to receive $1,000 an article and is now receiving $1,000 a lecture, "because the writer, with any ethical regard for facts, objects to the tail wagging the dog. First, it was the advertiser. We must not offend him. Then, it was the fool censorship of the war—we must suppress this, blue pencil that, exaggerate and throw into the limelight some other feature. Then, it was a censorship that advanced progressively from suppressing facts to issuing lies till every little ring-tail monkey of a foreign nation thought all it had to do was to unload its woes, its debts, its political plots on Uncle Sam; and the tragedy is—they got away with it till the writers, who had any regard for self-respect, took to book work, or history, or war work, or lecture platform, or a straight out-and-out commission in the economic department of some big institution, or big industry."

"And the results," added the former editor, "are the worst financial losses the magazine world has known in its history; a slump of circulation among the dailies because the public no longer believes the printed word."

"Well," asked the business manager, "what are you going to do about it? The root of the trouble was subscription at less than costs. Advertising had to be got by increasing circulation; and to get it, circulation was sold far below costs; and right there—the tail began to wag the dog."

Here again you have in absolute agreement an old-time editor, whose magazine's name was a household word; a writer, who is part shareholder in one of the most popular new-style monthlies, that sells big subscription at a terrific deficit; and the business manager of a big weekly, that had just expired.

Censorship Brought Evils

THE indictment is a terrific one. Is it true?

Undoubtedly, if the advertising tail, or the political tail, were wagging the dog, the publication with the biggest circulation at a deficit was hit hardest when the panic of 1920-21 knocked off the advertising; so New York witnessed the sudden decrease of three publications with circulation between 600,000 and 1,000,000 in as many months, one a woman's magazine, one a monthly, one a weekly, not to mention numerous minor sheets like church organs, which were reorganized or merged, and purely trade organs. The first year of the war, when advertising fell off with the same slump as in 1920-21, witnessed an almost similar casualty list—an old weekly went suddenly to the wall. A home magazine telling people what to eat—600,000 subscribers it had on its diet list—stopped suddenly and left the people to fend for their own fare, and a dozen minor monthlies expired without a gasp. When the tail ceased wagging, the dog ceased running.

The bright side of the picture in the same period is that of the steadiest old monthlies, who had never depended on advertising and raised their subscription price to cover costs as costs mounted, the one that showed the biggest profits in this era was the one that had never depended on its advertising revenue—even its revenue to advertise its own books—but had shoved up its subscription charges as mechanical and paper costs went up, on the supposition the public would pay for the real stuff if it got undiluted literature and history and economics. One hardly needs to add this old monthly had its habitat in Boston; and its editor had passed through the other phases of meretricious journalism to know the perils, when he came to the monthly and piloted it through the perilous era unscathed.

There was no editor, much less was there any correspondent, who did not feel the heavy and foolish hand of the censorship during the war. Great Britain led the way in the suppression of facts. Ireland played first base in distortion of facts; and Germany certainly won every home run for the deliberate dissemination of news that was not fact at all.

One has but to recall how Northcliffe blew the lid off the censorship by telling the English in the early days that they were being licked, when they thought they were winning. And though in so doing Northcliffe's services are recognized today as having aroused the whole British Empire from false security, one must also recall that in the face of the general policy of suppression, he was branded as a traitor and burned in effigy from the Thames to the Forth.

Until the 1916 elections, there was more truth published about the war by the American press than all the press of Europe or Canada, with the result that an American paper going into these countries—whether by mail, or sent by hand of friends— was ruthlessly "scissored" before being admitted.

From 1916, to get the facts, readers had to take a paper of one political stripe in the morning and another political stripe in the evening and then strike an average in their own minds concerning the truth. This was up to 1917. From the time of the United States going into the war the same heavy hand of foolish and false censorship was laid on the freedom of the American press. Results—the people did not know what to believe. Sentiment was divided, and instead of waiting lines of eager volunteers at the recruiting stations as in the Spanish War, we had to have the draft, which was a polite name for conscription.

The Facts on the Lusitania

HUNDREDS of examples of this could be given. Take the sinking of the Lusitania!

The Lusitania was sunk in May. By Thanksgiving of the same year, every fact of the sinking of the Lusitania, who sent the message, how the wireless operators were deceived through the enemy getting the secret Admiralty Code, how the ship on her previous voyage had been pursued by submarines and only escaped them by superior speed, and how she was finally lured between two submarines waiting for her in broad daylight off the charted route, where a British convoy waited to pick her up—was known to the British Government. Why these facts were not published is one of the stupidities of the war yet unexplained. Probably because *it would have led to a tracing of who betrayed the secret Admiralty Code*, which was immediately changed all over the world. Anyway, the facts were sent to Canada and the United States. The British officer, who gave these facts to an American writer, concluded his exhibit of proofs with these words: "Now in the name of God, don't let anyone know I showed you these cables! If it is traced back to me, I'll have to lie out of it, and leave you unsupported to defend yourself. We can't do anything that has the remotest resemblance to forcing the United States' hand in the game. You can get the facts confirmed by So and So and So."

The facts were confirmed; for though wireless operators and ship officers and the secret service set to watch them are bound to inviolate silence, even operators and secret service men and ship officers have wives and brothers and sisters; and secrets sometimes talk in their sleep. Dates and names were easily dovetailed into a fabric without a weakness in its proof. Yet the facts were never published in a single paper in either England or the United States. Why? The editors said frankly they were not looking for trouble, or disbarment from the mails. Later, when the real culprit guilty of the Lusitania plot and the execution of it was sent back by the British Government on another charge to the United States, he was tried and sentenced on that lighter charge. Then his sentence was remitted and he was shipped back to Germany. Not a whisper of the awful infamy of the Lusitania was uttered in the court, or in the press, or on his release from Atlanta prison. Each of the two big governments passed "the buck" of responsibility; and the press was muzzled.

Practically the same story could be told of the sinking of the Ancona in the Mediterranean, or of two other ships off the West Coast of Ireland. The American people were told to be patient—patient as the proverbial ass—to wait for proofs that these ships had not struck a mine; and commissions were appointed to investigate, which have not to this day reported. Yet I personally helped to decode cables, which proved in two of these cases merchant ships had come on the scene a few hours after the sinkings, caught the submarines, shot the "sub" officers and bundled them down the ladder of their own death trap, which was at once disabled and sunk. Yet two days after these cables were in the hands of the American and Canadian governments, I heard the officials of these governments come out and tell the press no facts had been ascertained to prove the sinkings had resulted from submarines.

What was gained by such censorship?

A story is told of one of the famous peace demonstrations in Madison Gardens; but in this case the "biter" was "bitten" in one of the most comical episodes of the war. Labor's co-operation in a demonstration against war was desperately needed. The organizer—a well-known operator of Wall Street, who has since served in Atlanta on another score—represented to his paymaster that labor delegates were poor men. He would need $1,000 each to pay their expenses to and from all parts of the continent. He was given a fund of $250,000. The labor delegates came all right and in good faith. The peace demonstration went off with a bang; but the Wall Street operator pocketed the whole $250,000; and his backers could not sue; so when he fell afoul of the law on another score, they let him take his medicine and go to prison. The press knew this but did not expose it.

The "Black Troops on the Rhine"

OF LIKE character was a demonstration against Black Troops on the Rhine. Now as every war correspondent, who cared to know, could know, the Black Troops of France were not massed on the Rhine. They were held in reserve in thousands in secrecy in the Pyrenees far from the Rhine; but if a correspondent had issued that fact, he would have been contradicted by another French Bureau of Misinformation, buttressed by another German Bureau of Misinformation; so the fake demonstration was held in the Madison Gardens against Black Troops on the Rhine; and from pure lack of facts on the part of the public, ended in a riot between Legion boys and New York police.

Great are the virtues of a censorship, which first suppresses, then colors, then distorts, then falsifies facts; and facts are what the public wants.

It was no doubt wise, with the United States on the verge of a European War, that inflamed public opinion should not force another distracting war with Mexico; but that hardly justified the suppression of facts on Mexico to such an extent that with hundreds of thousands of propaganda money on tap, which the Mexican press openly discussed and advocated, Mexico in the name of "independencia" and at the beck of factions fighting for power, should deluge the American press with contradictory statements and play the two great branches of the American church—Catholic and Protestant—against each other in a paid campaign of propaganda. It was not publicity. It was colored and often patently false propaganda. The Catholic party had suffered unspeakably in the 12 years of revolution succeeding revolution; but always when their petitions were forwarded to Washington with affidavits of priests and nuns, who had been subjected to torture, that would have caused shame in the Middle Ages—an unseen hand stifled these facts coming out to the public.

Propaganda from Mexico

NOR did war expediency justify such neglect of American life and property that Americans involved in losses in Mexico were forced to form an American Protective Association to get their own publicity out. Nor did it justify that American Protective Association being bled for money to get their statement of the case before the public. Cases are on record where correspondents of international fame came and offered their services to the Americans in Mexico, were rejected because of their unreliability, and immediately went over to the Mexican side of the contest and deluged the American press with Mexican propaganda. Some of these correspondents have since sued the Mexican Government for their services. The examples are too many to be given of entirely honest correspondents being subtly misled on excursions conducted by the faction in power; so that they came back and reported Mexico "peaceful and prosperous" to the American press within a week of the time Carranza was overthrown and assassinated with the connivance of his own generals.

It is a disarmament of propaganda we need in the United States today, from labor to bank, and from "red" to reactionary, quite as much as a disarmament of fighting weapons, to get back to sane thinking based on facts, and wise decisions from these facts laid openly on the table. Can anyone conceive for a moment that our tariff squabble would have dragged on a weary year; or the coal strike have kept 600,000 men idle for almost half a year; or the rail strike have hung like a sword above the public's head—if the facts on both sides had been plainly laid on the table in simple terms without preamble or argument?

Give the public the facts. It will do its own arguing and its own deciding.

Meet Mr. Peebles, You've Met Him Before!

Dynamic, Upstanding Sort of a Fellow, You Must Know Him; Has Done Everything First, Let Him Tell It, or Try to Stop Him

By MARK V. O'NEILL

WE HAD some friends to dinner the other night, John Walter Peebles and his wife. Fine couple. Wonderful talkers. Absolutely wonderful. Especially Peebles. He is what the ad writers call a dynamic type. Gets the floor and holds it in spite of everything. He will talk about any subject you like, so long as it concerns himself.

Peebles' vocation is, as far as I know, unique. He is consulting psychologist for the Sharpe Barbed Wire Fence Company. Everything to do with the psychology of barbed wire comes under his personal supervision. No detail is too small for his attention, provided it is psychological. He trains the salesmen, and after a while they get to be super-salesmen. He confers daily with the executives of the company and they eventually become super-executives. Every Saturday night the salesmen are all herded together in the shipping room and Peebles lectures to them about psychology. There are 30 of them and Peebles says it is an inspiring thing to see them all gathered there, fresh from a hard week's work on the road, eager to learn all about psychology. Peebles says that this is the part of his work that he loves most of all, and as you listen to him you can't help but believe it.

Right at Home

AFTER dinner we went into the living room and somehow the talk got around to psychology and its relation to salesmanship. Naturally Peebles happened to be right at home on this subject, and he told us some of his own experiences. I am anxious to stress this point a little. I mean about these experiences actually having been those of Peebles himself. There was nothing secondhand about them. These were not things that had happened to a friend of one of his friends and had been passed along to him. Not a bit of it. Not only was he, Peebles, on the spot when they happened, but he was the chief actor in every one of them.

First of all he told us about a thing that had happened out in Chicago. He had called on the purchasing agent of one of the rendering companies, he said, to get a large barbed wire order from him. It was either a million feet or a million carloads, I've forgotten which. The purchasing agent was located on the tenth floor of the building, and his desk was in one corner of an enormous room filled with stenographers and bookkeepers. Peebles said he thought there were between 700 and 800 clerks in the room. When he said this, he waved his arms vaguely to indicate vast space. Just inside the door was a little railed inclosure for callers. A boy came to the railing and Peebles gave him his card and told him to take it to Carter, the purchasing agent.

High Power Stuff

HE, THAT is, Peebles, could see the boy weaving his way in and out among the bookkeepers and stenographers until at last he reached Carter's desk, way over in the corner. In the distance, Peebles could see Carter look at his card, throw it impatiently on his desk and say something to the boy. The boy came back and said that Mr. Carter was not interested in any barbed wire that morning. Now, any ordinary man would consider himself licked under these conditions. Apparently there was nothing for it but to leave. Carter did not want any barbed wire. He said so himself. But Peebles was not discouraged. He was not even surprised. He had anticipated just such a move. He called the boy back to him, pulled out another card and wrote on the back of it, "Give me 30 seconds. No more, no less." Peebles said that this was a sure-fire trick. He said that no man alive would refuse 30 seconds. In this particular case, he said, he needed only 15 seconds, but he asked for 30 just the same. Presently he saw Carter coming across the room. This was where the psychology of the thing came in. As Peebles watched this man walking toward him, he sized him up. The minute that Carter got to the railing, Peebles pushed an order blank and a fountain pen into his hands. As he did so, he told Carter to sign it on the last line but one. He said that he did not raise his voice but spoke in a low, firm tone. He made no reference whatever to barbed wire. This, Peebles said, would have been fatal. Just the command, and the suggestion created by the fountain pen. It seems there is some sort of a signing impulse present in everyone. If you give a man a pen and paper he at once wants to sign his name. As Carter walked across the room Peebles had snapshotted him as belonging to the suggestible type. The pen and paper, plus the command, were all that was needed. Carter looked around the room in a dazed, helpless way for a moment and then took the paper to a near-by desk and signed it. Peebles put it in his pocket, shook Carter by the hand, and walked out. The interesting part of it was that Peebles had made Carter sign an order in blank! When he got back to his hotel Peebles filled it in himself for all the wire they had on hand at the factory. Fact.

Of course, we were all very much impressed by this story. I said that I thought it would be only a question of time before purchasing agents would be protected by law from psychologists. Peebles said by no means. It was fair, open warfare he said, with the battle going to the stronger man.

"Peebles" by Peebles

SEVERAL more stories followed, but they were all more or less like the Carter case. They all had to do with Peebles making other men do things that they did not want to do. Sometimes it would be bank presidents and then again it would be policemen or head waiters. It made no difference: the results were always the same. The method never failed. You had only to look at your man, size him up, and attack him where he was weakest. The thing was almost absurd, it was so simple.

Then some one said something about mental telepathy.

This set Peebles off on a new tack. He was the original mental telepathy man. It made him mad, he said, to hear people trying to account for mental telepathy and insist on treating it as some sort of an occult thing. There was nothing occult about it. Whenever you thought about anything, you set up a commotion in the air just like sound waves. They were vibrations, or brain impulses. They traveled around the room and could be taken in and interpreted by any other human brain within their range. Nothing uncanny about it. Not at all. Just a natural, physical phenomenon. He, Peebles, could read the thoughts of other people practically at will. He had done it scores of times. He assured us that there was nothing mysterious about it.

He Becomes a Mystic

AT PEEBLES' suggestion we tried an experiment. I was selected as the agent, or sender, and Peebles was to be the recipient. He told me just what to do. I was to pick out some episode in my past life. Preferably something that had made a very vivid impression on me at the time. Then I was to think about it. Not painfully, or with too much concentration; but just to keep it in my mind. We were to go right on talking. No lowered lights or tense silences with Peebles. All at once, he said, he would begin to get my thought, and then he would call it out to us exactly as it came into his mind.

Here was something real, and we were all excited and interested. I had often read and heard of this sort of thing, but had always connected it with Indian swami and astral bells. Now we were going to see it right under our noses, in our own houses, and beyond all suspicion of fraud. The thing gripped me, and I began to think of something that had happened in my childhood. It was long before I had known Peebles, and I felt that I was taking a mean advantage of him, but he had said emphatically that I was to pick out anything that I liked and just think about it with as little effort as possible. We talked along about indifferent topics for five minutes or so, when suddenly Peebles gave a little start and held up his hand for silence. It was positively thrilling, and we all looked toward him expectantly.

He began speaking in an ordinary tone of voice. He said that the first thing he got was a swimming pool. It seemed to be in Ohio. There were several boys, about 10 of them, running up and down the banks of the pool and chasing one another. None of them had any clothes on. He could see me clearly, he said, and I was being pursued by a boy much larger than myself. Suddenly, at the edge of the bank, I stopped abruptly in my flight and fell down on all fours. The boy who was chasing me sprawled across my body and went headfirst into the water. All the other boys laughed and capered with joy. The big boy, Peebles said, seemed to be a sort of bully and very unpopular. He said he couldn't be sure of it, but he seemed to get the feeling that the big boy had grown up to be a well-known public man. Then Peebles said that the picture was getting fainter; and a moment later he said that it had completely faded out.

He Does Some Sensing

IT WAS really very impressive.

Then we tried it again. I was to think of a person; preferably some one whom Peebles had never seen or known, or even heard of.

This time he seemed to get me much quicker.

We had hardly started when he began to tell what he sensed. He talked much faster and seemed very sure of his ground.

He sensed a woman. She was about five feet four or four and a half. The half inch bothered him, he said, and he could not be positive about it. She was plump, jolly, and had fuzzy blond hair and blue eyes. Her hands were especially noticeable: dimpled, small, and covered with rings. She was dressed in the style of about 25 years ago. Some sort of a silk waist with a lace yoke in it. Very full-bosomed woman. Seemed to be very fond of me. She was speaking and Peebles said he could hear her voice plainly. She was calling to me and addressing me by some nickname that was known only to her and me.

Was it Gilly? Silly? Billy? That was it. Billy. She had always called me Billy when I was alone with her, although it was not my real name. She seemed to be trying to send me a message, but Peebles could not for the life of him make out what the message was. We all urged him to try and finally he said that it was something to do with my heart or my shirt: he could not be certain which. She began to fade out then, just like the swimming pool in Ohio; and in another second she was gone.

Unimportant Details

WE HAD to stop then. The effort Peebles had made to get the message had tired him a little, and shortly afterward he and Mrs. Peebles said good night and went home.

I thought it had been a very jolly and instructive evening.

There was, however, one thing that bothered me a quite a bit, and I could not seem to get it out of my mind.

While Peebles had been sensing the swimming pool, I had been thinking of a sleigh ride. I was about 14 years old and had fallen out of the back end of the sleigh just after we had started for home. I had not been missed for almost half an hour; and the walk through the snow after the departed sleigh had made a very vivid impression on my mind at the time. It was impossible for me to see how Peebles could have so misunderstood me, unless he had done it purposely.

There was a similar peculiarity about the woman who called me Billy. I had really been thinking about an uncle on my mother's side. Uncle Angus. He was anything but full bosomed.

Noisy Minorities Viewed as Nation's Peril

Oklahoma's Congresswoman Also Speaks of the Woman Lobby at Washington

By AARON HARDY ULM

THERE is one member of Congress who smiles when "the most powerful lobby in Washington" cracks its whip. The lobby that has been so designated by friendly eulogists is the one which promotes Congressional measures sponsored by the women's organizations of the pro-suffrage type. It functions through the headquarters of the National League of Women Voters. The member, and almost the only member who smiles openly at its performances and occasionally talks back when the lobby becomes too pertinacious, is Miss Alice Robertson, of Oklahoma, the only woman who has a seat in Congress.

Miss Robertson, however she may "defy" the Washington spokeswomen of the organized women voters, is all woman—an outstanding type of woman who speaks mildly, very little and with a sense of humor. The printed speeches of no other member are so interspersed with the reportorial notation "(laughter)," but her humor always is kindly and her satire gentle.

She fought the so-called maternity bill, which headed the list of national measures put forward on behalf of the "new woman voter," and she has not shown great enthusiasm for what she calls other "hyphenated" bills on the list. Her term "hyphenated" has to do with the fact that the bills usually bear the names of their joint introducers in the House and Senate, as in the case of the Sheppard-Towner Bill, which was the maternity bill.

Why has the only woman member of the present Congress set herself in opposition to most of what has been proposed by leaders of organized women as demands of the "new woman voter"?

That question was put to "Miss Alice," as she is known throughout Oklahoma, at her office the other day.

"It is not pleasing to be accused of being a traitor to your sex," she replied, "and I don't think I can be so accused properly. Of course, the maternity bill now is water that has gone over the dam, and it is useless to stir the embers of an old fire. I opposed it, not as a woman but as a member of Congress who was elected to the House first as a citizen and next as a Republican and in no sense as a woman. I wasn't a woman's candidate and should not have been elected had I been, just as no man who is a man's candidate should be elected.

"I opposed the maternity bill because I believed it to be harmful. Furthermore, I doubt if women as a whole wanted it, and I doubt if they want many of the other measures being proposed on their behalf.

"Do you think the women who dominate what has been called 'the most powerful lobby in Washington' actually speak for the women of the country?" she was asked.

Miss Robertson smiled.

"Was it so demonstrated in the last election?" she asked. "In fact, it looks as if the women resented this more or less self-appointed leadership.

"Whenever the suffrage has been extended, there have been hordes of ambitious persons ready to exploit the new voters by flattery and by boasts of power, claim of wrong, and by pretense of accomplishment.

"You know what happened in the South after the Civil War led to the enfranchisement of the Negroes. They were told from a thousand stumps that each household was to get 40 acres and a mule. The poor Negroes believed it and have suffered ever since.

"Now I'll be taken to task for comparing the new woman voters to the Negroes when freed from chattel slavery. I am doing no such thing. What I want to do is to defend them against such comparisons which their so-called leaders constantly are making at least by inference.

"I once wrote of myself as 'one of the millions of conservative home-loving women who never asked to vote, who dread new and heavy responsibilities, but God, in infinite wisdom, placed upon us the burden of suffrage.' One of the ardent proponents of the maternity bill in a newspaper article exclaimed in reply: 'Can this be possible? That after centuries of treatment as a chattel or a slave any woman should now discuss her enfranchisement as a "burden of suffrage."'

"There is no comparison between the new women voter and other new voters to whom the franchise has been extended in the past. Therefore, they can't be exploited as other new voters have been.

"Suffrage, like fighting when need arises, is a duty, one that is still dodged by many on whom it has been imposed. It is a duty imposed more than a right extended.

"There are just as many women informed about politics as there are men so informed. They have gone to school and colleges like men, read the same newspapers, listened to and taken part in the same conversations.

"And don't let persons get the idea that women think along lines differing from those of men. If you want to see the proof, look up election figures. Women divide on public questions, almost identically as the men divide. If there is any difference, it probably is due to the fact that women are less radical than men, less given to making wild experiments. This is because of natural law. Women, by nature, are more cautious than men.

"When women vote as men do, it isn't because the men control the women. The rule holds in those communities where women have voted for generations. Women will vote their men folks for their candidates, as often as the contrary takes place. Women influenced the voting of men before they were enfranchised.

Scene at the National Press Club when Lady Astor, only woman member of the House of Commons, was photographed with the lady from Oklahoma, Miss Alice Robertson, shown at the right.

(C) Harris & Ewing

"Many measures, aimed to catch the woman vote, have the opposite effect. Such measures generally are made to appear to be what they are not, and are supported with arguments that are fallacious or overdrawn.

"Take the recent maternity bill. For the state of Oklahoma it provides the magnificent sum of $18,679, or $242 for each county. Now how much do you imagine that will allow for each mother and each infant, particularly after overhead administration is taken off? Not enough to be noticeable.

"The measure, while it takes a large sum from the United States Treasury which taxpayers must supply and authorizes a pernicious form of official meddling with intimate affairs of the home, doesn't pretend to provide a single bottle of medicine for a stricken woman or a single pint of milk for a hungry child. All that it calls for is instruction and undefined instruction at that. I wonder how the women who led the fight for it would like to have an official instructor come around to their homes and tell them how to bear and rear babies! If they wouldn't like it why impose it on other women? Because, some say, other women are ignorant. I suppose they mean the working class and farm women. Yet you will find that Sir Arthur Newsholme, the greatest living authority on the subject, says that 'there is little reason to believe that the average ignorance in matters of health among the working-class mothers is greater than among the mothers in other classes of society.'

"What the mother and infant need is not 'instruction' but real brotherly and sisterly aid, the kind that can be and should be and often is rendered by individuals more favored with this world's goods and by the communities in which they live. When the measure was up for debate, Congress was accused of actually murdering thousands and thousands of mothers and babies through failure to pass the maternity bill. What were these individuals who made such absurd statements doing about it as Christians, charged with being their brother's keeper? If thousands of mothers and infants were dying for lack of attention, these people, who could do far more by way of relief than Congress, were indifferent to the simplest obligations to humanity.

"The great danger of such a venture as the maternity bill is that when the National Government takes over the obligation of caring for mothers and babies, the individual and the local community may assume that if Congress does anything it should do all. They will be inclined to dismiss the matter as attended to and while Congress might do something, it can do only a little of what must be done. The main obligation must still rest on the individual and the community.

"The habit of looking to Washington for what the local community or the individual should do, isn't to be recommended for either men or women. President Harding in his Plymouther address called it 'the one outstanding danger of today.'

"It is coming to the point where every person with big ambitions buys public favor by getting something or pretending to get something for large groups out of the National Government. If a magazine wants to build up its circulation, it starts a fight for a large appropriation out of the Federal Treasury for some new-fangled scheme. The next most popular venture is to carry on a campaign of education for the new woman voter. Why don't they educate the man voter, too? Ambitious women come forward with demands for appropriations or doubtful legislation for the hundreds of thousands of women for whom they claim to speak. Frequently, I get orders based on figures in which I am counted several times, for I belong to four women's organizations. Even admitting that the woman's lobby represents 10,000,000 organized women as it claims, there are left more than 40,000,000 women they do not represent. And those women should be considered just as much as the others.

"What I should say is the most threatening danger of the times is the inclination of many persons in office to accept the demands of vociferous minorities as coming from the majority. Minority rule leads to officious meddling, with attempts to run before the walking stage is reached, to the accepting of appearance for realities, to all kinds of dangerous experimenting. A minority of women have no more right to make demands for all women than a minority of men has the right to give orders on behalf of all men.

"Women are the supreme individualists. They exalt the word 'my.' With them it is 'my child,' 'my husband,' 'my home,' 'my duty,' 'my burden.'

"I wasn't a suffragist but now that the 'burden of suffrage' has been put upon us I believe that we women should vote and take due part in public affairs. And if women as a class add anything to the political virtues of the times, I believe their greatest contribution will be along lines of true conservatism, to their standing up for the sacred rights of the individual and insisting on the keeping of the sacred obligations of the individual.

"Women know that when the family funds are frittered away on illusory experiments or ill-advised investments that they and their children suffer most. The government is merely the head of a big family of more than 100,000,000 persons. If it is wasteful, all who provide it with means must suffer.

"If I oppose wasteful appropriations, I am only doing for the national family what every prudent housewife does for her family.

"Now I believe women, the women in the homes and on the farms and in the offices, understand all that as well or better than men. I don't believe that those of one sex can be helped without those of the other sex being helped just as much."

"Selling" the State's University to Its People

New Chancellor of Kansas Institution Makes the Public Like to Pay Taxes

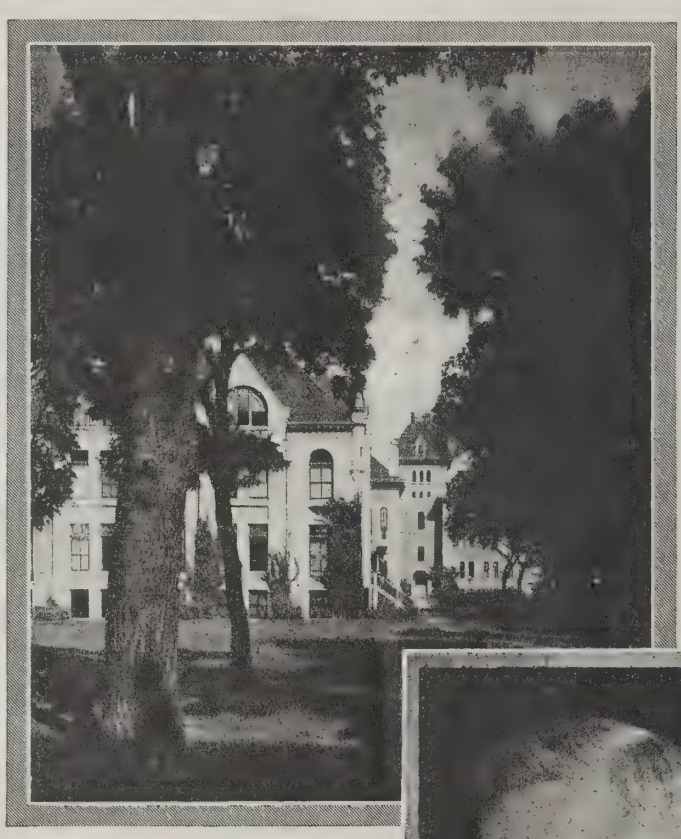
By FRANK M. CHASE

WHEN Kansas hired a new chancellor for its state university two years ago, it was felt that the institution should enter upon a new era. Since it had been founded, in 1863, it had laid a solid foundation, and the time was at hand to engage in the larger function for which it had been preparing so long. What was this function to be? The new chancellor was expected to re-define the purpose of the university, and he has done so. His definition is summed up in one word—service.

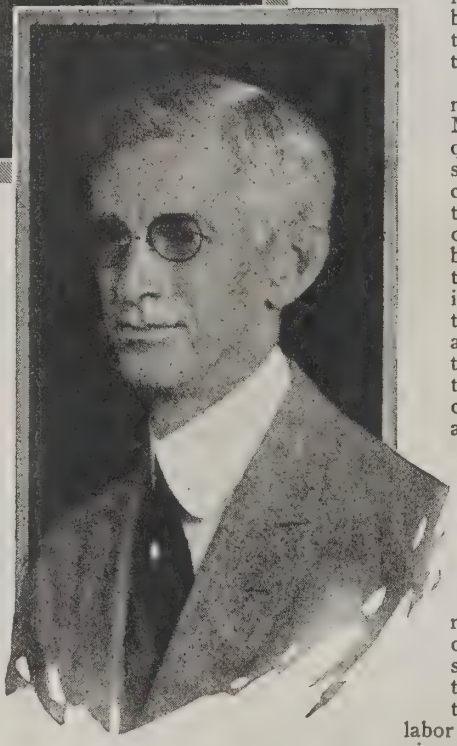
"The ideals for the university which the chancellor expounded last night were ideals of service—service to Kansas," William Allen White wrote in the Emporia *Gazette*. "He feels that the university should connect itself with every citizen of the state in some way. He desires a sufficient force to make the university serve the cities of the state, the health of the people, the welfare of the farmer and the business man each in his own place of business. The chancellor would make the university more than a schoolhouse; he would make it the super-servant of the people, a place of research, of advice, of information, of expert and technical knowledge. A fine ideal that—but realizable . . . . Only an idealist can make dreams come true. And the new chancellor of the university is an incorrigible idealist, with a great and profitable dream."

Six years ago Ernest Hiram Lindley was a professor of psychology at the University of Indiana, and content with his job. As he hoed in his garden one evening he received a telegram calling him to the West. Though the position he was asked to occupy was a minor one and temporary, necessitating only a few months' leave of absence, it was significant because it was eventually to bring him to his present place.

After delivering a highly successful series of extension lectures to the business workers of Portland, for Reed College, he was invited to spend some time with Washington State College, as visiting professor. The work afforded him a welcome change and rest from more than 10 years of continuous classroom service.



Over in Idaho just at this time a serious educational row was in progress; the culmination being a clash between the governor and the president of the state university, followed by the resignation of the latter and the commissioner of education. Before a new university head was named, E. A. Bryan, brother of President William L. Bryan, of the University of Indiana and a friend of Lindley, became commissioner.



The new commissioner, familiar with Lindley's scholarship, as well as with the rapid growth of his popularity in the Northwest, believed he was of university president caliber, and with Doctor Bryan's recommendation, Dr. Lindley was selected.

Upon his entrance into the educational affairs of Idaho, the troubles of the state university disappeared. As soon as he could conveniently do so after assuming his office, he called upon the governor. The governor's old hostility to the university melted before Doctor Lindley's resourcefulness and highly companionable nature, and he received the executive's promise of unrestricted co-operation. Other public men pledged their help, and so began a program to establish the university firmly and definitely in the life of the state. He also took his case to the people, showing them how a great university could serve them and interesting them in its adequate support. "You can't build a great state," he said to them, "without a great university."

During the World War he made the situation an opportunity. As a member of the State Council of Defense he assisted in organizing many county councils, thus bringing the university to the further attention of the people; while by its remarkable work in directing wartime crop production, resulting in the best record of any state in the Northwest, confidence in the institution was built anew. As a result, Doctor Lindley's presidency of the university was a period of unusual growth, both in material expansion and in the place it came to occupy in the minds of the people. Doctor Lindley's administration continued three years. During the last of these, Kansas was searching the country for the "right man" to head its own state university. Attracted by the rapid upbuilding of the University of Idaho, those in charge of the selection carefully studied the man responsible for the achievement, deciding that he was needed in the Sunflower state. Dr. Lindley accepted the chancellorship of the University of Kansas, taking up its duties July 15, 1920.

His arrival was the signal for a great quickening of the state's interest in educational matters. He was flooded with requests to speak in many parts of the state. He conceived his duty to be to awaken them to the untouched possibilities in this field. His job, as one editor very aptly put it, was to "sell" the state on education; and he has proved an adept at doing so.

Fraser Hall, the oldest building at the University of Kansas. To the right, Ernest Hiram Lindley, chancellor of the University.

Though many of those first invitations to speak emanated from simple curiosity and a desire to appraise the new chancellor, his reputation as a speaker quickly spread, only to increase his popularity. Well over six feet tall, and rather slender, his lean, boyish face topped by a mass of silver hair, he makes an interesting figure on the platform.

"Show me a great state," he said as he crossed and recrossed the prairies of Kansas, "and I will prove to you that its greatness was brought about directly or indirectly by a great university in that state. The university is a producer of wealth which yields the state more than it costs. It is not a tax-eater, but a tax-earner; the modern university adds more to the wealth of the state than any other agency the state has. If you don't pay for a greater university, you will eventually pay more; nothing is so expensive as ignorance.

The effectiveness of the chancellor's tactics was soon to be tested, for the legislature met within six months after his arrival in Kansas. The cry for economy was loud. Most of the appropriations were considerably lower than the amounts asked by the various departments, and it was freely predicted that the state university would fare similarly. Chancellor Lindley and his associates, however, were as awake to the situation in the state as the legislators, and made their budget accordingly. After whittling down their requests to the lowest point commensurate with the actual demands of the state, they asked the legislature for an appropriation of more than five million dollars for the succeeding biennium. The usual attempt to reduce the appropriation was made. Doctor Lindley was permitted to defend his budget.

"Gentlemen," he said to the committee considering the matter, "this budget was not built to be cut. We have already done all the cutting that is consistent with the temper of Kansas in educational matters. We understand that you, the people, are poor. But your children keep on growing, and you continue to send them to school. You believe in democracy, and in equal rights. Then should not the thirty-nine hundredth child who comes to your state university have equal rights with the first? But if you insist on cutting our budget, as some have suggested, we shall have to stop the line when only 2,500, or possibly fewer, children have entered."

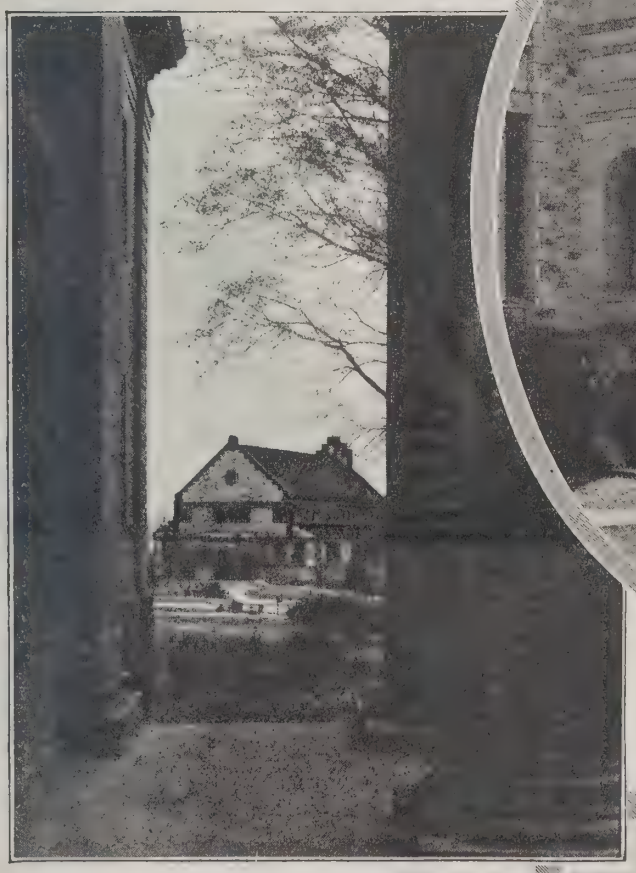
The upshot was that, without lobbying, he won for the university much larger appropriations than it had ever had.

Chancellor Lindley suffers nothing from an intimate view. He is a most gracious and congenial host. Of ready wit and an able phrase-maker, he is a conversationalist after the heart of Stevenson. There is nothing aloof about him either. Professors warm chairs outside his office door while he chats with a freshman. On one occasion he headed the students' nightshirt parade.

After spending almost a year in Kansas, Chancellor Lindley said:

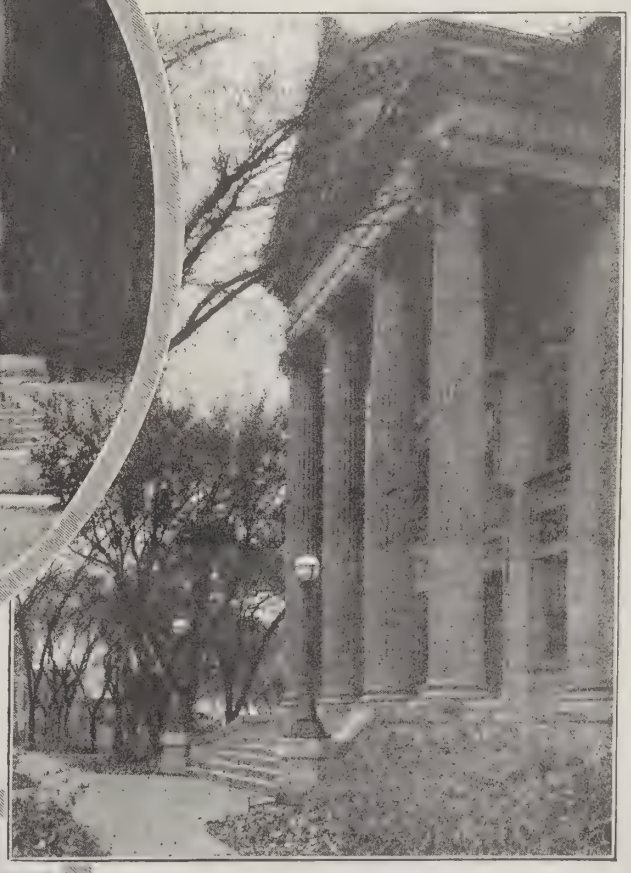
"The most baleful dualism that has afflicted the minds of man is the separation of thinker from worker, of leisure from labor, of culture from utility, of art from industry, of ideal from actual. Such separations may have been necessary in the evolution of primitive social groups, but it ignored the ultimate law that 'the strength of the wolf is the pack.'

"William Morris set up a humanistic standard for vocations. Man's work should possess four qualifications: each should be self-chosen, health-giving, educative, and a source of satisfaction and happiness. Most children choose their occupations blindly. When it is understood that three-fourths of the men in industry today are badly placed, the importance of discovery of aptitude will be seen; and when through right vocational guidance the youth is assisted in the wise choice of a career there will be a huge addition to production and to human happiness.

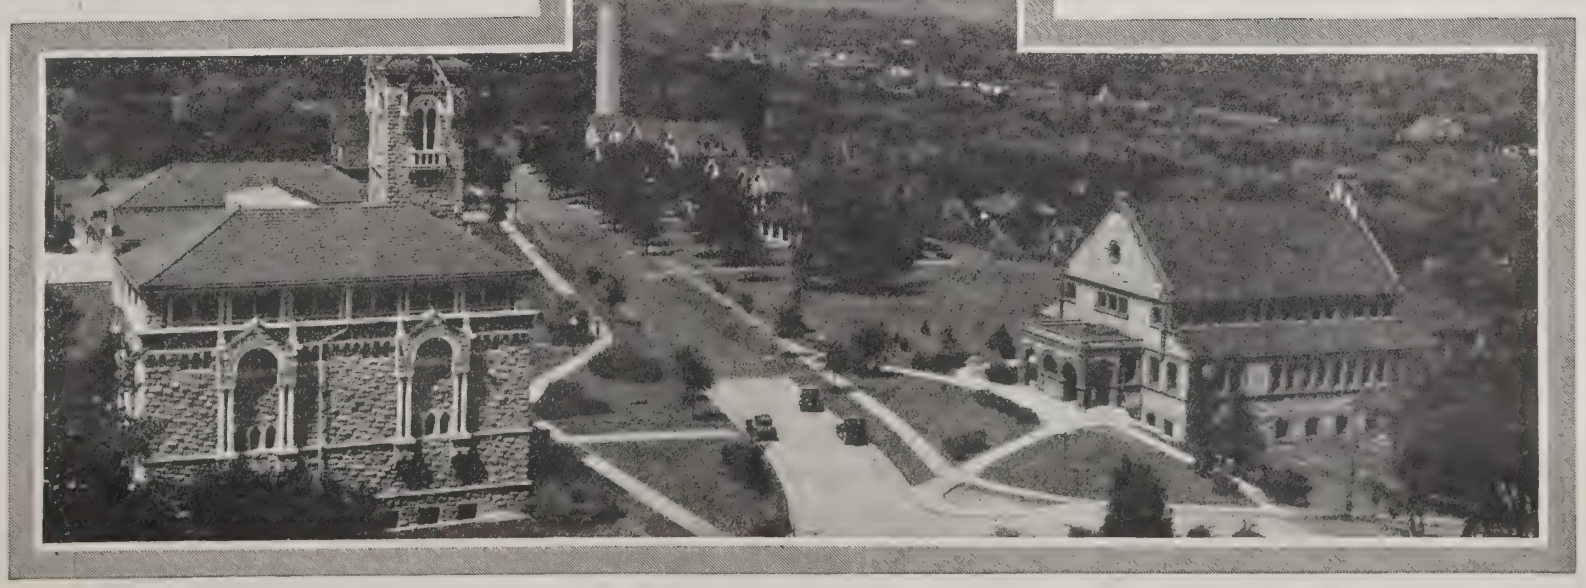


"When one gives most of his daylight hours to work, that work should, if possible, not destroy the sources of the worker's health. Society in self-defense must see to it that the man power of the world is not sacrificed to material production. One's employment, too, should be of such a character as to enrich rather than impoverish the personal life. The division of labor in the modern industrial plant gives little scope for enlargement of experience. It dooms men to become mere appendages of the machine. Rotation of work and frequent rest and leisure must compensate for routine. The satisfaction and happiness will come through adjustment of task to aptitude.

"The most tragic waste among civilized men is the waste of leisure. America does not know how to play. The arts of enjoyment and appreciation lag far behind the arts of production. The pursuit of pleasure, however, consumes vast sums of money."



Dr. Lindley has been engaged in humanization work for industrial establishments, but practically his entire life has been in the shadow of a university. His great grandfather, a Quaker Abolitionist, freed his slaves and led the first migration out of North Carolina to Indiana. The chancellor was born at Paoli, Indiana, October 2, 1869. His great grandfather had helped to lay out the University of Indiana at Bloomington.



Dr. Lindley became an instructor in philosophy and psychology at Indiana, continuing as professor until made president of the University of Idaho in 1917.

BRIEFLY TOLD

Thousands of magnificent bull elk have been slaughtered illegally in the Yellowstone Park region for the two teeth that may be obtained from each and sold to be worn as ornaments. Among the Indians the braves decorated themselves with necklaces made of grizzly bears and only the squaws wore elk teeth as decorations and they used only those from the animals killed for clothing and food.

The Forest Products Laboratory of the Forest Service has evolved a type of crate that will carry in an aircraft 1,300-pound bombs.

A freight car fumigating house with a capacity of 14 railway cars at a time, has been put into operation by the Federal Horticultural Board. It is one of several such houses maintained to prevent the pink bollworm from entering this country.

It is customary in England to enter a boy's name for Eton College as soon as he is born. All vacancies are now filled until 1932.

Motorists entering Southern California are warned not to pick the yucca blossoms found along the highways. They are protected by an ordinance passed by Los Angeles County. The yuccas were in danger of extermination because tourists could not resist the temptation to pick them.

More than one and a half million bales of cotton were stored in warehouses licensed by the United States Department of Agriculture during the year ending May 31.

A junior church, with membership limited to persons between 6 and 16 years of age, is being successfully operated in Indianapolis. There are 60 children members of the organization. They have a room to themselves for services, which are of 30 minutes' duration.

Jazz music will not be permitted in the public parks of Toronto. Community singing will take its place.

If a young artist of Iceland shows marked ability, the government pays him a yearly allowance, believing that if a man devotes his time to art, without worrying as to living expenses, he is able to do better work.

Blacksnakes are the most efficient natural enemy of the ground mole. For this reason they are used on the golf greens of Pennsylvania and are never disturbed. The snakes work only at night, are harmless to mankind and do not hesitate to go into the mole's borings to discourage that animal's operations.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

One-third of the attendance at the American library in Paris is French. This library has 30,000 American volumes on its shelves and its tables are covered with American magazines and newspapers. The library is used by the best-known literary, scientific and professional men of France.

Federal game wardens have found carcasses of scores of pronghorn antelopes on the shores of lakes in Lake County, Oregon, the only region where they are now found in numbers Foreign-born sheep men have been slaughtering the antelope to enlarge the sheep ranges and to do away with the need for a reservation, according to reports. There are about 300 foreign-born sheep men in that vicinity.

Seventy-two per cent of the earners of income in America receive less than $1,500 a year. Fourteen per cent more earn less than $2,000.

Aklavick, a trading post on the delta at the mouth of the Mackenzie River, is the most northerly post office in Canada. Two mails leave the new post office by steamer during the open season and one by dog team during the winter, the latter being the most lonely as well as the longest postal route on the continent.

More than 300 tons of soot falls every year on each square mile of London. This is enough to build a pyramid four times as high as the famous clock tower over the Houses of Parliament.

A stork caught at Lieskau, Germany, was found to be carrying a small leather bag containing the following message: "Greetings to my German home! Willi Bucha, farmer in Nowa on Victoria Lake (East Africa). Born February 12, 1897, in Gerdauen, East Prussia."

Between $15,000,000 and $18,000,000 was spent in moving Hibbing, Minnesota, off the iron ore bed it had grown upon. The town now stands two miles distant from the 40,000,000 tons of ore it had locked up.

Costumes of men of the thirteenth and fourteenth centuries have been found in an ancient burial ground in the southwestern part of Greenland by a Danish scientist. They are the only existing specimens in the world of garments worn in that period. The temperature of the frozen earth for the past 600 years has preserved them from destruction by age and moths. Several wooden crosses found bear inscriptions in the Gothic rune script and are considered to be of great historic value.

Electric light bulbs are now being manufactured with a perfectly smooth surface without the exposed tip. The tip at one time was necessary as the air was exhausted at this point through a tube which was pinched off, causing the tip. This tip was the bulb's weakest point and easily broken off.

Reports from Russia indicate that the grain crops are good and promise to yield sufficient to feed that country, if properly distributed. This in spite of the fact that during the year of famine a large proportion of the working cattle and other stock must have been eaten and the energies of the population greatly impaired by under-nourishment.

Ninety-six per cent of the population of Los Angeles is made up of residents formerly living in states other than California.

A prohibition campaign has been started in Germany by the "Committee for the Introduction of Prohibition in Germany." This committee comprises a number of academic, political and labor leaders and professional men and women from all sections of Germany. Straw votes will be taken in various cities to sound public sentiment.

Nine thousand, one hundred and ninety-four immigrants entered Palestine during 1921.

The annual fixed charges against the United States Treasury on account of the public debt are $41,300,000,000. Of this amount $975,000,000 is for direct interest payment, $284,000,000 for sinking fund and the balance for redemption of savings certificates, Liberty bonds, and certificates of indebtedness. The actual interest cost exceeds a billion a year.

In the first 12 days of 1922, 103 persons in the United States died of liquor poisoning.

Cash Payment—Which Congress Does Not Entertain—Would Cost Far Less Than Deferred Certificate That Gives Veterans Little, Bankers Much

By AARON HARDY ULM

IN THE spring of 1918 a passer-by in an automobile picked me up on a street in a city that was highly congested on account of war activities.

"This is my last week," he said as he drove along. "On Monday I go to camp and enter the employ of Uncle Sam at a wage of $30 a month. I am now earning $1,000 a month. But it's a part of the game."

A few days later I ran into an old acquaintance who came from a cotton mill village in the South. He was in uniform—better clothed than ever before in his life. The food he was getting in camp was better and ampler. The medical attention and physical training he had received accounted for several pounds of solid muscle that had been added to his physique. There was a new vim in his eye and a noticeable pep in his movements. He had more spending money than ever before.

The man of the automobile made a big economic sacrifice when he entered the service; the youngster from the cotton mill village undoubtedly was the gainer economically. The country is indebted to both for the service rendered.

These two classes, as extremes, and all varieties between, come to mind when the bonus question is discussed.

There are nearly 4,000,000 ex-service men who are rated as entitled to "adjusted compensation" as defined by the Fordney-McCumber bill.

On entering the military service they averaged slightly less than 25 years of age. The bulk of them had not reached high earning stations in life. They came from all occupations and all classes. The psychological examinations that were made of them show that at least 47 per cent were not equipped for high-earning positions, as positions go.

One-third Made Allotments

IT WOULD be safe to say that the *average* earnings were under $100 a month; they probably did not average $75 a month. The average pay of all railway employes in 1919 was only a little more than $100 a month and the average wage for that class of workers then showed an increase of more than 50 per cent over 1916.

The bulk of the service men were without dependents; to so select them was one of the purposes of the draft act. Only one-third of the enlisted personnel in all the forces made allotments to dependents, even though the government duplicated and more all that were made. Scarcely one-fourth of them were married and only a small percentage of those had children.

One of the first things Congress did on declaring war was to double the base pay of men in the military, naval and like forces. That pay was made twice what it was in the Spanish War and more than twice what it was during the Civil War. It was $30 a month for service within the country and $33 for service abroad. Only those of the lowest rank, perhaps two-thirds of all, received no more than base pay.

The pay was above all living expenses, food, clothing, medical attention, and so on. Both the government and outside agencies supplied more for the soldiers of the World War than for those of any other war in which we have been engaged. In the Spanish War, for example, butter was an unknown article of army food, except when purchased by the men themselves or out of "company funds" which they supplied. A ration of chocolate would have caused a riot in those days.

Indeed, the average per man cost of our soldiers in the World War averaged more than twice that of other countries in the recent war or of our own country in other war experiences.

In addition to allowances for dependents where there were any the most liberal provision ever known to any country at any time was made for compensation or pensions and the rehabilitation when possible of the disabled. That feature of recompense is now costing more than $1,000,000 a day, several times what it cost four years after the Civil War, a four-year affair of constant battle action.

Peak in Wages in 1920

OF COURSE, allotments made by the men themselves to dependents were deducted from their pay, as well as premiums on insurance sold to them then and still offered to them on terms involving large expenditures out of taxpayers' funds. Deductions also were made for Liberty bonds when purchased, and purchases were general; which things were in the nature of accumulated savings.

Of course, many men at the end of each month had little left for spending money and only those in the higher ranks ever had much. On the other hand, they didn't have anything like the need that the civilian, who had to pay rent, buy food and meet doctor bills and all the other running expenses of life, had for spending money.

While all comparisons of the kind are more or less odious and unsatisfactory, there is no correct analogy between what the service man received and the wages paid in civil life even during the same period.

Though wages went up while the war was on, it is a statistical fact that the general wage level during the war never kept up with the increase in cost of living. Most of the general war prosperity, as many have learned, was illusory. Even those branches of agriculture that seemed to profit hugely from high prices have since suffered as large or larger losses from post-war depression.

There were manifold exceptions. Profiteers in business and industry no doubt took a toll of many millions.

Another statistical fact not generally noted in discussions of the subject is that *the peak of high wages was not reached until the summer of 1920, after all the service men had been discharged.*

The average period of time served in the forces was slightly less than 400 days, or about a year and a month. Only about one out of two men served abroad and only slightly more than one out of three was in action.

Averages, however, are dangerous and rarely express even tolerable truth; neither do statistics.

While the country was never more liberal in the matter of pay and allowances and protections given the men while in service, it did not keep all of its expressed or implied promises made to them.

Land Program Was Killed

THE raising of every big army entails disabilities that cannot be computed in medical or monetary terms. These are caused by the disruptions, dislocations and general disturbances incident to taking large numbers of men out of their normal routine of life and placing them into a kind of life foreign to their experience and essentially artificial.

Thus from every large army there comes many you might term invisibly disabled by the service, whether or not it entailed fighting or caused visible physical harm. They are the ones who are made dissatisfied with former environments and occupations, the ones who haven't the push to get back snugly into old environments and occupations, and the thousands who pass through many and subtle psychical and physical changes. They are the ones from whom come much of the "restlessness" that follows most wars. They need radical readjustment just as the physically and mentally disabled need rehabilitation.

Following other big wars, the government provided some means by which such men on leaving the service would be aided in making readjustments. Generally they have been favored in distributing public lands. It was the restless energy of the Civil War veteran who was dislocated more than injured by war experience which largely built up the West.

But for such veterans of the last war nothing has been done. Yet the subject was taken up immediately upon our entering the war. A program, apparently very satisfactory to the service men (nearly 200,000 while in uniform wrote to Washington to ask about it), was evolved. It revolved around land. Nothing was to be given any non-disabled veteran, but those who needed readjustment were to be offered assistance that not only would make their way easy but be constructively helpful to all the country.

The program got caught in a jam of Congressional politics and was killed by inaction.

Congress "Pets" Veterans

SINCE then Congress has talked. A few "petting" measures applying to all veterans have been passed. One gives them a five per cent preference in the classified civil service and another gives them first choice of such public land as may be opened for settlement. Neither measure is of any value to the bulk of the more than 3,000,000 men, or the average of them, who have claimed no physical or mental, that is to say, visible disability resulting from war service. For them as a class there has been done NOTHING. Even the $60 bonus, given in lieu of the two months extra pay allowed after all other wars, was withheld until thousands had been discharged almost penniless, even the service clothes on their backs being theirs by "loan" only.

After the Revolutionary and Civil wars the government said to the dissatisfied or dislocated ex-service man:

"Here's land, lots of it; take it and it's yours."

Thus there was something that any veteran could get.

But in the case of the veterans of the last war there has been nothing that was offered to the veterans as a whole or that any veteran might get.

The result was that a great many ex-service men soon began to demand that something be not only offered but provided for all veterans. Naturally they demanded that this something be cash. They justified it on the ground of economic sacrifice, claiming substantially that as service men they were underpaid.

So the question is quite an involved one and any clear answer is subject to so many exceptions and qualifications that it would be difficult to make it stand up against attack.

But the problem is no more involved than the solution which Congress proposes to offer for it.

The pending solution is a bill that has passed the House of Representatives, been favorably reported by the Senate Finance Committee, is next on the calendar for voting with a majority of Senators pledged to support it. Unless the intimation of a probable presidential veto prevents it ever coming to vote, it will be passed.

The bill accepts the contention that a monetary debt is due the ex-service men, practically as a whole. It fixes that debt at $1 a day for all time served within the country and $1.25 a day for service abroad. It limits "compensation" to those of and below the rank of captain and to those who performed real military services. To pay the "debt" as defined in the bill would call for a cash expenditure of between one and a half and two billion dollars. But there is provided a roundabout way of payment by which the ultimate cost to the taxpayer will be at least $4,000,000,000 and very probably as much as $5,000,000,000. That is to say, the soldiers will get about $15 per capita from the people, but it will cost the people from $40 to $50 per capita to give it. That is the difference between principal and interest. If the soldiers only got the interest, they would get more.

Only those with claims of less than $50 will get cash in hand. Most of the others are expected to accept what is known as the "certificate plan." It provides for payment of the "compensation" in 1942 with 25 per cent increase and four and one-half per cent interest compounded annually on the whole. It is payable earlier in case of his death to the beneficiary's heirs or estate.

May "Borrow" on Certificate

IF THE service man who takes a "certificate" should need some of his compensation before 1925 he may borrow up to 50 per cent of its face value from any bank that will make loans upon it at an interest rate two per cent above the discount rate of the Federal Reserve banks. If he fails to pay the loan by late 1925, the government pays it for him and then remits to him about one-half as much as he would receive for the balance of his "certificate" if held to maturity. If he doesn't borrow from the banks or pays back the loan, he may after 1925 borrow from the United States Treasury 85 per cent of the base value of his certificate; after 1928 he may borrow 70 per cent of the full value at that time.

A very complicated arrangement. The lowest estimate of administration cost is $4,000,000 a year for the "certificate plan" alone. It should be noted that only a comparatively few veterans will get cash, and only in small sums, from the government. Until 1928 the bulk of the veterans can get cash on their claims only by borrowing it from private agencies.

There are three other options which the bill allows the veterans. They may take it in the form of pay while attending a vocational school, or in home or farm, of land settlement aid. The latter two are attenuated relics of the program of veteran aid that was evolved while the war was on and never put into effect. The bill provides machinery where the claimant may get his money in the form of part payments on a home or farm or assistance in homesteading on public lands to be provided presumably through reclamation. Costly and involved administration is made necessary by the vague and complicated way in which those offers are proposed. Even if the bill were passed right away it would be several years before any large number of veterans could avail themselves of those options. Indeed, the bill provides considerably greater aid for those who wait several years before accepting those options, thus penalizing the ones who may manage to realize on them while their need presumably is severest.

Knows No Way to Get Money

IN MANY ways the "adjusted compensation" bill provides most for those who least need the aid.

This is due to the fact that while it would place an obligation of between four and five billion dollars on the government, it is so designed that it will call for no large expenditures right away. That's how the problem of raising the funds is met—and solved by being passed on in fourfold form. Every part of the bill having to do with raising the money has been omitted.

Congress confesses that it knows of no way for getting the money out from the money profiteers. Ultimately, if expended, it must come from the people generally, veterans as well as non-veterans, persons who did not enjoy high war wages as well as those who did.

In fact, it can be shown how the burden of taxes entailed in the measure will exceed in many hundreds of thousands of cases of the veterans themselves, the "compensation" that will be received should the bill as it stands be enacted into law.

French Girl's Frank Opinion of America

Her Mind Mirrors the Funny Foreigners Called Americans; Trained in the Sorbonne, She Lands Heavily on Our Foibles

"Man's noblest gift to man is his sincerity, for it embraces his integrity also."—Henry D. Thoreau.

The Editor asked one of the French exchange students at an American college to lay aside her politeness and tell us just how we appear to her—tell us just as plainly as she will tell her people in France, where she has now gone. The result is this keen and revealing article.

THE soft blue night over Paris; the mist of the river slowly blurring the façades of the palaces, the impressive dignity of the old towers watching the island of Saint Louis enrobed in the dark; the magic power of things we call dead but which are in truth tremendously alive when we deign to listen to them: they were all talking to me on the night I went to bid them goodby. And the concert of their voices floating toward me, and their beauty, which they knew I adored, tried to lure me from my decision to go to America.

"Art is ignored over there," said the Holy Chapel, "nowhere will you see the radiant rainbow of my stained windows." "But there is Liberty, is there not?" I returned.

On my right the prison of the Conciergerie, which knows the secrets of the Revolutionary days, answered, "Yes."

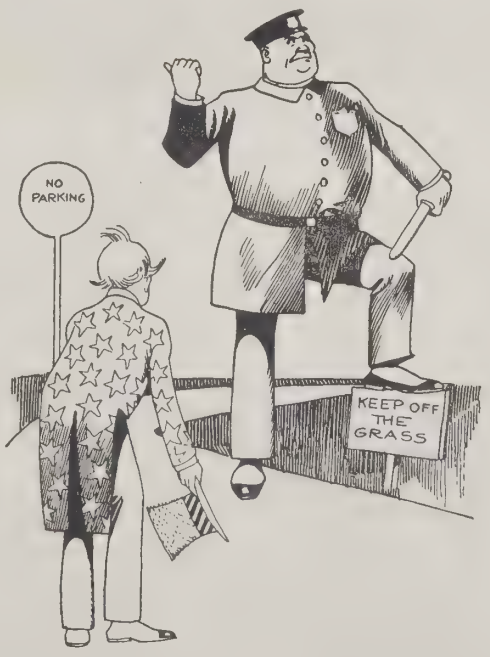
Then spoke Lolli, my friend, who had accompanied me on this pilgrimage, Lolli who shared my room under the roof but near the sky in the Latin Quarter. She warned me:

"Americans are a queer race; those who don't think only about drinking and the *Folies Bergieres* are unceasingly preaching and want you to enlist in the Salvation Army. As to the girls, you know how stiff and ungraceful the Y. W. C. A. girls look with their long skirts, flat heels and high collars. I wish you a good time among this prudish Puritan people, but I am afraid you won't have it."

I left France thoroughly believing that I was going to find America a country with no Art, plenty of Liberty and a people leading as a whole a Puritan life.

"Hardly Anybody Walks in the Streets"

WITH my two years of America as a background I may now sort right from wrong among my preconceived ideas. Although I think Art is not completely missing in America, it is not to be found where European people are accustomed to look for it. They may miss stained windows, haughty spires, magnificent old buildings, but the real reason for the absence of art is the uniformity, the general standardization of things and people. No doubt New York contains beautiful paintings in her museums, beautiful houses along some of her streets, but her museums are too conservative and her streets too straight. Should the palaces of Venice, the chateaux of France, the ruins of Rome be gathered in New York, what would become of their character if they had to be divided in square "blocks" by numbered streets?



Something which struck me in New York and the other big cities I had the opportunity to visit is that hardly anybody walks in the streets. One of the charms of Paris is the pleasure one has in loafing along, just loafing for the pleasure of it, enjoying the lively incidents of the street and the originality of each window display. A surprise awaits you at each turn of the capricious sidewalks. You change direction and you are in a different world. Houses, stores, displays have a character which is their own and cannot be found anywhere else but in that street. Here, in America, during my wandering along blocks, I admired some dainty houses cosily nestled behind trees on the deep green lawns; but on the opposite row were houses just as dainty, with trees and lawns just as green. The scenery was alike, houses of all the colors of the rainbow. So were the streets on the right and the streets on the left. As to the so-called main streets, their blood-red brick houses and the standardization of their drug stores, ice cream parlors and movie theaters, the intricate net of wires overhead, amaze a European not familiar with the principle of concentration.

The American village is better than the city, a fact not true of the French village. The French village shelters a race unknown in America, the peasants who don't understand comfort, even spurn it for the sake of their ancestors' customs.

How is it that in a certain mining country in Europe, no more than 60 years old, there is no such uniformity? How is it that villages only 10 miles apart differ entirely in style of construction and in the way of living of their inhabitants? No, it is not because the buildings are new, that cities and villages are so monotonously alike in America. Their uniformity takes its source in the uniform minds and tastes of the builders. They use ready-made plans for ready-made houses in ready-made streets. The sidewalk is built before the site is chosen. And inside their houses they place ready-made furniture—and this is not the housekeeper's fault, for she has the instinct common to all womanhood to feather her home in an attractive way; but she has no choice, the American furniture is machine-made and floods the stores in series. In France, crafts are still intensively alive and skilful artisans, patronized by the love of the race for distinction, chisel on their work their own originality.

Uniformity is also striking in clothing. As soon as a certain kind of dress or shoes or hat becomes the style, hundreds of duplicates swarm with the crowd. In France women adopt merely the outline of a style, that is, the principles without which they would be out of fashion. But from these principles, each draws an original model so as to be as little as possible the "copy" of anyone. Flappers are unknown over there for the reason that no girl would willingly wear the flapper's "uniform"; bobbed hair, plucked eyebrows, rouged cheeks and the special suit or dress which altogether constitute a "type."

Although this general uniformity is smothering art wherever it might have a chance to manifest itself, American people know art and, I believe, know the theory of it more thoroughly than the average European. They study history of art in high schools and colleges, they put the old masters and modern classics on the programs of their clubs and literary societies. Yes, they will seldom make a mistake when in a conversation they are able to use their knowledge. It is stylish to know what Corregio painted, what Beethoven composed. But whenever I entered a museum, I found it deserted,

whenever I went to a real concert, the crowd was strikingly a composite of all foreign elements, shouting for "encores" in Babel. There is the big American mistake; Art does not want to be possessed as an encyclopedia possesses rosaries of words. Art wants to be felt. Art does not consist in the acquisition of worthy masterpieces in front of which the crowd will bow because of the signature; it consists in the creation of things of beauty to enlighten the paths of life. Art is not a theory; it is an unceasing modeling of details. It is a touch of Art which requires the body of our French locomotives to be made of bright yellow copper, shining in the sun, and kept as smooth as a mirror—to the amazement of the A. E. F. men. It is a feeling of Art which made so happy the girls of the very strictly conservative school of the Legion of Honor when they heard that, for the reception given by the President of the Republic, although the style of their clothes—fixed by Napoleon!—could not be changed, nor the material, all the seams were going to be sewed with silk instead of thread and—hand-made!

It is a lack of Art which makes the natural wonder of some roads along Minnesota hills a perfect horror; the romantic groves and silvery lakes try vainly to peep above or glitter through six-foot billboards which explain to travelers that the individual painted without

economy of color will "walk a mile for a Camel" and that "Quaker ice cream" is worth spending a quarter in the next ice cream parlor.

"But there is liberty in America?" did I ask of the prison in Paris—and the prison answered "Yes." So would have answered anything or anybody to whom I might have directed the question for, over there, liberty belongs to America as style belongs to France and music to Italy.

"We want the freedom of the American worker!" was shouted among strikers of the first of May, 1919.

No, my friend, you don't really want this kind of freedom; you would not like it. You want to be free as an individual; he is satisfied to be free as a crowd. You want your personality to act as a unit; he believes in acting "en masse." You demand the right to bark at the "boss" when you feel like it without the "boss" having the autocracy to make you stop. The American worker will also bark, perhaps, but far from the boss's hearing—and should the boss hear him, the barker's carrier has 99 chances in 100 to stop short. Over here (in America) they will perhaps range you in the Bolshevik class, although you are not one, and you will perhaps call them "yellow," which they are not either. Your liberty is based on the need for a free expression of personality; their liberty is ruled by discipline. Discipline! that is the golden principle which is blindly followed in America and that I sometimes admire but know you will never admit, oh my fellow countrymen!

Discipline makes possible the "follow-the-white-lines" and "turn at the corner," the "please" on the new lawn, the hundreds of "don'ts" which, though negligible, would unnerve you like mosquito bites. Discipline allows the bossing of more or less well intentioned you-are-not-supposed-to-do-that which you resent because you believe yourself to be sufficiently grown up to dispense with a preceptor. In America policemen are kings and strictly obeyed. In France they are a joke, and ridiculed. The difference is striking even in the army; and French officers know that; had they talked to their men the way the American officers talked to theirs, they would have "started a row" with the poilus.

Our Degenerate Species of Liberty

YES, there is liberty in America. See the schools, for example. Schools of all teachings, all creeds, all ideals. Schools which don't have to worry too much about the supervision of the state. It is somewhat of a puzzle to think that, in the country which seems to have the "Americanization bug," some schools may teach American citizens in a language which does not echo the national tongue—and get away with it! These citizens are from a newly arrived stock, born abroad, yes; but why don't they talk their native idiom at home and learn the language of their new country in school?

And then the colleges. There is plenty of liberty in colleges as to the curriculum; there is plenty of liberty as to the choice made by students among courses offered, for the required subjects are limited to a few. I once discovered with great amazement that a great many among seniors ready to graduate from college never had to study any physics, nor anatomy, nor drawing, even in high school, while the French students are required to take every subject on the class program, whether they like it or not. That is why the French curriculum, alike for all colleges all over France, does not leave much time for athletics nor social activities. That is why French students cannot work their way through; during the school year they don't have time to work; during the vacations they don't have the strength. Should you wonder why July sees them exhausted, open the program of examinations for the *Brevet Superieur* or *Baccalaureat* for instance, which requires a terrible strain on the memory, for the examination covers the work, not of a semester but of three years' study. Then you will wonder how in the world they can ever pass it! That is why French students are exclusively students, students right through.

Moving From N. Y. to the U. S.

SECRETARY OF WAR WEEKS sees the country yelling for booze. The use of the word "sees" in that connection is unintentionally correct: Secretary Weeks does not hear the country, he only "sees" it through the pictures that are drawn for him by gentlemen who know exactly what they want him to see.

It isn't prohibition nor beer that is discussed here: it is the inability of publicists and officials to see the United States straight. Here is a New York editor, for example: maybe the editor of a "liberal" magazine supported by some International Financier. This editor lives in the midst of hip flasks and boozy humor: he dawdles and games and violates the Constitution in a club where all the club members assure him over and over again that the country is simply yelling its head off for booze and that unless something is done to suppress the "blue law tyrants" that are overriding the country we shall have a revolution here, man—a revolution here, man, sure as shootin'.

Clubs are poor places to hear the country think; you cannot gauge public sentiment by hip pockets, simply because these things prevent editors seeing straight the things that they ought to see straight. And they prevent officials, too.

One much needed reform is to take New York and strip it of editorial offices, transporting the editorial staffs to the United States and setting them down in the midst of the nation, where the voice of the American people will reach them. The same should be done with Washington officials. Men who have oscillated between New York and Washington all their lives, who think according to the interests of those places, are foreign-minded men and cannot help being foreign-minded. They represent a state of mind that has always been resistant of the mind of the United States. It is too bad that we cannot arrange branch capitals throughout the country, so that the government might ride circuit, as the older courts once did, and thus come in contact with all parts of the country, not on the rare occasions of public celebrations, but in common ways and as integral parts of our plain population.

It cannot be assuredly said that this would be of very great use to the country, but it certainly would be most valuable to the editors and the officials, and not only on the prohibition question, either. There isn't any prohibition question—in the United States! There may be in New York and in Washington.

Forgive Us Our Debts

AROUND the world resounds the cry to cancel debts. In tones varying from the plaintive to the belligerent, the nations are demanding that the obligations they owe be ended.

Russia says she can do nothing until her debts are waived. Germany's industrial future, it is said by Germans, is black with the clouds of indemnities which the Versailles Treaty imposed upon it. England, speaking through the mouth of Earl Balfour, demands the cancellation of debts. France is astounded that the United States fails to implore the privilege of marking paid on the bills which that imperial republic owes us.

"Forgive us our debts," pray and demand the nations of the world, but they somehow fail to add, "as we forgive our debtors."

The nations are correct in ascribing their governmental ills to their debts. Debts impose upon individuals and countries alike a financial and mental depression, which dulls ambition, discourages enterprise, and halts progress. Interest and usury are self-rising burdens.

Each nation desires to have its own debts written off. But it shows no signs of writing off those owed to it. The wise financiers in the United States reason that the opportunity for American business in Europe would be immeasurably increased if the debt burden were lifted from the governments of those nations, which in turn would then lift the taxation burden from the struggling peoples. But those same financiers make no suggestion of wiping clean the slate of war profits still owed to them.

The United States owes the persons who hold its war obligations something more than twenty billion dollars. The United States holds obligations of foreign governments for something less than half of that amount. How willing the United States Government would be to forgive the debts owed it, if by the same token the holders of all the United States bonds should simultaneously send them to the Treasury Department marked paid! And how willing, too, would be the majority of the individual holders of Liberty bonds and other government obligations to cancel them, if in turn their own several private debts were canceled.

Public and private debts, the world around, if it were possible to set them off against each other, would cancel with comparatively little inequity. But for the United States to cancel its credits and retain its debts is so palpably unfair that the wonder is any nation would dare suggest it. For a holder of a government bond to cancel that credit, and still be obligated for debts he has incurred, brings the chain of inequity right down to the individual. Were cancellation of all debts in the world possible, it would bring a year of jubilee. But for the United States Government to cancel the debts of a European power, debts which in the last analysis are owed to each person in the United States, offends all sense of fairness.

Where It Originated

THOSE who don't care for *Life*, or Charlie Chaplin, but who subscribe to the *Congressional Record* for their entertainment, doubtless oftimes have paused seriously to puzzle their minds as to the origin of one of our most expressive Americanisms—"bunk."

Back in 1830 a member of Congress from the sovereign commonwealth of North Carolina arose on the floor of the House and as he cleared his throat many of his fellow-members left the house to retire to the cloakroom. Whereupon the North Carolina member advised those who remained that he planned to speak for a long time, and that he would not be offended if they too left, for he was only talking for *Buncombe*. *Buncombe* was his home county. The newspapers gave wide circulation to his statement and "buncombe" became "bunkum," later to be curtailed to just plain, simple "bunk."

Members of Congress today are not so frank as was the gentleman from North Carolina in 1830.

The "Corner" in Gold

THE Federal Reserve Board reports an increase of more than $20,000,000 in gold reserves, "principally as a result of payment by England and other European countries to the United States on account of interest on debts owed this country."

Note the source of this addition to the cash reserves of the Federal Reserve System. Such is the stranglehold that this private banking corporation has on every ounce of gold coming into this country. The method of its transfer to the Federal Reserve cash holdings is unimportant, but doubtless is brought about by redemption of outstanding currency.

The gold reserve held by this financial institution is now the greatest in history and Reserve banks have practically dollar for dollar for all outstanding notes. Its volume of resources then is composed of credits extended; the profits enjoyed are from capitalizing the indorsement of the United States.

How long the people will be content with paying toll on their own wealth is a question.

Harmony—or Lethargy?

A SPECIAL political writer for a great New York daily has spent a week or ten days in a state and gathered a thorough knowledge of the struggles of the aspirants by barnyard rules as political headquarters, where men earn their living by their unbounded optimism for the party.

These persons emblazoned with incredible memories of vital statistics and the influences governing public thought are syndicated to all parts of the country and form a basis of speculation on the part of readers who desire to make wagers on their knowledge of the trend of campaigns. Sometimes they guess right, sometimes wrong, but always they are subject to self-deception in relying too strongly on these "staff" correspondents, because the latter must furnish the story, no matter how meager the information on which it is based.

In this particular series of tips from the field there is a strange harmony of "signs of a split" of a coming "revival of progressivism," and so on, in the Republican party, and of a "feeling of confidence" and a "remarkable harmony" among the Democrats which warrants the statement of the situation as one of cheer to the opponents of the present administration.

The results of the Republican primaries have been proof of an active revolt in that party, but are not proof that there will be any important defection in November. Success of the Old Guard might have alienated some of the other factions, but the Old Guard is composed of more political material. The Old Guard will not bolt, but make the nominees believe election, if it comes, is due to "us" and that means—disappointment for whatever group undertook to reform the party from without.

But why is there no harmony in the Democratic party—or is there? The all-seeing eye of the political seer discerns nothing but HARMONY, a cloudless sky, especially within the borders, which seems to comprise merely those states which normally vote nothing simply the party choice, the Republican ticket.

But is that bright sky indicative of harmony? Is it not possible it may be the lethargy of a sleeping giant to be awakened when Democratic factions come to grips at very, did only a quarter of a century ago, when Big Business went too far? There are indications of approaching storms likely to dash the hopes of Democratic leaders. A few more successes for the Progressives in Republican primaries and "organization Democrats" will have cause to seek safety themselves.

The same writer would probably simply reverse his picture in visiting the naturally Democratic states, for there is a primary battle worth seeing. In Texas the first round ended in a knockout of the organization candidate, but the fight was between a half-dozen, and the leader is yet to be chosen. In Missouri the anti-organization candidate for Senator won. These two cases point to a division in the Democratic party that may be as pronounced in the states where harmony seems to prevail.

It's Who Does It

INTO the souls of the high baseball moguls recently there came again a vast shame. There was much shaking of heads. There were smug interviews from baseball owners, decrying a blot on the game. There was a final, awful decree of banishment forever from organized baseball.

A player, nationally known, had fallen. He had offered to desert his team for gain, and thus further the chances of a rival pennant contender.

No words could express the horror of the baseball magnates for this treason to baseball *by an individual*. The great national game perilled by an attempt of one player to sell a little of a part of a chance for pennant—it was terrible.

But a few weeks and months before, without a protest, those same owners had witnessed, even consented to, an attempt by baseball club owners to buy the pennant. Club owners, eager to get the pennant for their team, purchased from another team the contracts of their most valuable players. By so doing they enhanced their team's chances for the highest honors, and eliminated the selling club's chances for any honors. It was never denied that the purchasing club owners possessed a hold upon the selling club owners.

Professional baseball is a private enterprise. But it is the public that supports it. Any other industry would realize the duty it owed to the supporting public. But owners of baseball clubs see nothing wrong in bartering their public's rights to the best possible in playing. Yet, they relegate to the regions of the lost, an individual employe who does a moiety of what they do openly. The system operating major league baseball under those now controlling it seems to believe in wholesale rather than retail buying.

Mr. Ford's Page

IT IS perhaps a blessing, one of the pleasant compensations of life, that the people live largely in unconsciousness of what is purposed against them. They do not know the deep-laid plans to bind and rob them and use them forever as the working army which shall fulfill a few private ambitions. They do not know the actual immorality of some of the systems under which they now work and live, and up to which they look as to worthy creations. They do not sense the movements beneath the surface of society, some of them emerging with the brazen lie of "popular welfare movements." They do not know that in written program, and financed by men whose inspiration is of the pit, there are schedules of destruction and damnation that would make even a decent devil hesitate.

Now and again the muckrakers, so-called, have lifted a corner of the veil which hides this underworld of evil from the common gaze. The people have looked, have passed a moral judgment on the thing, have seemed to accept the sop of corrective laws—and have gone on living their life.

Indeed, there are two points to be observed in all the attempts to rouse the people to a retaliatory pitch by exposures of rottenness beneath the respectable surface of things. "Big Business" has been repeatedly proved to be in very small business, such as using trick weights and measures. Very dignified and respectable branches of commerce have been shown to exist by a system of bribery. That is, the exposures have not been such as might be credited to the very bigness of a movement, but they have been such as can only be credited to mean, rat-like, cruel and criminal cunning—such actions as would make even a tramp blush.

And the first point is this: the exposures have meant nothing to the people exposed—for it was not only a system that was exposed, but people, persons, men of position, whose position is entirely dependent for its worth on the esteem of the people. The student who seeks to write the philosophy of our times will seriously fail if he overlooks this fact: that the policy of evil men under exposure is to persist in their evil. Formerly, and even now among normal people, when a wrong is discovered and exposed, it is over. Exposure is the end. Not so in corporate wrong. Exposure is only the end of the concealed phase. Next ensues the open phase. It is a recognized policy among corporations, old-guard groups of politicians, any group which is controlled by the new unmoral type of mind that has come up, that the game is to keep on, don't stop, don't bat an eyebrow, keep on and let them do their worst—but keep on! And they do keep on. It is clear as anything that this policy becomes superior to the policies thus far used in exposures, for the evils exposed are mostly in existence now, just as they were before. This point is worth knowing. It will help keep many a head cool, and many a heart free from the agony of helplessness, which grows from our normal moral feeling that, of course, of course! as soon as an evil is exposed it will be stopped for very shame. It isn't stopped, and here is the policy which explains the fact.

"Then," says someone, "it simply shows the stupidity of the people."

Well, that too will bear examination. It is worth considering sometimes that the silence and apparent apathy of the people may be only a deeper wisdom. It is true, beyond doubt or argument, that the masses of the people are better, morally, intellectually, physically, than the classes. So much will have to be conceded. This world exists for the multitudes who do the work of the world and rear the children of the world and who themselves are the fruitful soil for all the ideas of liberty that have enlightened the world. There is no doubting that.

PEOPLE are never so likely to be wrong as when they are organized. And they never have so little freedom. Perhaps that is why the people at large keep their freedom. People can be manipulated only when they are organized. The most closely organized groups and movements in the world are those which have been least friendly to the people's progress and liberty. Think that over! Every evil overthrown has been organized up to the hilt. The safety of the people today, in spite of systems organized to undermine it, consists in this fact, that the people are unorganized and therefore cannot be trapped. Sometimes we protest that the people ought to organize and do this or that, but the unconscious wisdom of the people tells them better.

And what if their silence should be an unconscious wisdom, the heritage of the plain people from of old? That's the question. Small predatory groups think they are "putting it over" on the people, think that their schemes in comparison with popular apathy show the superiority of the schemers. Suppose that it is the other way around?

You look at the reformers and their plans to redeem the people. They want the people to organize against this, against that, against the other thing. Organize, Organize, Organize is the constant cry. Some people cannot see anything else but organization. And yet it remains true that about the only unorganized mass on earth is the people, while every possible menace to the people *is* organized. That ought to give pause to thoughtful minds. Every predatory, destructive, mind-enslaving, world-snatching movement is organized, organized, organized. That is to say, they have forms in which they hold the persons they seize, hold them by fear, by hate, by false loyalties, by false principles. If you will look abroad upon the world and count the most closely organized of its institutions, those institutions where authority is by threat and menace and not by light shed abroad and service done, you will find an object lesson illustrating what is said here. Think of the evils recently overthrown in this country, think of the evils now in judgment, are they not all contained within the most closely and securely organized groups? Is not the principal fear they exercise the fear of their all-encompassing organizations?

Well, the people are unorganized, and therein is their strength. They are free. They can range. They are slave to no mere "anti" idea. They are open and pervious to the inspirations of the new era which they test by the principle of freedom. They would not bind themselves, nor enslave themselves, nor surrender their God-given rights to any organization; they remain as they were created, in that natural organism—a living organism, not an artificial organization—the Race.

The poetry and music, the prophecy and religion of the world, were free, they were not the products of organizations. Men taught or sung or suggested laws as they were moved by the free spirit of light. And something always went out of these things, something hard and hardening came in, when organization came. It has come to be that progress consists in breaking the shells of organizations that have encrusted themselves around men—and the only reason these shells could ever be broken is that the mass of the people were outside of them.

The safety of the people has seemed ever to be in just this habit of theirs, of going on about their business. Are the government taxes too high? Then the government that taxes too high will receive less of a total tax. The people seem to know that. Is the money system a private juggling game? Then presently coins will come to mean nothing, while the staples of the people will retain the quality of wealth.

Are there schemes to undermine the people, in favor of this class or that race? How can they undermine an unorganized mass? How can they enslave those who will not enslave themselves? If the people were organized, and bound tightly to the organization, then false leaders could betray them as often as required. But what can you do with what you can't control? You can only betray your own falsity. And the people seem to know this, too. No weapon formed against them can prosper—this seems to have been whispered in the people's innermost ear. Their very safety, their very power, their very triumph seems to be due in their double freedom—freedom from the fear that evil systems can last very long, and freedom from the bondage to organizations. Organizations too soon cease to be servants and seek to become masters.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Will Irwin—Ace Among Writers of Fact and Fiction

Personal Role of Press Bureau During San Francisco Earthquake Most Interesting Experience

By FRED L. HOLMES

WILL IRWIN

He claims the world record for producing the largest volume of copy in the shortest time.

WILL IRWIN made his first big hit in journalism on a job from which he had already resigned. Out of the West had come this husky reporter who knew more about the haunts of San Francisco than the police detectives of the Golden Gate city; knew the people of the mining camps and the life in the melting pot familiar on the Pacific Coast. For a time, he was on the staff of the New York *Sun*. Then came the offer of the managing editorship of the *McClure's Magazine*.

It was a hot, sultry day in summer. Sixteen years had passed since that editorship was offered him and we sat in a stuffy little office recounting newspaper experiences. The man was on his way to the West. This time he was going back to gather the threads and weave in fiction form the story of a once great mining camp on the Continental Divide.

"What was your most interesting newspaper assignment?" I asked, expecting to get some story of the World War where he served as a special writer and chief of the foreign department on public information. He paused for a moment trying to remember a date. It was April 18, 1906.

"My most interesting newspaper experience?" he repeated my question, as if his mind were shifting the scenery back into the past.

"It consisted in sitting at a desk and writing all the time for eight days," he continued. "I had been for two years a sort of star reporter of the New York *Sun* and had just resigned to become editor of *McClure's Magazine*. I was in the office of *McClure's*, giving the job a preliminary overlook when the news came that San Francisco had been shaken down by an earthquake. I knew San Francisco. I rushed down to the office of the *Sun* and found that for the first time in 25 years they were holding an editorial council in the morning. The situation was desperate. The *Sun* was conducting a press bureau independent of the Associated Press. They had only one correspondent in San Francisco. If anything happened to him, it seemed likely that they would be scooped on the biggest news story since the Civil War. As it turned out later, the correspondent, the late George Hamlin Fitch, did not come to time through no fault of his own. He had on his hands his own burning newspaper and he had turned our job over to an assistant who faithfully filed copy for eight days, but neglected to inform the telegraph office that the *Sun* was "press bureau." The operators had established the rule of throwing all copy on the floor except press bureau stuff.

"I wanted to go to San Francisco but they decided I was needed in New York. On the suggestion of Mr. Lord, the famous old managing editor of the *Sun*, I telegraphed to friends and acquaintances and newspapermen whom I knew all over the Pacific Coast, offering them any price to send us such news as they could pick up. From then on, I sat there for eight days and did the running story of the disaster.

"The first night I turned out by typewriter and dictation 14 columns and on no night did I do less than eight columns. This is said to be a record for production of copy. On about the third afternoon when the story had died down a little the city editor suggested that I put in the afternoon writing an account of San Francisco. At that moment, the city was still being troubled with settling shocks, and it was uncertain whether it would all be destroyed. Moreover, the fire was not yet checked. I wrote, I remember, with considerable emotion, the copy boy taking away the sheets as I finished. The late Franklin Mathews, then a copy reader on the *Sun*, took a phrase from the story and headed it, "The City That Was." It was not until after the smoke of the disaster cleared away that I realized that this copy had made a hit. It was afterward published in book form and is selling yet.

"However, the most interesting thing to me about this adventure was its mental effect. I was working not only under a nervous strain but under an emotional strain for I was uncertain until late in the day about the fate of my friends and family in San Francisco. I probably averaged no more than two hours sleep a night during the entire period. At the end of the second day, I was so tired that I thought I could not go on. Then suddenly I seemed to get my second wind. I felt no fatigue at all. I felt capable of going on forever.

"It was long years after that I read in William James' paper, 'Powers of Men,' of that reserve of consciousness upon which men draw when under exceptional strain. I am sure I had drawn on that. Mr. James said that when this happens one feels no reaction after he has finished. That was exactly my experience. On the ninth day, I took a day off, went to a large party with friends and sat out half the night talking and listening to the music.

"Another curious mental phenomenon manifested itself and I have never heard anyone record a similar experience. Memory suddenly arose to the 'nth' power. It would have been impossible for me when I lived in San Francisco to go down Mission street between Third and Fourth streets and enumerate from memory every building in it. It would have been equally impossible two days after I finished this job. But in the heat of this work, I could do that—I could take almost any familiar street in San Francisco and project in my mind a mental program of every house and every business establishment.

"I have covered strikes, conventions, shipwrecks, revolutions, and quite a sizeable war. I have been shot at, shipwrecked myself, buried under a falling building—the experiences of a man who has been a reporter for 20 years. But this last melodramatic event, I consider my most momentous experience in reporting."

For more than 20 years Will Irwin—William Henry Irwin was the name recorded in the old family Bible—has been a newspaper correspondent, varying his assignments with fiction stories and novels. Within the decade he has builded a reputation for carefully surveying a situation and accurately depicting it. He has written the requiem for falling empires and stood an onlooker at the birth of new republics.

"Reporting is fun," he declared. "It takes you out among people, gives you adventure, but on the other hand, the actual writing of fiction is more fun and you consciously get farther, for you create something out of yourself."

A life crowded with experiences — actor, elevator boy, clerk in a railway office, cowboy, invalid in a tuberculosis camp, reporter, editor and author—and he is now 49 years old. Will Irwin spent his early life in Leadville, Colorado, then a roistering mining town. Entering Leland Stanford University at 21, he was a freshman when Herbert Hoover was a senior. There sprang up an early friendship, which 20 years later found one the great American war correspondent and the other head of the commission for the relief of Belgium.

Within three days after the Germans had laid siege to Liege, Will Irwin was on his way to Europe, representing two large magazines. He was on all fronts, with all of the armies.

Irwin's memorable story of the battle of Ypres was called by the *Literary Digest* the greatest literary masterpiece of the war and was published in several languages. It almost ended his career, however, for the English War Department blacklisted him for it. He was not allowed to approach any of the army headquarters or to have any communication with officers or soldiers of the British army. He went to the French army and there found the same baffling condition. Then he went to see Lloyd George and after 10 minutes' talk with him—his rights were restored.

After the war, Mr. Irwin again toured the allied countries and made a long visit to Germany. He was just in time to cover the Ruhr rebellion.

The war, with its attendant horrors made a pacifist of Will Irwin.

"War today is a wholesale slaughterhouse instead of the highly romantic struggle that it used to be," declared Mr. Irwin. "Unless we wish to exterminate the human race, we must stop wars. War up to the present time has been fought under much simpler and less inhuman conditions, but nations have begun to put brains and energy into war. Professional patriotism is one of the worst enemies the world has. This extreme nationalism, national conceits, and all that sort of thing, is what is tearing the world to pieces. Our Canadian border is protected by three revenue cutters which would be of no value as far as military service is concerned, but we do not need any more protection because we do not have a hatred for Canada. If a European nation had such a border they would fortify it immediately. It is these fortifications, large armies and other symptoms of preparedness that precipitate wars. We must do away with them.

"This practice of financial imperialism and this jockeying for new fields of commercial conquest are the very things that will bring on another war."

Writing seems to be kin to Will Irwin. His wife, Inez Haynes Gillmore-Irwin is the author of a dozen novels. His brother, Wallace I., has written nearly a score of volumes. His niece, Phyllis Duganne, had a story accepted by one of the large magazines before she was 17 and at 21 was the author of a novel, "Prologue."

"I have typewriter batteries to the right of me and to the left of me," playfully remarked Mr. Irwin.

Shortly before the war, Mr. Irwin had decided to give up reporting and devote himself to fiction. Now that the war is over, he is bending to his former decision.

"Fiction in one way is the very reverse from reporting," comments Mr. Irwin, in explaining his desire and method of producing fiction. "I went through the whole war and I conceived only two short stories. The thing itself was too tremendous for fiction."

Correspondence has given Mr. Irwin a national acquaintance with men and women of affairs, leaders in political and economic thought, and authors.

Most of his writing in summer is done at his home in Scituate, Massachusetts. During the winter he lives in New York. His summer vacations are spent with his wife traveling from city to city; from mining camp to mountain peak in search of "color" for his stories. Those rough mining days of Colorado, 50 years ago, are now the focus of his studies for future literature.

Gigantic Hogback Mountains

By WILL IRWIN

MOUNTAINS are mountains; but the Alps are more abrupt, altogether more perilous in every aspect, than any range we North Americans know. They do not rise gently, slope after slope, like our own Rockies or our Sierras. They shoot up in gigantic hogbacks and walls and pinnacles. It is all very well to say that Mount Massive, of the Rockies, is some 14,000 feet above sea level, and the more famous peaks of the Alps only 1,000 feet or so higher; the comparison is not fair to the Alps. The peaks shoot up from low valleys, not from wide high plateaus. That same Mount Massive is 14,400 feet high, but the city of Leadville, at its base, is more than 10,000 feet high. Here, Mount Adamello, king-peak in one of the highest Alpine glaciers, had been peeping at us all day through the rifts of the valleys; and yet we had started that morning at a scant 2,000 feet. As a mountain-bred child, I had been hurt in my patriotism to hear a European say that there was no real mountaineering in the Alps of America; that climbing the Rockies was merely a matter of walking. I looked about me now, and understood. To the left and right shot up great ridges, bristling with straight firs, dusted now with snow. Behind these ridges rose white precipices; behind them pinnacles of gray rock so abrupt that the snow clung only to the clefts; and farther up . . . . but that was lost in the whirling snow-mists.—*"The Latin at War."*

A Chap Who Roves the Valley of Dry Bones

Story of Charles W. Gilmore, Uncle Sam's Hunter of Prehistoric Animals

By J. H. WALTON

This is one of a series of several articles dealing with important United States officials who are unknown to the general public.

EVERY normal boy at some time in his life has had his "menagerie" or museum. Especially after the circus has been to town, a close examination of almost any boy's collection of valuables will disclose at least one frog, a garter snake, a lizard, several beetles, and perhaps a leech.

Probably every man remembers how, in the halcyon days of his youth, he collected curios, the loss of which, through accident or design on the part of parents who did not appreciate the real value of the collection, was a tragedy.

After a time this "mania for collecting junk," as our parents often called it, was supplanted by new interests, and we apparently "outgrew" the disease. But this collection "bug" never deserts us entirely—witness stamp and post card collectors, antique and period furniture addicts, and hosts of other examples.

In many men this instinct for collecting curios, and seeking information about them, predominates throughout their lifetime. They never allow any other interest to overshadow this inborn impulse to learn the secrets of nature's handiwork. Among these are our great scientists of today.

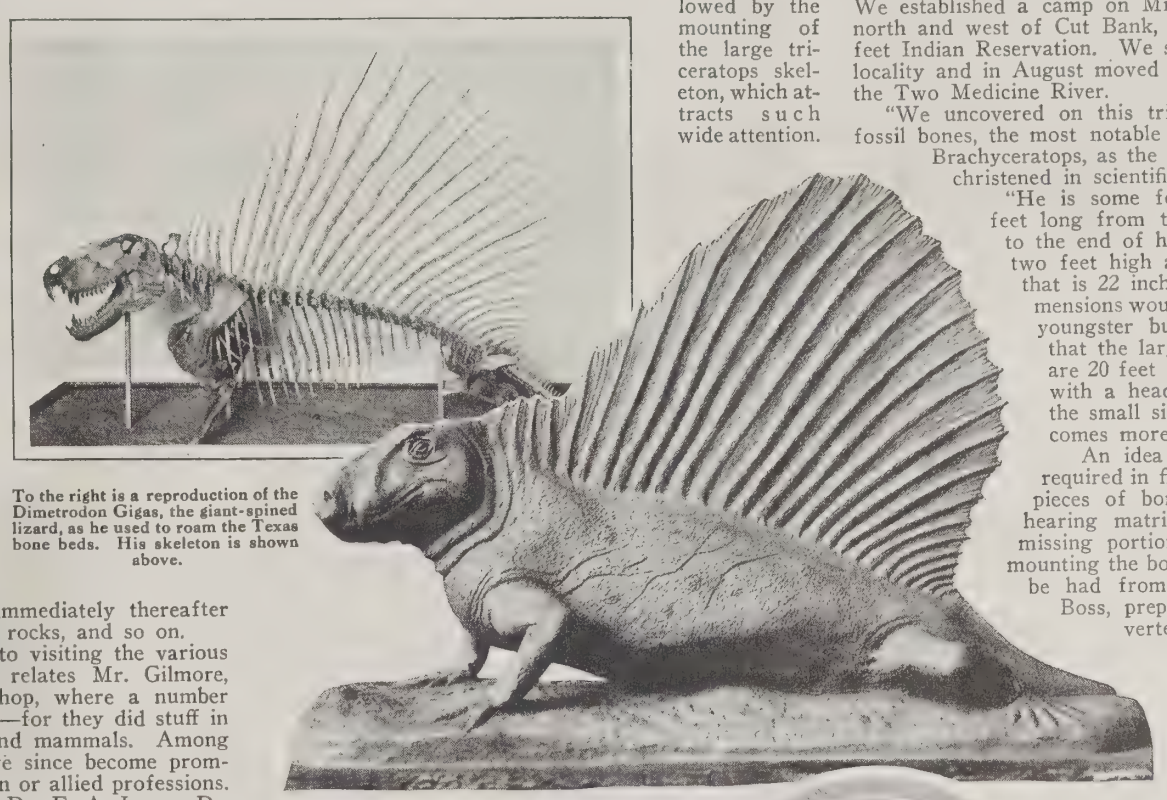
One of the foremost in the field of paleontology—that branch of scientific research which treats of the ancient life of the earth, particularly of fossils which are remains of such life—is Mr. Charles W. Gilmore, associate curator of the United States National Museum, Washington, D. C.

At the age of six years, Mr. Gilmore, accompanied by an aunt, visited Ward's National Science Establishment at Rochester, New York, and immediately thereafter started collections of birds' eggs, rocks, and so on.

"My time there was devoted to visiting the various buildings of the establishment," relates Mr. Gilmore, "and especially the taxidermy shop, where a number of men were engaged in 'stuffing'—for they did stuff in those days—all kinds of birds and mammals. Among these men were several who have since become prominently identified with their chosen or allied professions. I refer to Dr. W. T. Hornaday, Dr. F. A. Lucas, Dr. A. B. Baker, the late Nelson Wood, and others.

"Upon my return home the museum bug had been firmly implanted, for immediately collections were started of rocks, birds' eggs, insects, stamps, and fossil shells. Taxidermy, as a matter of course, having seen the work under way, had priority of interest over all others of my private museum activities. I well remember a perfectly good cloth elephant stuffed with bran, that was slit open, restuffed and sewed up time after time, until the poor thing lost all resemblance to its original form.

"That was when the idea of following museum work as a life profession was implanted, an idea that never deserted me though many years intervened before the work was seriously begun. This postponement was due to the necessity of obtaining an education, and to the lack of information of how to get in contact with those carrying on museum work."



His father a farmer, Mr. Gilmore had to struggle for an education. He persisted, and at 21 graduated from high school, and the year following went to Laramie, Wyoming. In 1895 he entered the University of Wyoming, where, after working his way. through, he graduated in 1901, receiving the degree of Bachelor of Science.

"Upon entering the University of Wyoming," said Mr. Gilmore, "the idea was still fixed in my mind of preparing myself for some line of museum endeavor, though the particular branch was somewhat vague at that time. There was always an inclination toward the biologic end. A collection of dinosaur specimens in the university attracted my attention, and from then until graduation all my spare time was devoted to the study and collection of fossil specimens."

In 1900 Mr. Gilmore was engaged by the Carnegie Institute of Pittsburgh, Pennsylvania, as a field collector of fossil specimens, and after graduation he remained with the institution nearly three years in that capacity, collecting for six months of the year in the fossil fields of Wyoming and Kansas, and working the remainder of the year at the museum in Pittsburgh, helping prepare the specimens for exhibition and in scientific study.

In the autumn of 1903 he accepted a position in the United States National Museum, and it is here that his most notable work has been done. His work has been duly appreciated by those in authority, and he has been successively promoted through the grades of skilled laborer, preparator, custodian, assistant curator, to associate curator in charge of the laboratory and exhibition collection, which position he still holds.

"My first piece of work," said Mr. Gilmore, "was the preparation of a skull of one of the large horned dinosaurs, followed by the mounting of the large triceratops skeleton, which attracts such wide attention.

To the right is a reproduction of the Dimetrodon Gigas, the giant-spined lizard, as he used to roam the Texas bone beds. His skeleton is shown above.

Other skeletons have been added from time to time so that the two articulated skeletons on exhibition at the time I came to the museum, have now been increased to more than 40.

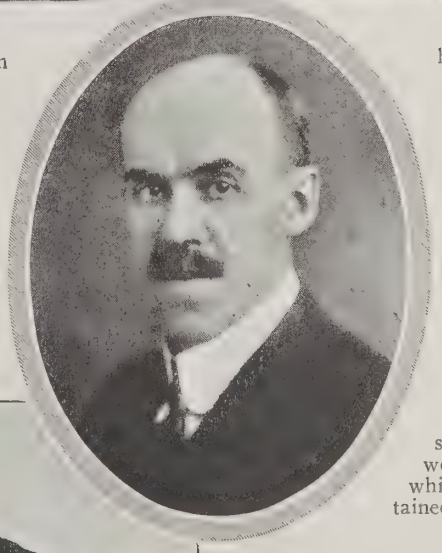
"One of our most interesting exhibits, and one which attracts a great deal of attention from the visitors, is the Dimetrodon Gigas, a giant-spined lizard from the Texas bone beds. This new and imposing mount forms a noteworthy and important addition to the constantly growing collection of extinct animal life, which now fills one of the larger halls of the museum, and to which a young lady visitor flippantly referred as the 'dead circus.'

"The most striking feature of this peculiar animal is the high dorsal fin. This ranges in length from six inches on the neck, to more than three and one-half feet above the center of the back. In trying to account for some practical use for this unusual appendage it has been suggested that it may have resembled some vegetation which existed in the same period and thus served to conceal the animal as it lay in wait for its prey, or for better concealment from its enemies."

Mr. Gilmore spent many months devoted to critical study in working out difficult problems in connection with the proper pose and articulation of the bones of this specimen, and has also prepared a model restoration one-sixth natural size of Dimetrodon based on the mounted skeleton, which depicts his conception of the probable appearance of this creature in the flesh. A picture of both the skeleton and the model are shown herewith.

Mr. Gilmore has on several occasions participated in the field work for the museum, excavating the fossil remains of many curious and important extinct reptiles. The most significant example which he personally assisted in uncovering, is the skeleton of a baby dinosaur. Of this expedition Mr. Gilmore said:

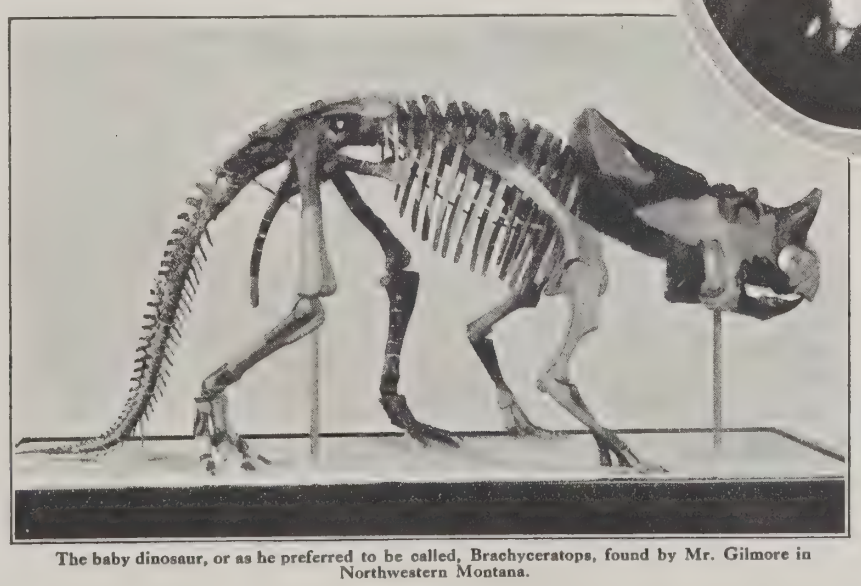
"During the summer of 1913 I headed an expedition under the United States Geological Survey, to obtain a representative collection from Northwestern Montana. We established a camp on Milk River, some 35 miles north and west of Cut Bank, Montana, on the Blackfeet Indian Reservation. We spent four weeks in that locality and in August moved camp 50 miles south on the Two Medicine River.



"We uncovered on this trip between 500 and 600 fossil bones, the most notable of which were those of Brachyceratops, as the infant dinosaur has been christened in scientific circles.

"He is some few inches less than six feet long from the tip of his baby nose to the end of his tail, and stands about two feet high at the hips, with a head that is 22 inches in length. These dimensions would indicate quite a sizeable youngster but when it is explained that the larger members of the race are 20 feet long, eight feet high, and with a head six or more feet long, the small size of Brachyceratops becomes more apparent."

An idea of the painstaking care required in fitting together the broken pieces of bone, cleaning off the adhearing matrix (stone), restoring of missing portions, and articulating and mounting the bones of this skeleton, may be had from the fact that Norman Boss, preparator in the section of vertebrate paleontology, who has so skillfully done all of this work, spent 345 days, or nearly a year in preparing this unique specimen for exhibition to the public.



Another interesting specimen on exhibition at the National Museum is a mastodon found encased in the ice in Siberia, of which portions of flesh, skin, hair and stomach have been preserved. From the contents of the stomach scientists have been able to determine, not only the geological period of its life, but, within two weeks of the time of year the animal died. This is known because of the undigested plants and flowers found in the stomach.

When going through any museum certain exhibits are sure to be uninteresting and tiresome to some people, but if more were known about the way in which these specimens were obtained, the work required to prepare them for exhibit, and the wonderful advance in a scientific way that the discovery of these relics of bygone days have made possible, they would take on an added interest to the casual observer. The human element must be considered in this as in all of our relations. Old dried-up bones of some little-known animal that lived thousands, perhaps millions, of years ago, may have very little interest for us as such. It is the work, the human effort expended in recreating the animal as it once was that generally arouses our interest. We perhaps do not realize the fact, but when we admire some particularly fine specimen on exhibition, we are really paying our respects to the scientist who discovered the bones, the curator who made the articulation and pose possible, and the preparator who assembled the jumbled mass.

(C) Harris & Ewing

CHARLES W. GILMORE, associate curator of the National Museum.

The baby dinosaur, or as he preferred to be called, Brachyceratops, found by Mr. Gilmore in Northwestern Montana.

The work of preparing these prehistoric fossils for exhibition requires great skill and patience. Very delicate tools are used with the greatest of care to guard against injuring the bones which come encased in large slabs of rock, as many as 100 bones to the slab. The bones are usually softer than the rock. It often takes several hours to remove one six-inch bone.

Owing to the highly specialized character of the work, skilled preparators are always in demand, and the supply falls far short of the need. The work is very interesting, and one needs but to imagine the feelings of a workman who is gradually uncovering the bones of some prehistoric monster, knowing that he is the first human being to view those bones, to know something of the thrills which accompany such work.

Milliards for Reparations and the Next War

Germany as She Is Today, Feasting, Starving, Working

By PAUL TYNER

WHAT is the truth in regard to Germany's ability to pay the indemnity of $33,000,000,000 in gold demanded by the Allies and which she pledged herself to pay in signing the Treaty of Versailles?

This question is at the base of any reasonable hope of an early re-establishment of economic equilibrium in Europe or the world. This has been said so often that it has perhaps become trite; but it is a truth, it seems to me, that calls for even "damnable iteration," if that is necessary, for people on either side of the Atlantic to awaken to a clear realization of its truth. Upon careful observation of the present world situation, I am convinced that it is not merely the restoration of industrial and commercial prosperity that depends on the early settlement of the reparations problem; but that in the absence of such a settlement a new war will be inevitable. And a new war will unquestionably draw all the nations of the world into its maelstrom.

The Germans are busy and hard at work—strikingly so. In the fields and the workshops, and in stores and offices, they start the work of the day about two hours earlier than the workday begins in France or in Britain; and they continue work nearly two hours later. And when they work they work. With evident pride and satisfaction in their accomplishment, they pile up production. The workers do not act as if they were driven. Rather they seem to drive themselves. They are remarkably cheerful at their work, and no people seem to practice better than the Germans the art of relaxation and enjoyment. Saturday afternoons and Sundays they get out into the country, or into the big city parks and gardens. They eat and drink with enjoyment, and they listen to good music. These summer evenings, the sidewalk or terrace tables of the restaurants and cafés are much favored. But there is no evidence of prodigality or waste except among the German profiteers and foreign visitors. The mark is worth only about one-third of an American cent, measured by the present rate of exchange; but it is wonderful how far the average German *hausfrau* can make that little third-of-a-cent mark go when it comes to buying things to eat and the material for clothes to wear! Wages and salaries are low—lower even than they were before the war, judged by the foreign exchange measure of values. But judged by present purchasing power of the mark in Germany, wages and salaries are high.

The Temptation to Over-spend

BUSINESS is brisk. Not only is there plenty of money, but it is in active circulation. People have money to spend, and are spending it. The cost of living is undoubtedly high—measured in marks; but there has been at least a corresponding increase in the number of marks in circulation. High prices do not worry us when we "have the price." And the German workingman and working woman in these days undoubtedly have the price.

Perhaps the worst thing about cheap and plentiful money is that it is a temptation to over-spend. The sense that one's pocketful of paper marks may suffer a depreciation tomorrow or next week is not conducive to saving. So people spend while the spending is good. A typical incident is that told of a man who walked into a shop in Berlin and ordered 1,000 electric light bulbs. He was asked why he wanted so many and replied: "I don't really want any at all; but I could not spend all my marks at the shop opposite, because it is sold out. Then I saw this shop and bought bulbs, simply because I would rather have bulbs than marks!"

Usually, it may be taken for granted that when the masses are steadily and productively employed, earning good wages and spending their earnings freely, the country must be enjoying business prosperity. Lord Northcliffe, in the first chapters of an interrupted serial account of a recent visit to Germany "incognito," declared himself convinced by his observations that "Germany is prospering remarkably because there was undeniable evidence of a high birth rate and of activity in the building trade." Precisely the evidence he cited might be cited by any observer in France.

As usual, the truth lies between extremes. Although (as the French never tire of pointing out) German territory was preserved from the destruction and devastation of invading forces and her industrial equipment practically preserved intact, the traveler in Germany today—especially in the Rhine provinces—would be blind and deaf indeed if he remained incognizant of the plain evidences of war exhaustion on every hand. How could it be otherwise when it is remembered that Germany sustained the brunt of the most exhausting and destructive conflict in the world's history practically unaided against a coalition of 17 nations, including the richest and most vigorous, through nearly five long years of herculean struggle. France lost nearly two million men in killed and about twice as many crippled, and Britain, including the Overseas Dominions, about half that number; but the German loss of man power was more than both France and Britain.

Common sense would suggest that if the Germans have come out of the war, so fresh and vigorous and wealthy that within three years of the signing of peace they are able to shoulder the payment of a war indemnity on top of the mountain of internal and external debts, public and private, contracted for the waging of the war, to say nothing of Germany's huge pre-war debt, imperial, state, municipal and corporation—*then the Germans must indeed be a race of supermen!*

The Germans have become tremendously serious. The old-time hilarity of the Teuton is rarely in evidence. On a train out of Cologne, I got into conversation with a well-set-up middle-aged man who proved to be a manufacturer of cotton goods. Through some change in time-tables, I had boarded a train that did not stop at Nurnberg. He very amiably fished a railway guide out of his bag and helped me about finding a connection. Discovering that my French was better than my German, he readily resorted to the late enemy tongue which he spoke fluently. I asked where he had learned his French.

"I lived three years in France," he replied, "as a prisoner of war."

Then followed some rather bitter reflections on French treatment of war prisoners. It sounded very much like the sort of thing of which the Germans were so freely accused in England and in America during the conflict.

"Personally," he went on, "I had little to complain of. The French seemed to make it a point of pride to accord decent treatment to German officers; but that meted out to our unfortunate private soldiers was simply brutal."

"All war is brutal," I remarked. "We had apparently well-authenticated reports of German cruelty to prisoners. Perhaps there was lack of kindly consideration on both sides."

"Working for Reparations"

"WE DID not want the war, and we want no more of it," he rejoined. "War is as foolish as it is inhuman. And probably it is waste of time now to discuss who was responsible for starting it, or which side was the more ruthless and cruel in its prosecution. But I am certain that the Germans did not allow their wounded and sick prisoners to drag out days and weeks in pain and wretchedness, and often to die for lack of surgical or medical attention, as too often happened in the frightful prison camps of France. Enemy wounded received as skilled and careful attention in the German hospitals and camps as did our own boys. The experience of our men who fell into the hands of the English or the Americans was very different. They cannot praise too highly the kind treatment accorded to them.

I remarked on the very evident industrial activity I had found in Germany. My acquaintance smiled bitterly.

"It is true we are working hard," he said, "but what use is it for us to work hard and produce, when all we produce has to be handed over for *reparations?*"

The last word was pronounced with a rather cynical emphasis, which caused me to exclaim: "We Americans who have traveled over the devastated regions of France and Belgium certainly feel that fair reparation for the havoc wrought there is justly due from Germany. Besides, you know, Germany set an example in that line when she exacted the milliards from France after the war of 1870-1."

"Do not mistake me," rejoined the manufacturer. "We quite expected and were entirely willing to make fair and reasonable reparation as part of the price of our defeat. Certainly, the facts show that. Although we lost the better part of our merchant shipping to America and Britain, our entire navy and the destruction of our air force equipment; despite the loss of our colonial empire in Africa and the Pacific, of Alsace-Lorraine and Prussian Poland; despite the fact that the turning over to France and Belgium of thousands of locomotives and railway cars immediately after the armistice left our own transportation system crippled and the thousands of milch cows exacted from us left our own children without milk; despite the deprivation of three-fifths of our mineral resources and the support of nearly half a million foreign soldiers quartered on our soil, and despite two revolutions that meant serious national upheaval, we have paid very nearly one billion dollars in gold on account of reparations up to March 1. Nor must it be forgotten that we have several times offered to make actual reparations in the devastated districts with German labor and German material.

Not Dishonest, He Says

"SURELY these facts are abundant proof that we are far from any dishonest evasion of our fair and just obligations! The truth is that it is not any objection to reparations as such that hurts and discourages us. It is the spirit shown by France that takes the heart of all hope from us. True, Germany exacted an indemnity of 20 milliards in 1871—but most Germans long ago conceded that in that matter Bismarck was guilty of a cruelly severe exaction from a fallen foe. As a matter of fact, we helped France to pay the indemnity by subscribing for nearly one-third of the loan which she so easily raised and out of the proceeds of which—not out of the woolen stockings of her thrifty peasantry as the tradition would have it—the indemnity was actually paid. No; we cannot avoid the conviction that the figure of 132 milliards of gold marks (more than six times the indemnity exacted by Bismarck) now demanded under the peace treaty, and so stubbornly insisted upon by France, has no right relation to the question of just reparations.

"It is insisted upon *because* it is impossible, and France knows that it is impossible, despite the flouting of every economic fact by her statesmen in their speeches. It is insisted upon because it is desired to use it as a pretext for the further crushing of the German people; as pretext for further invasion and annexation, and for the utter draining of German economic vitality."

"That would not do France any good," I suggested. "Surely she must realize that a crushed and impoverished population would be in no position to pay even half the milliards demanded. Was it not the French Lafontaine that pointed out the folly of killing the hen that laid the golden eggs? And was it not one of the wisest of the French kings, Henry IV., that summed up the wisdom of the art of government as seeing to it that every peasant had a fowl in the pot for his Sunday dinner?"

"We are convinced that France wants our milliards not for reparations; but for our destruction," was the reply. "That is the secret of Briand's refusal at Washington even to consider a proposition for any reduction of France's land armament in proportion to the reduction of sea armament agreed to by America, Britain, Italy and Japan. It is the secret of the even more militaristic attitude adopted by his successor in the French premiership.

"The outlook for Germany is a gloomy one. Should we simply throw up the sponge and admit our utter inability to pay the 132 milliards, France will march a million men into our country, seizing the Ruhr Valley and perhaps the entire Rhineland, placing her officials at our custom houses and in charge of all our finances, virtually reducing us to the condition of a subject colony. Should we strive to comply with the impossible demand that we make bricks without straw and labor to the point of exhaustion that France shall have her pound of flesh, we are still doomed to a slavery of the worst sort. You have probably heard some talk of a third alternative. There are hot-heads, both Monarchist and Socialist, who talk of armed resistance to such a French invasion. To those who point out the obvious fact that a war-torn, exhausted and bankrupt Germany would be utterly incapable of offering serious resistance to a strong, well-armed French army still flushed with victory, it is rejoined that however hopeless such a struggle might be materially, fortune favors the brave, and it would be better to go down fighting for the Fatherland than to submit supinely to enslavement.

"The German people do not want war; they are sick of war. They want to go to work; to work hard and steadily and to enjoy the fruits of their labor in peace and in friendly relations with all the world. But it cannot be concealed that Monarchist plotters are making effective use of the arguments I have mentioned. Our one great hope lies in the fact that the working masses are now busily employed at good wages and dead against any avoidable disturbance of that happy state of things.

Two Classes Prosperous

"THEN Germany is enjoying an era of business prosperity?"

"Yes and no. Times are prosperous for two classes: One, the wealthy war profiteers who are taking advantage of our depreciated currency to get the farms and factories into their hands and to obtain a first mortgage on its land and other real wealth, mines and public utilities; the other class is the working people, who are enjoying a fool's paradise without regard for the morrow. For the manufacturer, the jobber, the wholesaler (and often for the retailer), there is little profit in this terrific activity. Profits that should go into extensions and improvements of plant and equipment are ruthlessly absorbed by taxes exacted in the endeavor to pay the reparations bill. What surplus we are able to export must be disposed of at ruinously low prices.

"Our effort to recapture our foreign trade handicapped by the 26 per cent export tax included in the reparations exaction, and by the French, English and Italian import tariffs of from 30 to 80 per cent, which are levied by those countries in order to 'protect' their own home industries. So only the barest shadow of a margin of profit is left to us. For those manufacturers who are dependent on supplies of raw materials from other countries, the depreciated and fluctuating mark is a serious drawback. Realize what it means to pay from 1,200 to 1,400 marks for the pound sterling which normally exchanged for 20 marks; 300 marks for the American dollar that four marks bought before the war. The French franc today commands only about 50 per cent of what it commanded in pounds or dollars before the war; but it buys nearly 35 times as many marks as it did normally. All the expert economists and financiers predict that the continuing inflation of our currency must sooner or later lead to a crash in which the bottom will be knocked from under our whole industrial and commercial system. The big exploiters, like Stinnes and the Jewish bankers, money lenders and speculators, are making big money and find the very inflation and fluctuation of which the economists complain to be very advantageous to their pockets. But the real producers, the manufacturers and the wholesale distributors, are not prospering. They do well to keep their heads above water."

From all this, it will be seen that the average business man in Germany, as in America and in Britain, accepts the delusory reasoning that the evils of an inflated and depreciating currency are due in some way to a departure from the gold basis. They fail to see that all these countries still hold to the gold basis in theory, and that it is the gold basis fiction that really constitutes the disturbing factor.

Woman M. P. Pleads for Canadian Farmers

Country School Teacher First to Sit in Commons' Historic Green Room

By HOLLAND COX

WHEN Canada's fourteenth Parliament convened it brought with it a peculiar condition of things: a good-sized Liberal government, a small Conservative opposition and a larger third party which lies between the other two politically—a solid mass of farmers who call themselves Progressives. There are "also among those present" a Labor party of two; a perfectly good Independent party of one—and he's a party more than 6 feet, 3 inches tall, named Neill, a canny Scot from British Columbia—and, what has carried consternation to the hearts of the Quebec Liberals who insist upon keeping their womenfolk unspotted from the world and upon a pedestal (from which they show violent symptoms of stepping down)—a woman member! She is the first of a throng which these gallant gentlemen fear will soon be ousting them from the prerogatives and constituencies which have been regarded heretofore as belonging peculiarly to the male.

Now, Miss Agnes Macphail, Canada's first woman to sit in the sacred green chamber, was a country school teacher living not so very far from the United States border in a little village called Flesherton, near Owen Sound. The farm where her family lives is so poor that the family could not get along on its products, so Agnes, one of three daughters, taught for about eight years in the public schools of Ontario. She is now only about 30—though I was too polite to ask her exact age, since it isn't done any more in the best circles—and her funny bone must have atrophied when she was teaching the young idea how to shoot, for her sense of humor, as far as I could see, is very little in evidence. To her life is very serious. She has never cared for—and probably has never had much chance to get—the pleasures and dissipations which attract most young girls. Her tastes were always for what she would call the worth-while things of existence. She has a passion for civics and political economy; and if she doesn't end up in the Senate (where the solid old British North America Act, unchangeable as anything British can possibly be, in effect says no woman may desecrate its holy calm) she may become a professor of her pet subjects. The rôle would suit her.

The day Parliament opened, the new M. P. was its most interesting exhibit, vieing even with the recently imported governor-general, Byng of Vimy, and the women were agog with curiosity to see her and pass judgment on her appearance. They got something of a shock, for she is the quietest creature in the House one could imagine. Her taste is for simplicity in clothing, as in everything else, and she has worn all session but two colors that I have seen—a henna silk blouse under navy blue jumper dress, and a sand-colored silk sweater with navy skirt—and this latter was the costume she wore when she met me in the corridor back of the green chamber and invited me to her den. Her room is on the sixth floor of the new building which replaces the old stone Gothic structure destroyed during the war, and differs in no way from the offices of the other members of the Commons. It is plainly furnished with a workmanlike flat-top desk, filing cabinet and reference table, a couch and two or three chairs. A fern and some small potted plants lined the windowsill, and there were a couple of tiny framed watercolors on the wall over her desk. Here she spends most of her time when not in the Commons chamber.

Having been brought up in the country and knowing the problems which beset the farmers of her district, Miss Macphail is intensely interested in that class of worker. Long before she became a candidate she saw the hard lot of the men and women who try to scratch along on their little acreages without the education and comforts which make the existence of a city dweller shine so by contrast. That people should work so hard and get so little seemed unjust, and she began to study the reason why of it all. Her job as their representative came about as a natural sequence of this interest, and her training as a teacher helped to develop the poise and directness which were natural to her.

She uses no feminine wiles—somehow one can hardly visualize her powdering or using rouge; and her directness is more manlike than one usually finds in woman. She has little of the tact and *savoir faire* of the typical politician—and she isn't one, though she calls herself a propagandist, and she is, if giving expression to her views on the farmers' problems in the press and at any gatherings which may be handy constitutes that. Picnics are her specialty—and as June is the month of picnics, she is in great demand. Most of her utterances at these festive affairs have been reported, some probably garbled, for she denies some of the things that have been attributed to her. She is learning that silence is golden—but then, what's a lady to do when she is being urged and coaxed to talk, and it is represented to her that she is losing a great opportunity to help on the Progressive movement if she refuses?

While we were talking the phone rang and I heard her side of the conversation that ensued: "At 8:30? Oh, that's awful! We've been sitting so late for several nights . . . . That would make it 9:30 daylight saving time— well— Oh can't you get along without me?—I am very tired. . . . All right, then, I'll go," she ended resignedly. "Another picnic" was her explanation. "I've been trying to beg off, but it won't work."

She is about 5 feet 6 inches tall, I should judge, with fairly full figure, hazel eyes guarded by horn-rimmed glasses, and wears her brown hair ordinarily in a psyche knot, brushed straight off her forehead. If she had an atom of the vanity which is commonly supposed to lurk in woman's nature, she would study her dress and appearance with an idea of enhancing it. But that isn't her way. She is a bit of a fanatic, this young legislator, her Scotch forbears having probably bequeathed this along with other characteristics which

MISS AGNES MACPHAIL

make for solidity of character and oneness of purpose. She will never in the world make a great statesman—or should it be "stateswoman"?—or even a politician of note. She is too direct, too abrupt, not suave enough. She sees an object before her and, as though she had blinders on, cannot see, or refuses to see anything but the goal ahead. She came from Southeast Grey with an idea that government was taking the best from a collection of viewpoints and that to obtain justice—which is what she calls the farmers' objective—one had but to state the case and presto! behold a new order of things. She has become disillusioned. One can see it plainly now, and to those who have watched her daily in the House it has been a gradual but sure change.

As a speaker Miss Macphail talks plainly and clearly—an example which could be copied with advantage by many of her male co-workers. She addresses the House pretty much as she has been accustomed to address her classes, and it must be admitted that while her words may not go ringing down the ages, she is listened to with respect and interest.

"I have so much to learn!" she exclaimed, "and I seem to be able to learn only by butting my head against a wall continually in my work. I am so anxious to make good, not only for my people in Southeast Grey who elected me, but because I am the first woman here, and though I don't represent the women of Canada in any way—except those in my constituency—I feel sure that anything I may say or do which will not be wise will be used as a horrible example of the effects of equal suffrage."

"But surely that would be unjust," I exclaimed.

"True, but natural, too. As far as the members in the House are concerned, I must say that I have been taken in on a good-fellowship basis and treated as one of them, and have had every courtesy and kindness possible from them all. They make no difference on account of sex. All the same, I'll be glad when there are more women elected," and this she confidently expects will be the case before long.

"What do you think of the job of M. P. for a woman?"

"It's not an enviable one for the man or woman who really tries to do faithful duty. It's slavery at times . . . . And it's not because I'm a woman that I'm here"—harking back to her words of a few moments before—"but in spite of it. When more women get into politics it will make for better political conditions. Not that I believe for one moment that women are going to do anything spectacular; but when they vote they take a deeper interest in the affairs of government, and thinking women will not become inert or parasitic. Women have a place in public life—they are part of the human family and not mere fillers-in any more than men; but they won't be able to make the world a paradise by any means, though they have a tendency toward social reform, and as they do not approve of the double standard of morals they will try to better conditions along that line. As women are so will the race become, and if they fail in their duty, the men of tomorrow will have lower ideals."

"This farmer movement—where is it to lead?" I asked, for there have been a great many people on the anxious seats during the past few months since the agrarians have become a vocal class. The movement is growing, and although at present the Progressive party in the House seems to be headed in the direction of free trade all round, there are some in its ranks who would see that theory applied to every industry but the ones in which they themselves happen to be engaged. The leader, Tom A. Crerar, is a consistent free trader, but some of his followers would like to sneak a little protection in on the side, as it were.

"Where has any other movement led? This one started in the west and is coming east. We are in a transition period. Go back in history and you will find that every movement which upset existing conditions produced chaos for a while, and then settled down into different channels and its success came."

"But I mean—where is it to end? We have grown used to the two-party system. Won't this triangular business end in the Progressives who believe in a tariff no matter how low, going into the ranks of the Conservatives or Liberals; and the free traders in the Liberal cross into the Progressive ranks—and by and by we will have two parties again?"

"I don't care which side they go to, or how many parties there are: what does the name of a party matter? We are out to get our ideals realized."

"And they are?—"

"Well, personally, I stand on a straight U. F. O. (United Farmers of Ontario) platform. We believe that farming is the great basic industry of the Dominion. It supplies 50 per cent of our export trade. Fishing, farming, lumbering and mining—these are the great industries. They must prosper if the country is to prosper."

"Granted."

"We would change from indirect to direct taxation, and make an immediate and substantial all-round reduction in the customs tariff by increasing British preference to one-half of the general tariff. Then, too, we would impose a direct tax on land values; have a graduated income tax on the profits of corporations; and give full publicity to all campaign fund contributions, how raised and how spent. But these are only some of our planks."

"What about reciprocity?"

"In 1911 we had a golden opportunity to embrace reciprocity with the United States. The moneyed interests killed it with propaganda. I don't know whether we'll have such an opportunity again; but it would be the best possible thing for both countries."

"And the St. Lawrence Ship Canal?"

"Well, you know our party is out for reductions all round in expenditures. It might be a very good thing—I don't know. I haven't studied the question enough to say: but I do know that we are staggering along at present under a terrible burden of debt because of our overbuilt transportation systems. Why add to an already intolerable taxation? It will have to stand in abeyance; it is not practicable at present. What farmer would be so unwise as to mortgage his place to put up another barn when he still had more barn room than he could possibly use? Foolishness."

"I will say this for the Conservatives," she said. "They are wrong of course in desiring high protection, but they are consistent. I can't say that much for the government: it is all split up."

"Our good old neighbor next door is the most highly protected country in the world and is building a spiked railing along the top of the tariff wall right this minute," I commented. "And the farmers have asked for protection as well as the rest of the folks there."

"And it will be the destruction of them," she answered gravely. "For protection produces a false inflation of values. The farmers will suffer more than any in the end. They produce more than enough for home consumption and when they go out of the United States they must compete in the markets of the world. It is all wrong."

"It is difficult to speak before the Commons," she went on, "but it is different when I go to talk to the farmers. We understand each other, the farmers and I; I talk their language, and understand their needs. I always feel nervous about addressing them, but when I look into their poor, patient faces and their tired eyes where so many hopes seem to lie buried—I forget to be nervous and say the things they ought to hear."

It was the one touch of imagination which she had voiced during the interview—the farmers and the dead hopes she could see in their tired eyes.

A Twitch of Cy Young's Elbow—and Ty Stole

Tales of Baseball Finesse in the Days of the Stolen Base; Tobin's Traitorous Right Foot and Walsh's Unseen Balk

By H. G. SALSINGER

THERE is no doubt but that much of the finesse of ball playing, as it is done in the two major leagues, has been lost in the last two years, or temporarily abandoned.

Various causes are suggested for the loss of some of the fine points of play. Some blame it on a livelier ball, others on the lack of good pitching; some say it is because of the home run craze that seems to have swept the big circuits.

In the last two years all the rage has been long-distance hitting. In 1920 a swarthy giant named George Herman Ruth and known to the profession and its followers by the odd name of Babe or The Bambino, began to monopolize attention of the baseball public by his home run hitting. Ruth, in less than a year of terrific slugging, established himself as the super-swatter of all baseball history. His salary became the largest paid to any man that ever played the game and his name a household word.

With the stupendous success that Ruth achieved and its development in the season that followed, home run hitting became all the rage in baseball. Co-incident with Ruth's record-smashing performances last year, there appeared in the major leagues a baseball that was much livelier than any that had been used regularly before. Batsmen who formerly were happy enough to hit .250 suddenly began batting for averages above .300 and home runs became ordinary.

Home Runs Now Feature Game

WITH the home run craze sweeping both major loops, base stealing, one of the spectacular features of the attack, became comparatively a lost art. In place of base stealing the hit and run play was substituted.

A noticeable feature of the batting averages today is that the home run total of most clubs is larger than the total of stolen bases. This means that more home runs are being hit than there are bases stolen. Most of the bases that are stolen this year are not stolen intentionally but come as the result of failure of the hit and run play to go through. The batter signals the runner that he intends to hit the next pitched ball. As the pitcher releases the ball the runner is on his way. The batsman misses the ball and the runner reaches the base safely. He is credited with a stolen base but he had no intention of stealing. It was the failure of the batsman to hit the ball that made the stolen base possible.

Ball teams concluded early last season that there was more advantage in hitting and running than in stealing. A glance at the batting averages is convincing. Five times as many .300 hitters as formerly top off the batting lists published weekly in the newspapers. Where there were usually from 10 to 14 in this list it grew to a number that exceeded the total of players carried by any two major league teams. More than one-fourth the players in each major league batted .300 or better.

The hit and run play, once much of a risk and demanding clever batsmen and base-runners to make it succeed, no longer carried the extreme chance. Since so many batsmen were able to hit through and since pitching had unquestionably vastly deteriorated, the attack changed by rapid choice. Teams refused to steal and preferred to hit and run.

Figured on a mathematical basis the hit and run was the preferable play. For instance, with runners on first and third, two out and a weak batter up: This was the situation for the double steal under the system of a few years ago. With the hit column swelling so rapidly it became apparent soon that the double steal was more or less baseball nonsense so the hit and run play was substituted. It was far easier for the batsman to hit safely than for the runner to steal.

Signals of the Infield

SINCE so many hits are made and since any man in the line-up is liable to hit the ball safely, runners no longer tried to steal. It was far safer policy to wait for the hit. Day after day the wisdom of this policy received fresh evidence. Consider one game last July: Philadelphia was opposing St. Louis in the National League. Jimmy Ring was pitching for Philadelphia. Jimmy Ring was the poorest batsman in the league. He had an average of less than .050. This game was a pitching duel with the score tied at two. Late in the game Ring, who had made but one hit previously during the season, drove the ball out of the playing area for a home run, incidentally for the winning run of the game. Many similar incidents have occurred within the last two years.

But baseball retains its signals. The substitution of the hit and run has not destroyed inside play. The steal was a matter of individual undertaking but the hit and run concerns at least two, batsman and baserunner. On the steal the runner "plays" the pitcher, while on the hit and run the batter, second baseman and shortstop, as well as the pitcher, must be considered.

Success of the play depends on discovering whether the shortstop or second baseman will cover second base and ability to hit through the opening the infielder leaves when he starts for the bag. That knowledge must be had by the batsman. The runner must discover when the pitcher is liable to throw the ball to the base he is occupying and when the pitcher will throw to the plate.

Second baseman and shortstop do not both cover second; only one goes to the bag, the other remains in position. But, which one covers? With a runner on first, the shortstop or second baseman will invariably take two or three steps in the direction of second. The fielder that moves is the fielder that will cover. Clever second-base combinations, like Tinker and Evers of the Cubs' machine of bygone days, or Collins and Baker of Connie Mack's world champions, circumvented this by both stepping closer to the bag, thus making it impossible to tell who intended covering. This necessitated a risk by the offense. The runner would make a false start for second and, as he did, either second baseman or shortstop would move toward the bag. At times it would be merely a jerk of the shoulder, or the knee, but it was enough to inform the batsman where to place the ball.

With a "dead" left or right field hitter up the thing becomes less complicated. There is quite a number of ball players, and good batsmen, too, who hit almost exclusively to one field, either to left or right, and rarely in any other direction. Against a "left field hitter" the shortstop naturally does not cover second but, instead, moves closer to third. The second baseman moves nearer to second and gets into better position to take a throw from the catcher. Also, in better position for a double play or to field the ball himself. Against a "right field hitter" the shortstop moves nearer to second and the second baseman shifts toward first. However, left or right field hitters are rarely successful in hitting and running.

The infielders are watched carefully by clever batsmen even when bases are empty. The infielders frequently tell the batsman what kind of ball the pitcher intends to deliver. Second basemen and shortstops move in certain directions on curve balls, slow balls, fast balls. Many times the men around second base tell the batsman whether the ball is to be outside or inside, by their movements. When the catcher gives the signal the shortstop, if he is capable, will be nearer second base to discover what the catcher is signalling for. He will shift accordingly. His position in the field, and the position of all infielders for that matter, should depend upon the batsman and the kind of ball about to be delivered.

For instance, Dave Bancroft, of the New York Nationals, goes a few steps nearer second base when Art Nehf is pitching a curve ball to a left-handed batsman and goes in the opposite direction, a few steps nearer third base, when Nehf is pitching a fast ball to a left-handed batter. A number of batsmen this year outguessed Nehf by watching Bancroft's movements.

On Discovering Ruth's "Weakness"

KNOWLEDGE of systems of play also can guide a batsman. John J. McGraw, undoubtedly the greatest manager in the game today, plays a system. The New York Nationals, under McGraw, use a systematic defense as well as a systematic attack. This season McGraw's pitchers have been under instructions to use curve balls on batsmen whenever the team opposing New York has men in scoring positions and so, with a runner on second, or on third, or with both bases occupied, the man at bat can expect the New York pitcher to curve the ball. The reason for this system is simple enough as a curve ball is much more difficult to hit than a fast or slow ball.

While the batsmen study the pitchers and infielders, they in turn study the batsmen. There are some batsmen who always take the first one, in other words, never offer at the first ball the pitcher serves them. Many others prefer not to offer at the first one and rarely do. Others there are who like to hit at the first ball. The likes and dislikes of the batsmen soon become known to the pitchers and fielders. Those that do not care about offering at the first ball are quite certain to hear the first strike called many times while the comparatively few that go after the first pitched ball will rarely find a good ball coming to the plate on the first serve.

Pitchers, by studying the batsmen, can quite often tell when the batter is set to hit. He knows by the batsman's attitude, by the position at the plate and by the manner in which he holds the bat, that he has his mind fully made up to hit at the next pitched ball and the pitcher immediately tries to throw a ball that the batsman cannot hit.

With an average hitter a pitcher, wise in the ways of batsmen, soon discovers what kind of ball the batsman does not like. Few, indeed, have been the players in the history of organized baseball that did not have some weakness at bat. There is the old story of the two pitchers exchanging secrets and one telling the other that he had discovered the batting weakness of Napoleon Lajoie and the other eagerly asking for the information and the first pitcher replying, "A base on balls." A good story, as baseball stories go, but even Lajoie, whom many still regard as the greatest natural hitter the game ever produced, could tell you of one certain delivery that he preferred not to see when at bat.

Since Babe Ruth started on his meteoric home run hitting career, many claimed that they discovered his weakness at bat. The majority of guesses were a slow curve ball, inside and above the knee, which means that the ball curved just above Ruth's knees and over the inside corner of the plate. This conclusion later found some evidence when Pruett, a recruit from a Missouri university, pitching for the St. Louis Americans, held Ruth hitless the first 10 times he batted against him and struck out Ruth seven times in those 10 opportunities. Pruett used a slow curve, a fade-away, delivered just above Ruth's knees and winding over the inside corner of the plate. *But, there never was a man who went to bat, who liked to hit a slow curve ball at that spot.*

Certain batsmen have some peculiar movement which gives away their intentions. There is Johnny Tobin, right fielder for the St. Louis Americans and leading off the batting order. Tobin is probably the most expert batsman the American League has produced when it comes to bunting or "dragging" the ball. The public does not recognize the "drag," classing it with the bunt, but there is a difference between the two. When a batsman bunts he has both feet firmly on the ground. The bunt is generally used to sacrifice a base runner. The "drag" is intended to produce an infield single. When a batsman drags the ball he meets it while in motion, meeting the ball as he breaks from the plate. He holds the bat stiff and directs the ball on a line, or as near as he can to a line, between the pitcher's box and first base, shoving the ball past the pitcher and forcing the second baseman to come in so far that it will be impossible for him to make a play at first base.

Tobin's Telltale Foot

NOW, Tobin's ability either to bunt or drag is uncanny. By using these two methods at bat he should be able to hit .300 without ever driving a ball to a safe or unoccupied spot in the outfield. He is one of the fastest men in the majors getting down to first and few men ever broke away from the plate as fast as Tobin. But, he is thrown out many times each year because of a movement that gives away his intentions. Every time Tobin is set to bunt or plans to drag the ball, he raises his right foot. Pitcher, second, first and third basemen, watch Tobin's right foot and every time it comes up they come in toward the plate with the pitch. Had Tobin cured himself of this defect he would give anyone a hard fight for the batting championship of the American League. As it is, with the defect, he still manages to be among the leaders at bat. In 1921, Tobin set a new American League record by hitting 179 singles. Had he kept his right foot on the ground he would have made more than 200 singles. He batted .352 and the difference between that figure and a possible .400 average was a right foot in the air.

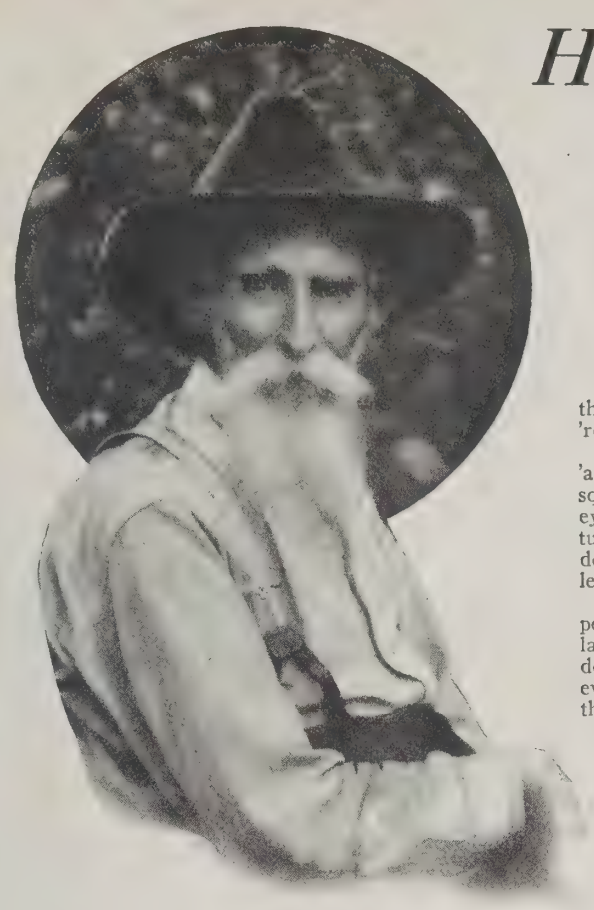
Some pitchers master batsmen by pitching to their strength, or, "shoving the ball into their grooves." Pitching into a batter's groove is pitching the kind of ball that he likes best and placing it where it is easiest for him to hit it. Some batters prefer to hit a high ball, others like them low and on the outside, others waist-high and outside and quite a few prefer to have the ball pitched inside. These imaginary lanes are the so-called grooves.

Harry Heilmann, champion batsman of the American League and one of the hardest hitters that ever stepped to a plate in either major league, made few hits in Washington although the pitchers constantly pitched into his groove. Washington has the largest playing field in the league. It is a long way from the home plate to the left and center field fences. With Heilmann at bat the outfielders would move 40 feet or so farther back, the pitcher would give Heilmann the kind of ball he likes best in the spot where he finds them easiest and Heilmann would "hit it a mile," high and far, and when the ball descended an outfielder would be waiting under it.

Base Distances Never Changed

BEFORE base stealing became a neglected art, the leading base stealers established their records because of their ability to analyze the style and system of the pitcher rather than because of their superior speed. The chap who decided that 90 feet was the proper distance between bases reached a decision that no baseball court has ever seen fit to change. Baseball has made many remarkable changes but with the advancement in play, with the change in style of attack and defense, with the scientific discoveries in batting, pitching and fielding, there has been nothing added to the game that created either desire or necessity to change the distance between bases and the home plate. This span of 90 feet has probably had more to do with the success of baseball than any other feature. The pitching distance has been changed and catchers, as well as pitchers and fielders, play their positions differently than pitchers and catchers and fielders used to. Batting has changed, the rules have been changed but 90 feet has continued to be the distance between bases and the home plate and undoubtedly always will be.

Ninety feet is the solution to the problem of play and to arrive at this decision, pitching, batting and throwing ability had to be considered. Much science was involved and the fact that it has remained 90 feet through more than 50 years of unchecked activity elevates the inventor to the list of leading scientists.



It is impossible for any runner, touching first base, to run from first to second, starting with the departure of the ball from the pitcher's hand and reach that bag before the catcher, receiving the ball, can get it into

(Concluded on page 12)

Human Facts vs. Human Fiction in Mountain-Land

Stories of Unknown America Ofttimes Distorted

By HARRY E. BARNET

He lives in Unknown and Unspoiled America.

YOU change your mind about southern mountaineers when you explore Unknown America—the country that centers hundreds of square miles of barbaric beauty near the headwaters of New River, in North-Central Tennessee. Much fancy has been set afloat about this part of the United States, and its people. Consequently, the wrong notion passes on the outside as the truth about them.

Mountaineers know this, especially Jim Allread. He is a lawyer, whose strongest hold on success is mixing homely stories with a stinger in them among his arguments to juries—it's his best method for reaching men to whom reading is a mystery. And, Jim carries his jury manner into his everyday life, so that sometimes his talk is a string of tales, holding a world of the mountaineer philosophy of life.

"My pappy, he war a fox hunter, he war, an' a likely nuf man, too, he war," Jim drawled one morning. "But fox hunters I've knowed down hyar, they don't seem t' 'cumulate nothin' much, 'ceptin' hit is dawgs an' bratzes—young'uns, y' know.

"Pappy, he had a pow'r uv dawgs. 'Mongst 'em, ole Big Red. An' I had a leetle ole fice dawg, I called Trip. One evenin', which hit war a-lackin' 'bout two hours uv sundown, me an' Trip, we tuk out over that 'ar ole ridge thar, a-squirr'l huntin'. In a leetle while, ole Big Red, he come a-runnin'. Now, that 'ar ole dawg, he war never knowed t' run nothin', 'ceptin' hit war t' skeer hit back int' hits hole, an' me an' Trip, we tried t' make him go home. But ole Big Red, he tuk in a circle, an' he went 'round, an' int' th' woods.

"So, me an' Trip, we war discouraged, a-thinkin' ole Big Red, he'd run all th' squirr'ls int' the'r holes, so we tuk out after a rabbit. 'Bout that 'ar time, ole Big Red, he opened up. He war 'way up on top uv that 'ar ole ridge 'cross th' holler thar, an' he war a-bellerin', 'twoo-oo-oo coons; two coo-oo-oons, soft an' slowlike, y' know. When Trip, he heerd hit, he wanted t' go, an' I didn't want him to, fer I thought that 'ar ole Big Red, dawg, he war a-lyin'.

"But Trip, he got away, an' up that 'ar ole ridge he went, a-never a-sayin' a word.

"Trip, he gits thar, an' he opens up, a-yelpin', hits a fac', hit's a fac', sharp an' fastlike, y' know. Well, I hain't never knowed that 'ar leetle ole fice dawg t' lie, so I started up. All th' time, Trip he war a-yelpin' 'bout hit a-bein' a fac', an' I most knowed hit war so. An' when I got clost nuf t' see 'em, thar war ole Big Red, a-standin' at th' foot uv a big ole hick'ry nut tree, a-bellerin', an' Trip, a-sittin' on his hams, a-yelpin'. When they seed me a-comin', them 'ar ole dawgs, they c'menced a-prancin' 'round that 'ar ole tree like they war bewitched."

"I got thar," Jim said disgustedly, "an' that 'ar ole Big Red dawg, he'd treed two leetle cat squirr'ls. But I shot 'em, right through the'r eyes. An' when Trip, he seed 'em fall, he tucked his tail atwixt his laigs, an' he made off down that 'ar ridge fer home. He never follered ole Big Red no more.

"But hain't that th' way, now, 'ith a lot uv people? Because somebody says somethin' outlandish 'bout th' people down hyar, they'll set down, an' say hit's a fac' fer all uv 'em, 'thout ever a-knowin' no more 'bout hit, er a-usin' th'r own jedgment 'bout hit. An' they don't seem t' learn nothin' more 'bout hit, like Trip he learnt hit, fer they keep hit up all the'r lives."

The complaint is general, and it is very old. The average mountaineer puts the gist of Jim's story in a sentence: "We bin missionaried t' death." The meaning is that the bulk of hill country literature is lurid, and that for years Unknown America has been overrun by a type of religious exploiter, and "reformed" this and that. They make an easy living—mountaineers are intensely religious. An immense amount of unhealthy excitement has been stirred up by these exploiters, who use it to get away with a lot of rascality. Two of them, as an example, were holding meetings in an isolated region. One exploiter disappeared, and was gone for a week. He returned about sundown.

"Brother Highflyer is exhausted," was the announcement by his smiling co-worker that night. "He has been to a far-distant city for a week, wrestling with the devil, who tried to stop him from carrying the word of the Lord to you in these mountains. But the Lord was with our brother, and he won after a terrible battle. Tomorrow, by the Lord's mercy, he will be refreshed, and will preach a red-hot sermon against tobacco and whisky.

"Just to show you how hard he fought," were the last words, "Brother Highflyer will step on the platform, but he will not talk."

The brother had a hard time crawling onto the platform, and lurched his way to the center of it. He stood there with a maudlin smile on his face. His hair was in a fumble; his eyes were bloodshot; cigaret stains yellowed the first and second fingers of his right hand, his clothing had the look of something badly worried by playful dogs. The brother did not talk, because he was too drunk. But he made a favorable impression on a good many of his audience. Religion is reality with the rind on in Unknown America. From afar the brother was pitied and heroed, "fer hit's plain nuf, hit is, that he war a-wras'lin', shore nuf, fer pore souls 'ith that 'ar ole devil."

The fact was that collections at this series of meetings were better than expected. Brother Highflyer took them to Knoxville, and went on a debauch. And, these are not rare and extreme incidents. "Missionaries" of the type are scampish. In the mountains they heartlessly take the last penny of scanty and hard-earned money their smooth tongues can decoy into the collection pans. When they come out of the mountains after a "campaign," they tell audiences wild tales about the hundreds of thousands of people there, who are on a level with savages. Once again they're believed and heroed. This time by people who do not stop to think twice about the matter, but admire the courage of men who take chances among such people. Moreover, they meet occasionally to compare notes about the easiness of plucking this mountain community and that, and lay out campaigns and routes that will not conflict.

In no way is this element to be confused with constructive missionaries. They establish churches and schools and settlements, where the crafts are taught—they are religious and practical missionaries, badly needed, asked for, and welcomed in that country. When they state conditions they do it honestly, and sympathetically—a few of them are overcome by their zeal, but they are not self-seekers.

Of course, if it's your first visit in the mountains, you're likely to think for a while that the wrong notion is the correct one. For the most part, the mountaineers are descendants of Dutch and Spanish and English, Irish and Scotch settlers, who brought into Unknown America the customs and folklores of their home countries. The latter and the bloods are mixed. They flower a type of people, with a philosophy of life, and ways of living strange to outsiders. Add to this decades of isolation, and you have a high percentage of peculiar human outcrops.

To illustrate: on a high and narrow ridge, overlooking the Big South Fork of the Cumberland River, is an ark. In it an illiterate old man and woman await the coming of a second universal flood. For years they lived in a cave, near the river. From the destructive type of missionary—whose vocabularies takes in the majority of the terrifying words in the language—the old couple heard a distorted story about Noah, and they mixed it with a mountain Indian legend, of the creation, which states that the earth is held above an expanse of water by slender cords.

"An' hit hain't a-goin' t' be long afore this hyar ole worl', hit's a-goin' t' slide under that 'ar water, hit is, an' ther' hain't a-goin' t' be no more worl', ther' hain't," they announced one day. "Fer hain't them 'ar ole cords, they're a-slippin', they are, fer hain't that 'ar river, hit a-risin'? We hain't a-goin' t' be ketched in no ole cave, we hain't."

They built the ark. It is a log cabin. The cracks are chinked with mud. Each end rests on a squared log, "so hit'll float easy, when them waters, they come." Planks, cut with an adz from logs, are the floor. Between the planks are wide cracks. The roof is of clapboards. In one end is a monstrous fireplace. A lean-to is the summer kitchen. It rests lightly against the side of the cabin, where it will not interfere with the departure of the ark when the waters creep up.

Heroism and individuality are mountaineer characteristics. Their spirit leads to queer doings. A bulldog in a Tennessee settlement was a terror to the whole community. A young mountaineer was passing a yard when the dog, with a tremendous bark, came bouncing out at him.

"Pa" Brown at his well.

On a Saturday afternoon, in a hitching yard of a mountain settlement.

What "Ship Subsidy" Means

Proposed to Pour Out Hundreds of Millions More

By RUFUS HARDY
CONGRESSMAN FROM TEXAS

WITHIN the last five years the government has spent, all told, nearly four billions of dollars—taxpayers' dollars—on our merchant marine. Three billions went for the construction of ships primarily for war need and almost another billion has gone for losses and overhead and other expenses connected with the ships. It is the most gigantic *subsidy* ever given, exceeding all other subsidies by all other governments and our own for all history.

Yet we haven't secured a well-established merchant marine. We have ships, about 2,000 of them, and good ships, most of them tied up at anchor. About one-third of our tonnage is being operated at considerable loss to the government, the loss being *another subsidy* which according to the Shipping Board at present amounts to about $50,000,000 a year.

We are told that we can get a securely established merchant marine only by providing more subsidies and subsidies that will be guaranteed by contracts for a long period of years.

The plan is embodied in the Ship Subsidy Bill now pending in Congress. It is known as the Lasker Bill because its chief promoter is the Chicago advertising man who is chairman of the United States Shipping Board.

Under the Lasker plan, the Shipping Board would be authorized to sell, on terms almost equivalent to gift, the fleet of nearly 2,000 vessels now in the possession of the government. It can sell to American citizens only and to any it may choose. Of course, the vessels never will be worth their war-time cost of construction but in time they will be worth much more than they would bring now, especially if their sale is limited to selected Americans only. It is reasonable to conjecture that in time they will be salable for $600,000,000 instead of the $200,000,000 that is expected to be received for them under the Lasker plan. *There is no restriction on resale,* except that they will be transferable only to American citizens.

The greatly reduced prices that will be received for them *will not be cash down nor when received will it go into the Treasury.* The Shipping Board is authorized to sell the vessels on terms of annual payments of installments spread over *a period of from 10 to 15 years, or the approximate life periods of the ships. Deferred payments*—and all payments may be deferred—may bear only four per cent interest and *need be no more*—and not necessarily that much—*than the depreciation of the vessels.* Thus the ships may be disposed of on the basis of rental at four per cent on a valuation far below their actual worth. At any time they may be sold at a profit by original purchasers, who may not have to venture a dollar of their own money.

What is collected, along with some other revenues, will go into a revolving fund of $125,000,000, which may be increased, to be loaned at two per cent interest, for ship construction. This will involve a loss, *in the form of interest alone,* of at least $3,250,000, in case the fund is kept loaned.

Those who purchase vessels from the government *may escape income taxes* by putting profits from operation into new construction. If operation is successful this means an indirect aid amounting to possibly $25,000,000 a year. They also are *relieved of all income taxes* on profits from resales of ships built prior to 1914, which includes all the ships we took over from Germany. They also are *allowed special deductions* from income for exceptional decreases in value since the date of purchase. This permits owners who bought at war prices to deduct the difference between that and post-war prices from their net income, although through the exorbitant freight rates of several years ago the ships may have paid for themselves and more.

Some Figures That Amaze

THE ships are to be sold on terms that amount to giving them away and, under the Lasker plan, are to be operated on terms that amount to paying favored operators to take the ships off the government's hands.

The plan of proposed operation involves paying out the largest direct and indirect subsidies ever given a merchant marine by any country.

The most important indirect subsidy is tantamount to a discrimination in the matter of tariff duties, except that it is worse than the discrimination that once prevailed and, but for treaty obstacles, would now prevail. It permits importers and exporters to *deduct from their income taxes* five per cent of all money paid in freight to American ships. Estimating those freight payments at $750,000,000 a year, which by all available data is a conservative estimate for normal times, the drawback will amount to not less than $18,750,000 if as much as 50 per cent of our exports and imports are carried in our own bottoms. Railroads are permitted also to *grant preferential rates* to freight handled by our ships as against foreign ships. Both provisos inevitably will bring about retaliatory measures by other governments and merely lead to unnecessary burdens being put upon our foreign commerce.

The direct subsidy consists chiefly of 10 per cent of all tariff duties collected on imports, which will amount to at least $35,000,000 a year in normal times. Other revenues will be added. The subsidy allowed a vessel will be governed, basically, by tonnage, distance and speed. The highest payments will go to the largest and fastest boats. Under the rate set forth in the bill, the *Leviathan,* for example, may receive a subsidy of more than $1,000,000 a year. On the basis of one-half of our foreign commerce being handled in vessels of American registry *the direct subsidy will total, in normal times, not less than $50,000,000 a year. But the Shipping Board would have power to double the subsidy* in any or all cases, or to reduce or withhold it in any case.

It provides for turning over the army and navy shipping, now handled chiefly by government transports, to the private shipping companies, and requires all government officials when traveling via the ocean to use American ships.

All told, the direct and indirect subsidies, outside of all benefits derived from the terms of sale, will amount to not less than $110,000,000 a year. The sales terms will involve a loss to the public of at least $400,000,000. Thus the 10-year program contemplated by the bill will cost the taxpayers not less than $1,500,000,000 by way of direct or indirect assessments.

While contracts between the government and the ship owners are to be for periods of 10 years, many of those contracts will not be entered into until several years after the act, if passed, becomes effective. This means that the government will be bound to a subsidy program that will run over a period of from 12 to 15 years.

The cost, however, is not the most objectionable feature of the Lasker plan for ship subsidy. A worse feature is the tremendous power it places in the Shipping Board. The bill makes it possible to favor anyone or any group. No one will be able to operate ships under American registry without permission of the Shipping Board. *It may force shipping into one port to that port's great profit, or, by withholding shipping, crush another port.*

The government reserves no authority to pass on or limit rates. The preference allowed in the matter of land rates gives the transcontinental railroad lines power to develop their own ship lines at the cost of other lines and to exercise a most dangerous control over the movements of large exports, such as cotton and grain products, which are dependent on those lines for transportation to ports.

Subsidy a False Move

THE bill will encourage a tendency long under way to put all ocean transportation under the sway of a gigantic combine. Already, before the war, ocean freight rates were fixed in great measure through understandings between the big shipping companies of all countries. It was stated at the hearings on the Lasker Bill that there have been several movements in the direction of a big banking combine to take over the Shipping Board ships, as a whole. Of course, they would distribute them, and control their operations. The Lasker Bill tends to encourage the formation of big syndicates with that end in view. In that direction it even goes so far as to provide subsidies for those ship lines operated solely or chiefly for handling the business of their owners, such as those of the Standard Oil Company, the United States and Bethlehem Steel companies and the United Fruit Company.

It will not lead to the development of a safe and secure merchant marine.

If the history of the subject proves anything, it is that the subsidy route, even at its best, is a false route toward such an achievement. This is proved nowhere better than in the historical summary prepared for the Shipping Board by Professor Broshaw of Yale and made public by Chairman Lasker himself.

The only countries that have earnestly tried to breathe life into the corpses of their merchant marines by any general subsidies are France and Italy and they have utterly and completely failed.

Our own experience with ship subsidies of various kinds have been very much the same. We made our greatest advance and reached our highest point of supremacy in ocean shipping during the period—roughly from 1815 to 1845—when the oceans were the freest they have ever been and when virtually no favors were given our own shipping. The same is true of the British merchant marine which for long has dominated world shipping. While, since 1845, the British have granted subventions, chiefly in the form of high pay for carrying the mails and construction loans at low interest for ships desirable for other than purely commercial use, "all writers seem to agree that the growth of the British merchant marine is in no sense due to the small subsidy paid." The words quoted are from Professor Broshaw's study as published by the Shipping Board.

The trouble with American shipping lies elsewhere than in costs.

The chief difficulty is due to the fact that, while affecting to pamper, we have unduly restricted our ship owners. We haven't allowed them to buy ships abroad for American registry. The result was that at the beginning of the World War *Americans probably owned more shipping in the over-sea trade that was under foreign than under American registry.* We killed our shipbuilding by putting what amounted to a prohibitory tariff on iron and steel products needed in construction. This burden was removed in 1914 but it is to be restored by the new tariff bill. We make an invincible American monopoly of our coastal shipping and propose under the Lasker plan to extend it to include the Philippines—against the unanimous opposition of the Filipino people.

All that Americans need to put and hold the United States in its rightful place is a free and unhampered field of operation.

A Twitch of Cy Young's Elbow —and Ty Stole

Concluded from page 10

the hands of the fielder covering second base. Not unless the ball is fumbled by the catcher or the fielder at second. Even then, a fast man leaving first base, would have difficulty reaching second, unless the ball rolled out of reach of either defensive player after being fumbled. In order to go from one base to another the base runner must have a lead, must break fast, run fast and slide well. And he must do more than that; he must watch the pitcher and discover when he is liable to throw to the plate and when he is liable to throw to the bag. If the runner takes too long a lead the pitcher's throw will enable the fielder to tag him out and if his lead is not long enough he will be tagged out at the next base for he loses a few steps needed to beat the throw.

This does not hold so firm when the hit and run play is about to be executed, for, with the hit and run signal given, the runner's immediate object is to break fast. He also needs a good lead. No play will be made for him at second unless the batter missed the ball or the pitcher happens purposely to pitch wide of the plate, what players refer to as "pitch out." Pitchers often pitch wide of the plate purposely to give the catcher an opportunity to throw out the base-runner, preventing the batsman from hitting the ball.

The runner must watch the pitcher. Every pitcher is taught a move to first, or develops one. Some pitchers are more expert at this than others. Some have achieved fame because of their ability to catch runners off base. Many pitchers have a certain movement of the head, knee, elbow or shoulder by which a base-runner can tell when the pitcher intends throwing the ball to first.

Tyrus Raymond Cobb is the greatest base-runner of the modern game. Cobb holds the base-stealing record. When Cobb was establishing his record Denton (Cy) Young was still a great pitcher. Base runners found a terror in Young. He was a finished pitcher and he had a good move to first. He threw out many runners, off first and second. If he did not throw them out he came so close to doing it that the runners did not dare take a lead long enough to make it possible to steal. Cobb suddenly began stealing bases on Young but other players did not. They attributed Cobb's success to his superior speed but it was not a matter of speed but one of elbows, for Cobb had discovered something about Young's elbows. Young had a characteristic pose in the box. He stood with one foot well extended and his body back. While Young was planning to throw to a base the elbows would be held off a few inches but when Young was decided to pitch the ball to the batsman he would pull the elbows in and start winding up. Young never threw the ball to a base to catch a runner after his elbows touched his chest. Cobb alone had discovered this. Young probably was never aware of it himself but Cobb stole bases on Young by watching the position of the elbows and continued stealing them until Young quit the major leagues. Any time the elbows touched the chest Cobb started his sprint.

How "Big Ed." Nipped Runners

WHEN big Ed. Walsh was the king of spit ball pitchers, he was famous for his ability to nip base-runners. Walsh had a fast throw, following a quick turn. He always caused a great deal of argument by his throwing to bases as opposing teams claimed he made a balk nearly every time he threw to catch a runner. But Walsh got away with it.

With a runner on first the umpire naturally moves behind the pitcher to be in position to watch the play at second or third. Walsh took advantage of the position of the umpire. With the judge of play behind him Walsh, after probably a few efforts to get the runners off first, would jerk his shoulder toward the plate. The umpire, standing a safe distance behind Walsh, would not see this move because of the relative positions of Walsh and himself but the move was distinct to the runner on first, who was watching Walsh from an angle. It was a conscious move and Walsh had developed it for the benefit of the runner. The runner apparently concluded that Walsh was starting his delivery, exactly what Walsh wanted him to think. Seeing this move the runner broke for second, the thing that Walsh wanted him to do. Immediately Walsh whirled and threw to the first baseman. The runner was either tagged out trying to slide back into first, or he was caught between bases.

When Cicotte was the leading pitcher of the American League, he caused runners to break by leaning toward the plate. Cicotte, like Walsh, took advantage of the position of the umpire. The leaning was not apparent to the umpire but plain to the runner. It was evidently the start of Cicotte's windup and the runner was off. So was Cicotte, but not toward the plate; his attention was turned to the base runner.

Some pitchers are in the habit of lobbing the ball to first base or throwing it with moderate speed. They do this two or three times. The runner, beating the throw easily each time, becomes more daring and increases his lead. Then comes a fast, snap throw from the pitcher and he is caught. Certain pitchers will throw only a certain number of times to a base, two or three times and never more, before delivering the ball to the plate. Each has a certain peculiarity.

Clever catchers are the most important cog of a team's defense. Good catchers often outguess the batsman and base runner on hit and run plays.

Baseball is a game of batting, fielding and base-running, a game of pitching, and in all of these things the movements of the head, arms, shoulders, fingers, legs and feet play a most important part.

French Girl's Frank Opinion of America

Concluded from page 3

In America they perform many functions besides. I once asked a future junior about the subjects he was going to take. He answered very seriously, "I am going to play football." Another had already registered to be a waiter. It is very fine indeed to like athletics and to worship labor, but there are certainly so many places more appropriate than colleges to play football or wait on table. Why cheat study hours?

To an American student, French colleges must look like "cramming houses," although French students take a great deal of enjoyment from this "cramming system." To a French student, American colleges look like personified calendars of social functions, a place to form friendships and get some kind of a "shine" before commencing real life. Should the college years be the apprenticeship for the years to follow, it is perhaps wiser to enjoy them, leading community life, than to spend them with books as companions in a somewhat secluded manner. When Time has blotted overloaded brains, the teaspoonful of general knowledge which is left seems not to be worth the work required at the starting.

If the American has liberty in the choice of his studies he does not have it in the choice of his reading. Everything which is believed could "hurt him" is carefully "pruned" from the library. Hence he is obliged to furnish his mind not with his own selections but with somebody's who may have opposite likings. I am aware that all books are not good to read, but many among those universally recognized as good are taboo for the American student.

This is true outside colleges. Americans don't read enough and the atom they are permitted to read lacks variety in opinions. A book need not emit too much of a radical vapor to be ostracized as "Bolshevik." The result is docility of mind, fear of struggling with ideas which scarcely leads the American people outside the Republico-Democratic duality, while in Europe ideas and ideals spring forth every day with new parties or the splitting of ancient ones. The accepted lectures, somewhat strained, don't raise too much controversy; part of the audience is there by snobbery, and does not desire a too strenuous discussion afterward. The chosen speaker—by the mere fact that he has been chosen—is supposed to be good, so his ideas are readily accepted.

Once I tried to bring up at dinner the subject of a lecture we had attended in the morning, and after some "positively wonderful," "wasn't he a peach!" "his voice did not carry far enough," someone said: "For heaven's sake, time is up for the lecture. What are you raving about? Let's eat!" Which we did without further comment.

When I stepped from the Pullman from New York, the first person I saw was a girl. There was nothing particular about her but the fact that it was 8 o'clock in the morning and that the girl was wearing a silk dress, was "dolled up." The wandering night of farewell through Paris with Lolli as companion adviser came to my memory. Well, Lolli, my friend, I had in mind the description you gave me of an American girl, so I thought the girl I just met was an exception and I continued to look for the real one: long skirt, flat heels and high collar. That morning I did not meet her; you were wrong, Lolli, for although the skirts I saw were somewhat longer than mine they were of a more expensive make and certainly more fancy and low-necked than any dress you may see on a working girl in France—at 8 o'clock in the morning! Later I searched for her among students; it amused me very much to think what the expression on the face of French professors would be like if they should happen to see, entering their classrooms, silk, transparent organdie, bright-colored dresses. The doors would be closed and the girls asked to go home and don the black aprons which the dignity of study requires them to wear. You would not imagine yourself appearing at a dance, Lolli, in decolleté, and usurp the privilege of married women in wearing jewels. Here I saw 15-year-old girls from the same class of society as yours, wearing low-necked party dresses and also a little more powder and rouge than you would be allowed to use. As to stiffness, good gracious, Lolli, I never heard such frank, loud laughs, I never witnessed such juvenile games, I never saw so many broad smiles as among the American society people. And even to my taste, laughs are a little too loud, games are too childish, considering the age of the respectable people who really enjoy playing them, and smiles are too mechanical. Those smiles are deceiving. Wherever you go a smile greets you and makes you feel like having entered the smiling greeter's friendship. Wait and observe; the next in line will get just as nice a smile as you. Smiles don't select you in the crowd, they are for everybody, exchanged by anybody; they are a little sparkle of hypocrisy thrown at rivals or even enemies, who return them.

I have often been asked if I shared the opinion of foreigners about the American's love for the "Almighty

dollar." I don't. Americans have to run after dollars for dollars are running away from them. It is a fact that the average American woman needs and spends more money than a French woman of the corresponding class. I often imagined the home improvements a French mother could afford with the spending money of an American school girl. Americans do not know how to play the game of poverty and enjoy it, they do not know how to dispense with comfort. I tenderly remember the ivory letter opener, with my initials in gold, which for two years was the only piece of elegance my Latin Quarter room ever saw. There the radiator was an ice box and the easy chairs the floor, but no merrier laughter ever echoed in the living room of any clubhouse than that which sprang from between the light gray walls. An American boy could not be accepted socially if he too often offered "walks" to the girl he called upon; the American girl wants to be taken to the "show."

From this race for dollars comes what is labelled American lack of taste: the appreciation of things and persons in terms of money. Listen to the American tourists abroad:

"Notice this chateau, sonny. It cost one million dollars!"

"Isn't this painting a wonder? You could not get it for 800,000 bucks!"

And over here:

"My dear, your dress is a beauty? How much did you pay for it?"

It would be well for the American reputation if tourists, before leaving the gangplank of some Mauretania, were aware of the fact that, in Europe, money cannot be used to measure beauty, appreciate styles or praise an individual. Furthermore, the American tourists who "make" Europe in two months bring back home some of the queerest ideas about over-sea people. I sometimes got the surprise of my life hearing about the way of living of the French people reported by such tourists who were listened to with remarkable attention. How can these whirlwinds "know" anything about the real French life, especially after haunting places from which French are generally absent? As a contrast to the American family who lives in a transparent "glass house," the French family is closed to the eyes of foreigners. Nobody but accepted friends can penetrate the intimacy of the French home, jealously kept from public interference, as the house and garden are walled in from neighbors' curiosity.

It always puzzled me to notice how the American family dismembered itself when it comes to the matter of distractions. When calling on friends on evenings I very often found but "Grandma" watching the fireplace. "Pa" was out at a party; "Ma" had a club meeting; Willie had taken his girl friend to the movies and his sister was attending a dance. This, I believe, is a consequence of the general craze for a "good time" which does not affect France so much. Over there the whole family moves together, be it for a walk or the theater. Women don't believe in clubs or card parties for the good reasons that their husbands won't believe in canned goods; the canning factories make little profit in France.

During my two years of voluntary exile, there is something I found among American people which is all to the credit of the race: their hospitality. Helped by the relative easiness of life, they are generous, familiar, friendly to strangers; they open their houses to them and admit them into the family circle. It may be the subconscious influence of the Mayflower experience, it may be the normal influence of foreigners' tide which transplanted to the New World the open-house custom of ancient Greece. This hospitable tendency, together with the fundamental Christianity of the race, makes possible the perpetual campaigns for funds to be used in far-away lands. It makes possible the particular kind of "ambassadors" whom America sends to China, Armenia, Russia or wherever there is a need to be filled, a wound to be nursed. Those "ambassadors" have the faith of apostles, although their joviality, sense of humor and love of life are characteristically American. The world may overlook what it calls the "business mind" of America, for America has also the soul of a missionary; she need not fear.

Human Facts vs. Human Fiction in Mountain-Land

Concluded from page 11

The mountaineer's first impulse was to run. But if he did, he thought it would shadow his courage. Turning, he faced the beast, and caught it by the head as the dog snapped at him. Grasping each jaw, the mountaineer lifted the dog off the ground, seized its nose with his teeth, and bit and shook the beast until its nose was almost bitten off. When it began to yelp from pain and terror, the mountaineer dropped the dog. It stuck its tail between its legs, laid its ears back on its neck, and with the whites showing in its eyes, the dog ran back in the yard, and under the house. The mountaineer went on his way—he had whipped the dog in a fair fight, and his reputation for courage remained clear.

Queer characters go into the mountains to live there. Years ago, a city clergyman with an enviable reputation throughout the South withdrew to the mountains to be a practical missionary. His object was to teach fruit growing, and advocate the utilization of browsing goats to clear the land of underbrush. Raising goats, by the way, is successfully being tried out. They return immense profits.

This clergyman located in the heart of Unknown America. His family refused to follow him, and for several years he lived alone in a cave. He went about, preaching the word of the Lord, and with it the practical use of miles of idle land.

Mountaineers of the South are not dullards; they are not hopelessly set in uncouth ways. Clannishness, they inherited. A mountaineer is related to one clan or another by blood or marriage. He is their man, which explains feuds as closely as the romance of them can ever be explained to an outsider. Moreover, these people are not murderers, marauders and moonshiners. Peace, law and order are their distinguishing characteristics.

Mention of mountaineers suggests whisky to the outsider. Making it is an old industry, for whisky always has been an important part of life in Unknown America. But thousands of mountaineers do not know the taste of it; comparatively few mountaineers have used it to excess. In the old days you were offered a drink when you entered a home, and that ended the drinking.

Resourcefulness is the most remarkable characteristic you find in Unknown America. For generations these people depended upon themselves. This developed their brains to the point where with reasonable opportunities the rapidity with which they learn is amazing. Power of memory is most noticeable. Families purchase merchandise at settlement stores and keep an account running for a year. When settlement day comes their mental account and the book account of the storekeeper will not vary five cents.

Displays of constructive genius are familiar. An itinerant singing master wandered deep into the heart of Unknown America. One evening, in the midst of his instructions, he broke his tuning fork. The loss was serious, because the distance to the "outside," where it could be repaired, was great. The musician was bewailing the accident.

"I kin make ye a tuner," drawled the musician's host.

"Nonsense," was the reply. "You can't do that. Tuning forks have to be made just right."

"Hit's all right," persisted the mountaineer. "I kin make hit, an' whut's more, I kin make a pianner."

And he did make a serviceable tuning fork from a horseshoe, which he melted in a crude furnace, and hammered into shape.

Horseshoes are valuable. Many of the best shooting rifles in Unknown America were made from horseshoes, melted in furnaces, and patiently worked into rods, which were afterward bored and rifled with exactness. All of this was done with crude, homemade appliances. With any of these rifles a mountaineer can knock out an eye at 150 yards.

An illustration of what mountaineers do if they have the advantage of technical schools is the case of Charles Dyer. Without education or training he came from among the high peaks of the Smoky Mountains to work in a sawmill. Within eight months after he saw a Corliss engine, he constructed a miniature duplicate of the main engine of the mills from scrap tin and refuse material. The engine is perfect in every detail, runs with precision, and develops power in proportion to its size.

Resourcefulness is not confined to the men. For generations mountain women were looked upon as a combination necessity and luxury. Yet, they paid attention to adornment. They painted their cheeks with red ooze from oak balls, and do still in isolated places. Moreover, they do such an artistic job that you wonder whether blushes are natural or artificial.

Yes, they're wiser than some think, those southern mountaineers.

At Last—Crime's Solution Discovered: Prevention

"Train Up a Child in the Way He Should Go," Said Solomon, the Wise; "And When He Is Old He Will Not Depart From It," Say 1922 Police

Punishment Costs More Than Prevention

A REPORT to the Committee on Criminal Investigation, at the meeting of the world's police chiefs in San Francisco, read:

"It cost the city of San Francisco more than $8,000 to take care of Lottie G., a criminally minded girl, during a period of 10 years. One-fiftieth of this sum, applied in proper medical attention to Lottie when she was a child, would have prevented all this waste.

"We checked up on the life history of this woman, who is now dead. She was always ailing when she was a child; in fact, at the time we took her in charge, she had the mind of a child of eight years, though she was then 30 years of age.

"It is far cheaper to have plenty of playgrounds and clinics than it is to neglect these factors and incur heavy expense later in arresting, convicting and confining these unfortunates."

By HARRY H. DUNN

THE beginning of crime is in the beginning of life. If every boy and girl could be taught the proper path; if the health of every boy and girl could be protected until he or she is "grown up"; if every boy and girl could be given, through education, the habit of industry—then we should have no more crime in the world. The prevention of crime lies in education, and the police forces must become educators as well as punitive agents.

This was the idea developed at the convention of the International Association of Chiefs of Police in San Francisco a few weeks ago. It came from men engaged in police work in every quarter of the globe. It presages the passing—and the police chiefs admit it—of the old type of policemen, and of the old kind of police officials, whose only object was to "get the guy," "get him quick," and "send him over the road." It means that police forces are becoming, slowly but nevertheless surely, educational forces; that they are seeking to prevent crime rather than to punish the criminal.

Men who have grown gray in the business of catching and convicting violators of the laws said in no uncertain terms that, as deterrents of crime the warrant, the prison cell, the gallows and the electric chair had failed; that the punishment of one criminal seldom checks the criminal tendencies of another; and that the education of all youth alone is the solution of the problem.

But by education was not meant exclusively that which can be taught from the books of the schools. The education of the youth was divided into three branches.

First: The establishment and maintenance of good health in all children, through free medical clinics; free public playgrounds; and such laws as may be necessary to allow the child to develop physically before he or she is placed at work.

Second: The study of the mind of the child, so that the education which is given to that child may be absorbed and understood, to prevent the man or woman coming to maturity with undeveloped mind. Records were adduced to show that the mind of the average convicted criminal is that of a child of 10 years or less.

Third: The retention of the child in schools until he or she has learned that there is a vast world of wonder and enjoyment outside the pleasures of play or sport or work, a world of books and reading, for, according to these police chiefs, idleness of mind and body is responsible for more crime than any other single factor. Lack of "something to do" causes, for example, the formation of neighborhood "gangs," whose first objective, the attainment of amusement, may be harmless in itself, but soon develops into massed crime.

Study of school children, based on previous investigation of arrested criminals, of whose "guilt" there is no doubt, was recommended as a preventive of crime, by August Vollmer, police chief of Berkeley, California, and retiring president of the International Association of Police Chiefs.

"In spite of the 500,000 criminals in the jails of this country," said Mr. Vollmer, "and in spite of the improved and increased work of the police departments, crime continues to increase. It is estimated that for every criminal in jail, there is another still operating.

"It is obvious then, that we have not arrived at the causes of crime, nor have we removed them. Criminal tendencies are a defect in character, due to environment, heredity, or early lack of mental or physical training, and the police have arrived at the point where they are asking the help of all citizens to correct them. We must make an intensive study of all men and women who are arrested, and then send psychiatrists, psychoanalysts and psychologists to study the children in the schools, to get at the root of conditions, and to aid in the eradication of evil tendencies at their source."

Investigations made by world police departments show that the average age of the criminal of today is less than it was 10, or even 5 years ago. This criminal age is constantly decreasing, and the police chiefs hold that this decrease in age, this entry of youths—both boys and girls—into ways of wrong, is due to lack of proper training by our educational system, and failure of the authorities to compel the giving of proper medical attention to children. The necessity of the age, in this direction, is prompt action to combat the tendency to criminality among boys and girls, rather than the development of better methods for detecting and punishing crime.

The International Association of Chiefs of Police in session in the St. Francis Hotel at San Francisco, with August Vollmer, chief of police of Berkeley, the president presiding.

A. C. Keane, probation officer, of San Francisco, who has been studying the inmates of San Quentin Prison, California, in the course of his address, said:

"Of a population of 2,532 in San Quentin on May 1, 1922, more than half, or 1,390, were 30 years old, or younger; 953 were 25 years old, or younger, and 357 were 21 years old, or younger. If the average criminal age is growing younger, and if crime is on the increase among our youth, we may well fear for our institutions, and even for our civilization. Undoubtedly the war with its influences was responsible for some of those who returned committing crimes.

"But more serious was the influence upon the boys who remained at home. During the war, they obtained unusual employment at abnormally high wages. Their labor was for war needs, and not of a kind tending to fit them for trades or industries on a peace basis. With high wages came indulgences and extravagant living, that could not be sustained in more moderate times. Peace arrived, and these boys, grown somewhat older, were thrown on the community without trades, without any sense of self-discipline, without habits of industry and frugality, and with appetites for indulgences which they cannot now satisfy with the returns from honest labor. This probably has been the most serious factor in creating unrest and in contributing to the recent criminal activity of young men. But we must educate the coming generation, the boys and girls of today, so that they will not be confronted with the same problems which met the young men and women at the end of the recent World War.

"If our boys and girls could be educated toward home-making, toward early marriage as one of the concomitants of a full life, a great deal of the opportunity for the sowing of criminal ideas, and, hence, the seeds of crime would be eliminated. The tendency of present-day young men and women is to marry later in life, frequently not until after 30; if for this idea could be substituted marriage—in a majority of cases—at an age of 21 to 25 for the man, and the responsibilities of home and family thereupon taken up, the community would be far better off."

The great trend of opinion in the convention, as expressed by police chiefs, detectives, policewomen, probation officers, psychoanalysts and juvenile court officials, is that crime, in a preponderance of cases, has its inception in physical sources—illness either of the body or of the brain. Generally speaking the criminal is a sick man or woman, either mentally or physically sick. Dr. Eva Charlotte Reid, psychiatrist of the University of California, holds the ductless glands responsible for much crime, a career of which could be checked before started, by proper medical attention in the schools. The thyroid gland was selected as an example, by Dr. Reid, who showed by a number of cases, that an undue amount of acidity in that gland had led many a man first to acts of violence and then to a life of crime.

"Each criminal case," said Dr. Joseph Cattan, of Leland Stanford, Junior, University, at Palo Alto, "should be studied exactly and exclusively on its own merits and specialists should apply themselves to physical, psychological and historical background of every man and woman convicted. Only thus can the criminal himself be healed and returned to the world a useful citizen; only thus can complete and strict justice be done, and only thus can we learn the causes of crime to such detail that we may be able to prevent them by education of the young.

"In every crime there are two features: the outward act, and the state of mind. One is the corollary of the other. No serious effort is being made today to cure men of their criminal tendencies while they are in prison, or to so train boys and girls that they never will accept criminal tendencies, either from their surroundings or from other persons. This must be done.

Less stress is being laid on the matter of catching the man who commits his first crime, and more and more importance put on so educating that man that he will not commit a first crime or, having committed the first, may be so "cured" that he never will commit the second. President Vollmer of the association laid the foundation for this sort of change in police systems, when said:

"Our duties have been drafted by lawmakers and theorists without seeking aid from expert po-

licemen, primarily because the policeman himself never has been altogether clear on the subject. The time is now ripe to prepare plans which shall not only aid the legislators in passings laws in the future, but the people in keeping those laws, as well. Police schools are highly essential, and, if the policemen are to become teachers, as they should be, men and women from the highest walks of life should be enlisted for police work. Modern equipment, such as gas bombs, machine guns, motorcycles, automobiles, speedboats, radio and all other mechanical equipment are necessary to outwit the man or woman already a criminal, but we must prevent the young man and young woman, the boy and girl, from becoming criminal, and the greater our success along these lines, the fewer the arrests we shall have to make.

"Blindly following the old trail in worn-out shoes is foolish economy, makes the policeman ridiculous in the eyes of the criminal and provides excellent material for the motion pictures and the comic sheets. We must be prepared, first, to prevent crime, and then to meet the criminal with better tools and better brain, and better training, than he possesses, if we hope to accomplish our utmost and to command the respect of the community which we serve. Every department of the municipal government will profit if the police organization devotes some of its time to the solution of the important police problems, such, for example, as the corruption of the police, erring women, gambling, illicit use and sale of drugs, traffic and the prevention of traffic accidents, the elimination of dishonest judges, lawyers and bail-bond brokers, education of the youth, medical care of the youth in schools, and, last, but by no means least, the education of the people, especially parents, in what constitutes the proper training of boys and girls to keep them away from criminal associates, and, consequently, away from lives of crime.

"These problems are common to every municipality and town in the world. The public should be honestly informed, and the information should come from the police. Uniform national and international laws, uniform classification of crimes, simplified court procedure, better methods of selecting and promoting trained jurists, are among the most important of modern requirements, and deserve much thought and deep study by the police of every city and every country. There should be commenced at once a campaign of education to bring about these reforms."

It should not be understood from these expressions that the police chiefs, either in general or singly, were or are in favor of abandoning the idea of punishment for convicted criminals, or for leniency to men and women who have embarked on lives of crime. On the other hand, they are in favor of much more severe sentences, with the proviso that the convicted criminal is to be treated as a sick person, and cured of his criminal malady. The present generation of criminals—it was held—must be prevented from further crime by confinement, and their criminal tendencies removed during that confinement, if possible. But it is the coming generation which can and should be prevented from starting on the way of the wrongdoer by proper training, education and medical care. The next generation of policemen, too, should be educators, in the belief of the police chiefs, and, if the tendency to crime is reduced, or eliminated, in the next generation, then the police will have the time to be of real help to the people.

In line with plans for the detection of crime and the capture and cure of criminals, the foundation was laid for an international police station, probably located in Washington, equipped with radio, and with a fingerprint bureau which shall contain the means of identification of every convicted criminal, man or woman, in the world. That is, the highways and byways of the world are to be brought into such small and compact area, from the viewpoint of the police, that the world will be too small to hide any crook who is wanted by any police force. At the head of this world police station, will be an international police chief, and a search for a man to fill this position is now going on, means for financing it having been found. The convention also voted to turn over to the United States Department of Justice the present National Bureau of Criminal Identification as the first step in the formation of this international police station. Three members of the International Association of Police Chiefs will act as an advisory board to the department of justice in the use of this bureau and its tremendous mass of data.

Recommendations of the convention included the following:

The establishment under Federal control at Washington of a bureau of criminal investigation and statistics.

The installation of radio equipment in every police department.

A continuous campaign of public education and information on vehicular traffic; co-operation of automobile associations and civic bodies; a uniform, nation-wide system of street signs.

Increased employment of policewomen in specialized fields.

Co-operation of the police with the department of labor in the education of the foreign-born and unnaturalized foreigners.

Organization of police departments on the basic principle of divorcing them from "all influences."

An international law forbidding the purchase, owning or carrying of a weapon without permit; records to be kept by dealers of all sales of such weapons; control over the importation of all firearms.

Heavy fines and long terms of imprisonment for vendors of narcotics; confinement in each case to be for a period long enough to permit a cure.

Use of bombs, gas and signal systems to controvert the efforts of safe breakers and burglars.

Prison terms for automobile thieves without parole or probation; that probation and parole also be denied to vendors of drugs.

BRIEFLY TOLD

The sculptured head of the Egyptian king, Amenemmes III, who lived about 3,000 B. C., was sold at Sotheby's in London, for not less than 10,000 pounds. The sculptor is unknown but the work is beautiful, a little bust barely more than six inches high, carved out of one of the hardest of stones, obsidian, a masterpiece that has not been surpassed by any sculptor of any country or age, according to experts.

I. B. Good is a Mennonite preacher in Pennsylvania. His precepts do not belie his name, for that sect believes in nonresistance.

One of the most famous trees in the United States, Richard Oak, near Rising Sun, Maryland, recently had a tablet placed upon it giving the part it has played in American history. It is estimated that the tree is 600 years old. It is 70 feet high and spreads its branches over a circle 105 feet in diameter.

Public debt maturities to March 15, 1926, aggregate $6,900,453,475, of which $4,867,962,203 mature in the current fiscal year, ending June 30, 1923.

The southern pine forests since 1900 have supplied more than 50 per cent of the soft wood used in America, also nearly all the turpentine and resin. Only one-fifth of the original yellow pine forests remain but if reforesting is begun at once on the proper scale the South can supply America for all time.

The largest turtle ever imported to London from India was killed recently for soup. Its weight was 450 pounds.

The use of electricity is increasing everywhere, according to the United States Geological Survey report for May. Forty-two and eight-tenths per cent of all power generated was by water as compared with 35.2 per cent in January, 1922. The consumption increase for the month was 2.1 per cent.

Wall paper was not used in the United States until after 1725 and then was ordered specially from Europe. It was not carried in stock until 1745 but by 1750 it had come into general use.

The Reformed Jewish Church has made a ruling allowing women to become rabbis. Orthodox Jews have not made this ruling and in congregations of Russian and Austrian lineage, women are not allowed during worship to occupy the same seats with the men or listen to the same service except through screens.

The mother of Marconi, the wireless inventor, was Irish.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

When lightning struck the city hall clock in Philadelphia recently two employes divided the time into shifts and started turning the clock by hand. The hour hands weigh 175 pounds and the minute hands 225 pounds. The clock has four faces.

Moonshine stills are responsible for not less than 25 per cent of the fires in the forests of the Pacific Northwest, according to reports. These stills are usually located in inaccessible places in the woods, where the dry timber and brush will take fire from the smallest spark and get beyond control before the fire-fighting forces discover the smoke. Unmistakable evidence of moonshining has been found in the newly burned areas.

Twenty-five per cent of the coal mines, employing 60 per cent of the workers on full time, can produce all the coal we can use in the United States, according to the commissioner of the Bureau of Labor Statistics.

California officers killed an automobile driver recently by firing at the tires of his machine because they thought he was a fugitive from justice. The tourist thought the officers were hold-up men on a lonely road and as a result did not stop at the command to halt.

The Jews that have emigrated to the northern provinces of China have adopted queues and bound the feet of their women but have kept all their racial and religious characteristics.

Spurious gems are being fabricated in England to such an extent that the position of many genuine diamond mines and miners has become a problem. Various stones have been treated to produce sufficient brilliancy to be passed off as diamonds.

The cost of warming the famous zoo, established by the kaiser in Berlin, is too expensive and unless private funds are forthcoming it will close on October 1. This zoo is regarded as the best in the world. It once contained 1,500 species of animals.

Professor Dallas L. Sharpe, of Boston University, will enter the race in Massachusetts for the United States Senate in September. He has declared himself out and out for the Eighteenth Amendment and opposed to light wines and beer. He believes that great moral issues belong to no party and that Christian men must come out and be willing to stand up for what the church advocates.

The American ambassador to England has given up his privately rented house in Chesham Place and will occupy the residence in the Prince's Gate, donated to the American Government by J. P. Morgan.

Each citizen of the United States should receive an average of 112 letters each year, according to the post office officials.

China plans to adopt a constitution similar to that of the United States. Each province is to maintain its own assembly which will comply with the demands of the southern provinces for provincial autonomy.

Millions of grasshoppers recently passed over Sheridan, Wyoming, in such a dense mass that when seen against the sun they looked like a mass of cotton. For over three hours they clouded the sky.

Near the Yukon border, in a valley in far northern British Columbia, a mining engineer has discovered the remains of mastodons that once roamed Northern Canada. This valley is north and west of the headwaters of the Findlay River and is not marked on the maps. Footprints of a three-toed animal are imprinted in the sandstone. The bones are not fossilized but are in an excellent state of preservation. Only dog teams are used in that section and it requires a year to make the journey.

Orphan cats, dogs and horses, and those deserted because of old age, will live in peace and plenty on a 150-acre national farm for homeless and aged animals that is to be established near Washington, according to the Humane Education Association.

While other cities are putting on anti-rat drives, New Orleans is raising $40,000 to be used in exterminating the Argentine ant which is the greatest pest in that section of the country.

Fly-by-Night Promoters and Their Swindlers

Chronicler of the Neglected Truth

Swindles of the Fly-by-Night Promoter

Bucket Shop Crookedness Far Outdone by Dishonest Schemers Who Float Fake Industrial Issues to Trap Ignorant and Gullible

By WILLIAM A. MCGARRY

This is the first of several articles by Mr. McGarry, in which will be related some of the many forms of crookedness in which the public suffers.

WHOLESALE swindling of the poor is going on without interruption in the United States while newspapers and public men rail about bucket shops and other forms of fraud, fattening, as a rule, on those who can afford to lose. Commissions are being formed right and left to protect those who take their money to the brokers. But nothing of any real value is being done for the wage earner whose savings are literally at the mercy of the meanest type of crook the world knows.

In virtually everything that has been printed during the last year concerning the operations of bucket shops and the swindling promoters using such institutions to sell their worthless paper, the attack has been directed toward the salesman catering to persons earning $2,000 a year or more. Apparently even public officials are unaware in many of the large cities where swindling of the poor is most open and flagrant that the brokerage end of the stock-cheating business is literally only a drop in the bucket.

For every dollar lost in or through a bucket shop promotion, anywhere from ten to one hundred dollars is lost by wage earners. For every bucket shop operating in the big cities, there are scores of promotions capitalized as high as one million dollars each that are utterly unknown to Wall Street. As a rule there is some semblance of productive activity back of the average bucket shop promotion. Most of the recent big failures in that line have been due to juggling of some industry inherently sound, on which basis had been built a top-heavy pyramid of over-capitalization. But that is not true of the fly-by-night promotions designed to swindle the wage earner.

Bucket shop methods of operation have been so thoroughly described that the process is now widely understood by the public. The method used by the other type of promoter will be instantly recognized by millions of his victims when it is described. The trouble is that in nearly every case the victim thinks that what happened to him was an accident. And therein lies the greatest menace of the fly-by-night promoter. Ninety-nine times out of a hundred he leaves his customers full of hope that some day the fish-catching machine or the turbine gas motor in which he has sold them stock will be placed on the market and make them all independently rich.

He Damns Wall Street

THE fly-by-night promoter makes an almost complete reversal of the method used by the bucket shop proprietor. In all bucket shops there are tipsters scattered all around the office. Every salesman is a tipster, for that matter. His business, after getting the ear of the sucker, is to convince him that he has inside information on all kinds of stocks. He is forever talking about "making a killing in the street." He refers to well-known millionaires by their first names. According to his account, the biggest men in the street spend most of their time running around telling other people about the pools and syndicates they are planning to swing in certain stocks. Wall Street is painted as a place of genial personages, each anxious to help the newcomer make a fortune.

But the promoter who takes his fat living from the lean savings of the poor tells a different story. He trades on an alleged hatred of Wall Street and "the interests." According to him, the poor man never gets a chance in the most substantial brokerage office, or even in a bank. He knows that it is human nature to be afraid of that which is mysterious. So he tells weird stories of Wall Street and its stock manipulations. He comes to the worker often in the guise of a wage earner giving good advice. Earnestly and at great length he urges his fellows to stay away from the bankers and the brokers. By way of illustration, he has a fund of specific instances, 99 per cent fake, to show how some poor inventor was swindled by the wealthy out of the product of his genius.

Uses Records of Earnings

ON THAT foundation of mistrust and suspicion the promoter builds his sales. He has at his tongue's end the records of earnings in a dozen or more of the phenomenal American industrial developments of the last half century. Generally he has the list printed on one of his circulars. There is never any basic variation. The method is always the same. The list shows what $100 earned in each of the many industries. Of course, the salesman is careful to explain that each example is one in which the inventor or the originator of the idea was too clever to take his plan to the bankers and brokers. Instead, he took it direct to the wage-earning public and let them all in "on the ground floor."

That is what the fly-by-night promoter offers to do. He does not offer a speculation. It is always a sure thing. Unlike the bucket shopper, he does not recommend buying the stock for a rise. His promise of profit is in dividends that never materialize. Experts among the breed protect themselves from prosecution at every turn. They take relatively small sums, averaging perhaps not more than $100 from each customer, and rarely exceeding $300. Anybody who has had any court experience will realize that it is generally not worth while to bring suit for the recovery of such sums. And even before making the sale the promoter and his associates impress on the buyer that if he takes some of the stock he ought to hold it for a year or two anyhow before attempting to sell it.

Scores of deliberate swindlers now doing business in various parts of the country even go to the length of buying back stock they have sold to suckers, to prevent having their scheme fall under suspicion. That is done, of course, only while the selling campaign is in full swing—generally for a period not exceeding three months from its opening. After that the promoter jumps to another city, charters another scheme and starts in on a new batch of victims. If he has been careful he will have no trouble whatever. Certainly if he has had any experience in the swindling business he will not have used the mails for the distribution of any of his literature. And when he deserts a town after a clean-up he never leaves a mailing address. Even if he did it would amount to nothing, for most of the skillful promoters change their names every time they change their schemes.

Mails Are Not Used

BANKERS, brokers, detectives and government secret service men with whom I have talked are almost completely ignorant of the extent of these swindles. The Federal Postal Inspectors have some knowledge of the business, but they are powerless to do anything unless the promoter uses the mails. Police hear of a swindle now and then, but always long after it has been perpetrated, when it is too late for them to do anything. In most cases they could do nothing even if they knew where to find the swindler. At the first sign of real danger the latter makes restitution and the prosecutor drops out of sight, glad to get his money back.

But the fact that the authorities do not realize how widespread is the business of cheating the wage earners does not lessen its extent. In five years' experience running down just that type of crook I have been offered stock in fish-catching machines, airplanes which were to rise straight up in the air and hang suspended over any chosen point, gold mines mapped by spiritualists, motion picture plays, bungalow lots with oil "rights," to say nothing of paint and mineral deposits thrown in; patent bricks, rotary automobile motors, fly catchers, perpetual motion machines under other names, banking schemes designed to put a bank on every corner, pig farms, oil from shale rock, Mexican plantations, and so many others that the list would be tiresome. Not one of those propositions has been developed. In not a single instance has any honest attempt been made to develop anything. The schemes were deliberate, cold-blooded swindles.

Oil Pipe the Only Gusher

A FEW instances will suffice. Take the record of the bungalow-oil-paint-quarry combination. I am still at a loss to know just which of three companies made the actual sale to the victims. The lots were located on an old pleasure park in Eastern Pennsylvania, far distant from the oil fields. Various attempts had been made to operate this place at a profit and all had failed. One of the promoters got hold of the site and tried to sell the lots for mere home-building purposes. The place was so far from easy transportation that he had no success. Then he "discovered oil." Small patches of the stuff appeared on a creek running through the property. Since he was familiar with the entire tract it is quite likely he knew there was a Standard Oil pipe line crossing the property, part of which was densely wooded. But he said nothing about that.

Instead he brought in two other groups of promoters, one to act as "fiscal agents"—whatever that meant—and another as selling agents. A plan of operation was drawn up that was seemingly airtight and law proof. Agreements of sale bound the promoters to sell a building lot 20 by 100 feet for $1,000 each. The actual land value was perhaps $10 or $15. With each lot went all "rights" to oil, senna, ocher, and conglomerate rock found on the property. There were several large deposits of the senna and ocher, which are used in making paints, but they had been known for years, had been examined by expert paint makers and had been rejected as of no commercial value. The same was true of the conglomerate rock.

A drilling machine was brought in and an "oil well" was started. When it had gone down 30 or 40 feet another tower was put up. In the meantime a campaign of sales was launched through advertising in questionable publications. And when the time seemed ripe arrangements were made for a free excursion. Each stockholder was asked to bring all his friends and relatives. More than 300 prospective suckers were taken along. They were shown the patches of oil. They looked into the black depths of the 40-foot hole. And nearly all of them signed up for the stock.

In that particular instance most of the "investors" were not swindled, merely because the writer and another newspaperman happened to be on the excursion, which took place on a Sunday. Few victims had enough money with them to buy lots. They signed agreements to come in and pay the next day. But on Monday morning the truth about the proposition was published in two newspapers and the promoters made no attempt to collect on the agreements. The whole scheme was dropped without any further effort to sell lots, oil, paint or conglomerate rock.

From the point of view of the promoter, however, that job was botched. As a rule the swindler does not lay himself open to public attack as easily as in that case. His work is done without publicity, well under cover. One victim thoroughly "sold" brings in many others. The "invention" or idea, whatever it may be, is displayed in a store window or a prominent city street. Exhibits include scores of photostat copies of letters from all sorts of bankers, millionaires and public officials. A member of the presidential cabinet appeared in one of the most notorious swindles years ago. Senators and Congressmen are common tools of the swindlers. The trick is to get the governor of a state, or the Senator or Congressman, interested in some local development and then put him on the board of directors. Then the scheme is incorporated and the stock is sold by the blue-sky method in a distant part of the country. As a rule the official is as gullible as the rest of the victims. There are exceptions, of course.

Profits Tremendously High

THE profits to the promoter are inconceivably high. In most cases he has nothing to pay but the sales expense, since he produces nothing. In the bucket shop promotions the public has read of commissions paid to salesmen ranging from 40 to 60 per cent. But in the rare instances when the other type of promoter makes some bluff at producing the thing back of his stock the commissions run as high as 90 per cent. In other words, the industry or whatever it is that he is promoting gets 10 cents out of each dollar and is then expected to pay for the entire dollar in dividends.

Within a comparatively recent time motion picture stock swindles were common. One of them was driven out of Chicago after selling several hundred thousand dollars' worth of stock. The promoters were fined $1.000 for the violation of the blue-sky law and forbidden to sell any more stock. They promptly shifted headquarters to a large eastern city. A bold bluff was decided on. Advertising men of all the newspapers were invited to a luncheon. They were shown a few hundred feet of film and given the usual "sucker talk" about the profits made by great motion picture successes. They were told that the promoter intended to produce the film in that city and that he would spend $150,000 in advertising. I happened to represent a newspaper that made a specialty of exposing stock swindles. The atmosphere of genial good humor permeating the luncheon suddenly evaporated when I asked what commission was being paid the stock salesmen and the selling agents.

Can Be Driven Out Easily

TWO or three stories drove the promoters out of town. But a few weeks later one of the men who had been most active in the swindle started another one. In the effort to divert attention from his new scheme he confessed to me that the first corporation made a deal by which the promoter sold the stock in the beginning at $10 a share, retaining $6 for himself. His contract provided that the corporation which was to but never did produce the picture was to get $4 from each share, no matter if the price obtainable from the suckers went to $100. As a matter of fact the price did go to $20 for a time, thus giving the promoter a commission of 70 per cent. The same gang controlled both the corporation and the selling agency, of course, so that in reality they got it all and gave nothing.

It is generally agreed by experts that the finest blue-sky law that can be devised will not protect the public. The answer is education. But so far I have not met a single expert who seems aware of the vital point on which education is necessary. That point is the matter of commissions. Any man can protect himself from the swindler merely by demanding documentary evidence as to the amount being paid in commissions out of each dollar taken in. If the proposition is legitimate there can be no valid objection to the production of such evidence. But if, as nearly always happens in a case of fake promotions, the salesman bristles up and becomes indignant when the question is put to him, the prospective buyer of his stock is justified in refusing to do business on the ground that he has a right to know just what is to be done with his money.

In another article a detailed explanation will be given of how to detect a stock swindle, and what to do about it in the way of getting one's money back. The only way to fight the crook in court is to use his own weapon—bluff. If the promoter is really crooked he will not dare to fight.

At Society's Throat: The Legalized Pistol

Crimes of Violence Laid at Door of Revolver Manufacturing Industry; Comes the Question: Shall We Prohibit Making and Selling of Weapons?

By J. M. SEABRIGHT

IT STARED at you like the eye of a Cyclops, did an unusual advertisement, from its ink-and-paper socket in a page of a great daily newspaper one morning about a year ago. This was the wording:

"I will pay $1,000 to anyone who will give one good reason why the revolver manufacturing industry should be allowed to exist in America and enjoy the facilities of the mails."

The advertisement was signed by John R. Thompson, of Chicago.

Already I can hear your inquiry, "Who received the reward?" The answer is this: no one received it, for no one earned it. Not a single person gave one valid reason for the present indiscriminate sale of small firearms to the public.

Note that Mr. Thompson referred, not to firearms generally, but to *small* firearms of the pistol type. To overlook this qualifying factor is to miss the point of this article; to understand its significance is to comprehend the process of reasoning by which Mr. Thompson reached the conclusion that the annihilation of the revolver industry would restrict—even eliminate—violent crimes.

His reasoning can best be shown by quoting from a letter written by him to one of the many contestants. Mr. Thompson says:

"The revolver is made to be concealed. No honest citizen or honest purpose requires a concealed weapon. Therefore, no good reason exists for its manufacture or sale.

"The rifle and shotgun have good uses and they meet all legitimate requirements for firearms.

"The public disarmed, our police can have no use for the revolver. Had the assassins of our three martyred Presidents carried rifles their murderous intent would have been discovered—the crimes prevented.

"The revolver creates the professional criminal, the thug, the footpad, the burglar, the murderer. And yet the manufacturers of revolvers enjoy the facilities of the United States mails and every protection given to honest business.

"I have challenged the manufacturers who have made tremendous fortunes out of the manufacture and sale of revolvers, to give one good reason for their use. They have not done so, and they cannot, and this branch of their industry should not be permitted to continue.

"The definite purpose of this publicity is to stop by legislative enactment the manufacture, importation, sale and use of the revolver; is to arouse a tremendous public sentiment that will back up our legislative bodies in putting through the necessary legislation. National disarmament would be a great blessing. The disarmament of our citizens would be a blessing to the home, and would bring safety and security into our everyday life."

Before we examine further Mr. Thompson's plan, pause for a moment and consider the reasons serving for its foundation. In other words, is his denunciation of small firearms justifiable? Is it based upon experience and common sense?

Such queries must be answered in the affirmative in spite of one or two seemingly meritorious arguments to the contrary.

Perhaps the most thorough discussion of the subject, one pregnant with logic and judicial restraint, is that of Judge George C. Holt, embraced in a paper which he read in 1910 before the Wisconsin State Bar Association (subsequently appearing in the New York *Independent*) on "Unpunished Crime in the United States." After mentioning the many violent crimes then lately committed, he continued:

"The question naturally arises, What should be done to put a stop to such a condition of crime and disorder in American society? In the first place, the use of the instrumentalities by which most of these crimes are committed should be restricted by law. The repeating pistol is the greatest nuisance in modern life. . . . . Nineteen-twentieths of all crimes of violence that are committed are effected by its use . . . No one should be permitted to carry abroad such a dangerous weapon, in view of the constant possibility of its being used for trivial causes. Wherever men meet there is always the liability of quarrels arising, and always, in the world, until the invention of the modern revolver, when a quarrel arose serious enough to lead to personal assaults, the attack was made by blows with the fist, or with a stick, or, at the worst, with a knife or sword. Even when the latter formidable instrument was used, there was an opportunity for the man attacked to escape, and in most cases of fights and assaults, there was little danger of serious permanent injuries or death. But as soon as a pistol is drawn there is always that danger, and therefore the right to have or to use a revolver should be under rigid public control."

The learned jurist follows up what has just been recited with advice as to what the householder ought to use for a firearm as the watchdog of his home. He says: "An ordinary breech-loading shotgun is a far safer weapon, and if it is actually necessary, for purposes of home defense, to use any such weapon, it is far more efficient and desirable." As a supplement to his argument, let it be said that in all probability—nay, even as an inevitable consequence—when the present unrestricted sales of small firearms come to a halt, then there will be that much less need of firearms of any sort for home protection. In other words, disarm the potential burglar, and burglary, along with other offenses of violence, will die a-borning.

But Judge Holt did not content himself with simply pointing out the cause of the then present rent in the social fabric. He went farther: he outlined a program of reform, a plan bottomed on sound sense and practicability.

On that phase of the question he declared: "There are in some states statutes and in most cities ordinances prohibiting the carrying of concealed weapons, and requiring licenses for the carrying of pistols. But these statutes and ordinances are not by any means universal. They are not usually made effective by serious penalties, and they are to a very large extent disregarded throughout the country. It would, in my opinion, be entirely justifiable for the government to prohibit the manufacture or sale of any pistols in this country except in national armies, for the use of the military and police. Such a law is probably impracticable, but it ought to be possible to have laws passed which shall provide that all persons manufacturing or selling or purchasing and using revolvers should be licensed by a responsible board, established for that purpose. At the present time anybody can engage in the business of manufacturing pistols who sees fit to do so. They can be sold to anybody who wishes to purchase them. Shops exist in every city where anybody can buy a pistol at any time, many of them at so cheap a price that the poorest persons can get them. Every person engaging in the business of selling revolvers should be licensed, and every person who wishes to obtain a revolver should be required first to obtain a license."

Judge Holt's views were propounded more than a decade ago. Do they coincide with those of our judges of today, when violent crimes seem veritably to be damming the stream of an orderly society? Or have present-day jurists and criminologists found a different solution, a new remedy?

The answers to these questions one finds in a recital of the recent activities of representative men of the city of Chicago. Their program, adopted as a means of stemming the crime tide, proves that Judge Holt's views bulged with truth. Among them were virtually all the municipal and county judges, the chief of police, the state's attorney, a number of leading bankers and lawyers, and prominent laymen interested in the rigid enforcement of the law. They held a series of mass meetings in the early part of February of the present year. This is a resolution they adopted:

"After a careful consideration of the subject we are of the opinion that the great cause of crimes of violence, such as murders, holdups, robberies, burglaries, bank robberies, and the like, is the promiscuous carrying of such concealable weapons as pistols and revolvers.

"We are also of the opinion that the clogging of the criminal court calendars and the overcrowding of the jails and penitentiaries directly result from the carrying of pistols and revolvers. And it is our conviction that the only feasible way to accomplish any permanent relief is by the suppression of the manufacture and sale of pistols and revolvers, except such for proper public officials.

"Therefore, be it resolved that a representative committee of citizens . . . . be appointed . . . . and that it be and it hereby is directed to take such steps as said committee may deem advisable to bring about such legislation as may be required to suppress the manufacture and sale of pistols, revolvers, and other concealable weapons."

But I hear some zealot shout: "What about the Second Amendment to the Constitution? Do you seek to take away my constitutional rights?"

Let us see. That amendment is in these words:

"A well-regulated militia being necessary to the security of a free state, the right of the people to keep and bear arms shall not be infringed."

The amendment is self-explanatory. It is the militia system which it protects, and the militia is not carrying concealable pistols. Moreover, the Constitution does not say that the citizen may keep his arms hidden in a pocket. It is the same moth-eaten contention of the pre-Volsteadian liquor interests who continually harped on "personal liberty." Time after time the highest courts of the several states, and the United States Supreme Court as well, have held that under the broad, though nebulous, police power those agencies which tend to undermine the public morals, the public health, or the public safety can be not only regulated but even abolished; and that in such cases there is no legal taking of private property without due process of law. Paring the objection down to its framework, it is difficult for one to detect any difference between a liquid which destroys lives and a specially designed instrument of steel whose use leads inevitably to the same result. These agencies of ill are equally reprehensible. One is already outlawed. Why not outlaw the other?

Senator Shields, of Tennessee, has introduced a bill to suppress the sale of such firearms as we are here discussing. In a nutshell the bill makes it unlawful to deposit any such arms in the United States mails, or to ship the same in interstate commerce, to sell, except those used by the army and navy. The second section forbids the acceptance of such articles by common carriers for shipment in interstate commerce, and Section 3 provides for a fine of from $100 to $500 for each violation and, if the offender be a person, imprisonment of from one to six months.

In the writer's opinion Senator Shields' bill is a sound piece of legislation. It deserves to pass—but will it? "Aye, there's the rub." For it happens that the bill is now being considered by a sub-committee of the Senate Judiciary Committee. A bitter opposition, fostered by the powerful firearms industry of Connecticut and Massachusetts, has transformed the committee room almost into a chamber of repose. In fact at this writing it looks as if those apostles of greed might succeed in keeping it dormant for a long period. But before they can embalm the bill, it behooves each one of us to see that those few do not make a success of obstructing a piece of legislation which will foster the common good.

Needless to add, such a bill as Senator Shields', if it becomes a law, will not of itself correct the existing evils. In addition, police officials throughout the land must make a concerted effort, and a determined one, to seize all concealed weapons. But the passage of the bill is the first important step. It can eventually pass.

SPECIAL CUT PRICE OFFER

25 Calibre Regulation Blue Steel Automatic Revolvers $7.95 Reduced to

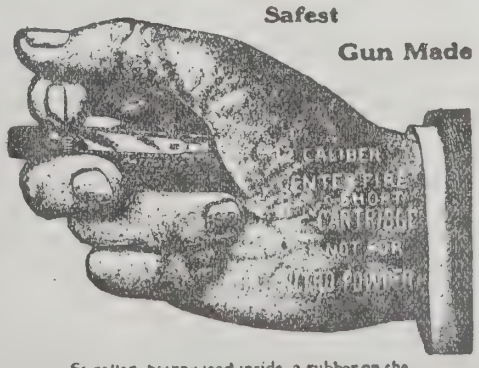
Regular price $22.50

Most sensational cut price sale ever made. We are making this sacrifice because we are closing out the pistol department and have only a limited quantity on hand. Take advantage of this offer while our stock lasts. Save yourself the difference. Every revolver guaranteed perfectly new and dependable. They are made of handsome blue steel, gunmetal finish, accurate aim, perfect grip, safety lever to prevent accidents, small, compact; does not bulge in pocket. SHOOTS THE STANDARD AUTOMATIC CARTRIDGES.

32 calibre Automatic Revolver..... $8.85

Regular price $25.00.

SEND NO MONEY



Order one of these revolvers now. Don't put it off. Protect yourself and your home. Our prices are the lowest, and the revolver one of the best there is in the market. Pay postman plus postage on arrival. Money back if not satisfied.

Note special price appeal.

The New Pencil Pistol

The Smallest. Safest Gun Made

So called having lead inside, a rubber on the end, and makes its mark when required to No. X-6. The most unique weapon for self-defense ever invented. Observe its insignificant appearance. Blue-black finish. Concealed in the hand or pocket. Safety cock, sure shot, 32 calibre. Doesn't hurt the hand inexpensive and lasting all steel except the rubber butt.

Special Price, Only $2.95

"Concealed in hand or pocket."

Co-operative Banking

THE *Western Banker,* of Omaha, has two noteworthy editorials, the first in discouragement of the establishment of small banks, the second in opposition to the co-operative system of banking. In each editorial it applauds the action of various banking commissioners in refusing charters for applicants from towns "sufficiently supplied" with banks.

Before passing to the propriety of co-operative banks, it may be proper to enter a protest against the assumption of judicial power by bank commissioners. The only basis for rejecting an application should be failure to comply with the law. Whether there is need for an other bank in a place is none of his business. As well might the state stop a man from selling groceries because the town already has a sufficient number to supply its needs. There may be too many banks in a town, but that is a matter purely resting with the judgment of those interested, as long as the laws are complied with.

As to co-operative banks—what difference does that feature make? In a sense all banks are co-operative. The stockholders are the equal beneficiaries on their investment, and it is usual for banks to rely upon as broad a distribution of stock as possible to popularize the institution. In so far as one owns shares in a bank, he participates in the profits. Naturally, his business is given his own bank, and his deposits form a part of the working capital. On time deposits he receives the same interest rate given a depositor who has no stock, and in that respect the two are equal.

The mutual, or real co-operative bank, does business under the same regulations governing the ordinary bank, *except that every depositor shares in the profits.* That is, instead of being a mere depositor, his money is carried to capital account. Ordinarily, he has no stated income from his deposit, and in case of failure to earn would receive nothing; but if business is profitable, his return must of necessity exceed any stated rate a savings bank could offer.

As far as co-operative banking is concerned, it is uniformly successful where carried on under state supervision. One bank in New England added a half million to its capital stock in the six months ended June 30, and now has a capitalization of four and a half millions. Heretofore it has not sold part paid shares on a participating basis, giving only a low interest until the shares are fully paid, but it now announces a guaranty of seven per cent on part paid balances, with full participation when shares are delivered on final payment. This indicates a better ratio of profit at that time.

The argument of the *Western Banker* against the plan marks the recognition of the banking business that collective banking is a menace to the old idea. Collective banking is only another step forward.

Another Inside Story

PLEASANT news for those persons who like to get the straight of the matter comes in the announcement from London that Premier Lloyd George is preparing to unloosen upon the world a nice set of personal memoirs, syndicate and book rights contracted for and motion picture rights reserved in the British Empire, Germany, United States and Latvia.

If there is anything we like to have it is the truth about everything. And coming first-hand from Mr. Lloyd George, who has been in a position to know so much about so many things for so many years, the information is certain to be worth the price—especially if the binding is good!

We have had the inside stories of a great many things during the last few years. Mr. Tumulty has told us all about the way we won the war and why. Mr. Frederick William Hohenzollern, crown prince sans empire, has given the real inside story of the war. Count William Hohenzollern, formerly of Potsdam, has figured much in the public prints, anent the bidding for his memoirs. Mr. Ludendorff, Mme. Calve, Mr. Kohlsaat, M. Rosen, Mr. Babe Ruth, Mr. Lansing, Mr. Chaplin and others have written indelibly upon the pages of world history the true stories of the stirring events in recent history in which they severally have played parts.

It would be difficult to withhold from Mr. Lloyd George a tribute to his courage in announcing his memoirs. There is so much that he can say. And if he tells it all, it is difficult to understand how he will retain the friendship of all the personages and elements which combine to enable him to hold his precarious tenure of the premiership. If he tells too little, his book won't sell. In the interest of accuracy, it is well to note that Mr. Asquith is in writing mood, M. Clemenceau has returned from his tiger-hunt, and former President Wilson is able to write notes. So there need be little fear that Lloyd George's book will, with temerity, trespass upon the facts.

Pity the Poor Adjective

THESE words and phrases were contained in one paragraph of a recent advertisement:

"Great; mighty; greatest; greatest and strangest; elegances and excesses; portrait of soul; ever-changing and ever unchanged; Babel with a thousand towers; wares and weaknesses of the earth; builder of palaces and wrecker of hopes; philanthropist; regilding her gauds; painting her old toys afresh; worshiped their glamour."

The particular advertisement dealt with the product of one of the writers of erotic novels of the era. It could as well have dealt with grand pianos or paving blocks.

The public is naturally depressed regarding the situation. It is not so much the nausea from seeing the superlative used so often; rather despondency that the writers are so old-fashioned. The superlative craze which hit our literature in the early days of the war is officially over. Even the writers of scenario titles realized that fact a year or more ago. But in advertising the users of superlatives still reign.

We read of the finest cloth, the most beautiful hats, the noblest charity, the purest distilled water. In New York theaters there are at least 25 shows playing, each of which is "the best show in town."

Not for the moment does the writer believe his superlatives convince the buying public of the superlative merit of the commodity he advertises. The only person he strives to impress is the head of his advertising department. The buying public long since became disgusted at adjectival abstractions; advertising departments still follow the vogue of 1917.

Too Good to Be True

AT LAST, Joe Miller's joke-book is officially to be banned from the American stage. Comes the management of a vaudeville circuit with the enheartening announcement that prohibition jests are out.

The vaudeville management took occasion to deny that this is any surrender to American sentiment for the serious treatment of a serious law. Rather, the management insists, it was merely that the prohibition jokes were more than three years old, and were getting a bit stale.

In view of the fact that there wasn't much of a laugh in them to start with, the management may be permitted to offer whatever reason it desires. As long as they are gone, the public will be satisfied. Theater men in connection with the demise of the prohibition joke also made it clear that they thought three years was long enough for any joke anyhow. In that period, there is plenty of time for a person to hear a joke, to re-hear it, to get the point, to tell it, to tell it again, and to get tired of it.

If theater managements can really enforce their pronunciamiento, we will get rid of the so-called joke altogether and may get a chance for a little real humor on the stage. But few will be hopeful of oslerizing the joke at three; most of us would be content if some of those of 300 are eliminated.

Strikes

FEW realize the full extent of the strikes and walkouts, hence the universality of labor disaffection in this country. The Department of Labor estimates that more than a million and a quarter of wage earners are idle in protest against wage cuts, and that more will soon be out unless the program is altered.

Public attention has been centered on the troubles in mining and transportation industries, but these comprise but a small proportion, a little more than half, of the entire number of toilers who will not work. The army of the unemployed is unable to supply the places of the strikers, chiefly because the latter are generally skilled in their lines.

It will not do simply to accept the statement of propaganda of the employers' organizations as to the causes of so much disaffection. The time was chosen by them to force labor to accept reduced wages and the campaign is a development of two or three years. Taking advantage of economic conditions following the industrial paralysis, due to money manipulation by the same leaders, the attempt has been made to make labor compete against itself in the employment market. Divested of all the camouflage of the divine right of men to seek employment as individuals, the whole scheme has been to degrade labor and make its compensation such that it will be impossible to gain more than a mere existence.

All the talk of liberty and freedom is for the ear, not for the reason. The horse is used until age makes it worthless. It is then mercifully put to death, unless the owner cares to realize a few dollars by selling it to some one who will drive it until it drops. The inspirers of industrial trouble, the kings of capital, would put the wage earner in the horse class.

Mothers and Babies

FROM the beginning of the habitable world, mothers and babies have been; as long as creation endures, mothers and babies will be, yet it has taken a good many hundred years for us to realize that mothers and babies, between them, hold in their hands most of the great questions of the day, and that when we get ready to make the world really safe for these two classes of the population, it will be a quite desirable place in which to live.

We were singularly stupid about this, for the reasoning is as plain and simple as that two and two make four: A happy, healthy mother usually produces a happy, healthy baby; a happy, healthy baby ought to and can, if it has half a chance, grow into a sound, normal child; a sound, normal child ought to, and will, if it has half a chance, grow into an efficient desirable citizen. Reverse the reasoning, and you see that the time to begin to make efficient and useful men and women is before they are born. Oliver Wendell Holmes told us this a long time ago, and other great men have said the same thing a great many times. Yet we are only beginning to get some idea of the profundity of this truth.

In the United States we did not bother much about mothers and babies until after the twentieth century was well under way. Then some few people began to get uneasy about our losing countless hundreds of babies every year in the hot summer months, and began to disturb themselves about the quality of the milk supply, and to talk and write a little about the significance of a high infant mortality rate. But most of the things that were done were in the nature of humanitarian efforts to relieve a present and intolerable condition. The idea of preventing unnecessary loss of life by preventing illness was hardly yet born in the public mind. The medieval notion that mothers must enter the valley of the shadow alone and with little hope, still prevailed long after the leading physicians had reduced their maternal deaths to one or two per cent. It was not considered to be a public disgrace to doom a baby to life-long blindness from *ophthalmia neonatorum,* even though Crede's discovery of the efficiency of a certain treatment had been public property for 40 years.

We are all slow and stupid, as well as poor miserable sinners! But we can and do learn. Whether we shall protect our mothers and babies from unnecessary death, illness and suffering by public or private means, by national or state agencies, they are bound hereafter to be somehow protected. A return to the old era of blindness and stupidity with its hideous cruelties and immeasurable sufferings, is unthinkable. Rather, we shall go on to demand more and better conditions for those with whom all the hope of the world rests—mothers and babies!

Mr. Ford's Page

THE coal strike was started and continued because speculation in coal is more profitable than mining it. It has come to be a part of the business of coal-selling to start some kind of annual scare which shall serve to stimulate a panicky feeling among the people and form the excuse for increased coal prices during the winter.

There is plenty of coal. Our annual production exceeds our needs. The coal supply is so plentiful that mine operators are always confronted by a full market when they try to sell. There is never a coal shortage—an actual shortage of coal: but there is often a threat of a coal shortage. The surplus stocks are always sufficiently large to supply a feverish country after it has been thoroughly frightened into a willingness to pay big prices.

To say this is equivalent to drawing a criminal indictment. To say that in this country there are men who can deliberately juggle with the coal supply and by fictitious scares draw millions from the people who buy their coal by ton and half-ton lots, is to describe something which belongs to an uncivilized, an enormously cruel and unorganized state of society. Yet it is all done under the protection of the laws which are supposed to exist for the protection of the rights of all.

Human cruelty goes this far: human greed thus deliberately precipitates widespread mental distress caused by fear of future physical suffering: human cupidity thus puts money above everything else. Perhaps it is intelligible in a world that so lately used a terrible war as a camouflage for the most horrible forms of profiteering. We shall have to accept the fact that there are human jackals in our midst who will do this thing whenever they can. But how long shall we leave our affairs so that they can? How long shall we be content to let Government be but an onlooker when these things are done? How long shall we regard these organizers of fictitious famines, these profiteers, as clever business men who are entitled to their gains, and to their freedom, even though they have thrown the country back five years by their action? We know how bad it is: how much longer shall we allow them to enjoy their game? There are men in jail for long terms whose only offense was a spoken word which was judged to be contrary to the welfare of the country during war time. For ten words some men received 20 years in jail. Yet these coal profiteers, who do more real damage to our nation than many an invading army could do—these men are allowed to pursue their game and enjoy the prestige of their money. Our complacency toward them is as immoral as their actions toward the country.

FUEL Control, as practiced by the men who are in charge of it, proceeds on the wrong principle. It accepts as a fixed fact the diminished supply, and doles out coal in driblets, when it should make its principal problem increased production. A Coal Control with no coal to control is an absurd spectacle. The profiteering brokers have plenty of coal. There are mountains of coal above ground, but it is in control of rascals whom the Fuel Control doesn't seem able to control. That is, we are witnessing a display of government with absolute power over the people, and no power at all over the groups that have forced all sorts of distress upon the people. This year everything seems to be "essential" except employment. Every kind of interest has been cared for except the interest of men who make their living by daily toil.

It is evident to all who have watched the proceedings of recent weeks that we have at last reached the place where strikes have ceased to revolve around questions of wages and working conditions, and have become a problem of national life. Both the unions and the managers in every field of labor involved have had ample time to demonstrate their ability to organize their several industries on the basis of justice, but all they have succeeded in evolving are more potent forms of interfering with the nation and giving ever wider and richer scope to that species of economic ghoul which we know as the profiteer.

Nor does this exhibition of helplessness remain only with the direct participants in the strike—it also spreads to the Administration. One must here carefully distinguish; one must not say that the Government is helpless: the Government has all power in these matters, but the Administration has not seen fit to use that power. There has been a too ready disposition to rely on words instead of acts. But worse than that, there has been a too ready disposition to think of "acts" only in terms of military force. If an Administration can only think of the army when it thinks of actually "doing" something in such a crisis, it is much better off "doing" nothing. We must credit the Administration with a sound instinct when it preferred doing nothing, to doing what some of its advisors understood by "action."

There were two things to do—either of which would have been sufficient. The Government could have invited all the parties to the strike to divest themselves temporarily of their characters as belligerents and resume their characters as American citizens for a national emergency, and take up their work until the country as a whole was safely provided for and until a tribunal of citizens could place the coal and railroad business on such a basis as would settle this strike not only, but absolutely destroy the fruitful sources of all strikes as they now exist in those two businesses. It can be done and it can be done easily, but it cannot be done either by professional capitalists or professional politicians. This, however, is dependent entirely on the wisdom of an Administration, and may be passed by if necessary.

But the second thing cannot be passed by, for it rests neither on the wisdom nor the discretion of an Administration, but on its plain duty: coal profiteering should not have been permitted even to begin. It was allowed to begin and to continue in spite of the oracular "statements" from Washington that it had been officially forbidden. There never has been such a flood of coal all year as has been offered to manufacturers since the strike began. The profiteers were all prepared for it, and the wires and mails have been burdened with their offers for weeks. It only needs an hour in any big factory office to see the wholesale robbery in operation throughout the country. Whatever may be right in the whole strike situation, this is wrong. Nobody has to debate about its wrongness. It is a case for police power executed upon men in upholstered offices. But, though it continues daily, has any profiteer been made afraid? Not one. The strike continued because it was profitable. Plans of settlement were frustrated because there was profit in unsettlement.

It was absurd to begin at the rationing end instead of at the supply end. And the absurdity was deepened by the kind of rationing and the sort of priorities decreed. Under the present rulings it is more necessary to supply gas to a theater and electric lights to thousands of glaring advertising signs, than to supply coal to industries. Just now, the giving of employment to wage earners is our most essential industry, and nothing can be more stupid, officially or privately, than to interfere with that.

The question is Coal, and Control of Coal. Efforts directed at getting coal would have rendered unnecessary the efforts expended in rationing coal. We have a great army of coal-rationing officers, and none at all of coal-producing officers. Why? Because politicians are more accustomed to accepting failure than to defeating failure by producing results. The place to attack the coal problem is not at the point of distribution, but at the point of production. Furnaces cannot be kept going on telegrams and announcements from Washington. We have a class of men trained in cutting down the people's supply but with no experience in maintaining that supply or increasing it. And they are in control of the present situation. Every conceivable mistake has been made and every possible evidence of bewilderment has been given. It seems as if a deadly gas had seized upon "our best minds," drugging them, incapacitating them to do the simple things which are so obvious to common sense.

But it is probably part of our emancipation that all kinds of mistakes should be made at once. A mixture of wisdom with the mistakes would prolong this era of mistakes a little longer. As it is, it is being exhibited without mitigation to the whole people.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Canada's Growing Problems of Immigration

Dominion's Alien Difficulties Similar to Those of the United States

By A. R. PINCI

TO OBTAIN a trustworthy mental bird's-eye view of the Dominion of Canada in relation to population it is imperative that either observer or critic be thoroughly imbued with two outstanding facts—the extent of its territory and the contrasting fewness of inhabitants. Without a clear conception of these two salient subjects it would be preposterous—and that is why so much sociological discussion of the kind at this time is preposterous—to indulge in any study about immigrations, kind, quantity and quality.

The Canadian immigration problems are essentially the problems of the United States, stated previously, and their solution should be impartially but jointly reached, both for the good of American and Canadian residents and to the detriment of no foreign peoples. In given circumstances there might be some difference of opinion and perhaps of application, but if variations were beyond the ability of either and both governments to adjust, then all other attempts to adopt selective policies would be necessarily inelastic and faulty.

Canada, fortunately, does not seem to be suffering from what is the most serious immigration-problem evil in the United States; that of well-financed, well-organized, subtle or vociferous pro-alien propaganda. Here and there exist evidences of agitating in favor of this or that emigrant-producing country, but it does not make much headway because, unlike the United States, Canada is nationally very young, and with the exception of French-Canadians all the others are families that boast, in a Canadian sense, genealogical trees that do not exceed two generations.

For this reason, as well as the fact that they are nicely scattered across hundreds of thousands of square miles of territory, it is quite impossible to start any campaign or movement that those responsible for it can finish. The two-generation Canadian, having had in general no opportunity to lose his identity through the atrophying influence of overpopulation, is not only a virtually recent citizen, but he has not forgotten that he had to roughhew his future endowed with little more than determination and an unerring home-building instinct; money itself, unaccompanied by those virtues, being a mockery.

That possession of money is no sign of a good immigrant has been realized by the Canadian authorities, and, happily, even by authorities in the United States. As a legal requirement, it was theoretically a very attractive proposition to provide that aliens should possess $250 or more, according to the number of relatives forming each family group, but there are too many individuals today who are little better than paupers and parasites who on the day of arrival were well-staked financially. In other words, a conditional capital of this sort is futile so long as it enables its possessor merely to defer, and not wholly to prevent, hoboism.

Now this hoboism, from which the United States is especially suffering at this time, is not the kind that is externally recognizable, as to dress, type, character and habits, but it is a sort of mental vagrancy that sooner or later degenerates into a moral vagrancy out of which grows that unhealthy civic unrest that during the last three years, for instance, has surpassed in destructiveness all the forces of the World War itself. It is understood, of course, that this analysis is not aimed at, and cannot possibly include, the immigrants that, staked or not, ready and willing, have not been successful in carving out for themselves a niche in either country, because in their case it is one of phys ical and personal discomfort but in no wise debilitating their sound principle of self-help.

The Parasitic Alien

SO FAR pro-immigration in the sense of a wide-open Canada has been without effect, but the movement has been started. It has failed, and will fail as far as the bulk of scattered inhabitants and citizens are themselves concerned, but it is not failing in those eastern centers where the population becomes more urban.

East of Windsor, and increasingly more manifest after striking Toronto, there are evidences comparable to those notable on the American side of the border not so much of unassimilable elements, but particularly of undesirable tendencies. Said in a few words, one begins to sense the sort of heterogeneous population that thrives upon speculative idleness, even though it is cloaked beneath apparently harmless commercial pursuits, that feasts upon the labor and effort of self-effacing individuals that stud the surface of the Dominion—especially to the westward.

One is not aware of this parasitism so long as one remains within the limits of this essentially artificial population. During a visit from Windsor to Quebec I was not aware of any unusual condition, of any conspicuous abnormality, for there are thousands of similar scenes in the United States, but as I began to wend my way northward, and especially after leaving the twin cities of Fort William and Port Arthur behind, Canada's foremost problem began to formulate itself in other terms.

This problem became more obvious as one traversed the territory from Winnipeg, in Manitoba, through Saskatchewan, up to Edmonton, Alberta, than may be the case farther to the south, especially where Canadian territory parallels our states of Washington, Idaho, Montana and North Dakota.

From a comfortable seat upon the rear observation platform one is apt to miss or ignore details that are vital in questions of this sort. The most suggestive and perhaps poignant of these were the alkaline splotches of white upon land that man has conquered against nature herself—splotches that look as if they might be caused by scattered artificial fertilizer but that instead are desiccating and corrosive.

Now these daubs of nature would mean nothing unless the eye at the same time sees hermit-like refuges along the horizon, sometimes many miles apart, but each and all remote from the world that we are accustomed to—and each representing the home of humble and patient settlers who are well-nigh feeding a fair proportion of individuals on this earth.

Canada, in this respect, represents the picture of the United States half a century ago, and thus what we refer to, in connection with immigration and population, as past history as of the United States, is vital and current history as of Canada. It is the eternal struggle between consumers and producers, or rather, an unhealthy disproportion of consumers against producers.

In the United States the struggle has long since been ended, and the consumers—that is to say, the speculators—have done their worst and are doing it yet, to the irritation of the Federal and state governments, that are forever enacting restrictive and regulatory laws to minimize the ill effects of the situation. In Canada, instead, this struggle has begun, but just now is almost at a standstill.

With Canada, the immigration question resolves itself to this—that the free or almost free asylum of present-day emigrating classes would add to the speculative and not productive elements of population. The Canadian citizenry of self-exported type, in contradistinction to the imported type, is that which glues itself eastward of Windsor, Ontario, with an eye to both the south and the north. This citizenry, mainly of Papadopouloses and Blattsteins, to use patronymical differentiation, has done the very best it could to preempt all such activities that will give them all of the fat of Canadian land for the least possible individual effort and discomfort.

Junk Dealers Thrive

NOW this is not my own opinion, but merely my interpretation of collective Canadian national opinion. I have not limited myself to the well-to-do and sometimes selfishly oversensitive classes that one may meet in parlor cars, in luxurious hotels, in idling hours. Rather, I have sought the views of the submerged citizen, the fellow that ordinarily has a vast amount of common sense but whose opinions rarely drift to public attention.

In a preceding article I have stated that Canada's immigration problems are so alike unto those of the United States that it is difficult to separate the two, except officially. What is said about Canada, therefore, is essentially an analysis of Canadian problems, but effect, if not always cause, is the same in both countries, and perhaps simultaneously so. In reading of and about Canada in this respect it should be borne in mind that whatever is not applicable to the United States conveys a moral for the latter's citizens.

National irritation exists throughout Canada with the semi-Slavic and semi-Ottoman elements.

In Canada the Greeks run all the middle-class, and, therefore, most important, aggregate business. The Slavic element runs all that is invisible but indubitably the most vital. Montreal, a Montrealer told me, "is owned by Jews and sold at retail by foreigners." Foreigners means aliens that are unassimilable even though they are naturalized citizens. Montreal is the chief city and commercial metropolis of the Dominion. One can walk for an hour along Craig street west and see "stores" that tell a tale that certainly is not in keeping with the traditions of ancient Hochelaga.

Why do they thrive? One of the "props" told me.

"There is always somebody who has something to sell; we manage to buy and resell it a few times."

That is an excellent principle, so long as there is demand for supplies. But it is difficult to conceive how a few hundred junk stores of this sort manage to fatten their sarcastic and surly proprietors simply upon the normal turnover of such merchandise, some of which is there, I suspect, for effect and not for business. One may observe such discrepancies as new cotton gloves for 30 cents a pair that can be purchased on the chief business streets at a chain store for half the price, but the latter of course are not shopworn and are not sold "at a second-hand price" because it is a second-hand store. But the most engrossing, compelling, provoking and even harrowing picture—told without words—is to see the collection of mementoes that bear a predominantly military or naval ownership or source; medals of honor, lockets of sentiment, gifts tragically personal.

Yet your everyday, garden variety of Canadian feels quite helpless, and he will tell you so. He will tell you that the newspapers refrain from comments that may displease or offend those persons that pull the strings in this sort of immigration game. Thus the subject is handled gingerly by the press. At Ottawa officials whisper with the same hesitancy and ominousness that would mark any traitor's intrigue.

Between Calgary and Vancouver there exists the same subjugation of private opinion, although in the territory between those two prosperous cities one hears much vociferating against the Oriental, notwithstanding that Canadian farmers tell their own story—or two or three such representative farmers have told it to me frankly—so plausibly as to show that though there may be honest differences of opinion about the pros and cons, there is a striking sense of favoritism toward "softer" alien types. I have been for the first time the listener of a story that throws a different light upon a phase of Oriental immigration that bears studying out.

A farmer of rough hands, negligently prosperous if somewhat rurally garbed, boarded the train at Wetaskiwin, on his way to Bowden. As I was traveling from Edmonton to Calgary I had an excellent opportunity to chat with him, and he spoke to me as a "writer from the States just looking around." I did not say at any time to any chance acquaintance that I was interested in any subject because I did not wish to be the recipient of pet theories, and in this instance his conversation was as natural as gravity itself.

He wanted to know about Wilson, about New York, about Congress, about labor, about business conditions, about radio, and from the diversity of topics it was obvious that without being highly educated he was well posted. The sight of a Chinese lolling at the door of a cabin set between stations, come there probably to obtain the only excitement of the day—a passing train—led me to say something about the Celestial.

"We haven't enough of that kind," said my traveling companion.

I was surprised. "Not enough?" I repeated. "Aren't you Canadians against Oriental immigration?"

"Against immigrants, to be sure, but not against workers. A pair of hands is a pair of hands. What they turn out, and the way they turn it out, is what counts. That's the way I tell if a man is a good worker or not. And just now we need a few thousand more Chinese than anything else, and I am not talking about Chinese people, I am talking about Chinese workers—their hands and nothing more.

"The trouble is that in all this worry about Chinese labor we have plumb forgotten that it's all wrong to reject workingmen by the job lot when our idea in the whole thing is that of protecting our people. But just now we have gone so far protecting Canadians from Orientals that bless me if they are not doing the contrary.

"What I want and what every man who has work to be done wants is somebody to do that work, and I agree with you that I mean work that does the whole country some good. If the work has to be done let's do it. Just now we are doing little of it, and less every year.

"I am not speaking for myself because I am on the other side of 50 and have enough to live on and work for, but I know what the job is and I know of farmer after farmer that is up against it. He has the land—and he has it just as it was created that third day of Genesis. Do you know what it costs to clear an acre of land down where the timber grows? No? Well, the farmer is lucky if he can do it for $500. That means a hole in his pocket and most of them can't stand it. They go broke, and they sell. They sell cheap—they don't get even 60 per cent of expenses of clearing, to say nothing of the land. Somebody profits shamelessly somewhere, and the worker of that land has to pay the way.

"You say you thought that we here in Canada kick against the Chinese? Well, in a way we do, but don't forget that we kick against them going to the towns and doing the work that white men, and natives at that, are doing. Down your way they went in for washing, I read somewhere, and cut prices. Well, that's a legitimate kick. But is it right to kick when they are willing to do the work, and doing it right and for fair pay, that no other mother's son is going to do unless he breaks you, if he isn't yellow-bodied?

Chinese Desirable (Immigrants)

"WAIT; there's more. It's a good argument, but nobody wants to start it. The Chinese don't come here to raise families. We can find fault with the way they live, but it's a good quiet life. They raise what they eat. They live in houses that they build. They give a sight more than they take.

"See that piece of land?" My interlocutor pointed out a bit of sparsely timbered land. "There is nothing on there—bare as bare can be. Give me 10 Chinese, and in a week they'll have a house, a vegetable garden started, and be working away to produce. They aim to go back to China and die anyhow, but if they don't we might fix it so as to make sure that too many of them don't stick around, but what's the good of perpetuating this wilderness?

"That's Canada today for you, and I have seen a bit of this place. Land and more land. Somebody must work it. There are not enough Canadians to do it, and the young ones who started wrong in the towns can't be taught new farming tricks now. They don't count. This back to the farm movement doesn't mean much. Few of those that try it stick because it isn't in their brains. And we can't stand that sort of thinking work.

"I don't care how it's fixed, but I do say that the Chinese are mighty good workers and we need them badly. They'll take a piece of raw land and don't ask your blood as the price to fix it up for you. They'll take reasonable pay—and we believe in paying what all work is worth. I can take 500 acres and start them going if it won't cost me more than $2 a head for men—but $5 or $6, and all fixings too? It can't be done.

"And, don't forget this—what there is to Canada today, farming, railroading, irrigation, and all hard work like that, is because somebody started it on fair and not fancy wages. Now that the fair wages are

Great Detective Stories That Are Never Told

Secret Service Archives Conceal Mysteries, Crimes and Captures

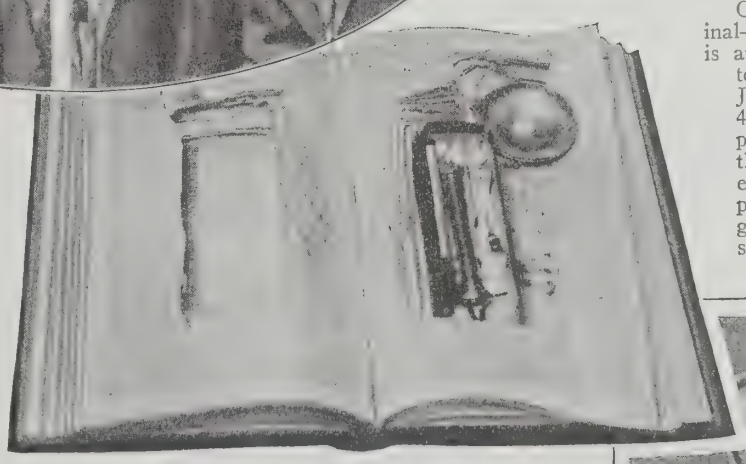
By GEORGE H. DACY

Chemical laboratory of Internal Revenue Department, where whisky of "bottled-in-bond" type is tested.

Office of Controller where $250,000,000 in national bank notes are stored.

DURING one of Woodrow Wilson's visits to the National Press Club where news writers and editors from all parts of the world get together, some one asked what kind of reading he liked the best. Smiling rather apologetically, Mr. Wilson replied that he realized the greatest enjoyment from reading a rattling good detective story—not a trashy dime novel but a complex-plotted, exciting, interest-stirring production such as the true stories about the activities of the United States Secret Service and other plain-clothes men who ferret out involved national and international mysteries.

One of the leaders of this service remarked during a visit I made to his office in quest of information, "How long do you suppose this Service would be secret if we told the press all about what we are doing?" The policy is to shun publicity. It is as easy to talk to the Sphinx of Egypt as it is to obtain a sanctioned and official interview with the leaders of Uncle Sam's detective service.



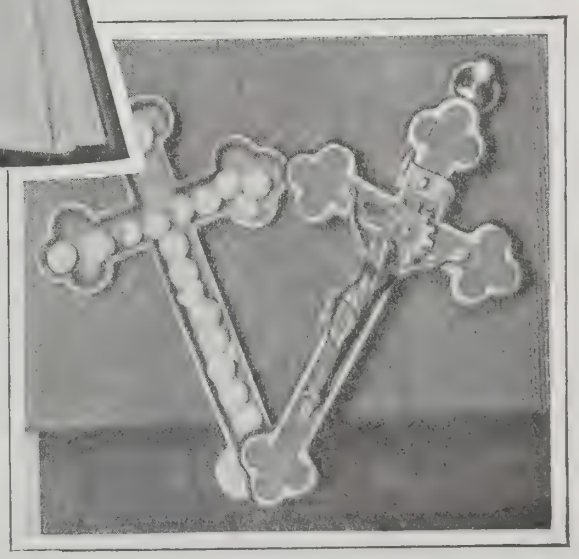
It is a catch-as-catch-can proposition as to how many members there are at present in the Secret Service. Ask the officials and they will reply that their oath of office prevents their giving out such information. Suffice it to say that last year there were enough Federal detectives to make 1,025 arrests—this is 100 more captures than ever previously have been consummated in a single year. Three hundred and twenty-four note raisers and 259 check forgers were included in this total, indicating continued activity among these classes of offenders. Twenty-eight new counterfeit note issues were discovered in circulation but, for the most part, they were crude imitations and were detected readily by the national sleuths. Many spurious specimens were received in remittances from European countries, indicating that the counterfeiting of our obligations and securities is more or less prevalent abroad.

Secret Service operatives have had to cope recently with a new crime which has followed prohibition. It features the counterfeiting of internal revenue strip stamps on bottles of "bottled-in-bond" liquor. Last year, Secret Service agents arrested 96 persons and seized many truckloads of labels of popular brands of whiskies and gins. In many instances these counterfeit stamps were being used on poisonous concoctions.

Counterfeit notes aggregating $196,993 were seized or captured as well as $12,239.33 in counterfeit coins, 171 counterfeit note plates, 14 engraved dies and 48½ sets of molds for coin counterfeiting, together with a large quantity of miscellaneous tools and materials intended for use in counterfeiting operations. The year's accomplishments also included the investigation of 3,500 forged check cases, 1,250 altered and forged Liberty bond cases and 560 altered and stolen war-savings stamp cases. Although only 259 arrests were made in the forged check cases, nevertheless, the Secret Service agents were successful in nearly all the cases assigned to them in discovering the forger, but a majority of these cases presented circumstances sufficiently extenuating to warrant the United States attorneys in dismissing the cases after restitution was made. In the altered and forged bond cases, approximately $750,000 in stolen and forged bonds was recovered to the government and banks during the year. In co-operation with the Bureau of Printing and Engraving, the Division of Loans and Currency and the Registrar's and Treasurer's offices, the Secret Service has also rendered valuable service in safeguarding the obligations and securities of Uncle Sam.

The same fear which is engendered among thieves and criminals in the British Isles by the mention of Scotland Yard now develops among the underworld denizens of the United States when they learn that agents of the United States Secret Service are on their trail. The government plain-clothes men have won the reputation of sticking to the trail until they get their men. If the inside story of Secret Service could be made public, the vast majority of our American homes would be burning midnight oil night after night while their occupants read the most thrilling tales of crime, chase and capture that were ever printed.

Did you ever hear about the criminal who planned on stealing the original copy of the Declaration of Independence, of spiriting it overseas and of holding it in concealment in Europe until Uncle Sam paid more than $2,000,000 for its safe return? This particular lawbreaker was successful in locating a confederate in a government position in the State, War and Navy Building in Washington where the precious document was then on display. Secret Service agents who at the most unexpected times bob up and frustrate the best-laid plans of clever crooks got wind of the proposed robbery and prevented it.



Above—Two Government detectives with a "Mexican Negro" they arrested for setting fire to Veterans' Bureau building. Below—The drug peddler knows no fear or sense of sacrilege. Here is a Bible hollowed out to conceal narcotics. To the right is a hollow crucifix used for similar purposes.

A certain prohibition enforcement agent in New York City has won countrywide publicity because he dresses and acts a hundred different rôles. The majority of our expert agents of Secret Service are more skillful. The difference is that the public rarely hears about the many and varied disguises which the government detectives can and do don. For example, one of the worst moonshine stills in Kentucky was raided and razed to the ground as a result of a Secret Service agent disguising himself as an escaped convict and seeking refuge at the cabin of the ringleader of this gang. After several months, the agent was treated almost like a member of the family. Finally, by keeping tab on the movements of the mountaineer, who occasionally stole away from the cabin in the middle of the night, the Federal representative located the still. Thereupon he communicated with his associates who raided, wrecked and ruined the plant where the illicit corn whisky was being made.

All the government departments and bureaus in the national capital are provided with skilled and expert detective service. The United States Secret Service is an important branch of the Treasury Department. The Department of Justice has a special Bureau of Investigation which was reorganized recently and placed under the directorship of William J. Burns.

One of the most interesting features is a training school for Department of Justice agents where the novitiates are instructed in the rudiments of crime study and criminal detection. The school is in charge of experienced and expert investigators. Henceforth, relatively "green" men can rub off the rough edges and acquire proficiency in the fundamentals of sleuthing under the supervision of practical teachers instead of having to obtain this knowledge under field conditions at heavy expense to the government. The detective college will be able to turn out enough graduates so that Uncle Sam can assign trained investigators to all cases of violations of the Federal statutes.

One of the most interesting files of criminal—and near-criminal—histories in the world is at present maintained by the General Intelligence Division of the Department of Justice. Index cards to the number of 450,000 containing brief histories of suspects, organizations and societies are in the government archives as well as many exhibits, photographs and descriptions of persons engaged in activities against the government. That national crimes are still an important factor in the evil deeds of the world is evidenced by the fact that more than 1,500 new photographs have been added to the "rogues' gallery" of the Department of Justice during the last 12 months. Complete data is kept on the purposes, plans and ideals of all associations, clubs and societies that are organized in the United States. During a recent year, 446 aliens have been deported under the anarchy provisions of the deportation law. During the last year, the activities of foreign propagandists in this

The Golden Mistake That Won a World Series

Stories of Brainy, Inside Baseball—and the "Breaks of the Game"

By H. G. SALSINGER

GEORGE BURNS, first baseman of the Cleveland Americans, was sitting on the edge of the dugout in the Brooklyn ball park, watching the infielders as the third game of the world series of 1920 was drawing to a close. Burns suddenly became more alert, gazed intently for several minutes and then, turning to Manager Tris Speaker, remarked:

"I think I got 'em."

"Who's giving 'em?"

"Kilduff—there at second. Watch him!"

Pete Kilduff, Brooklyn's second baseman, was bending low as the catcher signalled the pitcher before the delivery. Then, when the pitcher prepared to wind up, Kilduff picked up a few pebbles of dirt. At times he tossed the dirt ahead of him; at other times he tossed it behind him, his bared hand and arm swinging at his side or between his legs.

"Notice him?" asked Burns after Speaker had watched Kilduff on several pitched balls.

"Looks like it. We'll try him out," replied Speaker.

Calling the next batsman to his side, Speaker gave the player implicit instructions. He was to wait the pitcher out and he was to watch every pitched ball closely and discover what it was.

From the dugout Burns and Speaker watched Kilduff and when the batsman returned to the bench they had the key to the Brooklyn signal code. They knew then that whenever Kilduff tossed dirt in front of him the pitcher was about to deliver a fast ball and whenever he threw the dirt behind, it was a spit ball or a curve. The same signal was used for any ball other than a fast ball.

The discovery came too late in the game. Cleveland was beaten. Cleveland had been beaten on the previous day. The first game of the series was a Cleveland victory.

Signals and a Fast Field

BROOKLYN won its way through the National League chiefly because of a superior pitching staff. Grimes, Mamaux, Cadore, Marquard, Pfeffer and Smith were among the pitchers that had landed a league championship for Brooklyn and these twirlers were expected to win the world's title. The first game had been lost but in the next two they delivered. For 18 innings in the last two games at Brooklyn, Cleveland scored but one run and with the second defeat the Cleveland hopes sagged badly.

From Brooklyn the teams moved to Cleveland to continue the series on the American League grounds. In the coach carrying the Cleveland players out of New York that night there was an air of confidence not shared by the followers of the team.

"Little old New York, it's the last we'll see of you until next May for we're not coming back again this year," promised Joe Wood looking out at the disappearing landscape. To end the series in Cleveland the American League champions would have to win four games in succession.

"Four in a row for us when we get home," agreed O'Neill, the catcher. "When those infielders hit that Cleveland diamond they'll think they have been playing in a minor league."

"And when we start hittin' those pitchers they'll think their curvers has suddenly got paralysis of the throwin' arm," came a voice from the rear end of the coach.

A moving arm and a new supply of dirt were the foundation for this supreme confidence. Cleveland had solved the Brooklyn signal system and Cleveland, before this discovery, had decided that the Brooklyn defense could be upset by shifting to a faster diamond.

There is a difference in infields. There is individuality to infields. Different soil is used and in nearly all the soil is also used differently. Some infields are constructed so they are faster than others. A batted ball rolls more swiftly on one infield than on another, although not batted with any more force. Cleveland discovered, in the first game at Brooklyn, that the Brooklyn infield was unusually slow, slower than any infield in the American League. The home infield of the Cleveland club is fast, a great deal faster than Brooklyn's, and on the night of the first game instructions were wired to the groundkeeper in Cleveland to "speed up" the infield. For two days and two nights, workmen had been busy putting new soil into the Cleveland infield to make it even faster than before. Changing from the slow infield, to which they were accustomed, to this unusually fast infield, the Brooklyn players would be at a marked disadvantage.

"That's Funny"—But for Whom?

THE scene shifted to Cleveland and after one day of rest the series was resumed. The Cleveland players took the field with instructions to watch Kilduff. They were to set themselves and prepare to meet a fast ball whenever Kilduff tossed the dirt in front of him, the signal for a fast one. They were to ignore the delivery whenever Kilduff tossed dirt behind him.

The mastery of the Brooklyn pitchers disappeared in that game. Cleveland won, scoring five runs and five runs was more than their total in the first three games. The next day they scored eight, including a home run with the bases filled. They knocked out Grimes, leading pitcher of the National League and a spit ball pitcher. Grimes wondered why they swung only at his fast ball and ignored his spit ball. This baseball rout marked the turning point in the series. With Grimes knocked out of the box, with no pitcher able to stop Cleveland, the issue was all but completely decided and Cleveland achieved a complete victory in the next two days, winning each day and landing the championship, five games to two. The series, as Wood had predicted, ended in Cleveland.

Several months later, one bleak winter day, McAllister, the Cleveland coach, met Kilduff on the street in Columbus, Ohio. The world series was introduced into the conversation.

"I've never been able to understand how you fellows got on to our pitchers all of a sudden. The way you looked those two days in Brooklyn I thought you'd never be able to hit them," observed Kilduff.

"Oh, it isn't so funny," replied McAllister. "Not funny at all if you'd been where I was, on the Cleveland bench."

"I don't understand."

"I know, but if I were you, I'd get a different set of signals for next season. It's all over now and it makes no difference to us and that's my friendly advice to you."

"What do you mean? I don't need any advice. What have I got to do with a change in signal system?"

McAllister told Kilduff in detail how Cleveland had discovered the key to the Brooklyn signal code by watching him and how the batsmen, by observing the movement of his arm, had been able to know whenever a fast ball was coming up and bat accordingly.

As McAllister finished Kilduff laughed. "Yes, that is funny and you don't know how funny it is for I didn't give a signal all through the series. It wasn't me but Ivy Olson, our shortstop, who was signalling the outfielders on every pitched ball."

In baseball many movements of the fielders have meaning for the batsmen. Careful observance of these movements is among the first requisites for success. As soon as a new pitcher appears in the major leagues, seven teams begin watching his delivery, studying every movement carefully. Few pitchers can completely hide and deceive their delivery. Few can pitch without some telltale movement.

Not alone are the pitchers watched, but the infielders and the catcher. It is the duty of the catcher to signal the pitcher. Generally, by the use of the fingers, he tells the pitcher what kind of ball to throw. Then he signals the infield what kind of ball is to be thrown, curve, fast ball or slow ball. Spit balls, fadeaways and various other kinds of curve balls are all known under the general name of curve. Different pitchers use different kinds of curves. One of the infielders, second baseman or shortstop, signals the outfielders, giving them an opportunity to shift with the pitch.

If a team cannot find a flaw in the pitcher's movement it watches the catcher or the infielder that gives the signals to the outfielders.

Cleveland, being unable to detect a movement in the delivery of the Brooklyn pitchers, turned to the catcher and infielders. Then came Burns' discovery and the turning point in a world series.

A Home-Run Orgy

THE strange revelation, months later, that Kilduff did not give any signal, does not destroy the value his movements had for the Cleveland batsmen. Kilduff unconsciously went through a certain motion when a fast ball was about to be pitched and through another motion when a curve ball was asked for. Ball players frequently do that.

There was a memorable game in Philadelphia one day last season. Detroit was opposing the Athletics on Connie Mack's own grounds. "Dutch" Leonard for Detroit, and Edwin Rommel for Philadelphia, two of the best pitchers in the league, were in the box that day. The catchers were Johnny Bassler for Detroit, and "Cy" Perkins for Philadelphia. Few catchers as good as this pair have worn mask and chest protector in the major leagues in the last 10 years.

With two remarkably good pitchers and two crack catchers working, that game produced what the reporters described the following day as a "cloud-burst of hits." Philadelphia made two home runs off Leonard in the first inning and, before the game ended, Philadelphia had made six more, a total of eight home runs in one afternoon. Detroit, although getting but one home run, was making singles, two-baggers and three-base hits in batches.

Both pitchers were relieved early in the game, naturally, but their successors were given the same treatment. Each team felt certain the other team had its signals. Early in the game the infielders quit giving the signals to eliminate that possible source. But the hitting continued. Then each team felt certain that the pitcher had some telltale movement that was informing the batsman what kind of ball was about to be delivered. Both were sure the signals were not being "snatched" from the catcher for each catcher was a master, polished, finished, "sign proof."

Catchers have given away their signals by dropping their hands to the ground with the batsman "on deck," by moving to a position behind the catcher, noting the signal. Bassler and Perkins, as the heavy hitting continued, took constantly better precautions to hide the signals and they covered them so well that it was with difficulty that the pitchers got them.

There was much discussion after the game. It was a mystery. The mystery grew deeper in the remaining games of the series when pitcher after pitcher was badly battered. All explanations fell flat. It was months later that the cause was discovered. Each catcher unconsciously tipped off the delivery while giving the signal. Perkins had a curious habit of moving out his knees fast whenever he signalled for a fast ball. The movement of the knees had nothing to do with the sign. Perkins was unconscious of it and his pitchers and team mates had never noticed it but the opposing team had. Careful checking up of Perkins' movements disclosed the fact that every time the knees jerked sideways a fast ball was delivered to him. The coachers on first and third watched Perkins' knees and every time the movement occurred they would yell "Come on, Boy," to the batsman, who would set himself and "step into" the fast ball. Bassler also had an unconscious movement. Whenever Bassler signalled for a curve ball he brought his elbows forward but when he asked for a fast ball the elbows remained close to his side.

Had the Brooklyn players closely observed Steve O'Neill, the Cleveland catcher, during the world series of 1920, Stanley Coveleskie would not have had such remarkable success against them. Coveleskie, a spit ball pitcher, defeated Brooklyn in three of the five games that Cleveland won. Coveleskie himself is not a sign-proof pitcher because he does not always handle the ball before delivering a fast ball the same way he does when preparing to throw a spit ball. Every spit ball pitcher naturally bluffs throwing the spit ball many times more than he actually throws it, for the spit ball wears out a pitching arm faster than any other delivery with the exception of the fadeaway. When Coveleskie prepares for a spit ball delivery he "smears" the ball well, twirling it behind his gloved hand before winding up, but when he bluffs the spit ball he often forgets to twirl the ball the same number of times that he does for the real spitter.

His Tongue in His Cheek—Wham!

THERE was a more certain method of finding out when the spit ball was coming. O'Neill, after signalling the pitcher, always let the fingers of his bare hand touch the dirt. Whenever he signalled for a spit ball he would pick up some dirt and let it sift through his fingers. He did this to enable him better to grip the ball when it was delivered. He never picked up the dirt unless a spit ball was coming.

Jimmy Lavender was one of the best spit ball pitchers the National League produced. When Lavender was in his prime he could not defeat the Brooklyn club. Brooklyn batsmen ignored his spit ball and hit his fast one. Lavender never understood why. He finally decided they could see how he held the ball so the next time he pitched against Brooklyn, Lavender wore the largest glove that probably any pitcher ever carried to the pitching mound. Lavender had decided the large glove would completely mask his delivery. He started with a new confidence but before the third inning ended Lavender discovered that he was fooling Brooklyn no more than he ever did, so he scratched Brooklyn off his list.

Lavender had an unconscious habit of shoving his tongue against his cheek every time he expectorated upon the ball. Whenever the cheek bulged out the batsman could be certain that Lavender would throw a spit ball. For that reason Brooklyn batsmen never offered at his spit ball. Lavender's motion for his fast ball was the same with the exception that the cheek would not protrude.

When Walter Johnson, of Washington, was establishing his reputation as the greatest fast ball pitcher of all time, batsmen always knew what was coming. The delivery would be fast, or faster, but Johnson's fast ball was so fast and carried such a sharp, zipping break, that the batsmen were powerless even though they knew what every pitched ball would be. Later on Johnson developed a curve ball but his remarkable record was made on a single delivery and he is the only pitcher in history that ever reached the top on only one delivery.

Matty's Mighty Threat

CHRISTY MATHEWSON was one pitcher without a flaw. Mathewson was to pitchers what Valasquez was to painters. He had poise, technique, control. In the language of the sport "he had everything." Mathewson's control was uncanny. He had a remarkably fast ball, a sharp curve and a slow-breaking curve. He had a slow ball. He knew when to use them. His fadeaway was probably the most tantalizing delivery that ever broke over a home plate. It was a curve ball that dropped in, toward the right-handed batsman and away from the left-handed batsman. Mathewson pitched with system. He pitched practically the same way to all right-handed batsmen when he was ahead of them, that is, when the count of balls and strikes was in favor of the pitcher. He invariably pitched the first ball over for a strike, establishing an advantage. When ahead of a right-handed batsman he kept the curve ball to the outside of the plate, pulled in his right fielder and challenged the batsman to hit. On left-handed batsmen, Mathewson used the fast ball and a knee-high curve and sometimes the fadeaway.

The fadeaway was Mathewson's big threat. He never threw more than 12 in a game, rarely ever that many. It was too great a tax on his strength. Sometimes he did not throw any. After he established the reputation of the fadeaway Mathewson did not have to use it often. The fact that he was likely to throw it at any time created a mental hazard with the batsman that gave Mathewson the desired advantage. It was not the first fadeaway ever brought into the majors, for "Buttons" Briggs, who pitched for Cleveland and Chicago, had a similar delivery although it was not

Germany, Prey of Alien, Faces Complete Ruin

Condition of Country, and Especially of Capital, Steadily Grows Worse

Berlin yesterday and today. Unter den Linden when the kaiser ruled, and the same thoroughfare under the republic.

Circle—Slavic types in Berlin. Below—Residential and business scenes in the German capital.

By WALTER M. WOLFF

This is one of several varying views recently published by The Dearborn Independent that our readers may obtain an insigh into conditions in Central Europe. This writer, an American resident in Berlin, expresses little hope for Germany's future

FIVE years ago Berlin fairly bristled and glistened with steel helmets and sabers; never a day passed without the dress parade on Unter den Linden; and the kaiser in all pomp and glory journeyed down from Potsdam. Today a few ordinary traffic cops and Schutzpolizei (security police) grace the streets in their black helmets. Added to this, one occasionally meets a few of Germany's new standing army of 100,000 men, who look more like National Guard recruits than veterans of a world war. But there is no music—no pomp—no goose-step parade—nothing! Berlin, once the mecca in the world of militarism, now stands like a disgraced officer from whom all chevrons, medals, and buttons—even the uniform itself—have been torn away.

It may be said in good faith that Berlin has fallen prey to the foreigner. Before the war Berlin had a large foreign population, but today statistics show that every twelfth person in the city is a foreigner. When one remembers that Berlin comprises a population of 3,200,000, it is easy to see that the proportion of foreigners is very large. There are today perhaps more than 2,000 Americans living in Berlin, which means that the American is finding Berlin to his liking. In the first place, he can spend a very comfortable, enjoyable and profitable year in Berlin for a few hundred dollars (which translated into German means many thousands of marks). Of course, he must not mind a little inconvenience—or even excitement—now and then, if a general strike or revolution breaks out at more or less regular intervals. While Berlin itself may have good intentions, the general atmosphere in Germany today is, as yet, far from clear.

It may be of interest to Americans not in Berlin to know just how Americans in Berlin enjoy themselves now that the *dollar* has become the true Almighty Currency. Hotels, pensions and furnished rooms are fully as numerous as saloons used to be on the Barbary Coast, but if one succeeds in locating something unoccupied, he can well feel prouder than the luckiest Klondike aspirant for gold. Furthermore, the Germans (especially the Berliners) know exactly how much money an American *ought* to have, and they cannot forget that the dollar once stood at 325. It is, then, no wonder that one pays all the way from ridiculous to exorbitant prices for everything—and still lives many times cheaper than in the days of greatest prosperity at home. If I should tell you that an American who lived in a little back room for $8 a week at home has now engaged a beautiful apartment with maid service and all for *$5 a month*, in Berlin you would cry, "Preposterous!" but it is, nevertheless, true.

How you have often wished you might hear the finest grand opera, or attend a masterful performance of "Faust," or "Peer Gynt"—but remained at home because you hated to spend at least $3 for a seat. If, however, you were in Berlin and found that you could obtain the best seat in the house for 60 cents (including war tax), you might go and take a friend along for company. The finest recitals, concerts, and every form of entertainment and amusement can be had for but a few cents. Also, you need not bother to wait for a street car after the performance; there are plenty of taxicabs to take you all over the city for a dollar, and taxi drivers have been allowed to multiply fares *twentyfold* over the pre-war rates.

There are also other peoples who seem to be finding Berlin an ideal haven. These are Poles, Czechs and Russians, of whom there are fully 300,000 altogether. They seem to eke out some kind of an existence at various occupations, and live in the very poorest sections of Berlin. Most of this type have no passports and are refugees from Russia and Poland. If it were not for the fact that Socialists and the Communists are very strong in Germany—especially so in Berlin—race antipathy would be quite as strong as in California against the Japanese. The average German has long realized that the sooner these elements of agitation are forever dispelled, the sooner will Germany find herself on the road to a complete and healthy recovery. While the American comes to Berlin with his optimism and friendliness and desire for co-operation (as well as with a most varied assortment of negotiable credit instruments), the undesirable foreigner comes almost at the risk of his life, for if he is caught without proper credentials, he is expected to be on his way eastward or southward within 24 hours. However, Germany is to blame for a very poor enforcement of this rule, and the undesirables are losing no time making the best of their nefarious opportunities.

A conspicuous inhabitant of Berlin is the omnipresent Jew. The fact that Berlin has a very large Jewish population is ample proof that at least one city in Germany need not fear economic chaos or bankruptcy. Judging from the Jew alone, Berlin should be the wealthiest metropolis on earth, for there is not a Jew here who could not buy out the city many times over during the day and then sell it again at "sacrifice" the next morning. The best food in Berlin, the most luxurious apartments, the finest automobiles, and the biggest bank rolls belong *not* to the American but to the sons of Israel! Every bank, department store, clothing store, and source of big profits in general, is owned, rented, presided over, or controlled by the Jew; even the Reichstag itself is almost a German B'nai B'rith.

But the legitimate inhabitant of Berlin—what becomes of him? Is the ordinary man and the average German who calls Berlin his birthplace finding his home town any better off than it was in 1914? The truth of the matter is that the middle classes in Germany are far worse off than at any time in the history of the country. A well-paid clerk or government employe earns not more than 4,000 marks a month (at the time this was written 4,000 marks amounted to $11; since then German money has depreciated even more). If he is a single man he may be able to save a few hundred marks each month by strict economy, but the married man cannot afford meat more than once a week, and he *must* be content with oleomargarine and coffee without cream or sugar. Living costs in Berlin are increasing daily and are far higher than in any other city of Germany, mainly because of the ever-increasing influx of foreigners who momentarily benefit from the fluctuations in foreign exchange. I have read that this year several thousand new bank accounts have been opened up in Berlin banks by Americans; it is needless to say that a far greater number of German accounts have ceased because the average German, and especially the average Berliner, has been forced to draw on his savings to keep going in face of tremendous increases in prices. It is impossible for a German to save money on the salary he makes, because he never knows tomorrow what he will have to pay for food, clothing, rent, and all other expenses. While prices are showing strong inclinations in other countries of falling back to some kind of pre-war level once more, aspects in Germany are assuming more and more of the hopelessness that long ago prevailed in Austria, Poland and Russia.

Remaking the Disabled Veterans of the War

More Than 100,000 Soldiers Have Entered Training for New Work

By J. H. WALTON

This is one of a series of several articles dealing with important United States officials who are unknown to the general public.

AMONG the first volunteers immediately after the declaration of war, in April, 1917, was H. H. Milks, a young lawyer from the state of New York. Although married and beyond the draft age, he answered the call. Military training at Cornell University, and experience as a member of the national guard, qualified him for an officer's training camp, and he received a commission as lieutenant.

Lieutenant Milks was stationed at Camp Dix, New Jersey, training "rookies," until his discharge. In November, 1917, he met with an accident while riding which incapacitated him for further military duty, and he was honorably discharged. He felt, however, that he still owed a duty, and when the director of the newly organized Bureau of War Risk Insurance issued a call for lawyers to assist in this work, Milks again volunteered.

He was employed as an examiner on December 3, 1917, but his application to the work was soon rewarded by a promotion to reviewer, and two years later he was chosen from among 30-odd fellow workers and made chief reviewer, in direct charge of all the examiners and reviewers in the bureau. In October, 1921, there were 315 examiners and 60 reviewers, all lawyers, whose duty it was to assemble all the evidence and adjudicate the cases of claimants for disability compensation, death compensation, disability insurance, contract term and government insurance, reimbursement for medical treatment, rehabilitation training and so on.

When, at the request of the American Legion, the bureau was divided into 14 districts, Mr. Milks selected the reviewers and examiners sent to these districts, 250 in all. He now drafts all instructions to examiners and reviewers in the central office, in Washington, D. C., and in the field.

H. H. MILKS, chief reviewer, claims division, United States Veterans' Bureau.

He is responsible for the adjudication of all claims. All doubtful cases are passed upon by him personally, his judgment being subject to change only by the board of appeals or the director of the bureau.

The Veterans' Bureau, since its incorporation with the Bureau of War Risk Insurance, has a wonderful system for caring for our disabled soldiers. Much confusion had been caused by the overlapping of work; many times it was found that ex-soldiers were drawing compensation from both sources. Many were referred back and forth from one to the other for several months until they despaired of ever having their cases settled. Now, however, if a claimant has a clear-cut case, and presents all the evidence required with form 526 (application for compensation and vocational training), it is possible to adjudicate his claim in 10 days to two weeks.

The bureau is divided into seven divisions, namely: claims, medical, insurance, rehabilitation, legal, finance, and personnel, with approximately 30,000 employes throughout the country. While the chief function of the bureau is to provide rehabilitation, medical treatment and financial relief to disabled ex-service men and their dependents, it does not stop at that. Employment is found for thousands every year.

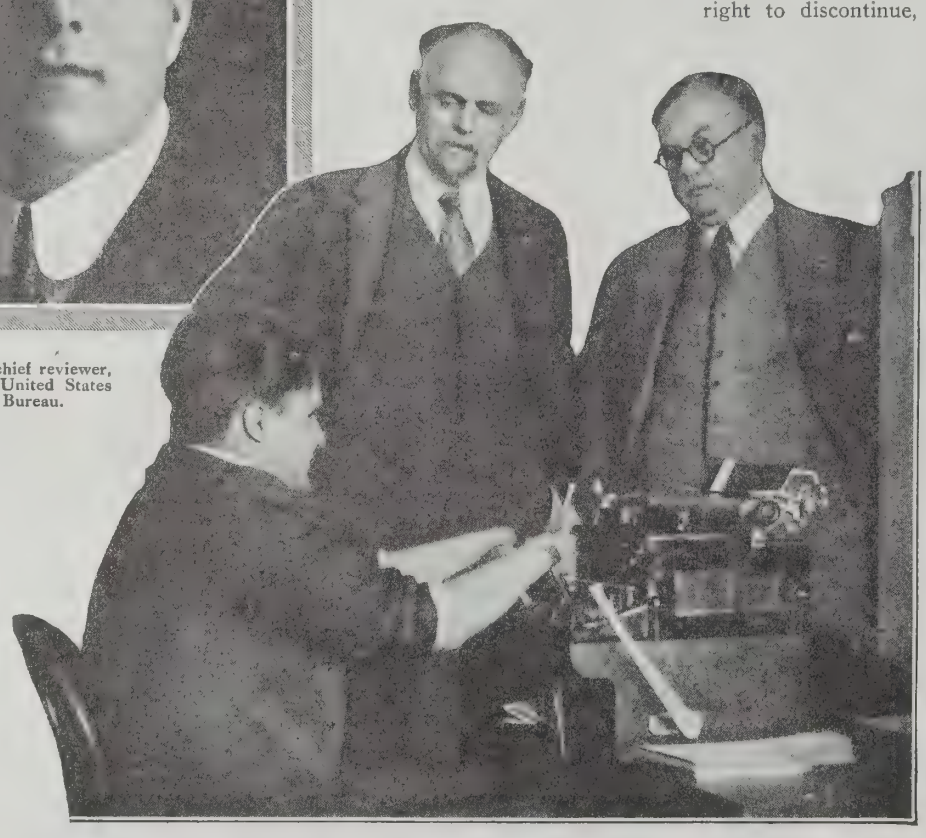
To provide for the rehabilitation of ex-service men the bureau has established a system of vocational training, whereby they are placed in a position to return to industry and become self-supporting. This training covers every conceivable branch of trade or industry.

Men are permitted to choose the trade or profession in which they are to receive training whenever their choices and the result of investigation warrant it. Naturally, if a man receives training in a trade or profession in which he is interested the chances of early success are much greater than if he were trying to learn something with which he is not in sympathy. But, there are times when requests for training in some particular branch cannot be granted.

"When a disabled soldier applies for vocational training," said Mr. Milks, "the main things to be considered are his previous occupational history, and his educational qualifications. We always comply with an applicant's request if his record indicates that there is a possible chance of his succeeding in mastering the trade or profession desired. We are spending the people's money and, while our first consideration is for the boys relegated to our care by the hardships of war, we do not feel justified in squandering money.

"Often it is necessary to refuse training in one line and offer it in another. Take for example a case a few days ago. This boy, before he entered the service, was employed as a stevedore. While in France, it was necessary to amputate an arm above the elbow. He has a vocational handicap and is eligible for training in some line of work which can be performed with one arm. He expressed a desire to study law. We found that he had gone to public school intermittently until he was 14 years old, receiving the equivalent of about five full years of schooling. He can read fairly well, but writes with difficulty. It was impossible for us to recommend training in law. He never could have mastered it, at least not for many years. His educational limitations, and his physical handicap, restrict the list of occupations he can fulfill to very narrow confines. The probabilities are that the bureau will obtain him a position such as feeding newspapers into a folding machine, which can be done with one hand, and does not require an education.

"A similar case, as far as physical disability is concerned, is that of a violinist who had his left arm shattered. His previous educational history and mental rating warrant our recommending him for training in medicine or law if he so desires, but we would question his ability to master the mechanical trades. It is necessary to use the utmost discretion in considering a man's fitness for various kinds of training.



"A boy filed a claim for compensation in August, 1920, at Denver, Colorado. We requested an examination of his physical condition, sending him the proper form. He filled the form out himself, with forged signatures, went to the local Red Cross, showed them our letter, together with the filled-in medical report, and borrowed money, promising to return it when he received his compensation. He did not send the form to us, and the next we heard from him was several months later when he filed another from Kansas City, Missouri. We sent him another medical form, not knowing the use to which he had put the other, and he repeated the operation. In fact, we found out later that he worked the trick successfully for more than a year, traveling from city to city, borrowing money from the Red Cross and others at each place. When his case was adjudicated it was found that he was not entitled to compensation, and his only reason for filing claims was to use the forms as a basis for borrowing money.

"One of the chief difficulties encountered, and probably the cause of 75 to 80 per cent of the delay in adjudicating cases, is with 'floaters'—men who move from place to place, and especially those who fail to notify the bureau of the change of address.

"The country is divided into districts, and the case of a man living in Denver, Colorado, is adjudicated in one district, while that of a man living in Richmond, Virginia, we will say, is handled by another. When a man moves from one district to another his case must be transferred, and a new staff of clerks, examiners and reviewers must go over the entire case and familiarize themselves with it. All this requires time.

"Here is a fair example of why men have trouble in getting their claims adjudicated: This case may seem far-fetched but we have thousands of just such cases. This boy filed his claim in May, 1921, at Jacksonville, Florida. We sent him a medical form and the letter was returned to the district office unclaimed. The district manager then wrote to the postmaster at Jacksonville, requesting him to send us the boy's address. We finally located him in January, 1922, at Philadelphia, Pennsylvania. His case was transferred to that district, and he underwent a medical examination there. When next we heard from him he was in Nashville, Tennessee. Before we could make final arrangements to pay compensation he moved back to Philadelphia, then back to Nashville, and then to Roanoke, Virginia, where he borrowed money from the Red Cross. We are now trying to get him to remain in one place long enough for us to dispose of his case.

"Most of the men who were actually disabled while on active duty have been taken care of, and are now receiving compensation or vocational training. The majority of cases handled now are those in which it is claimed that disability, although not having developed until some time after discharge from service, is the direct result of injury incurred while in service. It is sometimes hard to determine positively whether a disability is really a result of injuries incurred in line of duty and not the result of the man's own misconduct, or whether the disability is due to some illness or accident since his discharge. However, if there is a doubt as to a boy being entitled to compensation or training, we decide the case in his favor. Of course, we cannot pay out the people's money when it is not legally due, the law prevents that, and the bureau always reserves the right to discontinue, reduce, or increase payments at any time if new evidence is presented."

CARL BRONNER, blind and with both hands blown off by a grenade, demonstrating to COLONEL FORBES, director Veterans' Bureau (right) and MAJOR ARTHUR DEAN, assistant, how he is able to use a typewriter. He received training at the School for the Blind at Evergreen, Maryland.

Some idea of the volume of work of the claims division may be had when it is understood that approximately 1,250,000 cases are on file in the office. One case may involve from one to five or more claims. For example, a service man is disabled. He files a claim for compensation and medical treatment. He dies while in the hospital, leaving a wife and a dependent mother. The wife files a claim for compensation. The mother files a claim for compensation. If he carried government insurance the beneficiary files a claim. It is safe to say that the 1,250,000 cases involve at least an additional 1,250,000 claims, or 2,500,000 in all.

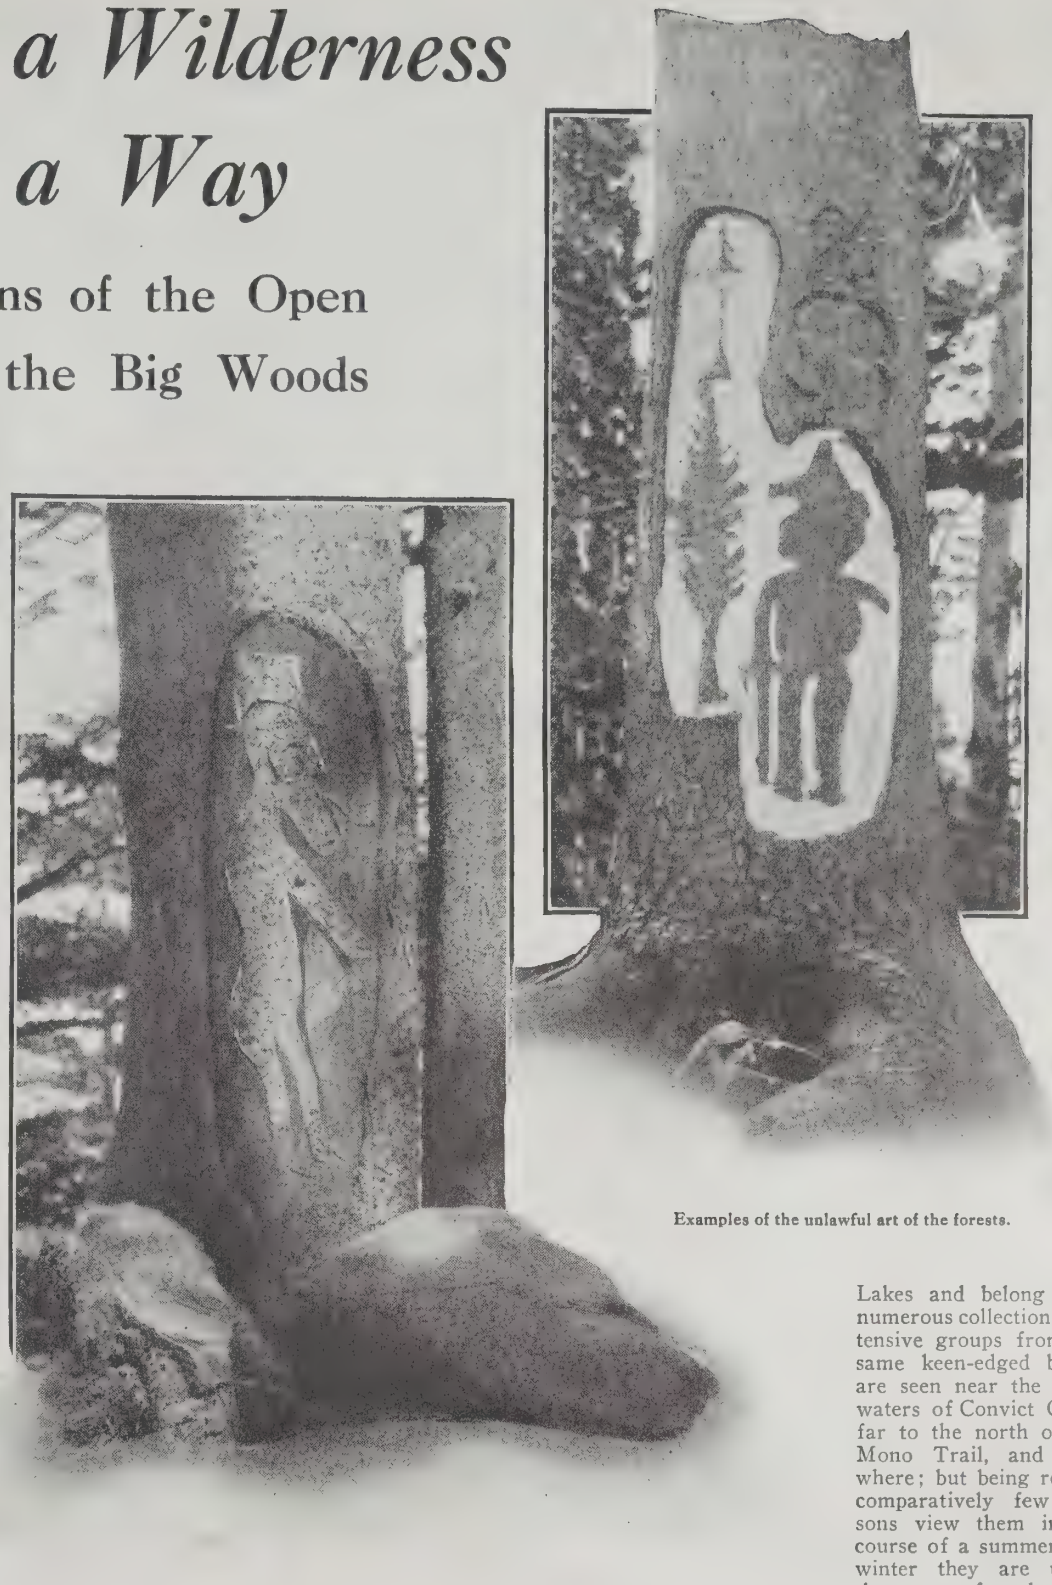
The total death and disability compensation paid to ex-service men and their dependents, on May 1, 1922, was $329,820,736.72. The number of men receiving compensation is 348,889, including 11,406, permanently and totally disabled. There are also 58,529 dependents of these men receiving compensation.

There have been 196,564 men declared elegible for vocational training, of which number 132,601 have entered into training, leaving 63,963 unassigned and in process of induction.

There are now in training 97,509 men. Those who have completed training number 11,360. There have been 3,071 deaths of men who had entered training, while 20,661 have discontinued training, a total of 132,601 men who have ever entered training.

This system of vocational training is turning out men capable of doing constructive work; men who never expected to be able to earn a dollar are now supporting themselves and families.

A noteworthy example of the results achieved by this system of rehabilitation is the case of Carl Bronner. While at the front, Bronner was wounded with a hand grenade resulting in the loss of both eyes and both hands. When he was visited in May, 1920, by the supervisor for the blind, of the Veterans' Bureau, he was helpless, unable even to dress or feed himself.



The bureau secured the services of a special instructor, who had lost one arm and one hand and had overcome his handicap, to tutor Bronner. No one present at the first lesson can ever forget the boy's delight to comb his own hair for the first time after his accident. After his discharge, Bronner was sent to the Red Cross School for the Blind, at Evergreen, Maryland, to which the bureau sends its blind veterans. The tuition of $100 a month and the salary of the special instructor was paid by the bureau.

Bronner is today, after two short years of training, a happy, self-reliant young fellow, with abundant confidence in himself and his ability to carry on. He is entirely independent and goes about constantly without a guide, dances, writes on both the Braille writer and typewriter, has finished his preliminary education, and will enter Johns Hopkins University to take up the study of law in September. No one who sees Bronner can ever doubt the worth-whileness of the government's efforts to rehabilitate its disabled heroes.

In the Heart of a Wilderness Art Finds a Way

Lonely, Untutored Sons of the Open Carve Lawlessly in the Big Woods

By JOHN L. VON BLON

Examples of the unlawful art of the forests.

ART will not be denied. It breaks out in unexpected forms and places and has recognized no barriers, since mortal made his first scratch on a rock. It is encouraged by repression and flourishes the more. One of its most extraordinary manifestations is in the Inyo National Forest, California, where the living timber is utilized for mysterious pictorial purposes despite the Federal Government's stern disapproval. There, carved on the boles of giant trees by adept hands, is an exhibit probably unique in the world. The secret of its existence is not yet fully cleared up, and inquiry continues.

Hundreds of human figures, life-size and skillfully, painstakingly executed, constitute this novel display in the high Sierra Nevada a few hundred miles north of Los Angeles. They range all the way from the sacred to the sacrilegious, from the pleasing to the shockingly ugly, and from ludicrous caricatures to serious and really attractive delineations. It's a versatile layout, to say the least. Cutting away of the bark leaves every one standing out in bold relief against the lighter background, as on a huge plaque.

Characters of every sort are faithfully depicted, though without sacrifice of imaginative qualities—women in evening gowns and in wrappers and sunbonnets; men in full dress, swallowtail coats and every detail; others in grotesque attitudes with various implements in their hands, formidable pipes in their mouths, and long beards monopolizing a lot of space.

There are happy, grinning faces and sad ones that reveal the touch of genius in their skulking creators. Heads and busts of a fine type occasionally are found, and a few dogs and other animals. The cross, symbol of Christianity, is impressively employed in a few instances, together with trees and flowers, but the story sought to be conveyed is somewhat obscure. Heraldic trappings, too, make their appearance. Every period from the Stone Age to the present may be glimpsed, and their treatment of the subjects indicates a knowledge of history and science as well as more than rudimentary art on the part of the authors, who may be termed experts in their freaky line. Not two of the "sketches" are similar. Whatever their failings in other respects they had not the glaring ones of repetition and imitation. Their "canvases" are original.

These remarkable pictoglyphs (some of them are colored) are in evidence throughout a region of about 1,000 square miles, generally in groups, and are startling when first encountered. The particular specimens herewith illustrated are on Tamarack Flats along a road that leads from the Owens River Valley to Rockcreek Lakes and belong to a numerous collection. Extensive groups from the same keen-edged blades are seen near the headwaters of Convict Creek, far to the north on the Mono Trail, and elsewhere; but being remote comparatively few persons view them in the course of a summer. In winter they are under the snow, for the altitude is 9,000 feet. Making their figures large and sometimes encircling a trunk with two or three hand-in-hand, the over-zealous despoilers naturally selected the choicest trees, six, eight or even ten feet in diameter for their operations—usually yellow or bull pine. These have thick, tough bark and the self-imposed task of removing such an immense amount with the utmost care was prodigious, and the time devoted to it and the patience required appalling. It is bad business for a tree to be peeled all the way around, or any part of the way, and none knows this better or resents it more than the United States Forest Service, which sought out the perpetrators. They got away with it several years but the constant investigation finally narrowed to definite suspicion directed toward—lowly sheep herders! It proved well grounded.

The lonely life of these men, mainly foreigners, without companionship months upon months save that of their bleating charges, dogs and burros, turns many "queer" in the head. That is the only plausible explanation of the graphic activities of the desecrating decorators of the big woods, and they are watched accordingly. Every spring after the snows have sufficiently melted to make the journey possible, tens of thousands of sheep are driven from the lower levels to the upper valleys for summer grazing, and returned in the autumn. It is hundreds of miles and there can be no hurrying. For days and weeks while the weary flocks rest and feed on lush meadows en route their tenders have only to guard and wait. Near Tamarack Flats is such a meadow, and there they halt; and so where other pictorial groups appear.

It is apparent by their peculiar characteristics that the tree carvings are the efforts of but two men. One, perhaps with a fair smattering of education, disclosed a degree of high-mindedness in all his "studies."

The remaining suspect now seldom makes his mark and evidences none of his former enthusiasm, probably fearing the prosecution and imprisonment which discovery surely would mean for him. The officers of the preserve, one of the largest, most picturesque and valuable and best managed in the country, believe they know his identity. So it is likely that the amazing "gallery" in the Inyo National Forest will not receive further additions. Eventually a new growth of bark will close it permanently—another lost art!

Germany, Prey of Alien Horde, Faces Complete Ruin

Concluded from page 9

Even as I am writing, butter has advanced another *20 marks* a pound; salaries *may* go up again *in six months!* Is it any wonder that the German dog can't catch his tail?

And, while the foreigners are besieging Berlin from all sides, the German resident is preparing for the worst. He sees himself becoming gradually locked out of all pursuits and enterprises, and he does not intend holding out much longer. If Germany declares bankruptcy in the immediate future, it will be only the natural sequence of events; and the rope is bound to snap sooner or later, but *snap it will beyond doubt.*

In America where the value remains stable, it is difficult for the people to realize the remarkable conditions prevailing in a nation of depreciated currency where, on account of the fluctuating exchange, one never knows today what his money may be worth tomorrow.

Recently thousands of foreign speculators in Berlin have become so frightened by the political and financial outlook that they are selling their paper marks for almost anything they will bring in foreign currency. They would rather run the risk of losing money than of holding German paper marks as their last financial reserve. The imports a thousand marks will buy today are *less than a third* what they would buy six months ago.

Hence the maintenance of stocks of raw materials becomes a critical problem, ever more serious to German industry.

The situation is well illustrated in the story I recently heard of a merchant who had 10 barrels of oil for sale. When he had disposed of them at the regular market price, the currency had so depreciated that, with the proceeds from the sale of the 10 barrels, he was able to restock only eight barrels. These he sold at a much higher market price, but in the meantime the value had again depreciated to such an extent that withal he had only enough to repurchase six barrels.

And so he kept on selling at still higher market prices, and the value kept on falling to still lower levels until finally he found himself with *no oil at all*, but with a lot of paper money which was not enough to buy *even one* barrel of oil.

But, in spite of all, Germany seems to keep going and the American continues to enjoy himself in Berlin, where he will always do so as long as the paper mark has any value left at all. When the paper mark has ceased being worth anything, it will be time enough for *exeunt Americani.* Coblenz will soon miss the Dollar Yank, and Berlin is not over-anxious to lose her American population (of which there is at present no danger).

Berlin is no longer the city of military pomp that she was in 1914, but among other dangers confronting her existence as a future European metropolis is the danger, not so much of the restoration of a monarchy, as of falling into the hands of the Jewish "conquerors"! And when this time comes to pass even the American will vacate his apartments in Berlin, and come back home where he must assume the rôle of a "regular fellow" again, but where he knows he will find the skies a bit bluer and the air a bit more comfortable.

If Humor Tipped the Reformer's Lance—

Then Might the Modern Don Quixote Fight On to Victory—Or Something

By JOHN BASIL BARNHILL

"YOU would pluck out the heart of my mystery," says Hamlet to Guildenstern who has had a long line of descendants engaged in the same work. No less a number of critics and interpreters have devoted themselves to the work of distilling the pure milk of the gospel of cheer in Cervantes' immortal masterpiece, Don Quixote. It has long since been conceded that while it may not have been the conscious purpose of the author, Don Quixote is more than a mere caricature of the extravagances of knight errantry. The novel would have died with knight errantry if that had been its sole content. Nietzsche's brilliant observation that Don Quixote is a profoundly pessimistic satire on all idealistic endeavor displays the abnormality of judgment which later culminated in complete and hopeless insanity.

The sanest and most helpful interpretation of Don Quixote is probably to be found in Professor Santayana's study, who writes:

"If we could have asked Cervantes what the moral of Don Quixote was, to his own mind, he would have told us, perhaps, that it was this: that the force of idealism is wasted if it does not recognize the reality of things. Neglect of the facts of daily life made the absurdities of the romances of chivalry and of the enterprises of Don Quixote. What is needed is not, of course, that idealism should be surrendered, either in literature or life, but that in both it should be made efficacious by a better adjustment to the reality it would transform."

"Don Quixote," continues Professor Santayana, "appears at first to the reader, and probably appears to the author as well, as primarily a madman, a thin and gaunt old village squire, whose brain has been turned by the nonsense he has read and taken for gospel truth, and who is punished for his ridiculous mania by an uninterrupted series of beatings, falls, indignities and insults. But the hero and the author, together with the ingenuity proper to madness and the inevitableness proper to genius, soon begin to disclose the fund of intelligence and ideal passion which underlies the superficial insanity. We see that Don Quixote is only mad north-north-west, when the wind blows from the quarter of his chivalrous preoccupation. At other times he shows himself a man of great goodness and fineness of wit, virtuous, courageous, courteous and generous and, in fact, the perfect ideal of a gentleman. When he takes, for instance, a handful of acorns from the goatherd's table and begins a grandiloquent discourse upon the Golden Age, we feel how cultivated the man is, how easily the little things of life suggest to him the great things, and with what delight he dwells on what is beautiful and happy. The truth and pathos of the character become all the more compelling when we consider how naturally the hero's madness and calamities flow from this same exquisite sense of what is good. Don Quixote is the eternal type, in fiction, of those seeking not gain but good."

It has been well said that adversity makes the small soul bitter while it makes the noble soul nobler. In truth, Cervantes had fought every inch of the long march which took him to the heights of spiritual serenity and joy where he dwelt in unassailable peace. "In perils oft," he might say with the Apostle; five years a prisoner in a foreign land; his left hand maimed ("for the greater glory of the right," as the indomitable soul cheerfully remarked) in the battle of Lepanto; in poverty always, Cervantes always seemed to say, "These minor afflictions which are but for a moment worketh in us a far more exceeding weight of glory." If sorrow alone has a right to prescribe for sorrow, then Cervantes had assuredly earned a right to the sacred office of tendering sympathy to all the afflicted.

There is a lesson of supreme importance which the reformer can learn if he will sit at the feet of Cervantes—he will be able to acquire or broaden his sense of humor, may we not say, his sense of humanity. The man who prayed, "Give, O Lord, thy Reformers a saving sense of humor" was well inspired. No class of people need this sense of humor more than the reformers; it "wad from many a blunder free them." The writer once asked that brilliant journalist and reformer, William Marion Reedy, if he were a Single Taxer. He replied, "Yes, I am, but with a saving sense of humor." Reedy, in a life devoted to reform, had realized that the average reformer is all too prone to narrow his perspective till he can see but one needed reform which to him is the comprehensive cure-all. A sense of humor would save him from such a pitfall. Lord Morley remarks that it is the fanatics of our own cause who fill us with despair. But a keen sense of humor is sworn foe to fanaticism. Hawthorne tells us that the reformer who does not now and then leave his special work and go out among the people will become unbalanced. We must take our bearings from time to time; we must "recognize the reality of things," otherwise we are trying to solve a problem while blissfully ignorant of the factors involved. Again and again the Don's fanaticism is wrecked on the rocks of Sancho Panza's ridicule and the extremist who is not instructed and ultimately saved by such a refreshing spectacle is surely sans help, sans hope.

How often we have felt the embarrassment of the extremists in our own camp, the earnest and worthy people who make no allowance for differences in experience and inherited traits. Such people would never have understood Solon when he replied to those who asked if his laws were the best that he could devise, "No; but the best that the people would accept." Aristotle said, "All extremes are wrong" and this is the burden of the prophet of humor, Cervantes. We cannot hope to attain our fullest possible strength till, like the hero of mythology, we build upon the solid earth of reality.

Who has a better right to unbend, to lighten his load betimes, than the reformer who is engaged in a very serious and responsible task? Nay, it is more than a right; by all the gods of sane living and serene reason it is a duty. Send thy Reformers, O Lord, a sense of humor and save them from intolerance, irrationality and selfishness—from the crime of taking themselves too seriously and wilfully living in sadness.

The scriptures of the East tell us that there are two spirits at work in the world. There is a spirit which pursues virtue and truth—this is the principle of light and salvation. There is also the spirit which seeks merely worldly gain and this is the spirit of darkness and damnation. History presents an eternal duel between these two spirits. Society, as now constituted, admittedly encourages the lower spirit and has built up a spider-civilization based on the acquisitive instincts. It is well that we have a great genius, an uncorrupted and incorruptible spirit, who presents in engaging and unforgetable colors the type which is verily the opposite spirit and is in eternal conflict with the spirit which seeks gain merely. He who has made the quest of good rather than gain the predominant motive of his life will betimes have need of all the lofty examples, both sacred and profane, which have been given to us for our inspiration and our consolation. He who seeks the good of his fellows above all else, who seeks to lessen the sum of human wretchedness, may at times think he is forsaken of God; he may at times say, "Is not the price of ideal endeavor too great?" The battlefield is strewn with the wrecks of many prophets—of those who gave all to the vision. Defeated, impoverished though they be, they will not be cast down if they can emulate the matchless pride of Don Quixote who, disdaining filthy lucre, cried, "I am second to none—in misfortune"—a bravely ironic boast which was echoed by his squire who, when he climbed the hill that stood above his native village, on his final return home, said, "We have come home, if not rich, at least well-whipped."

Per Cent Takers Now Ready to "Save" Russia

But Does That Country of Vast Resources Need So-Called Help?

IN A recent letter to the press, Dr. E. Dana Durand makes the statement that Russia sadly needs the help of the foreign investor; in fact, that she cannot possibly stand on her feet till she has aroused the interest and commanded the confidence of the "investing classes." This is an interesting statement and certainly most agreeable—to the "investing classes." As Dr. Durand is a high official in the Department of Commerce his statement may be accepted as the opinion of Secretary Hoover and, hence, a reflection of the official attitude of the American Government.

But the American Government has not always been so faithful a mirror of Wall Street sentiment. If Dr. Durand is correct, then he would have given the same advice to President Lincoln in the dark days of our Civil War. He would have said in effect, "The republic is doomed, Mr. Lincoln, unless you can secure the assistance of the investing classes." By the way, it is alleged that President Lincoln, in a fine outburst of patriotic indignation, once said of the "investing classes," who were holding up the government for 37 and 50 per cent on loans, "they ought to have their heads shot off."

If Russia had had a Lincoln instead of a Lenin, we know very well what would have occurred. Lenin would have said: "We have one-seventh of the land area of the globe—more than 8,500,000 square miles—and our undeveloped resources are beyond computation; we have 165 millions of people—one-ninth of the population of the globe: with this enormous extent of territory, with our wonderful resources, we have no need to borrow from anybody. If the people, in their sovereign capacity, through the government and under constitutional and legal forms, can lay under contribution the whole property and the services of every citizen, in protecting the lives and property of all, they certainly can issue tokens of this undoubted fact, in the shape of 'legal tenders'; and these become, by this act of sovereignty, the money of the country, the measure and the means of exchanges. The people who give them in their sovereign capacity, must take them in their private capacity, and again receive them, in their sovereign capacity as the government, for taxes. This makes their circulation and their use. The significance of these 'legal tenders' is that they are tokens of such service or material rendered to the government; and they are also promises to render an equal amount of money, service, or useful material in exchange, to the holder, by the government. If a private note of hand or a bank note is 'good' in proportion to the known credit and resources of the individual or the bank, so is that of the government, and in a superior degree, as the government has a larger credit and more resources than an individual or a bank. An individual or a bank pays its debts by means of its credits, or the valid claims either may have on others; so does the government; and the valid claims of government are all represented in rightful taxes imposed for its proper functions and employment. Government, on one side, is the giver of sound credit, represented by its paper; the validity and redeeming basis of this paper is in the fact that the community is indebted to the government in the shape of taxes for so much service and material as may be necessary to carry on its proper function and pay its officers for services rendered to the public; this creates an obligation on the part of the public to receive government money for 'value received.' Thus the circulation is complete."

It is unfortunately true that after the creation of the nation-saving Greenbacks, Lincoln was forced to compromise with the devil and it is equally true that this was due to the cowardice and incapacity of the legislative branch of the government; if every member of the House and Senate had been endowed with the courage and intellect of Thaddeus Stevens, no such compromise would have been necessary.

Dr. Durand's exertions as a special pleader for the investing classes, when viewed in the light of cold fact, appear to lead to a perfect *reductio ad absurdum*. Is it not a comedy of the first magnitude for the nation that numbers 165 millions, after driving off, by force of arms, a half-dozen invading armies, so far to forget the prodigies of valor which it has performed as to address the very foreigners it has conquered in terms such as these: "Emissaries of foreign tyrants, we have expelled you from the sacred limits of the fatherland, but we beg you to return and save us: you must return with bonds to bless us: the national integrity which we vindicated on the field of battle must inevitably perish unless you accord us your cash and your credit: we proved that we could live without the aid of your generals but we admit we cannot live without the assistance of your money-lenders. Unless your money-lords will be so good as to take over a mortgage on our victorious country, we must cease to function as a nation."

Is it possible that Dr. Durand and his chief, Secretary Hoover, have never read the history of our Civil War and of the French Revolution? The French Revolutionists had little use for Dr. Durand's counsel of despair—they could not have practised it if they would have done so for the all-sufficient reason that the foreign investors had covered their land with invading hosts. With her own self-created currency, in establishing which she did not say to foreign investors, "By your leave, gentlemen," though beset by armed foes without and traitors at home, France triumphed so absolutely over all her foes that the coldest narration of it thrills like a romance. "She saved herself by her energy and Humanity by her example." In spite of all the internal dissensions she maintained 13 armies in the field, compromising over one million men, and single-handed, defeated the allied armies of five European nations, all of whom were on the soil of France at the same time. She proved, as the sister republic of the West proved later, that a non-interest-bearing national currency is liberty's own ensign—the greatest champion that nations struggling to be free have ever found. Would that Russia might profit by their example.

There is no hope for Russia till she has a government open-minded enough to read and digest this lesson writ large on the page of history, a lesson now known wherever lips can lisp the sacred syllables, liberty. Lenin, mistaught, misdirected by the greatest enemy of progress that ever lived, Karl Marx, accepting with the faith of a little child Marx's *ipse dixit* that there is nothing in the money question, sought to debase the currency of the Czarist régime to the lowest depths of worthlessness, by incredible over-issues, and made no provision for a national currency to take its place, for he wished to do away with all money systems. Hence the inevitable epitaph: "BUT YESTERDAY THE MIGHT OF RUSSIA MIGHT HAVE STOOD AGAINST THE WORLD: NOW LIES SHE THERE AND NONE SO POOR TO DO HER REVERENCE."

The lesson of the sister republics grappling with the cobras of tyranny that sought to strangle young liberty is Greek, no less to Mr. Hoover than to Lenin. Hoover may protest that he, at least, was not misled by Marx; certainly not, but as if to prove that our Jewish friends will have their monopoly, if it is only a monopoly of error, Mr. Hoover was misled by Rothschild.

J. H. MC CALLUM,
President Board of State Harbor Commissioners,
San Francisco, Calif.

MISS HILDA GOHRMAN,
Secretary Board of State Harbor Commissioners,
San Francisco, Calif.

Frisco's Port, Owned by People, Returns Handsome Annual Profit

Forty Piers Provided to Care for World's Freightage

By HARRY H. DUNN

THE port of San Francisco, which is owned, controlled and operated in perpetuity by and for the people of California, made a gross profit of $665,782.07 in the fiscal year ending June 30, 1921. For the fiscal year just closed, the financial report will show a gross profit of very nearly the same sum. The average annual revenue of the port is $2,500,000. The gross profit remaining is applied to payment on bonds, interest, and addition of improvements and facilities.

The port is self-supporting. Its facilities never have cost the people one cent in taxation. It has issued bonds but these bonds are paid out of the income, and all that the port uses from the state is the authorization for issuance of bonds. The total bonded indebtedness of the port whose frontage, wharves and other facilities are valued at more than $50,000,000, is $13,000,000.

This is probably the largest, most successful and most complicated example of public ownership and operation of a utility in the United States. San Francisco, as a port, is to the western half of North America what New York is to the eastern half. It is the focal point of rail lines from within the United States, and of steamship lines, not alone from all lands on the Pacific Ocean, but eastward, through the Panama Canal to the Atlantic seaboard, and even to European ports.

All the port facilities on the entire San Francisco waterfront are owned by the state, and managed by the California board of state harbor commissioners, consisting of three members, appointed by the governor. It is the only port where all the activities are co-ordinated and harmonized under one single control. The harbor charges are the lowest, another powerful commentary on the benefit of public ownership of such utilities when properly managed. The present board of harbor commissioners consists of John H. McCallum, president; Harry H. Cosgriff and Frederick S. Moody.

The waterfront lies eight and one-half miles along the bay, and this improved frontage can be extended indefinitely. There is a completed sea wall 18,000 feet long. The jurisdiction of the active waterfront extends from the Golden Gate to the San Mateo County line, the city and county of San Francisco being co-lineal as to area and boundaries. The title is vested in the state and, under the broad powers given the board, the harbor—without taxation, and without contribution—has been equipped with the following facilities for which it has paid, or is paying, from its own earnings: Forty piers, from 125 to 200 feet wide, and 600 to 1,200 feet long, which provide a cargo area equivalent to 135 city blocks, and sufficient to take care of about 1,500,000 tons of cargo per month. Slip space ranges from 200 to 300 feet, allowing water space for lighters, or ship-to-ship transfer of export or import cargo.

Fifteen miles of berthing space, sufficient to accommodate more than 250 deep-sea steamships.

Sufficient depth of water so that a vessel can dock under its own steam at any stage of tide.

Fifty-four miles of Belt Railroad trackage, also owned by the state and operated by the harbor commissioners, connecting all piers with the railroads, and with many industries in the manufacturing district.

Full electric wiring and equipment for tractors, cranes, stacking machines and other labor-saving devices reducing the stay of a ship to the minimum. Floating and stationary derricks for loading, unloading or coaling in midstream.

The Embarcadero, San Francisco's waterfront street, 200 feet wide, running the entire waterfront, and paved its full length. This highway belongs to the state.

An oil terminal fully equipped to handle the large traffic in vegetable oils brought in from the Orient.

A new six-story concrete and steel warehouse, and concrete wharf, the latter 1,000 feet long, on the China Basin. The incidental filling in of an area behind the sea wall created a new state-owned industrial block of 105,000 square feet of land, available for industrial plants on long-time leases. A ferry building to and from which ply all the ferries and through which annually pass more than 50,000,000 passengers.

From President McCallum, of the board, I have received the following discussion of this great public utility:

"Last year, when every great port showed a decrease in earnings, and while all our rivals on the Pacific Coast showed a deficit, San Francisco Harbor made $665,000, which will be used in providing additional harbor facilities. Success in the management of San Francisco Harbor can be expressed in one word—'co-operation'—not only is there co-operation within the organization, but the board by appointing an advisory committee of 20 members, representing every interest using the port, has been able to co-operate with and harmonize every interest for the benefit of the port.

"The board is endeavoring to obtain the establishment of a refrigerated ship service between San Francisco and the Atlantic Coast, and Europe. It is to the mutual advantage of the port and the state and of all the people in the state to encourage such a service, for, if successfully maintained, it will greatly expand the markets for products of California.

"The history of San Francisco Bay as a port goes back to August 5, 1775, when the first ship, the packet "San Carlos," under command of Lieutenant Ayala, passed in through the Golden Gate and dropped anchor off what is now the presidio. With the American occupation and the rush for gold in 1849, however, the port witnessed its first development. The puebla of Yerba Buena—as San Francisco was first known—lay on the shores of a cove now filled in and part of the business section of modern San Francisco. This cove afforded a good anchorage, and Clark's Point, which is now Broadway and Front streets, served as the first landing place, and later became the site of the first wharf.

"With the establishment of municipal government at San Francisco, the city assumed control of the waterfront, and turned it over to private interests to develop. The wharf companies, however, were permitted to charge exorbitant rates, and, greedy for profits, they made no improvements in the port facilities. The result of this period of private control was that in the early '60's replacements became necessary, and a sea wall and fill were needed to furnish more waterfront land. The city was financially unable to undertake this work, and the wharf companies demanded long-term, exclusive franchises that would give them a monopoly of the waterfrontage. The city appealed to the state, and, in April, 1863, the legislature passed the act creating the Board of State Harbor Commissioners, to consist of three members appointed by the governor. Since that time, the waterfront of San Francisco has been developed under the control and jurisdiction of that body, its ownership having passed to the state when the latter undertook its development.

"Obstructive tactics at first made development and improvement slow, but finally this opposition was crushed in the courts, and a general scheme of permanent and steadily increasing development was outlined and development along rational lines followed. When the way for state control became cleared, the harbor began to prosper. It became self-supporting, even though tolls were reduced again and again, and further accommodations provided for the increase of shipping. In the meantime, of course, the city of San Francisco grew to be the metropolis of the Pacific Coast, and the leading financial, manufacturing, export and import and jobbing center of the West.

To provide rail connections between the railroad companies and the steamship lines, the Board of State Harbor Commissioners, in 1891, began the construction of the Belt Railroad, as authorized by the act of 1889. Operation of this line was delayed by opposition on the part of drayage and other interests, and, for a time, the operation of the Belt was confined to the hours between 10 p. m., and 6 a. m. but this was overcome, until today the Belt Railroad connects every pier, running to shipside on the majority of the piers, with every railroad entering San Francisco, and with the industrial plants in the business section, and each pier with every other pier.

Here, then, we have a public utility, representing a valuation of rather more than $50,000,000 with a gross annual revenue of $2,500,000, owned by the people, operated by the people, and presenting the people with more than half a million dollars profit every year—a net income of considerably more than 10 per cent—which is reinvested in this public utility for its development.

Facilities of the Port of San Francisco, Owned and Operated by the State

THE people of California own and operate the harbor facilities of San Francisco, which is to the western half of the United States what New York is to the eastern half. The facilities of the port consist of:

Forty modern piers, providing 15 miles of berthing space; 5,000,000 square feet of cargo area; room and equipment to dock 250 average-size deep-sea vessels at one time, and to accommodate 1,200,000 tons of cargo a month.

A belt railroad connecting all railroads with every pier and with adjacent industrial plants.

A paved avenue, 200 feet wide, running the length of the waterfront.

The Ferry Building.

The China Basin Transit Warehouse and Terminal, new this year, with a wharf 990 feet long and a six-story warehouse with 516,000 square feet of floor space.

This harbor is and always has been self-supporting; its charges are the lowest of any port in the United States; its assets are valued at $50,000,000, and its average annual revenue is $2,500,000, of which $665,782.07 was profit in 1920-21, and almost an equal amount will be profit for 1921-22, all of which is put back in the form of improvements for the people of the state of California, to be owned by them forever.

The World Court of Social Justice at Geneva

International Labor Office, Twin of League of Nations, at Work

By WILLIAM ATHERTON DU PUY

ONE is likely to arrive at Geneva, the gateway of Switzerland, with a vague recollection of that city as the birthplace of Calvinism, as the home of that world-flung organization, the Red Cross, and with a consciousness that it is the cradle of that child of the Versailles Conference, the League of Nations—a child sufficiently articulate to keep the international household constantly aware of its existence.

But at Geneva one finds another offspring of Versailles, perhaps to his surprise, for he may have forgotten that twin international organizations were born to this mother conference. The League of Nations and the International Labor Office came into the world at the same moment.

Down on the lake front, toward the end of that promenade which compares with the Board Walk of Atlantic City, the League of Nations has found itself a home, has acquired by purchase what was once a popular resort hotel. There its staff of more than 300 workers is busy on the task of making it accomplish its purpose.

A mile away, on the crest of a wooded hill, its twin, the International Labor Office, has found itself a home in a building which was once a school. There it has grown as lustily as has the League of Nations, is as large in its physical proportions, employs in fact a more numerous personnel, represents a greater number of nations. Yet withal, the purposes of this world agency, being non-political, humane, industrial, investigational, it has developed into its tasks somewhat quietly. Though it is the biggest, the most far-flung official organization in the world, it is far from being the best known.

Part XIII of the Treaty of Versailles created the International Labor Office. It is there set forth that the purpose of the League of Nations, the establishment of universal peace, must be based upon "social justice." The rôle of this second organization is to act as a clearing house among the nations in establishing social justice. A social injustice in one nation, for instance, may be impossible of cure unless its neighbor also acts. "The failure of any nation to adopt humane conditions of labor," says the preamble, "is an obstacle in the way of other nations, which desire to improve the conditions in their own countries."

Here is an example of a social injustice which the world had been attempting to remedy for two decades before this treaty was written. The use of yellow phosphorus in the manufacture of matches gave the workers a frightful and mutilating disease known as "phossy-jaw." It was proposed that the use of yellow phosphorous in match making be prohibited. Good matches could be made of other substances but the processes were a bit more expensive. If one nation gave up the use of yellow phosphorous and another continued its use, the latter, obviously, would be able to undersell the former, and would get all the business. No good could be accomplished unless they worked together. There should be an international agreement to discontinue the use of phosphorous in match making.

After five years of agitation, an international technical conference was convened which drafted the necessary regulations. A second conference was finally called which wrote them into a treaty. Then the nations forgot to ratify the treaty. There was no agency in existence to remind them of their duty, to exert pressure. Nothing happened. Yet this was the nearest approach that the nations ever made toward co-operation in correcting a social injustice.

Now the International Labor Office can very handily take care of just such situations. Primarily, all members of the League of Nations are members of the International Labor Office. A nation which is not a member of the League may, however, come into the International Labor Office. Germany has done so. The United States might do so. Argentine, which withdrew from the League, did not withdraw from the International Labor Office. There are now 54 member nations.

Once each year an International Labor Conference is held. It is attended by accredited representatives of the member nations and lays out the scheme for all that the organization does. Each nation may send four delegates and certain technical advisers. One of these delegates shall be a representative of the employers, one of the workers and two of the government, the public. So the meetings cannot be dominated by any particular element.

This conference deals with an agenda which has been drawn up under conditions which safeguard it from becoming merely a forum for the discussion of wildcat schemes, and may adopt draft conventions or recommendations with relation to it. Such conventions must carry by a two-thirds vote.

This action does not bind a government to ratify these conventions. It merely binds its representatives to submit them to the proper agency for action.

The International Labor Office at Geneva is the permanent secretariat of this annual conference. When a convention has been adopted it is filed at the International Labor Office. That office follows it up, and reminds the government of member countries of their obligation to give it consideration. Nations are not bound to act favorably on a convention, but they are bound to consider it and this office insists on that consideration.

Conventions have been adopted, for instance, prohibiting the use of white lead (which is poisonous) in the painting of the interior of buildings; prescribing the age at which children may be employed in industry; the employment of women and children in dangerous work; of women near the time of childbirth. These fifty-four nations have singled out these and other social injustices for cure and are proceeding methodically. As the years pass, one accomplishment may follow another. There is a world agency to handle such matters. If it finds a way to help a boy in a foundry out in Youngstown, Ohio, that same benefit, through it, may be carried to every such boy in all the world.

"In no case," says the treaty which creates this organization, "shall any member be asked or required, as the result of the adoption of any recommendation, or draft convention by the conference, to lessen the protection afforded by its existing legislation to the workers concerned."

In this way it becomes obvious that the real purpose of the organization is to improve conditions in backward countries, to bring them up more nearly to the level of those in progressive countries. An advanced nation like the United States, for instance, would not be likely to be affected much by regulations to improve the conditions under which its people work. A backward country, on the contrary, might be required to shorten hours, introduce sanitary regulations, make better living possible to the worker.

Provisions that better the conditions of the worker are likely to cost the employer money. The employer in progressive nations, therefore, must place a heavier charge against the labor item in production than does the employer in a backward country. This is a handicap which he must carry.

Now every step toward bringing working conditions in the backward country up to standard relieves the employer in the progressive country. The activities of the International Labor Office will be of greatest benefit to workers in the backward countries and to employers in the progressive countries.

Canada's Growing Problems of Immigration

Concluded from page 6

over and nothing but the fancy ones will do (and there are little of these) we are standing still. I am willing to trade every idle white hand in this country today for the same number of yellow hands, or black, blue, green, red, if they'll start things going again."

Here was some new and sound immigration philosophy. The same problem may not exist in the United States, or if it exists it may vary in its aspects, and for this reason will make its comprehensibility a little more complex. But taken from the standpoint of Canada the idea seems tenable. It becomes especially so as one rides along the sylvan, cespitose, bosky, and sometimes unfriendly, land toward the Pacific Coast. There are vast timber-working operations going on, and there is not a stream worth the name whose surface is logless, but, on the other hand, one may note abandoned attempts at land clearing. It is good land; it is valuable land because roads and railroads twain it, but it is forsaken land. "No money" is the excuse that alternates with the more eloquent one of "gone broke."

In undertaking any fair analysis of this subject it is important to avoid generalities, such as that embodied in the category of "Orientals." Racially, of course, the classification is just; for all other purposes it is not. That is why in connection with immigration it would be manifestly unfair to mix Chinese and Japanese under a single standard of acceptability or unacceptability. Much is feasible by co-operation with the Chinese that is not possible with the Japanese. The Caucasian can establish a degree of friendliness and contact with the Chinese worker in the latter's adopted home that will never be experienced with the Japanese.

In fact, a high Canadian official brought to my attention a simile that is pointed, and I refer to it for what it is worth—that as an immigrant the Japanese is as perilous to North American standards as the Jew.

"They have the common standard of segregation; they shift; they are protean; they are imitative in a curiously superior and disdainful manner; they are around but none knows what they do; it may be money, nationality or religion but in behalf of any of these things they will do whatever it suits them best, openly or covertly; they seem always bent upon biding their time for the sake of some ulterior purpose, not necessarily inimical to us but not always to our liking even though at our expense; and when it comes to a showdown we seem utterly helpless."

In California we have Japanese colonies of agriculturists of whose existence the average American citizen has learned through state, national and international controversies that sometimes became alarming. This is their utmost concession in the field of hard labor. If they are found in other difficult tasks out in the open air, where the Chinese sometimes shine, it is the exception. The Japanese prefer and quite easily gravitate into pursuits where one directs and orders—a rather notable Hebraic trait, if one stops to consider.

Officially, Canada is shutting the door to all Orientals, notwithstanding, too, that also officially the Dominion's attitude toward Japan and the Japanese is much more humble than that toward China and the Chinese. Whether this is due to the influence of London and the latter government's intimacy with Tokyo I am not prepared to state now, but I shall say this much—that the average Canadian of the Far West is ready to welcome Chinese laborers, whereas he is not ready to welcome the Japanese at all. For cause or not, the Canadians of Saskatchewan, Alberta and British Columbia are dead set against the Japanese in the same measure that their eastern compatriots of Manitoba, Ontario and Quebec are set against the Slavic breeds. In either case there is no compromise of either thought or purpose.

The Canadian problem is inherently as follows:

Shall future immigration consist mainly of half-smart and inexperienced urban denizens or shall it consist of rural or semi-rural hard workers?

A rather insistent multitude of amateur sociologists and welfare workers, now overrunning the United States are laying plans to transfer their energies to Canada. When the American Federation of Labor, at Cincinnati, went on record against "free" immigration over the protest of easily identified doctrinaires who harped upon the words "asylum for the oppressed," it made the necessity of new fields to conquer more imperative than ever. The organizations interested in immigration look to Canada as the field worth exploiting, and the Canadians fear their influence upon an already silent press. I suspect that there is a co-ordinate if not preconcerted attitude on the part of great Canadian employers to make no unusual demands for "new blood." In other words, it looks as if no opportunity will be granted by these responsible citizens that officials might construe as a sign to let down the bars. Canada can do this where the United States as a nation cannot do it for the reason that, million by million, there are proportionately more people *of* Canada than there are people *of* the United States. Immigration is one of those national problems that seems to be the concern of more persons *in* than *of* the United States.

The United States found that the sources of desirable immigration were fast being dried up by political unrest, false doctrines, the get-rich-quick tendency, and if the United States, much more advanced industrially and commercially, suffered from the growing shortage of select immigrants, Canada perforce must feel the same drawback more intensively.

All that is necessary is to know if the immigrant settles down as a future North American. Canada's methods and laws to guarantee the best migratory stock are quite excellent, and it will be interesting to note in detail just how they work out.

Great Detective Stories That Are Never Told

Concluded from page 7

country have been particularly noticeable and special attention has been devoted to the investigation of all such pernicious operations. Four hundred and forty-seven propagandists and couriers have passed through our ports from over-sea points. The movements, the nature and the compass of their activities have been under the intimate scrutiny of Federal agents. Every effort is exerted to prevent the development of movements designed and perfected for purposes obnoxious to the government.

To the most of us, it is news that a form of slavery is still existent in some of the states. Peonage is still practiced, county officers conspiring with employers to secure permanent and cheap labor supplies. The victims of the system are poor, illiterate mountaineers and country folk. Uncle Sam is doing his best to ferret out all such violations.

One of the most popular and famous government detectives is Mr. M. P. McInerney, chief of detectives of the Veterans' Bureau. Mr. McInerney was one of the two Federal agents, who captured "Pat" Crowe, abductor of Charles Cudahy. Recently, someone tried to burn the Veterans' Bureau, one of the largest office buildings in the world. Mr. McInerney tracked and captured the miscreant by means of a gasoline can which he left near the scene of the incendiarism. Making a round of all the service stations in the vicinity, Mr. McInerney finally found one that had sold gas to a man who looked like a Mexican. The government detective then studied the Veterans' Bureau records and finally found the case of an ex-soldier who had passed as a Mexican while on the border in 1916. This man was enraged because the government had refused to pay him a ridiculous compensation. The national sleuth finally discovered his whereabouts, obtained a confession from him and ended the case.

The Bureau of Criminal Investigation of the Department of Justice during the last year has received 74,491 criminal measurements of which 68,838 were fingerprint records and 5,653 anthropometric or Bertillon records. There are at present on file in that bureau 82,773 Bertillon photographs and records, 390,931 fingerprint records and 600,000 criminal index cards. During the last 12 months, 19,365 identifications were made, of which 18,848 were by the fingerprint system and 517 by the Bertillon system. This bureau fills an important function not only in the Department of Justice but in the interest of society generally by its valuable aid in the detection of crime and the apprehension of offenders.

Adds a Billion to the Wealth of the South

Texas Farmer, by Evolving New Cotton Variety, Aids Growers

By WILL G. CALDWELL

ONE afternoon in the early eighties a Texas farmer went into his cotton fields to determine the damage wrought by a violent rain and windstorm. Over the state other farmers did the same. Many, no doubt, cursed their "hard luck." None did anything about it except this one man. While examining and estimating the damage, an idea came to him that has since been conservatively estimated to have saved the southern farmers more than a billion dollars—rather, it has added more than a billion dollars to their income.

That man was A. D. Mebane, of Lockhart, Texas, now famous over the cotton-growing country as the originator of Mebane Triumph Cotton, a variety of cotton that produces an unusually large percentage of lint. More than that it is known as a cotton that will withstand a drouth longer than others, as well as stand up under violent winds, when other varieties are practically ruined by windstorms.

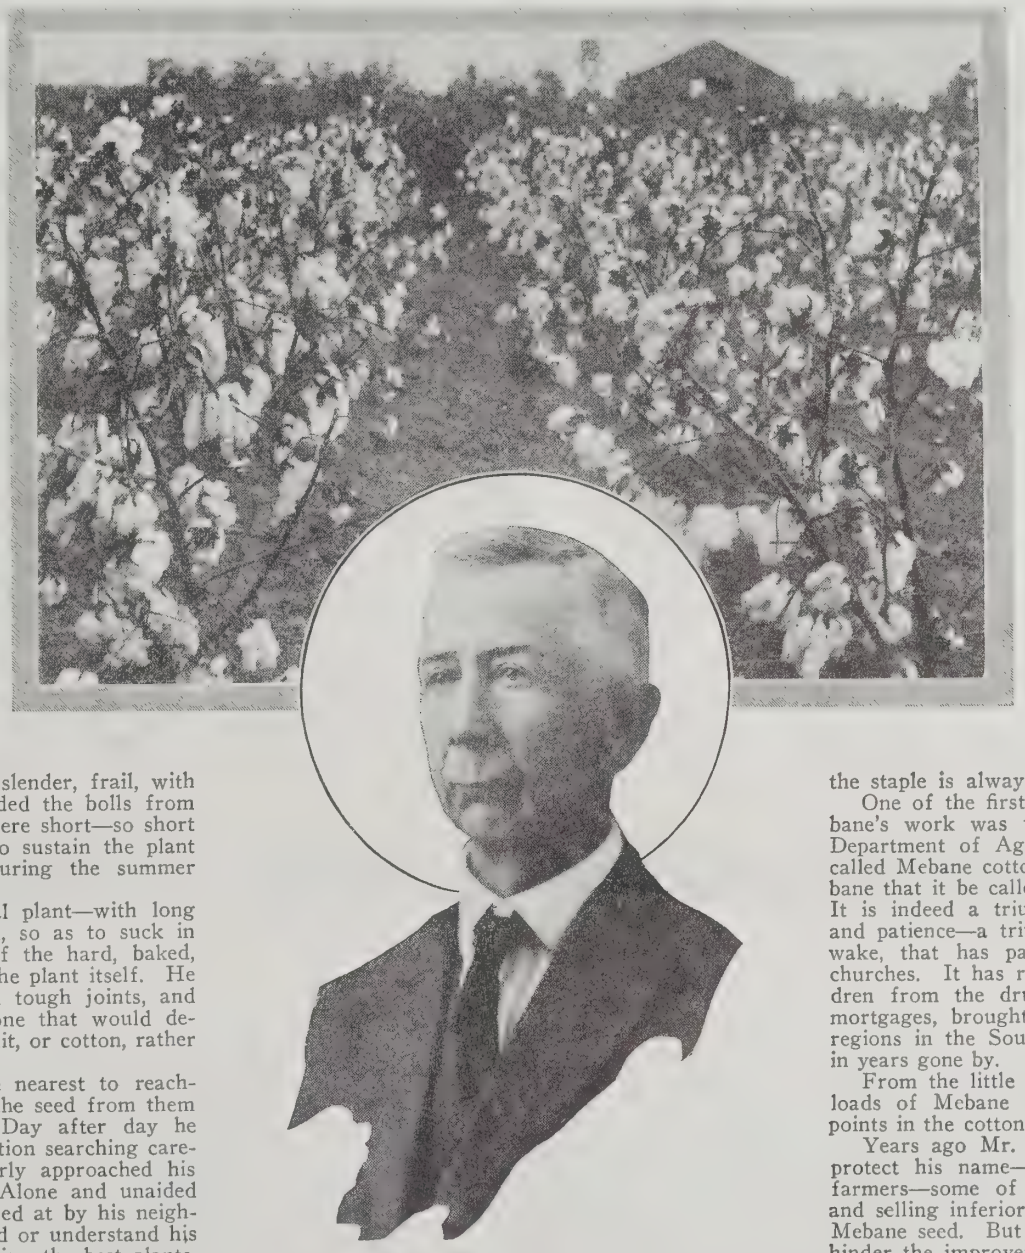
On that stormy afternoon Mebane was inspired to believe that he could improve cotton by using the age-old theory of the survival of the fittest. With him, to think meant to act, so he made a thorough examination of the stalks of cotton that appeared to have suffered the least damage from the rain and wind. This examination revealed the fact that the lint in some of the open bolls had scarcely been disturbed, while on other stalks the lint had been blown out over the fields, and ruined. He proceeded to collect all stalks that withstood the damage.

That night he started writing a description of the hardiest plants. A minute description of every boll, or pod, was written. Cotton when ready to be gathered is found hanging loosely in the bolls or pods, which are divided into four or five partitions, or locks, as the cotton men speak of them. In those days practically all the bolls had but four locks. Some few of the larger bolls had five locks, all full of fluffy, white clusters of the seed and lint.

Mebane found that some plants were shorter, stockier, and tougher than others. As a rule the plants of those days were tall, slender, frail, with a vast amount of leaves which shaded the bolls from the sun. Strange to say the roots were short—so short in fact that they were inadequate to sustain the plant through dry spells, so common during the summer months in the South.

In his mind he pictured an ideal plant—with long roots, sinking deep into the ground, so as to suck in the moisture beneath the surface of the hard, baked, dry fields; next in importance was the plant itself. He pictured a short, stocky plant, with tough joints, and few leaves. His ideal plant was one that would devote all its growing power to the fruit, or cotton, rather than to the plant itself.

Selecting the plants which came nearest to reaching his ideal he carefully preserved the seed from them for planting the coming season. Day after day he roamed through his extensive plantation searching carefully for the plants that most nearly approached his mental picture of an ideal plant. Alone and unaided he carried out his work, often laughed at by his neighbors who were unable to comprehend or understand his tenacity and painstaking care in finding the best plants.



The lint in one of the average cotton bolls weighs approximately one-tenth of an ounce. Thousands upon thousands of these bolls were gathered, weighed, and examined with minute care. An accurate record of the weight, percentage of cotton, and percentage of seed was kept for each boll that was above the average in size, or that in any way excelled other bolls.

Every plant that was selected as being in some way better than the average was carefully described in a written record. Every detail of the plant—roots, joints, branches, leaves, and fruit—was noted in detail in the record.

When Mebane began to select and record the facts it was necessary for a farmer to bring 1,800 to 2,000 pounds of the seed cotton to the gin to obtain a 500-pound bale of lint. The cotton as picked from the fields contains the seed. The seeds are removed in the ginning process. At that time the seeds were worthless except as a feed for cattle. Millions of tons of them were destroyed every year. Laws were enacted to prevent farmers from dumping them into streams or otherwise disposing of them so as to injure others. They had not even thought of using the seed as fertilizer.

After several years of work Mr. Mebane successfully concluded the experiments which have brought a billion dollars to cotton growers. Mebane for years sought to increase the amount of cotton, and decrease the amount of seed. The contents of a boll or pod of cotton were but 25 to 30 per cent cotton, the balance seed. Today there is an average of 42 per cent lint. This makes a difference of $5 to $15 a bale in the value of the crop.

To select the bolls that contained the highest percentage of lint, Mebane weighed on apothecary scales thousands of bolls of cotton. He computed the exact percentage of lint to the minutest fraction of an ounce. Year after year he selected and planted the seed from the bolls that contained the most lint. It was an endless task—thankless, and seemingly hopeless for several years, as the progress was slow. Infinite patience was required for the tedious work of going over, weighing, recording, and describing the characteristics of thousands of bolls each year. But finally an improvement was noted. Year by year the percentage of lint increased. Year by year the stalks of cotton gradually grew smaller, the roots increased in length, and the joints were stockier and tougher. His work was beginning to show results. Neighbors began to marvel at his cotton, and to inquire into his methods.

A. D. MEBANE,

And the Mebane Triumph variety of cotton.

In 1900, after more than 15 years of ceaseless labor, his fame began to spread. The United States Government sent its agents to learn his methods. Farmers began paying a premium for planting seed grown by Mr. Mebane. Mebane cotton was taking hold. He started exhibiting his cotton at fairs. The skeptics were slowly admitting that Mebane was right, and that his cotton was better than the average.

By 1900 his cotton had been developed to where it "turned out" about one-third lint, and two-thirds seed. This was considered marvelous by the cotton growers at the time. But today the lint "turn-out" is from 40 to 42 per cent. Although the seed is no longer destroyed, the lint remains by long odds as the most valuable portion of the crop. Today a cotton plant is considered extremely large when it is waist high. When he started his work the average man could hide standing up in a cotton field. Instead of raising large plants the farmer of today raises cotton and cotton seed, thanks to this man Mebane.

To the farmer this means a plant that will not whip in the wind, or throw the cotton out in the fields to fall and rot. The Mebane Triumph has long roots, that sink themselves deep, fortifying itself against protracted drouths. These benefits, however, are but incidental. The big value of Mebane's work comes in the increase of lint production.

The farmer who formerly took 1,800 to 2,000 pounds of seed cotton to the gin and came away with only 500 pounds of lint, may now take but 1,200 pounds of seed cotton to the gin and still come away with a 500-pound bale of lint.

Yet with all these benefits Mebane does not consider his work done. Visit his plantation today and you will find him at work among his cotton stalks.

Vast plots, each containing a slightly different variety of cotton, are scattered over his fields. The main fields are, of course, planted each year from seed from the best of the preceding year's crop, but not content to rest, Mebane gathers each year the bolls that seem to have in some way departed from the original. These are planted for experimentation. They are carefully watched for any new characteristics. He is always looking for the unusual, an improvement, or a change.

For several years Mebane has devoted considerable time and thought to increasing the length of the cotton fiber. Length of the staple is always a factor in determining the price.

One of the first to recognize the value of Mr. Mebane's work was the late Dr. S. A. Knapp, of the Department of Agriculture. It was Knapp who first called Mebane cotton a triumph. He suggested to Mebane that it be called Mebane Triumph—and so it was. It is indeed a triumph—a triumph of work, thought and patience—a triumph that has left prosperity in its wake, that has paved roads, built schoolhouses and churches. It has rescued millions of women and children from the drudgery of farm work, it has paid mortgages, brought automobiles and electric lights to regions in the South where prosperity was a stranger in years gone by.

From the little town of Lockhart hundreds of carloads of Mebane seed are shipped every year to all points in the cotton-growing regions.

Years ago Mr. Mebane was urged to take steps to protect his name—to do something to prevent other farmers—some of them unscrupulous—from growing and selling inferior seeds and passing them off as pure Mebane seed. But rather than do anything that might hinder the improvement of cotton he hesitated, only to see thousands of tons of seed sold each year to farmers as genuine Mebane cotton seed, but which is not.

Others have perhaps profited as much or more in dollars and cents from Mebane's work than he has himself, but Mebane is the type of man that works for an ideal rather than for gain. Rich in the esteem of his fellow townsmen, loved, honored and looked up to by them, he is content to search for still better methods of growing and improving cotton, rather than search for more dollars, or more acres of land.

The Golden Mistake That Won a World Series

Concluded from page 8

quite so good as the Mathewson fadeaway. It was what Mathewson used with the fadeaway, or without it, that made him the greatest pitcher.

Outguessing Mathewson was next to impossible. He had perfect deception. It is possible to discover what a great many pitchers are about to deliver by the way they hold the ball. Most pitchers hold it in front of them. They take a peculiar hold for a curve ball, another distinctive grip for a fast one. Mathewson held the ball in his hands behind his head. The batsmen never knew what kind of grip he was taking.

Next to Mathewson, Grover Cleveland Alexander, of Philadelphia, and now with Chicago, was the best pitcher the National League produced. In the early years of his professional career Alexander was buffeted about and passed by generally. He had a fast ball but was wild and he did not have a curve. He developed a curve ball and learned to control his delivery. Johnson achieved pitching greatness on one delivery, Alexander climbed to the heights by the use of a fast ball and curve. Alexander had a side-arm delivery and that is a hard one for a right-handed batsman to get away from. With Alexander pitching, batsmen did not take what the players refer to as a "toe hold," that is, set themselves. They would have to be off balance to shift quickly, for, if they took a "toe hold," the fast ball was likely to hit the batsman instead of the bat and there were many more pleasant things a batsman could think of than being hit by Alexander's fast ball.

Alexander, like Mathewson, masked his delivery perfectly. Also, like the peerless Mathewson, he always tried to get ahead of the batsman. If you study the methods of the leading pitchers you will notice that all of them try for this. Alexander succeeded.

It is almost always possible to tell when a curve ball is to be pitched by watching the catcher. As the pitcher winds up to deliver a curve ball the catcher moves back and spreads his legs. By doing this the catcher gets into position to catch the ball after it breaks. There are many angles to baseball's attack and defense, but from the home plate to the rubber runs the main artery of our national pastime.

BRIEFLY TOLD

The pearl button was first manufactured in Illinois in 1887 and has been developed until now the bulk of buttons are manufactured from mussel shells. Other buttons are made from nuts, potatoes, horns, hoofs, blood, porcelain, skim milk, glass, metals and seaweed. The total button sales each year in America alone are more than $32,000,000.

A new film corporation has been formed whose mission will be to make features for children, in which they will use child players.

One hundred and thirty-six thousand, four hundred and forty-one boys and girls were enrolled in agricultural extension clubs in 1921 for training in various phases of live-stock work. Last year these boys and girls owned 76,148 head of farm animals and 554,286 fowls, representing a total value of $3,605,176.

The "Bone Dry Federation" of California has just completed the making of a great campaign picture entitled, "Wake Up, Wash Your Hands." It is a six-reel picture carrying with it a tremendous appeal for the Eighteenth Amendment and the Volstead Act.

Pine, poplar, and other ordinary soft woods can be converted into hard wood comparable in all respects to mahogany, ebony and the like, under a new German invention, it is said. The device consists of an apparatus, hydraulic in nature, which compresses the wood to the point where it is so heavy it will sink in water.

Deer from the mountains recently raided hay fields and gardens in Skamania County, Washington. The hot, dry weather in the mountains caused the feeding grounds to be deserted and the animals swarmed to the valleys for food. Entire crops were ruined by the invasion.

Baseball and tennis are the national sports of Japan.

Only 18,500,000 of more than 313,000,000 inhabitants of India can read and write, and even these few are disproportionately of the higher castes.

A world's record for continuous speed in a passenger steamship was made recently by the White Star liner *Olympic* when she maintained for several hours a speed of 27.81 knots.

Ninety per cent of all the motion picture films shown in Australia are United States productions.

The Post Office Department spends approximately $160,000 every summer delivering mail to resorts by means of the "summer service."

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

The airplane has made possible the delivery in Paris at five o'clock of mail posted in London at nearly 11 o'clock. Mail posted in the ordinary way would require two or three days in transit.

About 60 years ago 300 feudal lords were in possession of all the land of Japan. The abolition of the feudal system placed the cultivators themselves in possession. Now these landowners have quit farming themselves and are leading luxurious lives on what they exact from poor tenant-farmers who toil day and night on the farms.

Every Sunday newspaper in London is owned by a peer.

The chauffeur of Prince Hirohito, regent of Japan, committed hara-kiri recently because of a tire puncture while his royal master was riding in his machine. Hara-kiri is a method of suicide sometimes practiced in Japan when any happening which in any way inconveniences any of the imperial family, is caused by the person in control of that portion of the royal entourage in which it occurs.

Peddlers outside the subway stations in the Bronx, Manhattan and Brooklyn recently drove a thriving traffic in German five-pfennig pieces about the same in size and appearance as an American nickel. They sold them at 500 for $1. The coins work subway gates the same as a nickel.

Divers have disclosed a Spanish Armada galleon under 10 feet of mud in 60 feet of water in Tobermory Bay, Scotland. The treasure consists of richly engraved silver plate of Elizabethan design, bronze bells and other valuables. The greater part of the galleon is still buried.

Members of the Italian Chamber of Deputies will not be permitted to carry their guns during sessions but must deposit them outside in lockers, specially designed for the purpose, in the cloakroom. The new ruling grew out of the threat of a Fascista deputy to draw his revolver against a Communist deputy.

A Japanese syndicate has acquired large estates in the far interior of Peru and is manufacturing, on a huge scale, cocaine and other alkaloids which it ships from the obscure port of Eten after packing the drug over mountain ranges instead of using the more accessible port of Callao. The natives of Peru chew the cocoa leaf as a stimulant to such an extent that they have become degraded to a plane slightly above that of animals, while in Chile, where the drug is unknown, the Araucanian tribe is a strong virile race that the white armies have never conquered.

A will, written on a telegraph blank in shorthand, has been admitted to probate in regular manner, in London, its validity being upheld by the probate court of England. It was written by a man who adopted phonetic writing as the quickest means of expressing his wishes regarding the disposition of his worldly goods when informed by his doctor that he had only a few hours to live.

Celery was once a fall and winter luxury associated with turkey and cranberry sauce but now it is eaten during the entire year. The celery industry in the last few years has grown from a novelty crop to a business of 17,000,000 crates in a year.

At an Episcopalian convention in Chicago recently, a report of a social and economic life said in part: "A fundamental change in the spirit and working of our social and industrial life is necessary to restore the world to peace and order. The fundamental change can be effected only by accepting on the basis of all our relations the principle of co-operation in service for the common good, in place of unrestricted competition for private or sectional good."

Certain railroad trains in Rumania are so crowded with the roving populace that the conductors cannot collect fares. There are not enough passenger coaches to handle the throngs of people who want to travel and the passengers are forced to ride on the roofs, running boards, bumpers and undertrucks of the coaches. Fights and altercations and accidents, fatal and otherwise, are of frequent occurrence.

Of the 737 members of the House of Lords, no fewer than 120 have not troubled to take their seats in the present Parliament.

BANKS MULTIPLY DOLLAR BY TEN!

Congressional Generosity Permits the Pyramiding of Dollars, Fosters Monopoly

Chronicler of the Neglected Truth

How the Banks Multiply the Dollar by Ten

Congressional Generosity Permits Dollar-pyramiding, Fosters Monopoly

By FREDERIC C. HOWE

This is the first of three articles by Mr. Howe; the second will appear in an early issue.

DURING the last few years the bankers and bankers' associations of the country have been carrying on a quiet, nation-wide propaganda to obtain the passage of laws to make it difficult for new banks to be organized, especially banks organized by groups not already in the banking business. They have done this by legislation conferring authority upon state superintendents of banking to decide whether there is need for more banks in a given community. The superintendent is also authorized to decide as to whether the persons applying for a charter are of such a character as to inspire confidence in their ability to carry on the banking business.

As the superintendent of banking is almost always a banker and as he expects to graduate from office into a distinguished banking position, he is very likely to accept the opinions of existing bankers as to whether there is need for another bank in their community.

The legislature of Iowa recently passed a law prohibiting the organization of any new banks at all for two years. In other states, banking superintendents have denied charters for new banks petitioned for by farmers and workers. The present United States Controller of the Currency has publicly announced that he would not grant any charters for national banks that are organized on the co-operative basis. He has refused a number of applications of thoroughly reputable men interested in the co-operative movement who had applied for national bank charters. The Controller has recently stated very emphatically that we already have too many banks.

Coming: Banking Monopoly

THE bankers are doing everything they can to make banking an exclusive business and to give the banks already in existence something like a monopoly. If the bankers succeed in this policy, the rule of the banking business is to be "ONLY BANKERS MAY ORGANIZE NEW BANKS. FARMERS, WORKERS, AND CO-OPERATORS NEED NOT APPLY."

For nearly 100 years we have had the principle of free banking in this country. Any one could organize a bank, just as he could organize any other corporation. This right, however, is coming to an end. Banking is being made a closed monopoly.

WHY THIS EXCLUSIVE POLICY?

There are a number of reasons for this policy—a policy as instinctive as it is nation-wide. It arose out of the big profits in banking; the many special privileges that the bankers enjoy and the fear that, if the people should learn of the profits and power of banking through state-owned banks, like the Bank of North Dakota or through co-operative banks, such as prevail all over Europe, they will want to go into the business themselves.

Now the first, and in many respects the most valuable privilege the people have conferred upon the banks is the privilege of lending about 10 times as much money as they have on hand. They have given them the right to lend far more money than they could possibly have, if they had all the money in the country in their possession. From the report of the United States Controller of the Currency for the year 1920 (page 760) we find that the loans and discounts of the 8,025 national banks amount to $12,393,357,000 and that the "legal reserve" held by these banks amounted to $1,245,233,000 or about 10 per cent of the loans and discounts. In other words, the banks had loaned 10 times as much money as an individual could have loaned and 10 times as much as they actually had on hand. The people have authorized the bank to expand its dollar to $10 and *to collect interest on each one of these phantom dollars that the bankers have so created.*

The Phantom Deposits

IT IS possible for the banks to lend twelve billion dollars when they only have one billion of reserve for two reasons. In the first place money is relatively obsolete in the modern world. We pay our bills and carry on our business with checks. The banks in turn carry on their business with checks. In the second place, the banker no longer lends money as he did in early days. He lends "bank credits." These bank credits are phantom money. They are created by phantom deposits in the form of entries made in passbooks given to borrowers when they make a loan. Bank deposits and bank loans are largely bookkeeping entries.

As the bankers discovered that they only needed a small amount of actual cash to meet the demands of depositors, they developed the idea of banking reserve; that is, the amount of actual cash "reserved" out of deposits to meet the current demands of depositors. For many years the banker himself decided how much cash he should keep on hand to meet these demands. If he kept too little and a run occurred, the bank had to close its doors. Some bankers did not keep sufficient reserves. There were bank failures. So the government began to fix the reserves that should be held. As time went on and checks supplanted cash transactions, this reserve was reduced. As the reserve was reduced the loans that could be made were increased. For the loans that the bank makes are made out of deposits, and the deposits in turn come from the loans to customers.

The Federal Reserve Act of 1914 did a remarkable thing for the banks. It cut the reserve required in two. It made the banker's dollar twice as valuable as it had been before. It increased the amount of loans and investments the bank could make by 100 per cent. The reserve required of national banks now averages 9.7 per cent. The reserves of state banks are fixed by state laws. They vary in different states.

The generosity of your government to the national banks is indicated by a comparison of the reserve required under the laws prevailing prior to 1914 and the provisions of the Federal Reserve Act.

The cash reserve required of national banks before and after the passage of the Federal Reserve Act are as follows:

Cash reserves required prior to 1914 for demand deposits under National Bank Act	Cash reserves required for demand deposits under Federal Reserve Act of 1914
In three central reserve cities banks required to keep 25 per cent of deposits in cash	In central reserve cities banks required to keep 13 per cent of deposits
In 51 reserve cities banks required to keep 25 per cent of deposits in cash, one-half of which might be in central reserve cities.	In 12 reserve cities all banks required to keep 10 per cent of deposits
All other national banks required to keep 15 per cent of their deposits as reserve.	All other banks (called country banks) required to keep 7 per cent of their deposits. Only 3 per cent is required for savings or time deposits.

By a half-dozen lines put into a law by Congress *the bankers' dollar has been doubled in value. It now carries ten dollars in bank credits where it only carried five dollars before.* The loans that can be made were increased, as were the earnings of the bank. It is doubtful if Congress ever made such a generous gift to any group or class in the nation as it conferred on the 8,025 banks of the country by the Federal Reserve Bank Act.

A Colossal Gift

THE Controller of the Currency himself discloses how fabulously valuable this gift has been.

From his 1920 report we find that the assets of all the national banks in 1913 amounted to only $11,381,558,000. This was the year before the Federal Reserve Act went into operation. Seven years later these assets had increased to $23,175,784,000, or an increase of more than 100 per cent. *The Controller himself says that this was a greater gain than had been made by the national banks in the previous 50 years of their existence.*

The claimed value of the railroads is less than $20,000,000,000. For a generation we have been struggling to stop the watering of railroad stock. Yet entirely unnoticed by the press and the public, in fact, heralded by the press and the public as a wise piece of legislation, Congress gave the national banks a sum equal to 60 per cent of the claimed value of the railroads of the country, or a sum equal to the total resources the national banks had built up in the 50 years since the Civil War.

Now a bank is like any other business. Its earning power is largely determined by the resources at its command. If its assets are doubled, its earnings are likely to be doubled as well. If we examine the reports of the Controller of the Currency we find that the banks have profited by the Federal Reserve Act by a colossal sum. In 1914, the net earnings of the national banks amounted to $149,270,000. In 1916 they had increased to $157,543,547. In 1918, they had grown to $212,332,000. In 1920, they leaped up to $282,083,000, or an increase of nearly 100 per cent in six years' time. The amount of capital invested in the banks increased only from $1,059,403,000 in 1913 to $1,248,271,000 in 1920, or only $188,868,000. But during these years their earnings had doubled.

This increase in net earnings was largely a gift by Congress to 8,025 banks by the reduction in the amount of cash reserve required.

The loans and investments of the banks increased as did the earnings. As one dollar would now support twice as much in deposits as it did before, it would support twice as much in loans as well.

That this is true is also shown by the reports of the Controller of the Currency for 1920.

Year	Capital Stock	Loans and Discounts	All Assets or Resources	Deposits
1913	$1,059,403,000	$ 6,288,338,000	$11,301,558,000	$ 8,346,011,000
1920	1,248,271,000	13,723,611,000	23,175,784,000	16,751,956,000
Increase	$ 188,868,000	$ 7,435,273,000	$11,874,226,000	$ 8,405,945,000

This reduction in the amount of cash reserve required of a bank is not in itself an evil. It enables an immense amount of work to be done by a small amount of money. It permits us to cancel debts by bookkeeping entries. Even more important, it permits the volume of credit to be greatly increased, and through this increase more wealth can be created.

One of the reasons urged for this reduction in the reserve was that it would reduce interest rates. If the volume of credit could be doubled without any additional investment, credit, it was said, should be so abundant that it would be cheap. The bankers, it was claimed, could afford to reduce interest rates. Competition would bring this about and the people would benefit by reason of it. In other words, the gains to the banks through the increase in their lending power would be passed on to the borrowers, who would be the real beneficiaries under the act.

This pyramiding of deposits and loans on a small amount of reserves is not ordinarily a source of danger. The depositor is perfectly safe, provided the investments and loans of the bank are safe. In case of bank trouble or a run that exhausts its cash, the bank calls in its loans or sells its securities and converts them into cash. It compels borrowers to pay up. Under the Federal Reserve System it can take certain kinds of securities to the Federal Reserve bank and convert them immediately into Federal Reserve notes. It rediscounts them through the act of the government. If it is not a member of the Federal Reserve System it takes its securities to another bank and borrows money on them. In other words, it rediscounts the notes and bills that it holds and secures actual cash with which to pay depositors.

A Privilege to Be Kept

THIS is one of the great advantages of the Federal Reserve System. It provides a market with almost unlimited resources to which the banker can go and secure money with which to meet his needs. If the assets of the banks are equal to the deposits the bank has no reason to fear a run, it has no fear of insolvency. The depositors are just as safe as though there were actual money in the bank to pay their deposits. For we now have a system by which securities can at any time be converted into money to meet a bank run, to relieve a credit stringency and to shift the monetary resources of one part of the country to the relief of another.

The bank depositor has no reason to fear the smallness of the cash reserve; his only concern is as to the investments and loans which the bank has made with his money. And these are reasonably well protected by bank examinations and in some states, notably North Dakota, Oklahoma, Texas, Kansas, Nebraska, Washington, South Dakota and Missouri, by bank guaranty laws that insure the depositors against the possibility of loss.

In this valuable privilege of expanding the dollar into ten dollars, we find one of the reasons the banks do not want outsiders to break into the banking business. For this is a most valuable privilege. It is probably the most valuable privilege ever conferred upon any group of men in the history of the world. It has given colossal and unprecedented power to those who benefit by it. And the bankers do not want to share this privilege with others; especially they do not want to share it with co-operative banks, which would pass the promised advantage of reduced interest rates on to the consumer. They do not want to share it with state banks, like the State Bank of North Dakota, which would disclose to the people how valuable this banking privilege is. For, if the people generally knew that a dollar could be increased to ten dollars merely by taking out a bank charter, the people would take steps to magnify their own dollar as they have magnified the bankers' dollar. They would do this through co-operative banks or through state-owned banks. They would start a mint of their own for the issuance of phantom dollars based upon "cash reserve" as do the private bankers. They would collect interest not on the one dollar that they loan, but on the ten dollars that they could loan did they use for themselves the privileges which they have so generously given away.

"Money" and Prices

"AN ANALYSIS of the combined figures of the 'Ten Great' Banks reveals, but only to the instructed, the interesting fact that the ratio of bank-manufactured Credit (operating as money all the same) to real Money or Legal tender, which itself is only fractionally gold in substance, is somewhere about 15 to 1. Deposits, which obviously are a liability, since the Banks 'owe' them to their customers, amount roughly to 1,800 millions. 'Advances' (another liability) amount to about 750 millions. Bills discounted—still another liability—amount to 350 millions. And 'short money' or money on loan (again a liability) amounts to 120 millions. In sum, the liabilities of the Banks, expressed in terms of legal tender, which constitutes their sole trading-stock, amount to something like 3,000 million pounds. Against this liability to supply legal tender on demand, the same Banks have, we are told, only 200 millions in actual cash, of which 200 millions a considerable part is paper and the major part is on deposit at the Bank of England. In other words, fourteen-fifteenths of the 'money' held by the Banks is pure inflation of the legal currency, and is the express manufacture of the banks themselves without the yea or nay of the community as a whole. In view of the well-known rule that fixes prices, namely, the ratio of Money to Goods, it will be seen (perhaps) what an astonishing power the Banks wield in their ability to manufacture Money at discretion. No matter what the amounts of Goods may be, more or less of Money in circulation will determine their price; and since, as is obvious, the Banks can determine the quantity of Money in circulation, they can, it is no less obvious, determine prices. We need not stress the fact that prices govern the lives of every one of us. The important practical fact is that the Banks govern prices. Until the community that creates Goods controls Money and Prices, there can be no reform with the name."—*New Age,* London.

The Rising Tide of Autocracy in the U. S.

Government by People No Longer Exists With Bureaus Reaching Out for Control of the Individual, the Home and the School

By AARON HARDY ULM

"HE HAS erected a multitude of new offices and sent thither swarms of officers to harass our people and eat out our substance." Thus was George III indicted in the immortal Declaration of Independence.

King George's "multitude of new offices" and "swarms of officers" were not as 1 to 100 compared with those now functioning in, through or from Washington "to harass our people and eat out our substance."

While such figures tell only a part of the story, some appreciation of the expansion of the Federal Government may be had from statistics bearing on the growth of what is known as its "civil establishment."

In 1819 the services of only 6,327 persons were needed for carrying on the civil affairs of the Federal Government. That is to say only about 1 out of every 1,500 of the population was a Federal official or employe.

In 1861 only 53,900 persons were on the civil payroll of the government. Ten years later there were 107,000 persons on that payroll, the big increase being largely a result of the Civil War. Thirty years later the number had grown to 256,000. Then began the big jumps. In two years, from 1901 to 1903, the "civil establishment" increased by nearly 50,000. Then there were average annual increases of 5,000 to 10,000 until our entrance into the World War sent the total number to practically 1,000,000. Since the war, of course, there have been declines, which have now about ceased. On June 30, 1922, there were 560,863 persons in the "civil establishment" as salaried or wage employes of the government. This represented an increase of 120,000 over the pre-war number. There are many thousands who are paid in part by the Federal Government but are not carried on its official payrolls, such, for example, as county agents employed under the Smith-Lever Act.

One Per Cent Overlords

IT IS reasonable to estimate that today at least 1 out of every 150 of the country's population is an official or employe of the Federal Government. This estimate omits all in the army and navy, who, if concluded, would make it *at least 1 out of every 100 of the population.*

The figures show how the activities of the Federal Government have grown out of all ratio to growth in population. Growth of activities has been accompanied by expansion of authority and power to even greater degree.

That expansion has been going on, with only incidental and temporary checks, since the government was established. Virtually all of it is traceable to a dozen simple, harmless appearing words in the Federal Constitution, to wit: "general welfare," "lay and collect taxes," and "regulate commerce among the several states."

It was contended for nearly a hundred years by many able men that the "general welfare" phrase in the Constitution did not authorize Congress to raise and spend public funds even on such things as post office buildings and the improvement of rivers and harbors. As late as 1845 President Polk vetoed a rivers and harbors appropriation bill on that ground. It is now an accepted practice that, by reason of those two words, Congress can raise and spend money on virtually anything.

The Tax Bludgeon

IT ALSO now is the accepted practice that Congress can use its taxing power for many purposes other than the raising of taxes. *It was employed only a few years ago to crush an undesirable industrial activity* and by every tariff bill it is employed in giving indirect subsidies to a wide range of industries.

It also is the practice for Congress to use its power to "regulate commerce among the several states" for the achievement of purposes having little if anything to do with commerce.

Nearly every expansion of Federal authority and activity calls for the expenditure of more money by the Federal Treasury. This fact until recent years had a severely restraining influence on the tendency of expansion, if not centralization.

For Congress's fund-raising power was limited practically to excise taxes and import duties. If the tax on tobacco, for example, reached a certain high point it would cease to yield revenues; likewise in the matter of imports when the tariff was excessive. Thus the traffic that could be taxed would bear only so much by way of levies.

This restraint was removed very largely when Congress was empowered by amendment to the Constitution to levy income taxes. *Under its present taxing power there scarcely is any limit to what Congress may raise. The difficulty of getting funds is no longer an important restraining influence on the expanding tendencies of the Federal Government. The income tax makes it possible for Congress to raise virtually any amount.*

It does not change materially the seeming fact that the burden of taxes is carried by a comparatively few. In the one city of New York, for example, more than one-fourth of Federal taxes are collected. Superficially it would appear that a majority of the states regularly get much more out of the United States Treasury than they pay into it, and that nearly every general appropriation adds to that excess. But *the higher the burden of Federal taxes the richer the wealthy centers like New York seem to become.* The reason is that *the big taxpayers are in great part mere tax collectors who pass the burden, usually augmented, on to the general population.*

Implicit Trust in Government

THAT, however, is not the sole incentive to Federal expansion. Another important one is *the very extended belief that the Federal Government can do everything governmental better than any other governmental unit.* Many who hold to that belief also insist that government can do virtually anything better than anyone else. They see no truth in Goldsmith's lines:

"How small, of all that human hearts endure,
That part which kings or laws can cause or cure."

If a "wrong" exists anywhere they insist that the Federal Government correct it, regardless of whether the method of correction in the end would not be worse than the wrong.

Thus the Federal Government steadily has been induced to reach out and exercise jurisdiction over matters that its founders held belonged solely to state or local governments, and possibly over matters which properly belong to no governmental jurisdiction.

Some of those ventures have been all but absolute failures—as with the fourteenth and fifteenth amendments to the Federal Constitution. The first was to give national protection to the Negroes in the enjoyment of their freedom. *Of the several thousand cases that have gone to the United States Supreme Court under the fourteenth amendment, fewer than 50 have had to do at all with the Negro, and only a half-dozen of those were decided in his favor.* All others involved limitations on the powers of the states over other matters entirely, in the main corporations. And the fifteenth amendment for years has been virtually a dead letter.

But most of those ventures have continued to operate and be enlarged upon, and new ones constantly are undertaken.

The result is more than a governmental change—it borders on revolution.

Even as recently as, say, 1910, after Federal expansion had gone on for a decade at a pace never before known in peace-time, the average American's virtually only regular touch with the Federal Government was through the postal service. Now, only 12 years later, there is scarcely a moment in his waking life when he is not conscious of Uncle Sam, figuratively speaking, standing at his elbow and exercising a measure of jurisdiction over most of his acts and, to a degree, his thoughts, too. *The interstate commerce clause of the Constitution has been made to cover even purely mental operations.* A person may be prosecuted under an act passed by virtue of it for *only expressing the intention* of committing an act that belongs to the realm of personal morals and has no more than the moon to do with interstate commerce.

Where Absolutism Reigns

THESE expansions of Federal activity function through an increasing number of governmental agencies, which are only remotely within the area of public control as exercised at the ballot box.

For example, the power of life and death over transportation within the country and our own facilities for foreign transportation lies with *two boards that are outside of the responsible departments of the government.* They are the Interstate Commerce Commission and the Shipping Board. They are continuous and excepting in so far as not modified by law they go on just the same regardless of the result of elections.

The entire monetary system of the country is within the absolute control of the seven men who constitute the Federal Reserve Board. Though the Secretary of the Treasury and one other Treasury official have membership on it, that board is independent and *is not at all directly subject to restraint or change via the ballot box.*

It is a truism that nine parts of a law is its administration. Thus not only are Federal laws being multiplied but their administration in many cases is being put beyond the realm of direct responsibility.

Even the law, as well as the rule of administration, is making, openly, another departure that is of significance.

The application of many Federal laws now are removed, calculatedly, from all local influence, even when the application has to do with exclusively local problems. There was a time when a great rumpus would have been raised in any community to which rank outsiders were sent to enforce a Federal law in a local matter. Every community has insisted that it supply its own postmaster, its own United States marshall, its own Federal district attorney.

Now "flying squadrons" are maintained for activity on behalf of Federal laws in communities to which the members of those squadrons are strangers. This is the way despotic rulers govern unruly provinces.

The change has been characterized by a tremendous growth of Federal Government activity of the "secret service" kind. The old, romantic "secret service" branch of the Treasury Department—the business of which is to look after counterfeiting—is now insignificant in comparison to all the "secret service" agencies that operate on behalf of the Federal Government. They are known usually as investigators or intelligence collectors but in every real sense they are "secret service." The Department of Justice has a "secret service" department, directed by William J. Burns, the well-known head of a private detective bureau. It contains several hundred operators. The Internal Revenue Bureau has several groups of the "secret service" type of operators to look after tax matters or prohibition.

Spread of Secret Agencies

THUS the expansion of the Federal Government takes on aspects peculiar to governments of the autocratic sort. Agencies removed from direct public responsibility are intrusted with the enforcing of many laws, and *vast secretive agencies that are laws more or less unto themselves are established for the purpose of exercising a surveillance over what often are private affairs.*

These and other factors might not be of any great danger so long as the Federal Government deals chiefly with things, as was the case until recent years.

Steadily has it gone beyond *things* to *persons.* It is not satisfied with regulating the conduct of business and gradually is coming to regulate the conduct of individuals.

The tendrils of centralized government are reaching out for the home, the school, the community.

And, unless public opinion on the subject changes, there is no telling how far the government may go. The late war—as did the Civil War for that period—demonstrated how far under necessity or compulsion the national government may go toward controlling activity and even thought.

Straws of Change

"CONGRESS has already gone far," wrote Henry Litchfield West only a few years ago, "but judging the future from the past it has only touched the edges of the great domain wherein Federal power may be exerted."

"The public mind has become completely saturated with a feeling of absolute faith in the efficiency of Federal power," he added.

Recently, however, there occurred two events which may indicate that a reaction still is possible.

One is the renomination, after a bitter contest, of one of the only two or three present United States Senators who persistently have opposed the rampage of federalization that has been on for the last several years. He was attacked chiefly for that opposition.

The other is the action of the Massachusetts legislature directing the state's attorney-general to attack the constitutionality of a Congressional measure offering the states donations from the United States Treasury on condition that certain work having intimately to do with the home be carried on under Federal supervision. Four other states have rejected the donations, which are proffered under the so-called maternity bill.

Another occurrence that may be of significance is the decision of the Supreme Court to the effect that there are limitations on Congress's right to use its taxing power to accomplish social reforms belonging within the jurisdiction of the states. Already it had held that like limitations are on its right to "regulate interstate commerce" for the same indirect purpose.

These may be "straws" showing a changing of the winds of public opinion but it will take much more to offset the insidious influences that are working for the complete federalization of the country.

Stockholders and Employes

A FALLACIOUS idea in modern industrialism is that wages are in any sense to be compared with stock dividends. Yet the argument is often made that the employe is enjoying a greater benefit than the owner of the industry.

Such an instance of comparison is the presentation of the records of the Pennsylvania Railway system, which has many shareholders, and to the casual reader the argument may seem pertinent. However, it falls far short of dismissing the case, for it neither admits a difference in status nor shows why the alleged investment of the shareholder is not profitable.

The statement is made that while wages paid employes now have gained in purchasing power as compared with 1914, stock dividends have lost; that the owner is not receiving his share of the profits of the business. Hence, wages should be reduced.

There is no relation between the wages paid employes and the dividend returns. The wage is a stated sum, not to be increased if the profits are increased, and forms a fixed charge, as the cost of equipment, maintenance and fuel. The employe is not a shareholder and should not be asked to participate in business losses. He would not share in profits.

But is the stockholder the owner? How many of the 140,000 shareholders in the Pennsylvania system have an active voice in its business management?

The shareholder has probably paid less than face value for his stock, perhaps not more than 50 per cent, hence a small dividend may really be a very fair return on the money actually invested. If he has had larger returns, he was receiving more than money invested should earn, perhaps.

But here is the real point. *The shareholder has mortgaged his property to the bondholder,* and really does not own it at all. Foreclosure would cut off his income entirely and cost him his investment. The three classes of bonds of the Pennsylvania system outstanding are active on the market at from 96 cents to $1.10. No information is given on aggregate indebtedness or the actual value of the system, but it is safe to say the physical worth is less than the bonded debt; the real security of the bonds is the earning power.

The difference between the employe and the stockholder is simply that the one is selling his services, expending his capital, for a fixed return, while the shareholder is speculating on his capital, permitting it to earn for him. The employe risks life and limb, physical energy and health; the shareholder risks money only.

No man with common sense has charged the shareholder with getting rich from his investment. He is not the target for the criticism. It is the real ownership, the manipulators of the system who have burdened the organization with debt until it would be difficult to tell how much is real and how much water.

Facing Austria

SHALL Austria become a deserted land?
Shall Vienna become a city of the dead?

The proudest monarchy of the Middle Ages with the gayest capital of the world a few years back, has come to the end of the road. Perhaps we should not deplore the falls of the mighty; some stern law of nature seems to balance the great with the small, the heights of happiness with the depths of despair.

But the world cannot be forgiven the economic loss it causes, if it idly permits some principle of retribution to destroy the productive possibilities of a nation. Thousands of years have passed since Babylon fell to decay but the world still yearns for its glories. Vienna's evils have been many, but the world cannot afford to lose her art, her music, her culture.

Austria, stripped of her vast dominions and merely a shadow of the Holy Roman Empire that was, has pleaded, argued, reasoned with the European powers in an effort to obtain some relief from the problems that doom her. France, whose fear that Austria's union with Germany would raise again the menace of the mailed fist, has vetoed that suggestion. Italy, eager to establish a protectorate over Austria, has come forward with no suggestion for her aid. England has all that she can take care of at home.

In the meantime, Austria, economically ruined, has been rushing on toward political dissolution. In the one month of July, the circulation of printing-press money rose from 439,000,000,000 to 618,000,000,000 kronen, an increase of 40 per cent. The krone, now circulating by the billion, worth in American money something like one one-hundred-and-fiftieth of its pre-war value, and fluctuating wildly, has long since ceased to resemble a medium of exchange. Grocers or meat dealers, selling a few thousand kronen worth of food in the morning, may have to pay hundreds of thousands more for the same commodity at night. With such conditions, it is impossible to expect persons to labor for hire—their pay is worthless when they get it.

They are talking openly in Austria of the "crash." They expect foreign bourses to cease to accept the kronen at any exchange. The great tourist agencies already refuse to exchange kronen into other money, on the return of travelers from sojourns in Austria.

The "crash" does not mean state bankruptcy when applied to Austria. Portugal, Greece and South American states have become involved and repudiated their state debts. In Austria, everybody long since wrote the state debt off as unimportant. It is the *buying power* that the "crash" applies to. Austria must have clothing and food from foreign countries. If the markets are closed to her through the debacle in kronen, it means she must become a subject of wholesale world-wide charity, or else her inhabitants to the last man must make their separate ways across the borders.

Business of Yawning

LORD LEVERHULME, who possesses a vast fortune made in the soap industry, made a speech recently in which he sought to arouse the ambition of England's younger generation. He discussed America's vast wealth.

"America's great wealth," said the British peer, "lies not in possessing three-quarters of the gold of the world, but in the Yankee habit of early rising."

This theory would indicate that America's wealth has declined rather than increased with the rise in population. It would indicate that New York instead of being the wealthiest city is actually the poorest city. It would rate the pioneers of the country as far richer than the men of today.

But paradoxical as it may seem there is no doubt of the accuracy of the Leverhulme assertion. Wealth is the product of the physical and mental energy of men superimposed upon the material and intangible possibilities of the country. The simplest of reasoning would show that early rising with its consequent alertness would be reflected in the product of labor.

As nations pass from barbarism to civilization, to decadence, it is a cycle in which the wealth of early rising and the poverty of late hours play parts. America is at a crucial point. If the decadent tendencies of the pleasure-seekers can be arrested, and the productivity of early rising can be restored, we may hope to escape the fate which overtook Greece, Rome and other nations which fell.

Mencken and England

IT IS to be hoped that Great Britain will not accept the visit of H. L. Mencken as a bit of studied revenge on the part of the United States. It is true we are glad to have him in England, but the pleasure is not in any way malicious, though the British might be justified in jumping to that conclusion.

The British know that Americans were getting pretty resentful over the repeated visits of English instructors. We were compelled to preserve the serious mien while Mrs. Asquith was here. We looked credulous when Sir A. Conan Doyle lectured, and we pleased Lady Astor by heartily agreeing that she is English through and through. Writers, lecturers, statesmen have condescended to visit us at so much per lecture, and have freely told America what is wrong with us. With all due humility, it must be confessed that we had got pretty sick of the whole business.

And then came the visit of Mr. Mencken, self-confessed leader of intellectual thought in America, to *our* mother (it may be *his* stepmother?) country. Mr. Mencken has been giving the English first-hand assertions that America is a country of boobs. But we are willing to let him do that, confident that before he is finished England will have its fill. But there is nothing nationally malicious about the visit—we never would have been able to think it up so beautifully.

Begin Nearer Home

PEACE between nations goes on apace, however much industrial, political and social warfare continues within the limits of individual nations.

On an American cruiser, three miles off the shore of Central America, the presidents of Nicaragua, Honduras and Salvador signed a treaty of peace and amity. The treaty was concluded in the presence of the American ministers and under American inspiration. The aim of maintaining peace between the principal Central American countries is stressed in the document, which takes care to define satisfactorily points of controversy between the republics.

The United States takes a natural pride in being instrumental in restoring good feeling between other nations. The good offices of this country were responsible for the settlement of the long-standing differences between Peru and Chile. South and Central America were for many years the hotbeds of revolutions and wars, but due largely to the influence of this country the differences have been rendered insignificant.

When nations are in controversy, it is the United States which most frequently is called upon to give diplomatic first aid. We have the distant perspective which enables us to establish, most nearly, justice. And despite frequent aspersions regarding our selfish aims, other nations seem to have considerable confidence in us.

With the remarkable success which has attended our individual efforts on behalf of international peace, it is a wonder, indeed, that we are so far from success in maintaining peace within our own borders. We have been suffering from the railroad war and the coal mine war. The coal strike was not settled; it settled itself after exhaustion had hit the combatant forces. In Porto Rico, our wards have manifested great discontent. In Cuba, the American orders as to how much sugar shall be produced, and how finance shall be regulated, has actually stirred up an agitation for Spanish sovereignty, which the island threw off after a half century of struggle. In Haiti and San Domingo, the bitterness over our financial and military overlordship is deep.

The United States seems to possess abundant faculties for settling troubles which do not intimately concern her. Would that she was able to handle as well her own exclusive business!

It Must Go On

ONE of the great faults of Americans is lack of stick-to-it-ive-ness. We mean well most of the time; and we mean well actively and enthusiastically for a brief period; but gradually our intense excitement wanes and we begin to mean well passively, finally winding up with a mere mental state of meaning well.

Nowhere is this characteristic more thoroughly exemplified than in our recent governmental history. We have had vehement crusades against monopolies, feverish conservation of our natural resources, intense peacefulness and intense warlikeness. And then we have cooled down. But instead of cooling down to the desirable state of comfortable warmth, we have cooled down to lukewarmness, cold or absolute frigidity.

A dozen or more years ago, irrigation of arid lands and drainage of marshlands engaged the thoughtful attention of the entire country. Indeed, the pure reasonableness of the propositions appealed so strongly to the imaginations of everybody that we were surfeited with talk, writing and agitation upon the subject. And now it would be a marvelous personality who could succeed in arousing more than passing interest on the subject.

Yet, it remains as vitally an important problem as ever. According to the president of the National Drainage Congress, there are 75,000,000 acres in the United States that can be reclaimed. The tremendous waste is patent. The population of this country is going to grow. Its growth calls for more productive land.

The reclamation of arid or marshlands will increase values of those lands. In many instances land formerly worth $15 to $20 an acre has been increased in value from $200 to $300 an acre by the process.

There has been considerable individual reclamation work, and some vast governmental irrigation projects. But for the most part the great field of reclamation is untouched. The tremendous cost of a complete reclamation program makes it impossible for the government to finance it. The inequity of piecemeal reclamation by the government is manifest when one considers how quickly political demands would result in the bestowal of reclamation patronage upon favored interests. Reclamation should be a private project, under a general government supervision and in accordance with comprehensive plans of the government.

There is little controversy over the points involved. But for good to come, we must begin to transform our good intentions into constant, unremitting accomplishment.

Mr. Ford's Page

THE strikes which have marked this year have been of a new and startling character. That is, they would be startling if we did not know the mental reactions of the American people. The really impressive mark of the strikes has been the feeling of apathy that has pervaded both strikes and public. The combatant spirit has been almost entirely lacking. The zest of contest did not even spring up to die down again. The bad temper which certain types of men find it their highest pleasure to indulge has hardly appeared anywhere. The character of the strikes is more that of a slump than that of a struggle.

This may be full of meaning for the future. In another people it would mean the first inroads of a despair which would permit all kinds of social despoilers to get in their work. In some European nations this apathy would be fatal. In Russia, for example, it would most certainly spell a long period of lethargy on the part of the public mind, with consequent destruction by the enemies of government and law and order. And it would mean the same thing here but for a combination of racial elements.

Citizens should know—and many of them do know—that the revolutionary forces, the forces of darkness and disorder, have made the world their stage. The fact has been stated many times, but usually in a way that conveyed an essential untruth with it. The truth is this: that plans for world upheaval have been laid in every land. The untruth is this: that the plans will be equally successful in all lands.

Look first at the revolutionary plans as revealed in the present strike situation. These plans first involve the employers, the so-called capitalists, who are usually not capitalists at all, but dependents on capitalists. What a mistake to call a manufacturer a "capitalist" when he must borrow his very working capital from the capitalists! If industry were free of the grip of international capitalism, industrial disputes would disappear, because it is the pressure of capitalists upon both managers and men that provokes most of the conditions which result in strikes. But even so, managers have been so organized, employers have been so unionized, that they constitute a dangerous mental condition in this strike. There is more hate, more criminal disregard for fundamental human rights, among the employing class today than among the employes. That is, the old brutality that used to mark the labor leader, now marks the other side. The employers have been as strongly propagandized against labor, as labor was formerly propagandized against capital. The forces that make for destruction have carried out this part of their plan beautifully, and the pity of it all is that the business men of our country cannot see it. Business men and manufacturers have been so tightly tied into unions and employers' associations, that they are just as much shorn of independence, just as much at the mercy of *their* leaders, as are the innocent duespayers who think their walking delegate is a god.

That is what happened in other countries—in Russia and Germany, for example: the so-called upper classes were organized. Now, under such conditions, this can be accomplished only by making the members of this class believe that they are *organized against* something. That is the motive that is used to bring them together. But the real motive, the concealed motive behind their being brought together, is that still another power might handle them. If you want to handle the workingman, organize him into unions or any other group, then by the motive of loyalty to his own group you can swing him any way you choose. Men are never so much like a herd as when they are organized. When they are free to go afoot and alone and across lots, they are intelligent individuals. There is enough individuality in the average labor union to revise every strike policy of every labor leader, but that individuality is suppressed by the pressure of group loyalty.

What has been done to the workingman has also been done for his employers—both have been organized that they might be more easily handled by those who pull the strings above them. Both are dupes. And they are the most hopeless kind of dupes—the kind that laughs when they are told that they are dupes.

The stage has thus been set. The forces of production have been divided. Managers and men have been made to believe that they are enemies. The machinery of revolt has been perfected to such a degree that it has been made easier for managers to use the ultimatum and easier for the men to use the strike, than for either of them to make a move to get together as co-partners and find a solution. The ways have been greased so that both of them just naturally slide into a situation that deals a heavy blow at the stability of the United States. And this has occurred so often of late years, and with such fatal ease, that now that the slump is deeper than ever before, and the element of hopelessness and futility more apparent, a spirit of dejection has seized upon both parties. It is just at such a juncture that the destructive forces get their opportunity. And they would have made this year their opportunity but for one hindering fact, namely, the vast majority of the American people have an inkling of what is afoot; their racial instincts, their sense of self-preservation warn them.

What is going to happen? This will happen: it has already occurred within recent weeks wherever men of the contending groups have come in contact with each other: They are going to look at each other and make a discovery, and the discovery was actually voiced in these words: "Why, we are fighting our own people!"

Men get the idea that there is a difference between the two groups: as a matter of fact they are mostly the same. The miners, for example, are mostly members of the dominant races in this country, not the newcomers, but sons of the fathers who gave America its destructive character. It isn't a struggle like that between the Jew and the Slav in Russia, nor like that between the Armenian and the Mohammedan in Turkey: it is a struggle between men whose greatest genius has been their ability to find a working basis beneath each disagreement. And when men like these discover that they are alike, and that the influences which have worked for their separation and enmity are alien in blood and spirit—then reunion and readjustment are coming.

The contestants are not happy in this contest. They are not thirsting for deeper upheaval. Their very unhappiness is the protest of their common humanity against this fraticidal struggle. It is in their very dislike of the means they have used and the situation they have brought about that you can see the evidence that the world program for civilization's overthrow is not going to succeed in this country. Our racial and spiritual soil is not hospitable to such seed. Some peoples are slow to realize the insidious influences in their midst: our nation is alert and quick in this regard. Our dejection over the pit into which we have fallen, our hopelessness of ever finding a solution by the methods we have chosen, our disgust at the by-products of criminal greed and selfishness which the industrial dislocation has disclosed, are all indications that we are seeing one more phase of the old era coming to a finish.

THE Conscience of America is a more powerful force than any program of disorder. The hopes of those who desired the strikes to usher in the complete downfall of American institutions, are not destined to be realized. While it is true that the tactics which resulted in disaster overseas have been tried here, and while it is true that some of the preliminary manifestations of revolution have appeared, it is not true that these are signs of a baneful success. It takes a certain receptivity to lawlessness, or a certain lack of national initiative to accomplish a subversive program, and these cannot be found in our country. The necessary racial soil is not here. The air of this nation neutralizes alien plans of disorder. Our people are entering a frame of mind which portends ill for all the sources of economic discord.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Communism—With Uncle Sam Standing Guard

In Samoa Where Every Prospect Pleases, Even Man Is Kind

By CARL SCHURZ LOWDEN

DID you ever see a fish farm where the catch from the ocean is placed in fenced sections of a lagoon, fattened carefully and then turned into an at-home fry or carried to market? We have nothing of the sort except gold fish farms and the hatcheries maintained by the government; but in the middle of the Pacific lies one of our island possessions where fish farms are common.

In this colorful insular group with a climate described as the "most pleasant in the tropics," if you relish wetness to the extent of 195.5 inches of rainfall a year, you will like Samoa. Evidently Robert Louis Stevenson, who gave us "Treasure Island" and other gripping fiction, loved the palm-fringed spot; for there he lived and there he died while the natives wailed their grief, built huge beacon fires on the hills and spread the sad news by means of weird, mournful-sounding drums.

Samoa is frankly communistic. Back in the long ago when Captain John Smith ruled the first colonial settlement in Virginia he set forth that "those who will not work cannot eat." That principle is followed by the village chiefs, "pulenuu," i our far-away land of the South Seas; and the heads of the families, "matais," act as able lieutenants for the enforcement of it. For example, the fish farms are owned by the villages and subdivided to the families: the Samoan is lazy by nature but he will assist in the catching and fattening of the sea denizens rather than forego the food.

We speak of Russia in hushed words as rabidly communistic. Uncle Sam scores Russia as a veritable devil while at the same time he humors his own baby, likewise communistic, and pursues his policy of democracy with non-interference. "The child," he smiles, "will not harm itself."

"By the simple communistic system under which the Samoans live," says Captain Waldo Evans who served as governor from November 11, 1920, to March 1, 1922, "each person contributes the profits of his industry to the family fund. There is no incentive for one person to work harder than his fellow laborer. Energy and ambition must be manifested in the head of the family to produce any increase in prosperity."

Suffrage is restricted to heads of families or "matais" because in the Samoan scheme of things the individual as the unit of society has been replaced by the family. These "matais" constitute the village councils. From their number the various parts or communities select delegates to attend the "fono" or general meeting held toward the end of each year. This "fono" is the Samoan legislature rather markedly like the system of campfire councils employed by the American Indian before the white man fashioned reservations for him; for at this general meeting petitions are presented, laws are changed and new ones adopted.

Incidentally some of the laws are remarkably wise. Those on marriage require the publication of a notice of intention two weeks before the ceremony is scheduled to occur. If a foreigner wishes to marry he must obtain from the governor a certificate showing that he is free to wed; then either a clergyman or a district judge may "tie the knot." There is no polygamy. The child of the unmarried mother does not live under the disadvantages found in the United States; the family forgives her, likewise the community, and her reputation is not regarded as sufficiently besmirched to make of her a social outcast or pariah. Though certainly not encouraged, most sins are pardoned in Samoa and the offender is given a chance to rise after falling; in fact, the people of that land seem kinder than the haughty boastful civilizations of today.

Apparently Uncle Sam does not wish his child to be too far-reaching. Does he think he may be playing with fire? The natives are allowed to own neither rifles nor revolvers; they may have shotguns for sporting purposes but these are carefully restricted in number according to the density of population.

There, as in our own country, the manufacture of intoxicating liquors is prohibited. The Sunday "blue laws" are enforced so strictly that nobody works then unless his labor can be classed as indispensable. This rule suits the Samoan who ever loves to lay off and be as irresponsible as the boy in Riley's "Knee Deep in June."

Vaccination has been made compulsory. In the matter of health measures Uncle Sam conscientiously provides for the well-being of his Polynesian baby. When the scourge of influenza ran riotously elsewhere and islands within eyesight of Samoa lost 19 per cent of their population, this land of ours in the South Seas had not a single case. In 1921 "Sanitary Instructions for the People of American Samoa" was issued in the native language and distributed to the families, rather the heads of the families, and the village chiefs required to make enforcement a fact and not a mere name.

There is an almost indistinguishable mixture of communism and paternalism. There are no civilian physicians and only one medicine man; his name is Dr. Uncle Sam. He treats the native population without cost in a hospital at the naval station in Pago Pago, branch dispensaries on the other islands, a corps of visiting nurses, a daily clinic at the government school in Pago Pago, a sanitary inspector who makes periodic trips to the villages and a surgeon who on two days of each week gives the natives dental treatment free.

(C) Keystone
The natives of Samoa have co-operative fish farms in which they fence sections of a lagoon and stock them with various kinds of fish; when properly fattened they are carried to the market and sold.

Uncle Sam is very thoughtful, almost more thoughtful of his foreign people than of those at home. He does not attempt to impose an overdose of Americanism. "The Samoan Hospital" is the official name of the institution at Pago Pago, and the wards consist of large Samoan houses. Why? Well, the houses are cool, they supply an environment to which the natives are utterly accustomed and give the maximum amount of ventilation. All in all the sick individual has little to worry about; consequently he has the content which makes quick recovery possible.

Samoa can be properly called a land of queer trees. The au'auli provides a vegetable caustic as potent as nitrate of silver. The breadfruit provides the staple food of these Samoans. From the fetau wood for canoes, a medicinal oil and an aromatic gum are obtained. The ifi gives a fruit edible when cooked and its wood is used for burning lime. The lagaali and the mosoo'i supply a perfume the latter of which is known as "Ylang-Ylang." The burned nuts of the lama deposit a carbon much employed as a color in tattooing; and the o'a furnishes a reddish pink dye.

The native houses resemble gigantic mushrooms. There is a rock base, a multiplicity of supporting posts and a conical thatched roof. The structure is round or egg-shaped. There are no walls; when rain or wind comes reed curtains or "pola" are let down as a protection. Small pieces of smooth coral from the beach form an excellent floor; if guests arrive the Samoan displays his pleasure by overlaying this floor with woven mats.

You will find fields of sugar cane in Samoa but no sugar mills and no native sugar. It is grown for the sake of its broad leaves which form the best type of thatch to cover the houses and keep the rain out. Without this thatch the houses would be cool but certainly less clean and probably not water-tight.

A few years ago the wealth of a Samoan family was calculated upon the basis of the "fine mats" it owned. These were woven by the women from the "lau ie," a species of the pandanu tree. After the leaves had been sun-dried they were carefully scraped and cut into strips with mussel shells serving as knives. Sometimes the "sega" bird's red feathers would be worked into the fringe; such mats were choice presents to be bestowed on the occasion of births, marriages, deaths and functions of great importance. When offered for sale the "sega" mats with historical significance or embodying family traditions have been purchased at a cost approximating $200.

"Fine mats" are worn as clothing on special occasions; but ordinarily the dress of the men consists of a loin cloth or "lavalava" with the women wearing both a waist and a loose skirt. When they go to church or receive foreigners the men add a shirt or coat or both to their attire. At home the women discard all but the "lavalava" but do not appear thus before guests; the one exception, however, comes when the native girls present the "siva," the national dance which would be farcical with an array of clothing.

Though prohibited in the Manua group of the islands, tattooing is a general custom in Tutuila where a young man without such adornment ranks as an inferior sort of person. The process is so extremely painful that the subject becomes incapacitated throughout many weeks. Ordinarily the women are not tattooed at all but some of them wear small designs on the legs and hands.

A Samoan has black hair usually soft but seldom wavy. His color may be described as copper or reddish-brown. They are of an athletic type with a straight nose, firm chin, high forehead, prominent cheek bones, an absence of fat, a striking height and a proudness of bearing. The girls have beautiful figures which they lose after reaching womanhood. The Samoans, however, are often pointed out by anthropological authorities as the finest physical specimens of the Polynesian race. A native girl becomes a bride at an early age. The children are many and the families are large. Uncle Sam has owned the islands since 1900. In that interval of only 22 years the population has been increased by one-half.

Intensely religious are these Samoans, though some of them do not go to church. They scrupulously put aside Sunday as a day of rest; each morning and evening they have family prayers. Practically all can read and write. They read the Bible punctiliously; it is, in fact, their only textbook and they are more familiar with it than is the average citizen of the United States.

Pago Pago Bay ranks as the safest and best harbor in the South Seas. Formed in a volcanic crater it nearly cuts the island of Tutuila in two parts. It has the shape of a stocking foot with the naval station at the instep. The most important village of the island bears the same name and sits on the stocking toe. The harbor, however, qualifies as the wettest spot of Samoa, as Mount Peoa or the "Rainmaker" on its east side bursts every cloud that dares to approach.

The naval station, as the name implies, serves as a supply base only to vessels of our navy; yet in emergencies the merchant ships of any nation may obtain coal in a sufficient amount to make the nearest port. Water either for drinking or for use in the boilers is free to everybody and every ship at any season. The

The Country Bank's Case Against Wall Street

Reckless Loans Made to Big Gamblers; Funds Scarce for Farmers

By CHARLES ALBERT COLLMAN

THERE are about 32,000 banks in the United States, but some 30 national banks in Wall Street control the greater part of their surplus funds. So there is a great concentration of money in New York, with the eloquent inconsistency between the dearth of ready money in the large farming communities, where the wealth of the country is produced, and the superabundance of funds in the non-productive region of Wall Street.

Wall Street, as the country's fiscal agent, fulfills a useful purpose, but its management of the surplus money intrusted to its hands has always been open to criticism, and may best be illustrated by an affair of very recent occurrence.

The son of a wealthy and influential financier several years ago embarked upon a spectacular career as a Stock Exchange speculator. He organized a chain of corporations, and began manipulating their securities in the market. Soon he made himself a reputation as a talented "pool operator." The successful gambler is Wall Street's god. He was quickly surrounded by an admiring throng of speculators, who followed in the wake of his operations, buying when he bought, and selling when he sold.

Had it been another man who was engaged in these activities, the banks would have frowned upon him, and probably checked his operations. But, being the son of his father, the most powerful banking institutions in the Street liberally advanced him all the funds and credits he asked for.

The operator reached the apex of his career in the fall of 1919, at which time he was managing three successful pools in the stock market. One day, having been unusually lucky in his manipulations, he telephoned to a prominent banker, who had been helpful to him in many large loans, and invited him to motor uptown.

"Do you know what I'm worth tonight?" he observed to his companion, when they were on their way. "I thought you'd like to know. I had my bookkeepers make up the accounts, and here are their figures."

Killing the Goose

THE short, typewritten statement which he handed to his friend showed that the assets owned that day by the speculator, personally, including cash in the bank, stocks, bonds and other securities, aggregated $30,000,000. This was the high-water mark of a fortune made in about six years, on an initial capital not particularly imposing.

Several months later, in the early part of 1920, the speculator began to corner the stock of one of the companies in which he was interested. He and his associates owned 80 per cent of the outstanding shares, and it was therefore an easy matter for the insiders to run up the price of the 20 per cent of the company's stock that was floating about the Street. They put it up from $100 a share to $134, and then ran it up still further, to $245 a share.

The stock was now selling far out of line with its real value, and that was the design of the group of insiders—to make it appear a tempting object for a bear attack. The shorts, believing that the stock was vulnerable, began to sell it heavily. Now the stock gamblers put over a trick that has been a favorite one with their fraternity since the days of the Civil War. They declared a dividend of 85 per cent, payable not in money, but in new stock. This nearly doubled the amount of shares outstanding, and jumped the price to $391. The bears were thunderstruck, caught in a trap, and deprived of any further hope of depressing the price of the stock.

But the corner, so flagrantly conducted, had by this time become an open scandal in the Street. The Stock Exchange felt that it dared no longer countenance the gamble, and, as a punitive measure, suspended all further trading in the shares. A fierce controversy now arose between the speculator and the officials of the Exchange. He alleged that he had been trying merely to defend his property against a bear attack by prominent members of the Exchange, who were now trying to save themselves from loss by striking his stock from the list. In the end he resigned from the big board, and his Exchange seat was offered for sale.

But the financial glory of the speculator was dimmed the moment when he was deprived of a market in which to sell his high-priced shares. However, he had trimmed his enemies, the shorts. He demanded the stock which they had sold, they were unable to make deliveries, and a settlement was concluded on April 24th, according to the established rules of the Street, by which the bears paid him $550 a share, which represented a price of $425 a share, plus $85 a share in payment of the stock dividend, and an additional cost of $2 a day, the premium demanded on each share of stock under the short contracts.

The profits of the manipulator of the corner amounted to a good many million dollars. But suddenly all these gambling profits were swept away like dust. As a direct result of the action of the Stock Exchange, terrific declines occurred in all the shares of companies with which he had been actively identified. His financial circumstances became straitened. The banks which had aided him, now became aware that his collateral for their loans was not so good as they had imagined. They demanded cash or further collateral, and he could give them neither.

The speculator, who had won Wall Street's admiration through his stock corner and his pool manipulations, now scored distinction of a less enviable kind. On July 21, of this year, it was announced that he had filed a voluntary petition in bankruptcy, with liabilities estimated at from $18,000,000 to more than $32,000,000, and assets of only $643,533. It was the biggest personal failure in New York in recent years, and one of the biggest on record.

The principal creditors were the financial institutions which had taken over the management of his affairs to protect his loans after his pyrrhic victory in the famous corner which had resulted in his ruin. It was now found that the collateral for the loans was very much less than the amount of the loans. The collateral loans were bad enough, but the unsecured claims amounted to more than $4,000,000.

The loans disclosed the extent to which leading Wall Street banking concerns had aided and encouraged a great Stock Exchange speculator. The schedules filed with the clerk of the United States District Court with the bankruptcy petition gave them in part as follows:

	Loans	Collateral Value
Guaranty Trust Company, Trustee	$8,660,445	$1,776,989
Chase National Bank	3,456,429	667,756
Mechanics & Metals National Bank	1,402,963	258,500
First National Bank	53,067	Unknown
Lawyers Title & Trust Company	389,089	Unknown
Empire Trust Company	166,705	13,000

The last act in this latest of Wall Street scandals was staged in an auction room in Vesey street, August 2, when virtually all that remained of the speculator's fortune, which only two years before had been estimated at from $30,000,000 to $35,000,000, was sold to the highest bidders for the sum of $3,615,791. That represented the proceeds from the sale of the securities which had been pledged under his bank loans. The stock of the company that had been "cornered," and which sold at $391 a share at the time when trading in the issue was suspended on the Exchange, brought $20 a share at the public auction. This represented a decline of $371 a share, or more than $47,000,000 on the block of 134,414 shares that were bid in that day.

The principal loss from this great failure fell upon the banks that had made the injudicious loans. The managing heads of these institutions feature as the economic leaders of Wall Street. They preach the doctrine of high banking ethics. Without their aid and encouragement, the disastrous corner and the unscrupulous pool manipulations would have been made impossible.

Having witnessed an example of the present-day methods of the great underwriting banks of Wall Street, we will turn to the problems confronting the small bank in the rural districts. There are in the United States 15,000 such banks, having a capital of $50,000 or less and deposits of $300,000 or less. They are mostly located in villages whose population does not approximate 2,000. In championing the cause of these country banks, at the American Bankers' Convention in Los Angeles last October, Guy Huston, a banker from Blandinsville, Illinois, presented a graphic picture of the "Farmers' State Bank on Main Street."

"It makes no difference," said Mr. Huston, "whether you have in mind a village in New York state, Ohio, Iowa, Texas or California. Their problems are all the same, and anything that gives relief to one, will give relief to all. But in drawing this picture, I will have in mind the typical small town bank of the corn belt, as it is with the corn belt banker and his business that I am most familiar.

Farmers Own Bank Stock

"PICTURE a one-story brick building on the corner of Main street. Building and fixtures, and entire equipment probably represent an investment of less than $5,000. The elm-shaded streets are lined with the comfortable homes of retired farmers. The capital of the bank is $30,000 and the deposits are, say, $300,000. Its stock is owned by the banker and the leading farmers of the county. Seventy-five per cent of the stock of all the Iowa banks is owned by farmers.

"Banker Brown is the leading citizen of the community, and he is in daily contact with all its members. From his savings department, he sends greetings and a pass book, upon arrival, to every new member of the families of his clients. His maximum legal loan is only $3,000, and yet the state authorities, recognizing that there are legitimate borrowers in that community whose seasonable needs are in no wise met by the maximum authorized loan of the bank, have laid down rules under which he can greatly exceed that.

"There are not more than enough surplus funds in the community, if they are all on deposit in bank, to finance the legitimate needs of the farmers. To the farm hand who has saved a few hundred dollars, this banker loans money to buy his first farm equipment. He prevails upon some landowner to rent the man a piece of land. The banker carries him through the crop season, and if the young tenant is a good manager, in an average period of five years he will be able to pay off his bank loans and own his live stock and implements clear of debt. Within another period of from five to ten years, this tenant farmer will have accumulated surplus funds, and will want to buy a farm.

"In the corn belt an economic unit of land, with implements, necessary tools and live stock, for profitable operation, is worth at least $50,000. Now it is a more or less precarious undertaking for a bank to attempt to finance several hundred such units, in each of which the investment is larger than the capital stock of the bank, and yet three-fourths of the state banks in the United States and about one-third of the national banks are operating under these conditions.

"If this farmer were banking with a bank of $500,000 capital, then his note for $50,000, which is perfectly good, would be readily discounted by the Federal Reserve Bank, and yet, since he is banking with a bank of only $30,000 capital, the bank cannot rediscount the note should his aggregate loan amount to $3,500, for the Federal Reserve Bank will not accept, for rediscount, notes where the borrower owes the bank more than 10 per cent of its capital.

"This ruling is the reason why more small state banks have not gone into the Federal Reserve System, and also explains why, in the period of greatest stringency ever known in the rural districts, the Federal Reserve System, with its six billions of assets, held less than four per cent in agricultural and live stock paper. Now it is said that 54 per cent of the total deposits of the country originate in these small rural banks. On that basis they should be entitled to at least one-half of the loanable funds of the Federal Reserve, or three billion instead of $230,000,000 of live stock and agricultural paper held by Federal Reserve banks on July 31, 1921, and based on a proportionate part of the wealth of the nation, they would be entitled to more than two billions of credit.

"Banker Brown is, of course, unable to finance the purchase of lands. He has no acquaintanceship, no direct connection with outside capital, and he can only send his clients to the mortgage lender at the county seat. During the past two years, practically all of the country banks suffered greatly from withdrawals of funds loaned to farmers to pay maturing mortgages that could not be renewed. Many banks have had their deposits reduced one-half in the past six months. This condition still prevails and is growing more acute daily.

Where the Pinch Is Felt

"RECENTLY a banker called me by phone and asked me to negotiate a $50,000 loan for him immediately. He stated that a quarter section of land in his community had been purchased by two of his clients for $44,000, and that they had been unable to obtain a mortgage loan, although they had 800 acres of land worth $200,000 clear of encumbrance and had been compelled to borrow money of their friends and relatives, all of which had come out of his bank. His was a good bank, with a good record, and I was able to get him the money. I urged him to collect enough to make a substantial payment on his loan. He asked each of his heaviest borrowers to pay him $1,000, which they did, but they raised the money by selling immature farm stock to their neighbors and borrowed from friends, which meant only a shifting of credit in bank, and did not bring in any outside money. He said that was the fourth time such an occurrence had happened to him this year, and it had reduced his deposits by one-half. We have a list now of more than 200 bankers who tell, with slight variations, the same story."

Such are some of the tribulations of country banks. The American farmer feeds the United States and a large part of the world. He is the basic producer of the country's prosperity, but there is scant regard shown for his needs in the banking system that has been imposed upon the nation by the lords of Wall Street's finance, although we have seen with what lavish hands they extend credit to their friends, the stock gamblers.

The Federal Farm Loan Act provided for the organization of Joint Stock Land Banks. This was the opportunity that Banker Brown had been looking for. He immediately took up the matter with other country banks located in borrowing communities and organized a Joint Stock Land Bank. By this means he was able to make farm mortgages on the amortization plan, permanently financing his clients. He converted them into bonds, issued under government supervision, running for a period of years, that made them marketable in money centers on terms and denominations to suit investors.

But at once, Wall Street, which thought that this plan interfered with its underwriting schemes, began a campaign to destroy its advantages to the farmer. The Joint Stock Land Bank bonds are tax-exempt. This exemption must be removed.

It was this species of agitation that caused Mr. Huston to champion the cause of the corn belt banks. "For 60 years," he said, "the Federal Government has in various ways encouraged business and commerce. There have been tariffs for manufacturers; land grants and subsidies for railroads. These have even been given the right of eminent domain, and our cities have been built by employing certain forms of special privilege in issuing tax-exempt bonds. But in the doing of these great things, we have neglected agriculture. Indeed, some of these things have been done at the expense of the farmers of America.

"Only recently, we approved for the railroads, an average increase in freight and passenger rates of approximately 33 1-3 per cent, in order that the railroads could pay their owners 5 1-2 to 6 per cent on their investment above the cost of operation. The farmers are not asking that they be guaranteed fair wages and 5 1-2 to 6 per cent of their investment. They only ask to be able to obtain long-time credit on just and equitable terms, and they are warranted in demanding that their representatives in Congress shall defend the Federal Farm Loan Act tax exemption, with all the logic and vigor with which they have defended the special privileges they have extended to manufacturers, transportation and mining interests.

"On the same day that the last general offering of $15,000,000 joint stock bonds was made to the public, the City of New York offered $60,000,000 bonds for

(Concluded on page 9)

Steel Plows From Battle-Scarred War Craft

Activities of Graveyard of Ships Result From Disarmament Decision

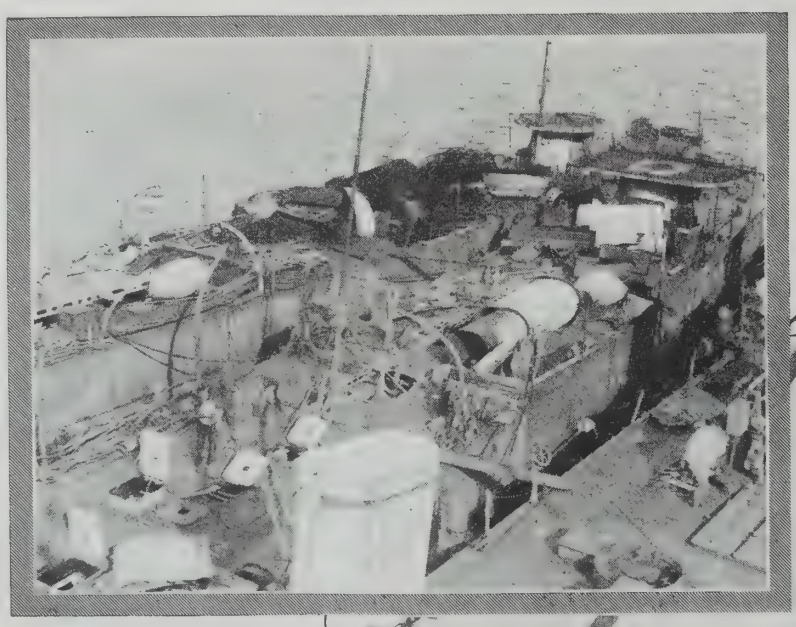
STEEL plows made of battleship armor that stood between the guns of German submarines and the freight and transport ships of the United States will be turning furrows on American farms before another season rolls around. Some of the insides of trim little destroyers already have found their way into automobiles and are now rolling over peaceful American roads, as a result of the Disarmament Conference and the activities of the largest junk yard in the world—the graveyard of ships.

In recent years that graveyard has been filling up. It is now busier than ever before in its maritime department. It is operated by Henry A. Hitner's Sons Company on the Delaware River at Philadelphia, just around the bend and a few miles upstream from the League Island Navy Yard. In the backwaters of the Navy Yard dozens of famous sea fighters and scores of destroyers marked for ultimate destruction lie cheek by jowl, packed in like sardines, awaiting their turn to be towed to the Hitner plant.

The end of United States steamship destroyer Paul Jones.

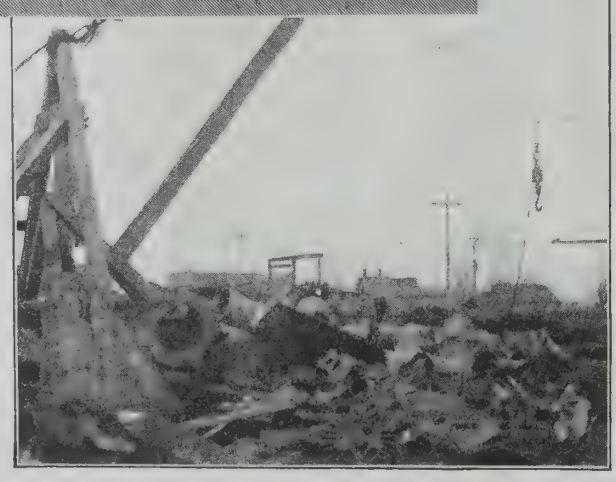
That turn will come when the oxy-acetylene torches and the automatic chisels and the 10-ton crocodile shears have finished the job of chewing up the battleships *Wisconsin, Missouri* and *Maine,* the cruisers *Columbia, Raleigh* and *Detroit,* the destroyers *Stewart, Perry, Bainbridge, Barry, Dale, Paul Jones, Hull, Lawrence, Preble, Smith* and *Decatur,* and the monitors *Tonopah, Monterey, Ozark, Canonicus, Manhattan, Mahopac, Catskill, Jason, Ajax, Nahant, Miantanomah* and *Puritan,* now in the junk yard in process of demolition.

In former years it was the custom to park retired fighting vessels in the back channel of the League Island and other yards, there to lie and rust, sometimes for years. As a rule these ships were wholly or partially dismantled, but they were never damaged. There was no reason why they could not have been put back in service in event of an emergency. In the present era of wholesale reduction of naval fighting forces, however, America has left no doubt of her intentions.



Months ago crews of bluejackets swarmed over the dismal gray hulks of the fighting ships, armed with oxy-acetylene torches. Navigating and other instruments, including the secret range-finding devices, previously had been removed. The sailors went to work on each big rifle. A hole was cut in the barrel in such a manner that none of the big weapons can ever be fired again. And then, with true naval thoroughness, the sailors filled up the holes with putty, thus protecting the interior of the rifles from the action of the elements.

Some of the adherents of disarmament have clamored loudly for the sinking of the discarded vessels in the ocean, or for blowing them up, on the theory that the resultant publicity would be of far-reaching value in the cause of peace. They argue that the destruction of a navy of more than 800,000 tons is being carried on in such a way that it furnishes no object lesson, since the public does not visualize it. But the fact is that the huge basin of silent ships at League Island is its own advertisement of what may be accomplished when nations come together in good will to lift unnecessary burdens.



The story of how the ships are junked and what happens to them after being cut apart contains the elements of a new romance of American industry. It is not so many years since many naval experts said that it would be impossible to make anything useful out of a discarded battleship. They said the steel was too hard to work and the process of tearing them apart would be too expensive. But when the Navy put its 845,000 tons on the market for sale the predictions that there would be no bidders fell flat. The Hitner Company put in bids for all sorts of fighting ships. And it has already demonstrated that although the process is expensive, every pound of metal in these floating fortresses can be put back into commercial use.

The custom at the huge junk yard is to run the nose of the vessel to be destroyed into the mud of the river bank. Then sections of armor plate are removed and swung by derrick to the shore, where they are laid flat and cut by torches into sizes small enough to be placed in open-hearth furnaces. That lightens the vessel considerably. Then all the machinery is removed; everything in the interior, in fact, except the hull. By that time the once squat battleship is riding high. Workmen then start in on the superstructure. The problem then is no different than that offered by any other of the numerous commercial vessels junked in the yard.

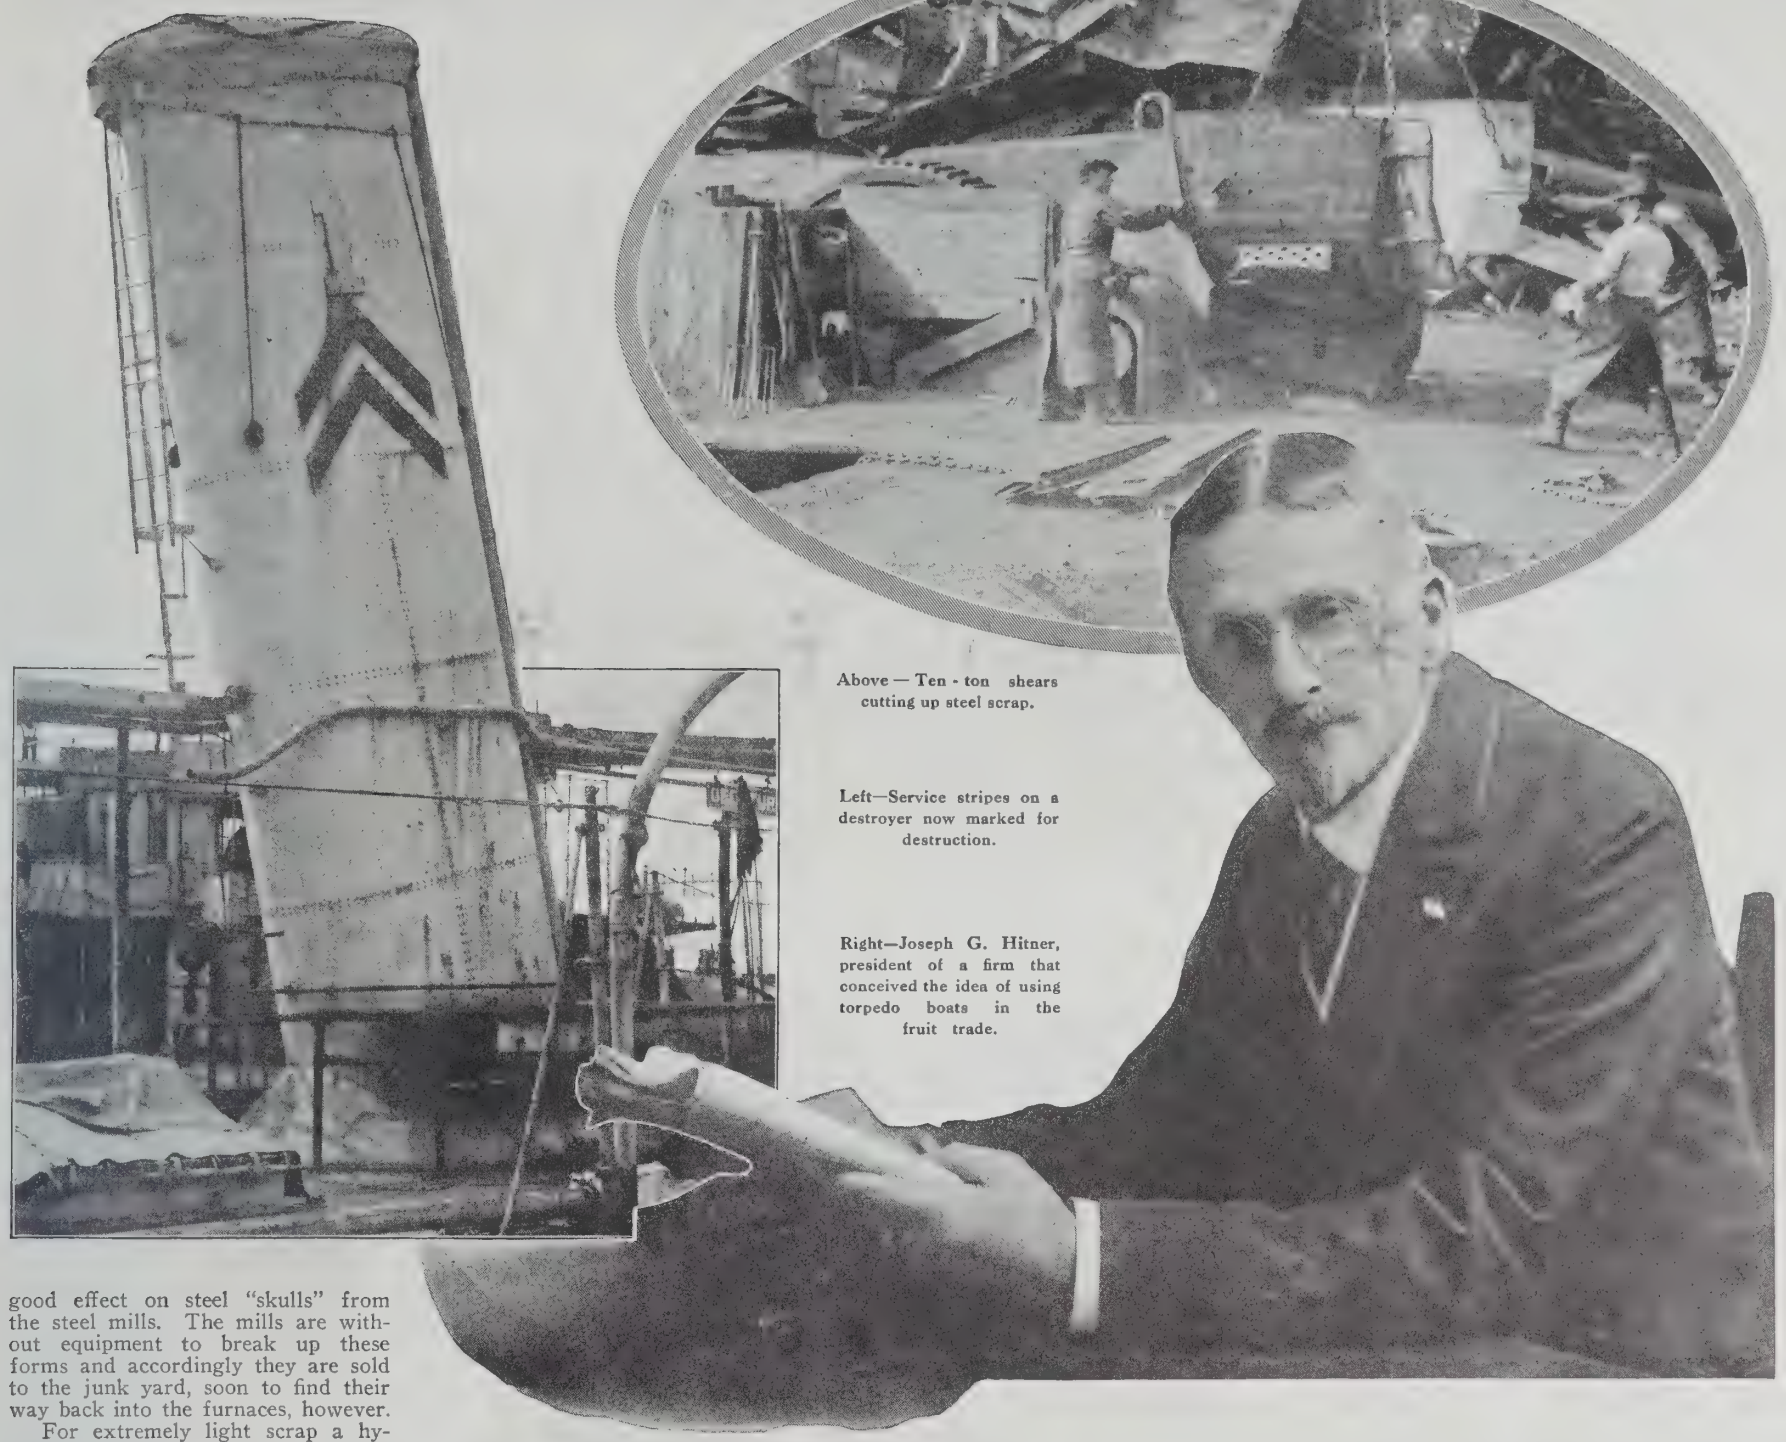
Various markets offer for all of the scrap. As a rule, however, the armor plate is sold to makers of automobiles and automobile parts. The machinery is sold to foundries where it is mixed with new ore and used for the making of agricultural appliances, among other uses. All sorts of special metals are removed and are sold to specific industries, of course. There is nothing out of the ordinary in handling them. Large, structural sections of relatively light metal are lifted out of the hulls by derricks, swung ashore and carried to the maw of the crocodile shears. They are fed into these shears by workmen as they swing from derricks, and thus cut up into sections small enough for a single man to handle.

Above—Stripping off everything above decks.

Right—After the weight drops. How machinery is broken up in junk yards.

It is possible that before all the vessels now consigned to the Hitner yard have been destroyed some of the material will have found its way into foreign lands, and into some strange markets. Since much of the junk that comes into the yard is of a special metal composition, it has been necessary to scour the world to find places where it might be used over again without extra trouble. In that way the Hitner Company has built up quite a business in the sale of American worn-out horseshoes to the village blacksmiths of China, who make them into knives and trinkets of various kinds on their ancient hand forges.

Not all the destroyers now in the yard are to be torn apart and remelted. When the first batch of these little ships was bought, long before the Disarmament Conference, it occurred to the head of the junk firm that they could be put to some use if remodeled. After some study he hit on the idea of using them in the coastwise fruit trade, and he had little difficulty finding customers once the idea was put to shippers. When big vessels are used to transport fruit it is necessary to use lighters from the plantations, the ship lying offshore or out in the channel of a stream. But the destroyers, relieved of their heavy machinery, are of such light draft that they can penetrate into small streams and tie up at the banks. Oil-burning engines are installed in place of the high-speed power machines. Even with that equipment the little boats are remarkably fast and it is not necessary to install the costly refrigerating machinery in them.



Nowhere is it possible to get a better idea of the extent to which metal is used than in the huge junk yard. Along the river front, in addition to the fighting ships named, are the hulls of the British troopships *Malabar* and *Hotspur.* The *Malabar* was once used as a prison ship. It was sunk for nearly 30 years before being bought by the Hitner Company. But the company's purchases are not confined to marine equipment.

Into its yards comes every possible variety of machinery. Twice the company has bought electric railroads, lock, stock, and barrel, that had been found unprofitable to operate. The roads were dismantled, tracks taken up and trolley wires taken down. One of the ancient summer cars is still in use in the yard, hauling any oxy-acetylene outfit to whatever part of the plant it may be needed. Locomotives without number have been scrapped by the company. One of the largest phases of the business is the purchase of contractor's equipment. Quite often such machinery is capable of further service after being repaired and a machine shop is operated for that purpose. The company also is a large producer of washers, made from various kinds of metal plate.

One of the first large vessels handled at the yard was the cruiser *Detroit,* which had a proud history in the American Navy. Its armor was removed, together with the excess machinery. And for some years it has been giving good service in the transportation of bulk molasses between New Orleans and New York. Just before America got into the World War the Hitner Company bought the famous old frigate *Franklin,* built of wood but riveted with copper. It was estimated that the ship contained one hundred tons of that metal, which was extremely valuable for use in shell making. The company made a clear profit of $20,000 by the rise in the price of copper before any move had been made to get the metal out of the ship. The *Franklin* was burned to get at the metal.

Removal of smokestacks is another activity of the firm. When stacks become rusted and in danger of falling it is sometimes difficult to find men capable of removing them. Hitner employes have become as expert in felling stacks as lumberjacks are in cutting down trees. They undermine one side of the foundation, shore it up with wood, and then blow it out with a light charge of explosive. The company also has junked abandoned railroad bridges. It maintains several other yards along the Atlantic Coast.

A great deal of the large scrap is broken up by means of a five-ton weight attached to a cable. It is drawn to the top of a 90-foot mast and then dropped, with devastating results. That method is used with

Above — Ten-ton shears cutting up steel scrap.

Right—Joseph G. Hitner, president of a firm that conceived the idea of using torpedo boats in the fruit trade.

good effect on steel "skulls" from the steel mills. The mills are without equipment to break up these forms and accordingly they are sold to the junk yard, soon to find their way back into the furnaces, however.

For extremely light scrap a hydraulic press is used, and the stuff is compressed into bales. In previous years such light tin scrap was all waste, and troublesome to get rid of. Nobody wanted it even on a dump. Then the Hitner Company devised the press and now the stuff is easily sold for remelting. The company boasts it will tackle any sort of a dismantling job anywhere.

The Country Bank's Case Against Wall Street

Concluded from page 7

wharf and dockage purposes. The tax-exempt New York bonds were immediately oversubscribed; not a single bond was offered to the public through the medium of newspaper advertisements or the usual channels for marketing securities, and not a voice was raised against the issue. But millions of dollars in newspaper space, and hundreds of speakers, at bankers' meetings and elsewhere, have raved for two years about the injustice of joint stock tax-exempt bonds."

Year after year, at bankers' conventions, protests become more numerous against the unjust dictation of the large Wall Street institutions, in trying to impose their will upon the interior banks. Wall Street assumes the right to compel country banks to refrain from making an exchange charge, although many of the smaller institutions depend upon the proceeds from exchange for paying their overhead or the salaries of their employes.

But what the country banks regard as the greatest menace to their future existence, is the continued attempt by the great national banks to gain the right to establish branches. They demand that any national bank, with a capital of one million or more, located in a city of more than 100,000 inhabitants, should have the privilege of establishing branches within corporate limits, and that any national bank, located in any other place, should have the right, with the approval of the Federal Reserve Board, of establishing branches within the limits of its county or within a radius of 25 miles of its banking house, irrespective of county lines. While Congress refused to authorize the measure as proposed, the national banks of Wall Street are still continuing a forceful campaign toward the object they have in view.

One of the chief opponents to this form of branch banking is Andrew Jay Frame, president of the Waukesha National Bank, of Waukesha, Wisconsin. "The granting of such rights," says Mr. Frame, "would be signally destructive and also would be a stepping-stone to a general monopolistic branch banking system, which would practically destroy the 25,000 to 30,000 independent banks of the United States. It would revolutionize and monopolize the banking business of the country, and substitute 100 or 200 great central banks, with 25,000 to 30,000 tails to their big kites, thus destroying our independent banking system. It would skim the cream from the country, to enrich the exchequers of the great central banks and increase the people's tax burden.

"More than 86 per cent of the banking power of Great Britain is monopolistic. France has a few great central banks, and Germany likewise. In both of these countries the central banks practically dominate the commercial banking business. In London, Paris and other large cities, wherein branch banks are authorized, the central banks throw out their arms all over those cities, overthrowing any independent banks.

"If Congress should ever authorize branch banking in the United States, will not the great central banks, in competing for the business of city and county, openly or tacitly say to the state as well as to the national independent banks: 'Sell out to us, or we will establish a branch bank near yours.' The result would be a fight to the finish. And if local bankers would not sell, what would become of the investments of more than a million stockholders who now own the local banks of the country?"

When the resolution was again brought up at the meeting of the National Bank Division of the American Bankers' Association last October, that it was the duty of Congress to amend the National Bank Act, so as to enable national banks to establish branches, it was vigorously opposed by the independent bankers.

"This plan," said Mr. Frame, "will bring about a condition of affairs similar to that prevailing in Canada, where there are 17 central banks, which have more than 4,000 branches. These central banks have deadened human progress in the Dominion. So far as the Waukesha National Bank is concerned, I want to say right here—now I do not like to make a comment of this character, but I will say—that any bank with which we have deposits that begins to run a branch banking proposition will lose our account immediately."

Banker Brown, president of the Farmers' State Bank on Main street, is accustomed to keep a balance on deposit with the bank over at the county seat. That institution deposits a portion of its accumulated balances with the national bank in the nearest large city. The national bank, in turn, passes on its surplus funds to one of the large Wall Street banks. But Banker Brown has the situation in his hands, for he controls 54 per cent of the total bank deposits of the country. Some day he may awake to the fact that it is to his best interest to keep his balances on deposit where they will do him the most good.

Communism—With Uncle Sam Standing Guard

Concluded from page 6

station functions as a storehouse, but it has a limited equipment for repairing such of our ships as may be in need of attention.

The nearest cable lands at Suva, Fiji, 600 miles southwest. Pago Pago remains in touch with the outside world not by the cumbersome means of going to Suva and there using the cable but by employing its own radio which can communicate with all stations in the Pacific and maintains fast schedules to Australia and to San Francisco. Though under governmental control the plant may be used for commercial business.

One of the oddest sights Samoa has to entertain the tourist consists of its imitation geysers invariably near the sea. The water tunnels into the lava bed that forms the coast and at certain points makes comparatively small openings in the crust. Then the rising of the tide compresses the air and forces the water out through these "blowholes." On stormy days these fake geysers stage a show of such surpassing weirdness as to delight the eyes of the most critical artist.

Of all the trees the cocoanut has the greatest importance. Its fruit provides both meat and drink while its leaves share with those of the sugar cane the honor of giving shelter. The leaves are also used for making rough baskets, crude brooms, and as torches. The men plait the fiber from the husk of the nut into sennit straw with which they fasten together the parts of their canoes and the framework of their huts.

Practically the only export from American Samoa is copra, the dried kernel of the ripened cocoanut. Its marketing entails a combination of communism and paternalism. Every year at the "fono," or, general meeting of the natives, the marketing question is discussed and every year the "fono" after its deliberations requests the government to act as agent; whereat Uncle Sam invariably consents.

After trying many places, Robert Louis Stevenson settled in Samoa because no other land had so many virtues with so few vices.

Galveston, the Leading Wheat and Cotton Port

Hurricane the Turning Point in Development of Great Harbor

At right—Arched construction of the gigantic concrete causeway at Galveston.

By ROBERT H. MOULTON

SINCE 1906, Galveston, Texas, has been the world's greatest cotton port, the number of bales passing through the port in 1921 reaching 3 020,560, as against 1,037,979 for its nearest competitor. But not content with this record it went after and captured premier honors in the export of wheat last year, approximately 75,000,000 bushels being handled. Galveston also leads the world in a number of other enterprises, notably in the handling of crude oil.

War conditions brought about a clearer conception of the functions of water terminals, and the principal fallacy disposed of was the idea that the commerce of the United States could be forced through one or two ports. War-time necessities showed clearly that the nation was only as big as its commerce, and measures were set afoot to expand and enlarge the existing system of terminals. Galveston benefited by this expansion program in several ways. The principal one was that sufficient ships were allocated to the port to take care of the tonnage voluntarily proffered, and coming from the logical trade territory of the port.

Little aid was needed to make the port of Galveston one of the first class. The facilities were there, and all that was necessary was the allocation of ships to handle the tonnage, and the conversion of the shipping public to the idea that shipments could be handled with less delay and at a less expense through this than through any other port along the Gulf or Atlantic seaboard. Galveston was fortunate, too, in possessing not only unequaled facilities, ideal geographical location and the natural surroundings which go to make up a port of the highest efficiency, but a citizenship willing to cooperate in any effort to better conditions, or to overcome obstacles which had long seemed insurmountable.

Galveston is the logical port of entry or outlet for that section of the United States lying on and west of the Mississippi River and west of the Indiana-Illinois state line, which area comprises the largest producing field for raw material in the whole of the United States. By far the greater portion of the grain grown in the United States originates there, and from one-third to one-half of the country's total cotton crop is grown in Texas, Oklahoma, Arkansas and Western Louisiana. To all this section Galveston offers the best of transportation facilities, the most reasonable handling charges and as high efficiency as any other port in the country. Economy of car equipment calls for the shipments to be transported over the shortest possible route to the sea, and Galveston furnishes that by reason of the fact that the lines serving the port and touching the trade territory mentioned are "north and south lines" and as such serve only the one port. They are accordingly rendering service of the highest efficiency in order to foster additional traffic to the only major port served by them.

The first business conducted through the port of Galveston was a purely coastwise trade, through the medium of light draft-sailing craft, operating regularly between New Orleans and Galveston. The natural result of this pioneer movement was that the trading later shifted to New York and continued to grow with rapid strides after the steamships began to supersede the sailing craft. At the present, Galveston is the greatest coastwise port on the Gulf coast, handling large quantities of miscellaneous merchandise during each shipping season.

The early navigation to the port was attended by innumerable difficulties, not the least of which was lack of sufficient water over the bars at the entrance of the harbor. The natural depth of water over the outer bar then was about 12 feet, while the depth over the inner bar was only about nine and one-half feet. The result was that it was necessary to lighter all cargoes except those of the smallest vessels. Many are the interesting facts that are told by old mariners concerning the difficulties encountered in those days.

The first development of the harbor took place in 1869, when the citizenship demonstrated interest by constructing a pile jetty extending more than a mile into the Gulf from "Fort Point." The object of this first step was to deepen the channel over the so-called inner bar. The Federal Government was appealed to and an appropriation amounting to $30,000 for the improvement of Galveston Harbor was made that year. In the following two years additional appropriations amounting to $51,000 were made. The first real building came in 1874. Then engineers began to deepen the channel to a depth of 18 feet by the construction of jetties. The work was continued for a period of several years, but the desired results were not obtained, and the plan was finally modified into the present system. With the partial failure of the initial plan, a board of engineers worked out a project to provide 25 feet of water over the outer bar, and the following two years found the government making appropriations amounting to $825,000.

Between 1883 and 1889 considerable progress was made in the development of the harbor notwithstanding difficulties. But it was in 1889 that Galveston really began to see visions of becoming one of the leading ports of the country. In that year a board of engineers authorized by Congress to designate the most eligible port west of the Mississippi River for harbor development settled on Galveston. The board reported that additional appropriations amounting to $6,200,000 would be necessary to complete the project, and they recommended that Congress appropriate that sum. In 1890 Congress authorized that appropriation and still other appropriations were made until the completion of the jetties in 1896. The construction of the jetties was a remarkable engineering feat in itself. The rocks used were taken from Granite Mountain, Texas.

Altogether it has cost the United States Government nearly $20,000,000 and more than 40 years to develop the port. But the result is a harbor which is undoubtedly the most perfectly arranged on the entire Gulf coast, with facilities not surpassed by any in the country. The length of the improved channel from the Gulf to its westerly or northerly limit is about 10 miles, its average width 1,200 feet, with a minimum depth of 31 feet at all points and a minimum of 35 feet over the outer bar, offering refuge to the largest and heaviest craft afloat. Galveston is the port of quickest dispatch in the United States. The average car detention on export shipments through the port is one and one-half days per car, while the average detention of all cars, export, coastwise, and for local consumption, taken for a period of one year, is only three days per car. The turn around of ships is equally as quick as freight cars in proportion. The fact that the docks are only one hour from the open sea, yet amply protected from storm damage, assures excellent dispatch.

Galveston owes its position as the greatest cotton port in the world not alone to its favorable location, but also to its splendid warehouses, numerous compresses, and labor skilled in the handling of cotton in all its phases. The storing and handling of cotton has been developed to a fine art, and nowhere more efficiently or economically than at Galveston. The storage facilities are capable of handling 1,329,000 bales of cotton without resorting to tiering as in other ports. If tiering were employed the entire cotton crops of Texas and Oklahoma for the year 1921, about 4,000,000 bales, could have been stored in Galveston's warehouses without difficulty. Incidentally, Galveston is believed to hold the world's record for loading cotton in a ship, the steamship *Daniel Webster,* owned by the United States Shipping Board, loading out 33,120 bales. Seldom does it require more than six days to load a ship, and there are instances of cargoes taken in less than three days.

The process of "jamming" cotton was started at Galveston for the purpose of obtaining maximum use of the cargo space and has proved so successful that many of the ships are using this method, which serves to increase the load and consequently swells the revenues. Much of the cotton passing through Galveston in the past had been handled directly from car to ship, but the demand for high-density cotton has grown in recent years so that many of the compresses have installed the necessary equipment for handling. The question of responsibility by rail and water carriers became so pronounced, however, that six shipside high-density presses have been installed at the port. Now the interior shipper can have his cotton routed on a through bill of lading and still have his cotton pressed to high density before being loaded aboard ship, thus effecting a material saving in time, money, and valuable storage and cargo space. All handling processes at

Tories Would "Reform" Lords to Curb Labor

Old Question of Part Peers Are to Play in Government Up in England

By W. P. CROZIER

MOST people outside England must suppose that the question of the House of Lords is dead and buried. Many people in England think the same. But it is not and it is to enter once more upon the public stage. Lord Curzon, the British foreign minister, is to propose in the Lords certain "resolutions" announcing the forthcoming "reform" and reconstruction of the House into a second chamber more in keeping with the times and more like those enjoyed by other democratic countries such as the United States or France or Norway.

The proposal is to come up first in the Lords because theirs is the house that is to be "reformed" and it is being brought up by Lord Curzon not only because he is "Leader of the House" but because he is known to have given great thought and study to the question of second chambers. But it is a curious choice, all the same, because a few years ago Lord Curzon was the strongest champion in the country of the hereditary principle. He used to explain how he had been Viceroy of India and had seen a particular trade or occupation handed down from generation to generation and the system, he thought, worked pretty well—why should it not be good also for the British people to be ruled by peers simply because they were their fathers' sons?

"Reform" Not by Reformers

LORD CURZON must have modified his views since then or else he will presumably conceal them, for their day is past. But his part in this revival of old controversy makes the honest democrat suspicious. What do Lord Curzon and his fellows mean by "reform" of the House of Lords? What are they after? Do they want to undo the Parliament Act of 1911 which put a bit in the mouth of the hereditary peers and made the Commons ultimately supreme? Do they want a grip over the Commons before the advent of the labor ministry which they anticipate and fear? Is that why so many of the Unionist leaders insist, in season and out of season, that before the next general election in England the House of Lords must at all costs be "reformed"?

When at the beginning of this year Mr. Lloyd George had, as there is reason to believe, decided to hold a general election, Sir George Younger, the chief Tory organizer, interposed with a plain veto; no general election, he said, until the House of Lords had been reconstructed. For it is now or never with the Tories. They have a majority in both Houses of Parliament and regard themselves, therefore, as having the actual physical power to remake the constitution as they choose. And they foresee the likelihood of a Labor ministry which, under the protection of the Parliament Act, will put into force all kinds of socialistic schemes, including the nationalization of the mines, the railways and no man knows what else. The Parliament Act, therefore, is their enemy and their plan is to get around it.

Under the Parliament Act, if the House of Lords three times in successive sessions rejects or modifies, in a way which the House of Commons will not accept, a bill passed and sent up to the Commons, then the bill automatically becomes law. The government having a majority in the Commons has only to sit tight and refuse to accept any changes in its bill and at the third time of asking the opposition of the Lords is simply overruled and set aside. Suppose that in 1923 a Labor government were in office, and that it passed through the lower house a measure nationalizing the railways and the mines. Later in the same year the Lords would certainly reject it. In 1924 the Commons would send it up again and the Lords would once more throw it out. In 1925 the Commons would return it, the Lords would reject it for the third time and the King would at once under the Parliament Act give his formal assent to the bill and it would become statute law.

Labor Government Bogy

OF COURSE, the delay interposed by the Lords gives opportunity for debate and criticism in the country, with the possible result that a government which had no strong majority might be seriously weakened and even compelled to withdraw the measure altogether. Also, a government which was losing popular favor might be disposed on substantial details to come to a compromise with the Lords. But on vital principles, no. A labor government, as long as it retained its majority in the Commons, would never yield on a principle like nationalization. It would put the measure through. That is why the Tories are never tired of declaring that under the Parliament Act the English are really subject to single-chamber government (like the Greeks). There are really two questions to be settled:

Is it or is it not intended that where the country at a general election deliberately puts a certain party in power, knowing well its policy and program, that party should be free to carry out the essentials of that program?

What the Tories who would abolish the Parliament Act and set up a strong second chamber really mean to do is to prevent any party whose program is objectionable to them personally from carrying it into execution, even when the country has returned it to office and the House of Commons gives it a steady majority.

Is it practicable to devise a second chamber to take the place of the present impossible House of Lords which will nevertheless not be so powerful as to diminish the authority of the House of Commons? It should on the one hand act as a true "revising" chamber in the interests of sober, balanced national development and on the other it should possess no power to stand out permanently against the will of the Commons as expressed even by a small but steady majority of the house.

The present arrangement is, of course, illogical and undemocratic. The hereditary principle, in which no intelligent person now believes, is absolutely maintained. Whatever the powers left to the House of Lords by the Parliament Act may be, they are wielded by a body of men who for the most part are where they are and possess the authority they do because they are the sons of their fathers and for no better reason. It makes no substantial difference that a few of the peers are Law Lords, who hold office for life and do not pass on their seats in the house to their sons; or that the same is true of the bishops; or that a good many of the peers are the first holders of their titles; or that the actual work is mostly done by a small nucleus of peers who in experience and judgment far surpass the average member of the House of Commons. These men's services could, and, of course, should, be made available under a different system of election, but well on into the twentieth century we are still maintaining a second chamber based on an indefensible principle. The House of Lords is like the human appendix: it is an organ which has lost its usefulness in political society.

The Parliament Act was not intended to be a final settlement. The "preamble" to it itself indicates that it is to be followed by a "reform" of the Lords, and Mr. Asquith, who was then Prime Minister, spoke of reform as a "debt of honor" that must be paid. So the Lords must some day be reconstructed. But how? That is the rub. So many men, so many views. There is no agreement about the method, though there is a general agreement about the result. Liberals would like a second chamber that would reflect their views rather less than a Liberal House of Commons, but would still reflect them. Tories would like a House that would be nicely Tory in sentiment.

Many Schemes Proposed

THERE are all manner of schemes for choosing a new house. Some of them retain the hereditary element in an indirect form. That is, they would allow the present peers to choose a small portion of their number (a hundred, fifty or thirty) to sit in the new body, arguing that in this way we should maintain continuity with the historic past—the House of Lords is a more ancient body than the Commons—and also obtain the best of the brains which the House of Lords contains. But this latter we could obtain just as easily in many other ways and the objection still remains that we should be allowed hereditary peers, simply because they are hereditary, to exercise an important share in government.

Others would have the new chamber chosen directly by the same electorate which chooses the Commons, only at different times and with much larger constituencies. An important committee presided over a year or two ago by Lord Bryce proposed that the members of the Commons should be grouped into geographical areas (such as London, Yorkshire, Lancashire) and should then elect their quotas of members to the upper house. Others, again, suggest that the Commons should elect by proportional representation or that the selecting bodies should be the organs of local government—the county and borough councils. Some of the schemes provide for the selection of representatives of clergy and distinguished representative men of various kinds. All propose that members of the upper house should sit for a period of years, so that only a part of the house would be elected at any one time and its constitution would tend, therefore, to be somewhat different from that of a newly elected Commons. It would therefore be detached and impartial in its function as "reviser" of Commons legislation, which is, in theory, what a second chamber would be. But what is to happen when it comes into conflict with the Commons?

Looking Far Ahead

THAT is a wholly unsolved difficulty. The desire of English Tories is that when such a conflict took place the government (Liberal or Labor on this hypothesis) should be forced to "go to the country—hold a general election." That is a settlement which Liberals and Labor men will not tolerate, for it means simply the destruction of the Parliament Act and the restoration of the unlimited veto of the upper house.

The best solution would seem to be that the second chamber should be kept small in numbers, that it should be chosen in sections at intervals of four or five years, and that if a serious deadlock with the Commons arose, the two houses should meet in joint session. The House of Commons has about 700 members. If an upper house of about 100 members were established and if it were chosen as suggested, it is very unlikely that there would be a party majority in it at any time of much more than a score or so of votes. No government can survive in the House of Commons which has not a normal working majority of about 40 or 50 and this, therefore, in joint session would always be able to override a small opposing majority among the members of the upper house.

But this is looking rather far ahead. The latest news is that the situation is pretty much what it has always been. The Coalition Government is agreed that the House of Lords must be reformed but it is hopelessly divided on the question of what to put in its place. If Tory ministers insist on restoring the House of Lords Act against the House of Commons, the ministry will break up.

Galveston, the Leading Wheat and Cotton Port

Concluded from page 10

Galveston have long since passed through the experimental stage and only the tried and thoroughly modern devices are now used. Formerly a mule, a Negro, and a dray were used to convey three or four bales to the wharf, but now electrically driven saddle trucks move noiselessly through the streets with a load of 25 bales.

The grain season, ending June 30, 1921, was epoch-making. Many times the port interests were much concerned because of the enormous amount of business offered and the corresponding lack of railway equipment. Galveston, however, did much toward relieving the car shortage by promptly returning to the interior cars unloaded there. Galveston has storage room for 3,750,000 bushels of grain, and within the current year will increase this capacity to 5.150.000. These elevators can load ships at the rate of 40,000 bushels an hour.

The growth of Galveston's coastwise trade has gone hand in hand with the development of the territory contiguous to the port, and has attained such vast proportions that it is now estimated it ranks second only to New York. The trade does not represent a sudden growth, but a gradual development. In pre-railway days Galveston was the western terminus of only two steamship lines. Today 67 regular steamship lines ply to and from this port, in addition to hundreds of "tramp" steamships, taking varied and costly cargoes to the four quarters of the world. During the past calendar year 1,731 ships cleared from Galveston.

These ships were enabled to receive coal or oil bunkers at any of the 32 piers while loading or discharging cargo, thus saving valuable time and money for owners and operators. The wharves are miles and miles of deep-water slips, concrete and other fireproof warehouses of huge proportions, shipside delivery of all commodities, immediate rail connections at all docks, ample room for maneuvering of vessels, and berthing space for 100 ships at the same time. Across the channel is Pelican Island, with electric light, telephone and fresh-water service. On Pelican Island is also a 10,000,-ton dry-dock which is capable of making any sort of repairs quickly on both small and large ships.

The building of the causeway connecting Galveston Island with the mainland, the building of the great sea wall and the extension thereof and the raising of the grade of a large part of the city are three achievements of which the city is proud. It was on September 8, 1900, that Galveston was visited by a West Indian hurricane which did much damage to property and caused great loss of life. To guard against any such disaster in the future the city government procured the services of an engineering board to prepare plans looking to the protection of the city against storm damage. The county of Galveston, assisted by the railroads, constructed the great causeway, which is 10,685 feet long and spanned with 107 arches, 63 feet wide, and has an immense lift bridge. Its cost was $3,700,000.

The county constructed the sea wall and the Federal Government extended the same in front of its own property. This remarkable structure is 17,593 feet long, 16 feet wide at the base and 17 feet high. The total cost of the sea wall and raising the grade of the city was approximately $5,000,000, while the cost of raising 2,156 buildings amounted to another million. The plan adopted in raising the grade of the city was not only remarkable in itself, but one that called for the highest patriotism on the part of the people of Galveston, involving as it did the excavation of a canal two and one-half miles long, 300 feet wide and 20 feet deep from Galveston Bay right through the residence section of the city. The people, for the mere payment of taxes, leased their lots to the city, and improvements were moved to vacant lots. Five self-loading, self-propelling and self-discharging hopper dredges were employed on the job.

Sand was sucked from the bottom of the bay and brought in through the canal and discharged through pipe lines, the water draining back into the canal. The work completed, the canal was refilled and the houses that had been moved put back in their original places. The sea wall and grade raising have rendered Galveston safe from serious damage and the wall affords a favorite promenade and automobile drive for the residents of the city.

That Galveston will maintain her position as a port of the first magnitude can hardly be doubted in the light of her past achievements, and in view of the fact that the resources of the country served by the port have barely been tapped.

Percentages of the Promoters Tell Stock Story

Deep Gouges in Investor's Capital Before Actual Investment; More There Is for the Glib Seller the Less Chance You Have

By WILLIAM A. MCGARRY

This is the second of several articles by Mr. McGarry, in which will be related some of the many forms of crookedness in which the public suffers.

"DON'T buy stock from strangers," is the common advice of experts in the wave of propaganda against crooks now sweeping the country as a result of the many failures of bucket shops. But as far as the wage earner is concerned it would be better to advise him not to buy stock from friends—especially new friends who seem to know all about the intricacies of finance and are anxious to let him in on a good thing. Even old friends who have fallen for the lure of some stock salesman are dangerous. Before following their example it is a good idea to find out what they know of financial methods, and just what specific information they have concerning the proposition being offered.

Assertions made by stock salesmen are not information. They should be checked up. The first and most essential step in checking them is to find out what commission the salesman gets, what commission goes to his employer, and what amount of stock has been issued to the sales promoter by the parent company. *By all odds the best mark of a swindle is the amount of indignation shown by the salesman when the prospective buyer of his stock asks him questions designed to elicit the foregoing information.* If the proposition is legitimate any of those questions will be answered without a trace of doubt. Often the underwriting cost of a promotion is made public when the stock is offered for sale, in advertisements.

De-capitalized Capital

THE reason the commission paid is important ought to be self-evident. Every cent taken out of the investor's dollar puts more burden on the amount left, which is supposed to be put into production of something or other. When the amount taken out ranges from 25 to 70 per cent it is clear that the investor's chance of ever getting a dividend is extraordinarily slim. In the class of frauds under discussion here the investor has no chance whatever, for the simple reason that in a large majority of the stock propositions offered through the store window method the promoters take every cent and invest nothing. Their sole purpose is to make a killing quickly and safely.

Doubtless there is on sale now in several parts of the country stock in a group of shale oil enterprises. The stock is based on alleged ownership of oil-bearing shale rock, found in various parts of the Rocky Mountains. Every oil man knows that those deposits are of tremendous future value. But he knows also that it may be many years before the production of oil from such sources will reach any figure of commercial importance. That will not be until the gushers are beginning to show signs of exhaustion, and the price of oil is consequently higher. It may not be for scores of years.

But the promoter doesn't let that worry him. Not long ago an office was opened on the principal thoroughfare of a large eastern city for the sale of stock in one of the shale oil companies. The selling agents were men who had previously been driven out of several other lines of stock selling, none of which ever was developed. One of them had been in an insurance scheme that was taken over by the Pennsylvania Insurance Department. A small retort was set up in the window to show how the oil is extracted by heat from the shale rock. Then the sale of stock started.

A Subject for Secrecy

BARKERS were employed to stand in the doorway and solicit passers-by. Thousands of men passing the store every day stopped to look at the exhibit. The barkers tried to get them inside. Then other and more expert stock peddlers got to work on them, exhibiting photographs of the property and much literature, including magazine articles on the future possibilities of shale oil. Hundreds of visitors bought the stock without having the least definite idea of what was done with their money.

When I went to that office to ask for information I met the usual bluff of indignation. The salesman tried to argue that to ask him what commission he was getting was like asking a fellow worker the amount of his salary. It was explained what he already knew—that there is no analogy because the salesman is trying to get some of the prospective buyer's money, and the latter has a right to know what is done with it. After much argument the salesman admitted that he got 15 per cent. Then one of the promoters was approached. He asserted that the total commission paid by the corporation that was expected to produce the oil was 25 per cent. The figure looked suspiciously low for a promotion of that type.

Further inquiry was made. The promoter soon discovered that his record was being revealed. He sent for me to explain that he had misunderstood my questions, and that in reality his firm drew a total of 50 per cent. An attempt was made to justify that commission on the ground that promotion costs were high. The promoter even made the amazing statement that the Federal Trade Commission had ruled that a commission of 50 per cent was not too high for the sale of the first $100,000 of stock in a $1,000,000 corporation. The particular corporation whose stock was then on sale was incorporated for a million dollars. It was planned to operate under a holding syndicate.

By dint of continued inquiry I learned from the promoter that he and his associates had hit on a novel scheme to draw big commissions. Instead of selling stock in the holding syndicate, they incorporated a half-dozen leasing companies, to each of which was allotted part of the shale rock territory. Each was incorporated at one million dollars. But the promoter and his friends sold only the first hundred thousand dollars' worth of stock, retaining for themselves $50,000. When they had sold that amount in one corporation they took up another, moving to another city.

Of course, the Federal Trade Commission never made any such ruling. But by the time the letter making denial had reached me the promoter had moved, taking along the "investments" of hundreds of stock purchasers. And that case is typical of the ease with which such operators work. Police and other legal authorities rarely act until they get a complaint. The buyer is told not to expect profits for at least a year. Long before he has time to discover that he has been hoaxed into buying a lot of worthless paper, the promoter is gone, never to return under his old name.

Commissioning Themselves

MANY promoters use what might be called a progressive or pyramidal system, to take advantage of every legal technicality to protect themselves. Some times a half-dozen corporations are formed. By the time each gets its "expenses" and commissions, there is nothing left for production purposes. It is customary for the original incorporators to make a contract with themselves as selling agents to dispose of the stock. A fat commission is provided for in the contract. But if there is any real tangible value back of the stock the selling agents also give themselves a big block of it. The method of operation there is that followed in most of the promotions sold through bucket shops. A market is worked up for the stock. The promoters then sell their own stock and pocket all the money, leaving the corporation's stock in the treasury. When the promoters have sold all their own stock they simply move on to another proposition, and the stockholders are "holding the bag."

In schemes where there is no tangible value it is not necessary to take such precautions. Corporation charters may be obtained in Delaware at ten cents a thousand dollars of capitalization. A description of the charter will be given in another article. Sometimes the crooks do not even take the trouble to get a new charter. Old ones may be found in certain places where men make a business of supplying them. The crook needs only the corporation seal. He can order all the stock he wants from the nearest printer and sell it right and left—always in small lots.

The building-lot scheme is one that is worked all over the country with little interference from the authorities. Most of them that have come to my attention have used swamp land for sale to the victims. Several variations of the swindle are in use, but for the most part they all follow the general line of seeming to give the buyer a lot for nothing but the expenses of conveyancing. In many cities small neighborhood motion picture houses are used to get the names of the victims.

Too Free to Be Free

THE promoter pays the proprietor of the motion picture house a small sum for the privilege of running a screen announcing a "free drawing" for lots. If the promoter is particularly glib he may talk the motion picture man into doing his share for nothing on the argument that it is free advertising. Every person entering the theater on a given night is presented with a ticket on which he or she is asked to write his name and address. The tickets are put into a box provided by the promoter as the patrons leave. Customers are informed that they will be notified later if they are "lucky."

Next morning a staff of "hustlers" is sent out. Every name and address put into the box is visited. Each person is told that he or she has "won" a $500 building lot at Swampoodle-on-the-Sea, or some such place. The lot is described in glowing terms. It is explained that the cost of conveyancing will be anywhere from $14.69 to $31.72—whatever the traffic in that particular locality will bear, taking into account the nature of the homes and the evident earning power of its occupants. Often the man of the house is not home. His wife is told that he has won a nice building lot. If she demurs about paying, the agent insists that the company reserves the right to cancel any winning unless the costs are paid. Quite often the "winner" becomes excited and wants to know all about the lot. Then the agent trots out a map showing more desirable locations that may be had for a few hundred dollars extra. The actual value of the land is rarely more than a few dollars for any purpose, and as a rule it is useless for home-building purposes. Yet, in three months, a promoter can clean up from $20,000 to $25,000 by such a scheme, operating at the lowest possible figure.

Fake spiritualists have invaded the get-rich-quick stock business in recent years in large numbers. One—with a jail term in the Atlanta Penitentiary in his record—has built up quite a large fraternal organization, mainly to sell stock. He holds meetings of the society at which little groups are told of the wonderful work of two mediums. Some highly intelligent citizens have bought stock in the various enterprises operated by that particular promoter. Among them are physicians and lawyers. Yet there is nothing back of any of the deals but hope, and a thin hope at that.

P. T. Barnum Was Right

ONE glaring example of the fake spiritualist method of operation was in the sale of stock in a certain "gold mine" near Washington, D. C. That is perhaps the most heavily sold, overcapitalized mine in the world. To the best of my knowledge nobody ever got any gold out of it in commercial quantities. There is gold in the mine, just as there is gold under the streets of Chicago and New York—almost anywhere, in fact. But when the cost of extracting $3 worth of gold runs from $20 to $1,000, mining men do not call the earth gold bearing. The mine at Washington is one of that type.

In the case in question a spiritualistic medium got a number of his visitors interested in the mine. One of his associates had served time for another swindle of gigantic proportions. The visitors were induced to come to the medium's home. There his wife went into a "trance" during which she was asked questions concerning the possibility of getting rich from the mine. She described exactly what work must be done to succeed. She even explained that when certain tunnels were dug the diggers would come upon a pocket of gold worth $50,000. And then she drew a map to prove it.

All that may sound ridiculous. But there are court records to prove that by means of the mine and certain large promises the spiritualistic promoter induced an insurance agent and his wife to yield all their savings, amounting to about $1,200. Not only that, but the promoter took extraordinary precautions to protect himself from legal consequences. He drew up an elaborate receipt for the money in which it was agreed that his responsibility ended if he pumped the water out of the mine, which was full of it. The receipt was signed by the victims.

Just Waiting to Be Sold

A COPY of that receipt was turned over to me by the investor and published in a newspaper article. The article did not reveal the source of the receipt. As a result of the publicity the victim brought suit against the promoter. The latter was advised by the court that if he could prove that the victim agreed to the form of receipt and understood it at the time it was signed, there would be no judgment. Agents of the promoter promptly sought me as a witness. I agreed to testify if subpoenaed and to tell "the whole truth." But the promoter was taking no chances. He wanted a signed statement of what my testimony would be, and, of course, I refused to make any such statement. As a result, judgment was entered against him and he served time when it was proved that he was hiding assets.

Some experts try to explain stock swindles by asserting that the man of small means is gullible. It is a fact that as a rule he knows nothing about promotion and banking methods. But the same is true of many wealthy men. Physicians offer the easiest target. Their names are on every "sucker list." Lawyers and judges are taken in. In every big city there is a hotel or other rendezvous for stock salesmen of the fly-by-night type. They sit around waiting for work. Every few days a promoter turns up with a list of names and some "gilt-edged proposition." A certain nationally known surgeon was visited by a total stranger a few weeks ago, and within 15 minutes had signed a check for $2,000. He got a batch of stock certificates the next day, by mail. And a week later the promoter himself came around, got a check for $5,000 and disappeared.

The reason the wage earner, the small merchant and the ordinary citizen offer such fair game to stock swindlers will be explained in the next article. It has nothing whatever to do with gullibility. Promoters can swindle banking experts when it is worth while. The fact is that legitimate investment interests completely overlook a market far bigger than the one they cater to.

When the Storm King Sweeps the Great Lakes

Great Disasters, Unsolved Mysteries, Dot Pages of Navigation Records

MILLIONS of persons who do not live near the Great Lakes are of the opinion that these great bodies of fresh water are tranquil seas, free from peril to navigators and travelers. This is true only for a few months each year, during the summer season, but the lakes are navigated eight months or more each year, and it is in the spring and fall when danger besets ships and men. The lakes are not terrors to navigators, but neither are they without risks.

At the fore and tail end of the season, boats have severe storms to contend with; and often heavy fogs envelop the lakes, causing the danger of collision or running ashore. Many staunch ships have gone to their doom in storms or through collisions in fogs. Lake seamen fear the fall storms more than fogs.

Fire, too, used to claim many ships and lives on the lakes, but with the passing of the wood and the coming of steel, such disasters have almost disappeared. There isn't much on a steel freight vessel to burn, and passenger vessel sides and hulls are of steel, and about the only wooden work is the interior of the cabins.

As a rule, passenger ships on the lakes are not operated in the late fall, and they are not subject to the severe storms. The few lines that do operate their ships late use their best boats, and no serious accident has befallen them in late years.

Wreck of the Monarch, driven ashore on Isle Royale, Lake Superior.

Steamer Mataafa being pounded by waves while thousands of Duluth residents looked on, November 28, 1905.

Steamer Elwood making Duluth harbor after storm of November 28, 1905. She later sank from leaks suffered in that gale.

Excursion steamers are operated out of all ports, but the season is short—three months—and they do not make long runs.

The worst disaster that ever befell a Great Lakes excursion steamer was that of the *Eastland*. This fine steel ship was moored to a Chicago dock one bright summer morning in 1915, taking on a load of excursionists, when, without warning, it turned over on its side. More than 800 men, women and children lost their lives, in spite of the fact that the boat was tied to a dock in a narrow stream that was alive with traffic. The human cargo was caught in the ship and perished. The cause of this disaster was never fully determined. One theory was that the boat was top-heavy. But the question arose as to why the vessel did not capsize on any one of its hundreds of excursions that it carried previous to the accident. The *Eastland* excursion route was on open Lake Michigan, yet it met no accident until it tipped over at its dock.

The government investigated the disaster, but no body could be held responsible. The boat was raised, but it carried no other excursion.

Another terrible disaster was the burning of the steamer *Phoenix* on Lake Michigan, November 21, 1847. Passengers and crew to the number of 240 lost their lives.

Three years later, on June 17, 1850, the steamer *Lady Elgin,* bound across the lake from Milwaukee, collided with a schooner and went down with a loss of 287 lives. The schooner, a much smaller craft, remained afloat.

These disasters took the heaviest toll in number of lives lost in proportion to the number of vessels involved, but there have been hundreds of other disasters in which hundreds of lives and millions in property were lost.

In the fall of 1914, for instance, a sudden storm of hurricanic force swept the lower end of Lake Huron, and sent nearly 30 freight vessels to the bottom. Upward of 200 sailors lost their lives in this one storm.

Freak wreck of the Crescent City, blown ashore at Duluth in a gale a few years ago.

Stern view of Steamer Mataafa after having been wrecked and broken in two.

Steamer Umbria, safe in Duluth harbor after a 48-hour battle with the gale of November 28, 1905.

Some of the ships that were caught out in the storm disappeared without leaving a trace, while others were piled up on the shore and dashed to pieces. One freighter, the *Charles S. Price,* 500 feet in length, was found bottom up after the storm abated. There was no sign of the crew of about 30 men, all having perished. This was the first instance on record of a modern Great Lakes freight vessel capsizing. It is probable that its cargo of iron shifted during the pounding from which the boat suffered.

The overturned hull of the great ship was visible in the lake for months after it capsized, but all attempts to right the boat and float it were unavailing. It gradually sank into the bed of the lake, and now ships steam over the spot at will.

Of course, storm warnings are displayed on the lake during the fall storm season, but this particular storm came so suddenly and unaccountably there was no way of warning the ships that were out in the lake. It may be mentioned here that very few freighters of the lakes are equipped with wireless.

As a matter of fact, up to this time masters of the larger freight vessels paid little attention to storm warnings, believing that their ships would "stand up" under any kind of a blow. Vessel owners, insurance companies and masters took a lesson from this storm and began paying strict attention to governmental warnings.

The disaster that overtook the passenger steamer *Algomah* a number of years ago was a sample of the faith captains had in their ships. The *Algomah* left port in a storm, and was making heavy weather. Some passengers beseeched the captain to turn back, but he said no storm could wreck his boat. The *Algomah* finally was blown on the rocky shore of Isle Royale, in Lake Superior, and about 50 persons, including a number of passengers, lost their lives. The *Algomah* was a steel vessel, built in Scotland, for service on the Great Lakes. It was necessary to cut her in two after she reached this side of the Atlantic to permit her passage to the upper lakes. The two parts were joined after the boat passed through the Welland Canal, which connects Lakes Erie and Ontario. This operation did not weaken the vessel. Many boats on the lakes today were treated the same way without apparently weakening them. The storm simply tossed the *Algomah* out of her course and against the rocks.

Rocky shores are what Great Lakes navigators always are looking out for. No matter how severe the storm they may be caught in, they feel safer away out in the open lake, provided they cannot make a harbor.

A striking illustration of this is found in the wreck of the steel freighter *Mataafa* outside of the harbor of Duluth in the fall of 1905. The *Mataafa,* a fairly large vessel, was out in a terrific gale and was heading for Duluth. To reach that harbor, vessels must enter between piers. Waves were washing over the piers, making it difficult for ships to enter. The *Mataafa* missed the entrance and struck the end of the piers. The captain decided the landing hopeless and turned the boat around to head for the open lake, to get away from the piers and shore. As the vessel was turning, it struck the rocky bottom and stranded. It was helpless and the pounding of the seas soon broke it in two.

Duluth is built on a hillside, and the entire town turned out to see the struggles of the ship. It was tragic, for the townspeople were helpless, as was the coast guard, which had gone as near the scene as possible. All night long the seas pounded and broke over the *Mataafa.* In the morning, when the storm abated, the coast guard hurried to the ship's side and found nine dead sailors in the stern section, which had become submerged. To escape from the flooded quarters below decks in the stern, several of the sailors crawled up through the ventilators, and their lifeless bodies were found there.

The men in the forward end of the ship were saved, but they were nearly frozen when rescued, because there was no heat aboard after the water had put out the fires in the vessel's boilers. If the men in the after section could have reached the forward end they would have been saved, too, but it was impossible for them to leave their end of the ship.

This disaster led the government to promulgate a rule requiring all freight vessels to be equipped with a breeches buoy arrangement, whereby it is possible to carry a person from one end of a large freighter to another, even if it is broken in two and its deck is being washed by the waves. If there had been such an attachment on the *Mataafa,* all hands could have been saved.

Two other steamers were caught like the *Mataafa,* but they succeeded in getting into Duluth. One of them was so badly battered by the storm, however, that it sank inside the harbor.

The question often is asked as to why vessels are lost in lake storms; that is, those that disappear entirely. It is a difficult one to answer, especially when there are no survivors to tell the tale. Undoubtedly, many disasters have been caused by hatches giving way under pounding of the waves. Lake freighters, when loaded, do not have as much "side" out as ocean vessels. By this is meant that the loaded lake freighter does not stand as high out of the water as the ocean freighter. In a gale, waves wash completely over the hatch deck of a lake freighter, and if the hatches are not securely fastened, the water gets into the hold, and if it continues to pour in, the ship must founder. For that reason great care is taken in securing hatches before a freighter sails, especially in the fall.

If a ship is blown ashore in a storm, the wreckage, of course, tells the story. Leaks were often responsible for vessel losses in former days, but these are not so

(Concluded on page 15)

The World's Trees Gathered in 240 Acres

Wilderness of Natural Beauty Created by Man's Hand in Boston; Cedars of Lebanon, Shrubs From Himalayas, in Arnold Arboretum

By E. I. FARRINGTON

SOME years ago a Chinese young man, a student of forestry, aspired to write a book on the trees of China. It was to be a very complete textbook. To get the material, the young man journeyed all the way from China to Boston, Massachusetts, that he might study in the Arnold Arboretum. "Why," he said to a friend, "should I travel all over China when I can find here in the Arboretum grounds every tree which grows in my native land, from the Himalayas to Manchuria?"

This is an illustration of the completeness of the collection in the Arboretum, which has come to be known as a museum of living trees and shrubs. Established in 1872, it is the youngest of the great botanical institutions of the world, and yet it is one of the most widely known. It is a remarkable institution in many ways. While it is directed by Harvard University, it is a part of the public park system of Boston, and is open to the public from sunrise to sunset every day in the year. The contract between the college and the city is a most unusual one, providing that the Arboretum shall be perpetuated under the present arrangements for a thousand years, and then for another thousand years, and so on, forever.

Although spoken of as a museum, there is nothing artificial about the Arboretum. The trees and shrubs are not planted in straight and labeled rows, like specimens on exhibition tables. On the contrary, all the planting has been made to look as natural as possible. The ground under the trees is not bare or covered with closely cropped grass, as in English arboretums, but is filled with underbrush of many kinds, such as would naturally be found in the woods. There are little ponds here and there, with wild flowers growing on their banks. There is a meadow through which a brook quietly ambles, and a great hill covered with native hemlocks growing among the rocks, forming a retreat which is welcomed by hundreds of people during the summer months. Here one can imagine himself in a distant wilderness, although actually within a mile or two of the state capitol. In many ways the Arnold Arboretum is a remarkable example of landscape architecture. It illustrates the use of native plants in a way which has proved an inspiration to many gardeners. Instead of being left bare and forbidding, the stone walls are hidden under draperies formed by grape vines, bittersweet, Virginia creeper and other plants of the same nature.

Forming as it does a wonderful pleasure park for those who love nature at its best, the Arnold Arboretum is visited by multitudes of people from the city, especially at seasons when there is a great display of bloom. On Lilac Sunday, in May, for example, from 10,000 to 20,000 persons walk up and down the paths, rejoicing in the beauty of the 220 different kinds of lilacs planted on the sides of Bussey Hill. The flowering cherries, the crabapples, the rhododendrons and the mountain laurel all draw crowds of people.

While the lilacs make the biggest show at the present time, they will eventually be eclipsed by the azaleas, as hundreds of plants grown from seed are being set out each year. In time there will be 300,000 azaleas on the slope which drops to the meadow, making a collection without a rival in all the world. Already the hill is crowned with azaleas, many of them brilliant species from the Orient, and when they are seen from a distance through vistas in the trees, the hilltop seems ablaze.

Although the Arboretum is thus made an unsurpassed beauty spot, it has a more serious purpose than merely to delight the eye. It is intended to serve as a natural textbook for students of botany and of forestry. To make this possible all the trees and shrubs are arranged in families and in groups. You pass from one group to another through the botanical variations that separate them, and you find every specimen properly labeled. It is a part of the contract by which the Arboretum was established that every tree and shrub the world around which will grow in the climate of New England shall be planted there. To make this possible it has been necessary to send plant scouts to many distant parts of the globe. Oftentimes they have penetrated to places never before trodden by the foot of a white man. They have undergone great hardships and faced many dangers in their efforts to search out new plants which would prove of value to America. As a result thousands of trees and shrubs which naturally grow in China, Japan, Siberia, Korea and other lands are found within the confines of the Arboretum walls. In addition there are, of course, all the native American trees and shrubs which can endure New England's rigorous winters.

Administration Building of Arnold Arboretum in Boston.

Some of the plant immigrants have made themselves very much at home in New England. Others pine for their native land, apparently, and can barely be kept alive. The Arboretum is a testing ground for these new introductions, and those which prove worthy are distributed among the nurserymen through whom they eventually find a place in private gardens. Several well-known plants now in commerce came to America in this way. The best known is probably the Japanese barberry, Berberis Thunbergi, which is without question our most valuable shrub for making hedges.

The best known plant scout of the Arnold Arboretum is Ernest H. Wilson, now the assistant director, who has just returned from a two-year trip to Australia and India. Mr. Wilson has made six expeditions to China and Japan. He has traveled much in Korea and has spent weeks among the head hunters of Formosa. On one occasion while descending a mountain in Western China he was overtaken by a huge rock which broke his leg. He lay in a native hut until he recovered, but later went back and obtained bulbs of what is known now as the Regal lily, one of the handsomest garden plants in commerce.

The Arnold Arboretum had its inception in the generosity of James Arnold, of New Bedford, Massachusetts, who left $100,000 for horticultural purposes. His trustees turned over this money to Harvard College, which decided to use it for an arboretum bearing Mr. Arnold's name, and chose for its location a farm in Jamaica Plain, a Boston suburb, which the college owned. The original farm has been added to from time to time until now there are 240 acres of hill and valley and meadow. In some ways it is the most valuable 240 acres in the world, for it would be almost impossible, at any expense, to replace the plant specimens which it contains.

Shortly after its establishment, Professor C. S. Sargent, then at the Botanical Garden in Cambridge, was made director, a position which he still occupies, although now well advanced in years. The success of the Arboretum is due in large measure to his efforts and his great knowledge. It is said he knows more about the trees and shrubs of New England than any other living man. At the same time he is a man of wealth, and has many wealthy associates so that he has been able to secure large sums of money from private sources to aid in the institution's development.

The Arnold Arboretum is a great monument to the industry and capacity of Professor Sargent. He has made the Arboretum so well known abroad that it is among the first spots to be visited by naturalists, botanists and plant lovers from across the water when they reach the shores of America. Indeed, it has sometimes been said that the Arboretum is better known in London and Paris than it is in the United States, although this, of course, is an exaggeration. It is a fact, though, that the Arboretum has contributed much to the advancement of horticultural interests in other lands, for it has been very generous in sending to other institutions and to private gardens specimens of plants which have been introduced from the Far East. It is looked upon not as a New England but as an international institution. Some of the best things which Mr. Wilson has found in his travels have not been hardy enough for the northern climate. They, however, have been distributed through the South and the West, where they will thrive.

When Professor Sargent first took charge of the new-born Arboretum his first care was to map out the plan of the future tree garden in company with the eminent landscape architect, Frederick Law Olmstead. From the first, nothing was left to chance, but it has been no slight task to develop this straggling and neglected property into a seemly and beautiful garden, with comparatively small funds. At first there was no enthusiasm among horticulturists in regard to the project. In fact, the lack of sympathy and of support made Professor Sargent's task doubly hard. Now, of course, all this has been changed, and horticulturists of America look upon the Arnold Arboretum with the greatest pride. Even in the early days there were a few friends who stood by and could be depended upon in any emergency. One of them was H. H. Hunnewell, whose wonderful estate at Wellesley, Massachusetts, is known far and wide. Mr. Hunnewell contributed the money for the Administration Building which now houses not only the office but also a huge collection of plant specimens mounted and filed away in fireproof cabinets. Here also are specimens of different woods from all parts of the country, as well as cones from every cone-bearing tree.

One of the wide driveways in the Arboretum leads to the summit of a hill from which there is a commanding view of the whole surrounding country. On one side of this hill is a special collection of Chinese plants, largely those brought back by Mr. Wilson. Here, too, are the Cedars of Lebanon, which attract special attention from visitors. These cedars have proved remarkably hardy and have grown faster than any other evergreens in the grounds. Years ago Professor Sargent secured seeds from Syria, but when the trees grew they proved too tender for New England. Then the director sent a representative to a mountainous region several hundred miles farther north where exactly the same trees grew, but

Mountain laurel in the Arnold Arboretum.

A road where the mountain laurel blooms.

under different conditions. Seeds from these trees were planted, and it is from them that the group now growing was raised.

Less than 20 years ago it was believed that there were only 16 different species of hawthorns in the United States. Now, through the investigations of the Arboretum, it has been learned that there are fully 700 distinct species on the North American continent. More than 400 of these species have been grown from seeds to blossoming size and have been named. This in itself has been a tremendous task. It has been necessary to visit the trees when they were in bloom and mark them, and to visit them again when the fruit had formed to secure the seed. The seed itself requires two years to sprout, being kept in boxes of earth in a cellar or buried in sand for that length of time. Then the young plants have to be nursed along until they are large enough to place in their permanent locations.

The Arboretum now has a project for a great rose garden, the greatest garden of the kind in the world, and one which shall include every rose that will stand the New England climate, including all the native species of foreign lands. The mayor of Boston is deeply interested in this project, but believes that it will be necessary for some wealthy man to help finance it. The man who is generous enough to make the establishment of such a garden possible will undoubtedly have it named in his honor, and such an honor is well worth coveting.

A thorn apple tree from the Middle West.

The real story of the Arnold Arboretum cannot be told in words. The printed page cannot convey its meaning. One must see the Arboretum in its springtime splendor when the rising tide of life bursts through the bonds of winter; one must watch the procession of summer shrubs, rejoice in the golden glory of autumn and stand in awe before winter's majesty to really know it. For the beauty of one season is not the beauty of another. Yet together they constitute nature's ever-changing pageant.

Appreciative persons have spent weeks in the Arboretum. No available time is adequate to enjoy the wonders of the 240 acres in which are gathered the trees of the world. Surely it is a matter for congratulation that such an institution is to continue, "for a thousand years, and then for another thousand years, and so on, forever."

When the Storm King Sweeps the Great Lakes

Concluded from page 13

common now, because a steel vessel will not spring a leak as quickly as a wooden ship, no matter how badly it is pounded. Losses through collision are generally explainable, for seldom do both ships sink.

How can ships and men disappear without leaving a trace is another question often asked about disasters on the Great Lakes. Well, Superior is the largest body of fresh water in the world and its greatest depth is 700 feet. If a ship goes down in that depth nothing is ever seen of it again, and if the crew goes down with it, the men stay there, because the water is so cold at all seasons their bodies do not come to the surface.

Lakes Michigan and Huron also are very deep in spots, but not many ships have disappeared utterly in those bodies of water. Both lakes have claimed their share of lives and ships, but usually there is some trace—bits of wreckage, an empty lifeboat bearing a vessel's name or something that tells a ship has been lost. The same applies to Lakes Erie and Ontario.

Another element with which vessels on the lakes must contend is a short-choppy sea. The lakes do not compare with the oceans in depth. On the oceans, during storms, the waves run high, but they are longer and easier for a ship to ride. The short, sharp waves on the lakes pound the boats severely, run high, too, in a heavy gale; the difference in length causes the hazard.

In the late autumn the lake freighters have ice to contend with and must fight their way out of jams. The boats are not built for ice-crushing and such battles invariably damage them.

Winter navigation probably will never become a practical fact on the lakes. A few steamers try to run on Lake Michigan the year round, but a cold winter plays hob with their schedules.

Winter navigation on this lake has not been without misfortune, for several boats and a number of lives have been lost in the business. The most notable of the ice disasters happened a number of years ago, when the steamer *Chicora* left Chicago for a Michigan port across the lake, some 85 miles distant. The *Chicora* vanished with all on board—some 50 persons. It was supposed that she was crushed between the floes and went down.

Insurance companies will not take a risk on vessels leaving port after December 1, and many of them manage to get out with a cargo just before midnight on that date. If the boat is out four or five days and is lost, the insurance company pays. The attitude of the insurance companies illustrates what they think of winter navigation on the inland seas. In late years quite a number of vessels have left ports with cargoes after December 1. Of course, they were not insured, and if they met with misfortune the owners stood to lose big sums. There never is any trouble getting full crews. The sailors say it's all in the game, and what is one more trip, anyway. If they can leave the ship in time to reach home for Christmas they are satisfied.

BRIEFLY TOLD

The Prince of Wales was considerably out of pocket as a result of his recent extensive trip to the East even though Parliament granted certain sums for the tour.

In the United States Senate, from noon on April 20 to 2:50 p. m. on August 2 constituted but a single legislative day of 2,475 hours without opening prayers by the chaplain.

The Cape Peninsular Road encircles the whole peninsula of South Africa, skirting the entire rock-bound coast for 125 miles. It is believed to be the finest marine drive in the world, even surpassing the famous Corniche Road in Southern France.

The farm population of the United States is 31,614,269, or 29.9 per cent.

The new U. S. ZRI airship now being constructed requires a section of the intestine from more than 2,000,000 cattle. Only a small piece of this tough skin, known as "gold beater skin," can be obtained from each animal. After the skins are cemented together the fabric is varnished.

The will of a veteran of the Union Army of the Civil War provides for a monument to be erected in Washington, D. C., in memory of General Robert E. Lee.

There are now approximately 4,000 buffaloes in the United States and 6,000 in Canada.

A volume of the first edition of Bunyan's "Pilgrim's Progress" recently sold at auction in London for $10,000.

The centenary of the decipherer of the Rosetta stone is being commemorated in Paris. The Rosetta stone contains the key to the ancient writing of the Egyptians and was discovered by a French officer in 1799, at Rosetta, near Alexandria. Champollion, the French Egyptologist, found the key to the writing after eight years' labor. He was only 11 years of age when he started deciphering the hieroglyphics on the stone.

Hailstones large enough to burst watermelons wide open fell in the Piedmont section of North Carolina recently.

Norway has reduced taxes of foreigners owning property in that country from one to one-half per cent of the value of the property.

Members of the British Expedition to Mount Everest managed to reach a record height of 27,300 feet, more than half a mile higher than man ever scaled mountain heights before.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

There are 50,000 Jews in Italy and the Italian colonies, of whom 12,000 are resident in Rome.

Negroes own and direct 113 newspapers and 14 magazines in the United States. Nearly 1,300 employes, of whom 61 are white workers, manage the publications. The papers include 96 secular, 23 religious and eight fraternal papers.

The Leather Bottle Inn, immortalized by Dickens in "Pickwick Papers," is for sale.

Colorado has a mountain area six times as great as Switzerland, with 42 peaks exceeding 14,000 feet altitude as against eight such giants in the Swiss Alps. It has 36 mountains higher than Mount Fuesteraahorn, the highest peak in Switzerland.

Unsightly black patches, which mar the appearance of concrete roads after repair work has been done, will be avoided by the use of a material for the purpose developed by the Department of Agriculture. It has the same color as concrete and consists of 12 parts rosin and one part crude rubber, with sufficient barium sulphate to give the desired color.

Indian trappers of the Lake Athabasca post are using gas engines in canoes instead of the paddle.

Ex-kaiser William's memoirs in book form will sell in Germany in October for 15 cents a copy. Among the headings, as shown by the prospectus, are the following: "My Attitude Toward the Church," "The Outbreak of the War," "The End of the War," "The Pope and the Peace," "Friendly and Neutral Powers," "The Destruction and Germany's Future."

Aristide Briand, seven times premier of France, was arrested as a chicken thief by an ambitious gendarme near Rouen, France. The gendarme had been instructed to be on the lookout for suspicious characters and to demand their papers of identity. M. Briand had forgotten his papers and was going fishing a few miles from his summer home. The gendarme walked his prisoner two miles to the police station before he learned his identity.

The original hero of Owen Wister's novel, "The Virginian," recently dropped dead in Los Angeles. The man, who had been a guide in Yellowstone Park 35 years, punched cattle with Buffalo Bill and had many exciting experiences in the days of the old West, died eating an ice cream cone.

William Allen White has removed his name from the editorial staff of *Judge*.

The Harvard Board of Admission met early in August and elected a Jewish professor as chairman.

A unique feature in the ventilating system in the council chamber of the London County Council's palace at Westminster is that each member is able to control his own immediate atmosphere. A control button below his desk feeds cold or warm air from a maze of pipes beneath the floor which lead to noiseless fans, water sprays, thermometers, dynamos and a network of brass pipes. A sudden change in the outside temperature is automatically conveyed to sensitive instruments so that they promptly adjust their efforts toward maintaining an even temperature inside.

Northwestern University no longer will employ married instructors, because the cost of living and social demands are excessive in Evanston. Married instructors employed at present can remain.

The largest collection of fingerprints of criminals in America is that belonging to the Leavenworth, Kansas, penitentiary. Long-term prisoners arrange and classify the 250,000 prints that bring them more cell mates.

The salvation of mankind from war is the only thing worth writing about, says H. G. Wells.

Pope Pius is to have the first pontifical automobile. The people of Milan have presented him with a machine of the latest Italian model. It is mauve colored and bears the papal coat of arms, surmounted by the triple crown and the pontifical keys. Vatican officials have remarked the change from relatively recent times when ecclesiastics were forbidden to ride bicycles.

Those Competent, Inconspicuous, Gray Swiss

They Don't Know Their President's Name and They Wear Suspenders

By WILLIAM ATHERTON DU PUY

THE Simplon Tunnel runs under the Alps, there on the boundary between Switzerland and Italy. It is the longest tunnel in the world, the schoolbooks used to tell us, twelve and one-half miles in all. At one point there is a roof of rock a mile and a half thick. In digging it, two decades ago, these Europeans deprived us, as Americans, of one opportunity to indulge in our favorite diversion of using superlatives. We cannot say that we have the longest tunnel.

You plunge into this tunnel, say, from the south. You have come up from the Lombardy plain, past the Italian lakes, have climbed that mountain rampart which through the ages has presented its incalculable difficulties to the peoples who have surged back and forth in the making of those events that are the historical background of Europe. Hannibal, Caesar, the Goths, the Huns, the Germans, fought these Alps.

You have been fascinated by the colorful Italian landscape. Each village has been like the riot of color on the canvas of an impressionistic artist. Solemn fortresses of the Middle Ages have looked down from the hilltops. A teeming, peasant population has filled the fields, the villages—an attractively ill-dressed population, poor, not over-tidy nor over-clean—a population with an air of vagabondage about it, with always a splash of color in its dress, its habitation, a people that places shrines along the roadside.

And the town at the Italian end of the tunnel is called Iselle di Trosquera, pronounced to music. You ride 23 minutes under the mountain and when you emerge the name of the place is Brig. It is an omen.

Busy People, Immaculate Gardens

YOU look at this town of Brig. It is made up of rows of well-built, gray, stone houses. They are good, utilitarian houses. One would feel secure for the winter in them. But how could one choose for himself a place to live? None stands out from the other so there is no choice. They are placed conveniently along immaculate streets, well-paved, well-sidewalked, clean-swept, gray.

Figures move about these streets but do not congregate nor loiter. They likewise are gray and inconspicuous. You would hardly have noticed them. They fit into the ensemble, fade into it as the color of a jungle creature loses it among the leaves.

Yet this is a busy people. Everywhere is evidence of their industry. You note the immaculate and weedless gardens, the prim flower beds. The wood for next winter's fires is already sawed and piled in a circular figure like the turret of a battleship, buts out. The trees along the streets are wide and flat-topped like so many circular, giant one-legged, green-painted tables set out for summer refreshments. They are carefully trimmed into just this form. Thus they give more and denser shade and thus they yield every season a crop of twigs for the quick cooking of peasant meals. It is efficiency.

This, of course, is Switzerland. On this side of the mountain is a people as unlike that which you have left as a robin redbreast is unlike a gray Jennie wren or as the poinsetta is unlike the practical cauliflower. These are the gray Swiss.

We are riding down the valley of the Rhone. Matterhorn is there on the left, Mont Blanc a little further on, the lesser ranges running down into the valleys. On our right is the most striking demonstration of intensive farming I have ever seen. The mountain side is a series of terraces rising one above the other, a stone parapet at the foot of each, communication from one to the other being by means of ladders, all overrun by a luxuriance of vines of the grape. The mountain side is as well tended as a pansy bed in a town garden. Strangely, the opposite side of the valley is unused. As a matter of fact it is the slope of this ground, its pitch to catch the perpendicular rays of the sun and therefore extract more heat from them, that makes this hillside a reservoir of wine for which the seasons turn the spigot.

In the Center of Art, Utility

"THE thoroughness of these Swiss is incomparable," I said to my companions in the smoker. "I have never before seen a country so well-kept. This is surely a remarkable people."

"Competent," commented the man in the corner with convincing finality. "Competent expresses the Swiss. But they never produced a cathedral, a painting or a book worth remembering. I will wager that there stands out in your mind the name of but one Swiss, William Tell, and he was a myth."

Since then I have traveled over most of Switzerland and viewed it critically. I have looked for some building that deserved attention, that was not merely drab and gray and conventional, but I have never found it. Geneva on her magnificent lake with Mont Blanc in the background, has only plain utilitarian rows of stone buildings and drab, solemn museums, this people having a strong predilection for putting specimens in museums. Zurich, over at the German end, has her so-called cathedrals, the Grossmunster and the Fraumunster, that date back a thousand years, but they are without an artistic touch. Yet they came into being at the time when Notre Dame and the cathedrals at Milan and Frankfort were being given to the world.

There is only the chalet, with its overhanging eaves, that is in any way distinctive to the Swiss and it is but a bit of a lumber cottage. Yet Italy, greatest of builders, is on one side; France, mother of Gothic magnificence, on the other; and Southern Germany which contributed a splendid architecture though now lost to that nation of otherwise merely imitative builders, is on the other. Surrounded thus by architectural splendor Switzerland has made no single contribution. Odd.

You look out the window and chuckle, for yonder is a lady scarecrow. You have never seen this guardian of the fields of this sex before. When you come to think of it the presence of this lady scarecrow carries with it a peculiar significance. It means that it is the members of this sex whom the birds are accustomed to see in the fields, by whom they are used to being scared away. Women, in fact, work in the fields of Switzerland. Look out your train window to see. I did so and grinned, surreptitiously and behind my hand, not daring to let my wife catch me at it. I had been thinking of the idle spinsters and barren wives who sit through the decades on the benches in front of the apartment houses in which people of my class live in America, and do nothing to justify their existence. I had pictured a flock of them in these Swiss vineyards.

There are many things different in Switzerland, some better. There is, for instance, a map of the road you are traveling nailed right up there in the car. That is handy. On the contrary there is no drinking water. It is usually impossible to get plain water to drink while in transit and quite an effort in the restaurants. You are forced by necessity to buy your drinking water and at that you must take mineral or carbonated water, 25 cents a bottle, whether you like it or not. Plain, thirst-quenching water out of the hydrant you cannot get.

There is no porter on the train which is variously regarded as a blessing or deprivation. And here is an interesting thing! Across the platform in the station in which you have stopped is another train. There is on it a large party of young men, apparently just out of college and going home. It is warm and they are taking off their coats. And every mother's son of them is wearing those old-fashioned suspenders that, 20 years ago, used to be part of the wardrobe of Americans. Strange how universally the belt has supplanted them in America. But throughout Europe, including England, everybody wears them. They are not called suspenders or galluses as in the United States. Suspenders, if you take the British as your authority, are the appliances which hold up your socks. These are braces. Such is the proper European nomenclature. The continental clings to his braces.

Cleanly, Formal, Well-kept

HERE is another thing. If you speak of your vest in Europe you must call it your waistcoat. One's vest over here is his undershirt. And listen, girls. There isn't a single corset in all Europe which laces down the front.

But one more thing about the Swiss railway train before we leave it. The windows. The windows along the sides are five feet wide. There is an unbroken expanse of scape like that through which you can look right out upon the passing landscape. It runs all the way up to the top of the car. You don't have to hunch down and peep through a stingy little pane of glass like you do at home at all. There are no up and down and crossbars that bisect and mutilate your view. You can look right out and see what there is to see. Why not? You can even look across the car and out the big window on the other side. These big windows have a comfortable hand hold at the top and almost anybody can reach right up and pull them down without breaking a single finger nail. And there is a soft, comfortable strap at the bottom and all you have to do to put them up again is to pull the strap and you can stop anywhere you like. I will here and now promise my patronage, when I get back, to any American road, other things being equal, that will install these windows.

But to get back to these hard-working, gray Swiss. You stop for a week in Basel or Berne or Zurich or Geneva. These towns all have the same monotone of color, the same formal appearance, the same cleanly well-keptness. Here in this riot of mountains which is Switzerland they are as conventional as the settee in mother's parlor back in Podunk. But when you get into one of them you begin to notice conditions different from those back home. There are, for instance, few automobiles and almost no trucks. You get this idea and so you conclude that things must be moved hereabouts by horse power and begin to look for the horses. Then you find that there are even fewer of them than of trucks. How, you ask yourself, do they deliver the groceries and bring your trunk down from the station?

Everybody on Bicycle

JUST as you find in Rome that the low-necked hacks in which the past generation of Americans rode had been shipped to that historic city and were being utilized in showing its wonders to the tourists, so you discover that the bicycle of yesteryear has been shipped to Switzerland. And in Switzerland it is blooming into a usefulness which the manufacturer's press agent dreamed not of.

Men, women and children are awheel. The bicycle is the passenger conveyance of the average citizen and they are all average. It is the delivery wagon of the small shop and they are mostly small. There goes the grocery boy. He has on his back a basket as big as an ash can. One side of it is flat for purposes of fitting on the back and to this side are attached straps through which his arms pass He puts the basket on as he would his coat. It may have a hundred pounds of packages in it. He mounts his wheel and rides away. He defies the world to show a more economical delivery system

Or, maybe, he is the boy from the milliner's. His packages are lighter and so he may carry a greater bulk. He has on his back a rack five or six feet long which looks like a ladder. There is a base to it like the seat of a chair. Upon that base he starts to build and erect an imposing structure. It looks like an amateur haystack constituted of bread boxes. They are all bound to the ladder. Being a Swiss he goes carefully, encounters no accidents, introduces no comedy, accomplishes his mission.

I have been expecting to see a man awheel delivering a piano but times are hard and no pianos are changing hands.

The porter resorts to a pushcart. He comes down from the station with four trunks and thirteen bags. Why maintain a horse and wagon? The porter moved all my family effects on his pushcart and felt rich when I gave him five francs. The mass of all the business of these cities of 100,000 and more is done on bicycles and pushcarts. Man power is more plentiful and cheaper than oats or gasoline.

Every one of them tones into the buff gray of the streets and buildings. They have lightish hair, sallow complexions, wear drab-colored clothes, are smallish, inconspicuous, in every way self-obliterating. There are few of them on the streets. When darkness comes they disappear. In Genoa the twilight draws the whole population into the streets which become ateem with life. In Geneva it drives the last of them into the unknown. Such is the outward manifestation of a difference of temperament.

Beautiful Women? Well

CRIME here is almost unknown, demonstrations, disturbances, curbstone Johnnies The last man to speak on a street corner was John Calvin, 300 years ago. This straight-laced reformer, daddy of the Puritans, got his start in Geneva. His little church still stands and his influence is still felt. If you own an automobile and drive it out on Sunday you get arrested.

Then, that I might make my report complete. If you will pardon a bit of self-revelation I may say that I am of the South. I, therefore, hesitate to give voice to a sentiment that might cause other than the flush of pleasure to mount to the cheek of women. But I am sure that what I write to America will never get itself translated and reprinted in Switzerlad. Further than this I owe the truth to my own people. My profession calls for truth-telling. And the truth is that these are the homeliest darn women in the world. They have us again there in superlatives. They are just plain ugly—squat, slab-faced, sallow, colorless. Any American woman who has a Lothario husband who troubles her can find a surcease by settling him in Switzerland. It is strange that a country that is so beautiful should be full of people who are so plain.

There are three races in Europe, as Professor Madison Grant so lucidly explained: the tall, blond, fighting Nordics from the north; the artistic, temperamental Mediterraneans from the south; and the Alpine peoples of Slavic origin who project themselves through Switzerland, furnish the bulk of the blood of Germany, and drive a wedge into France. These are the Alpines, sturdy, round-headed peasants. They are frugal, productive, competent. They are the best hotel keepers in the world. But adventurers, artists, philosophers, chorus girls. No.

"Who is president of Switzerland?" I asked an average citizen.

Real Democracy, Real Government

HE DID not know. This was not because he was ignorant nor uneducated, for he was neither, but because of the talent of this people for taking the flare out of things. A man may be president inconspicuously in this country. The legislature appoints heads of departments and the chairman of these is president. The post sort of rotates and a man occupies it only a year. The Swiss genius for obscurity has taken all the zip out of it.

Yet what a government it is! There is probab'y not a more efficient, nor a more democratic, in the world. Little Switzerland has had a wonderful influence upon the development of model governmental institutions. It is doubtful if any other country has done more to demonstrate the possibility of evading war. The Swiss took their stand and refused to resort to this national hara-kiri. Though entirely surrounded by the great turmoil they had the sturdy determination and stability to stick to the path of peace.

But they will not open the windows in their street cars. They are against ventilation. I was riding over to the Lindenhof, in Zurich, that hill now covered with the most magnificent grove of lime trees in Europe, upon which the prehistoric lake dwellers built their first fortress when they emerged from their water-protected homes. It was a hot summer day. Every window was down. The car was full, the front platform crowded. But there was a little slot in the front door through which he might collect the platform fares without opening that door. He got all the fares without letting in the least bit of air. They are thorough, these gray Swiss.

Regimenting the American Home a la Prussia

Fifty-Fifty Method, Whereby State and Nation Exploit Taxpayer; Subsidies Keep Pace With Trend Toward "One Big Government"

The course we are now pursuing will prove in the long run more dangerous to our government than a foreign foe. A proud, strong nation may suffer a reverse in arms, but time fights on their side to final victory. But a nation whose citizenship has been drugged and debauched by subsidies and gratuities and bonuses, who has surrendered to the excesses of a treasury orgy, has taken the road over which no nation has ever yet been able to effect a successful retreat.—Senator William E. Borah

By AARON HARDY ULM

"EVEN in this comparatively new land of ours we have reached already the era of embargoes, subsidies, gratuities, bonuses, and finally that sinister invention of American politics—50-50 between the states and the government—that is, *the states will exploit the taxpayer for 50 per cent and the government for the other 50 per cent,* thus dividing responsibility and augmenting extravagance, unmindful, apparently, that while the taxing power is two, the taxpayer in both instances is one and the same."

Thus spoke Senator William E. Borah in Congress recently.

"That sinister invention of American politics" he mentions accounts for more far-reaching expansion of Federal Government than does any other incidental factor entering into the trend of centralization toward One Big Government all supreme in this country.

While it has been most exploited during recent years, it is not a new invention. It was first proposed in the late fifties. It was originated by the late Senator Morrill. It grew out of a very wise forethought on the part of Thomas Jefferson.

When the western lands were opened up for settlement, Jefferson suggested and Congress provided that certain portions should be reserved in perpetuity for the support of public schools and universities in the states that were thus to be brought into being. The plan had much to do with the quick development of educational facilities in the new communities of the West.

Later, as the West developed, Senator Morrill advanced the contention that eastern states had a property interest in the public lands, for which they had fought and paid. He urged his famous bill for distributing among eastern states certain proportions of funds coming from the sale of public lands in the West. That was the beginning of the 50-50 "invention of American politics." President Buchanan vetoed the bill in 1859, but in the midst of Civil War it was approved by President Lincoln. Later, in lieu of what was received from land sales, a direct appropriation from the Treasury was made. It is a perpetual appropriation, being increased in 1890. It now amounts to $50,000 for each state. In 1887 the same device was used in the Hatch Act setting up agricultural experiment stations in the various states.

But it was not until 1914, after a Constitutional amendment made it possible for Congress to raise any amount of money it might desire to appropriate, that any extravagant use was made of the device.

In that year, Congress passed the Smith-Lever Act, whereby appropriations, now totaling $4,580,000 a year, were made in perpetuity to the states for agricultural extension and home economics. *That virtually was the first link in a chain which connects the Federal Government intimately with the citizen's ordinary life, his occupation and his home.* Under the act a majority of counties now have what are known as "county agents" who, while technically state officials, are in great part representatives of the national government among the farmers. A large number also have home economics demonstrators who, while on the pay rolls of the states, are agents of the Federal Government directly to homes in rural communities.

The Smith-Lever Act was followed in 1917 by the Smith-Hughes Act by which $7,000,000 annually is now distributed among the states on a "50-50" basis for the promotion of vocational education. The expenditure of both the Federal and state governments' parts are supervised by a Vocational Education Board in Washington.

For several years Congress has been on the verge of making a similar appropriation to the states for the vocational rehabilitation of persons injured in industry —"industry" being made to include every form of activity, even that of a hobo beating his way on a freight train.

The greatest "50-50" venture yet made is that having to do with roads. It was initiated in 1915 when a modest appropriation of $500,000 was provided. That act didn't get very far, as it required the states to put up at least three times as much as the Federal Government. It was buttressed in 1916 by an amendment making the Federal appropriation $25,000,000. The present Congress has increased it to $50,000,000 for the coming year, $65,000,000 for the next and $75,000,000 for the following year. The states are required only to duplicate. While construction of roads under the act is left to the states, supervisory power over it is in the hands of the Bureau of Public Roads in Washington. This means that the improved public roadways of the country will be national highways; already they are called "Federal aid" highways.

The culmination, so far, of the "50-50" device is the so-called maternity bill, which passed last year and only recently was put into effect. It appropriates $1,240,000 to the states for the promotion of the "welfare and hygiene of maternity and infancy."

It, like most of the others, was the outgrowth of innocent-appearing and, as far as they went, harmless Federal ventures of an advisory kind that preceded them.

The Children's Bureau, for example, was created a dozen years ago, for the purpose of setting up a Federal agency of investigation and advice of and on matters having to do with children. As with like undertakings that preceded it, the bureau hardly started operating before it began to demand wider authority and ampler funds.

It found that the infant death rate and maternal mortality vary widely in this country and are higher on the whole than in some other countries. It is a very subtle problem, with much contradictory evidence as to actual facts, causes and possible cures. But it is one highly charged with sentiment. The leaders of women's organizations became interested and generally concurred in the bureau claim that the solution lay with Congress. After equal suffrage was granted by Congress, those who had led the fight for it determined to make the maternity bill the first object for the display of the new power represented by the "woman vote."

Senator James A. Reed on the Federal Maternity Bill:

There are some who believe in this sort of thing, who think the government should regulate everything. They believe that if Congress were to pass a bill directing all men to be happy, every human face would thereafter wear a smile of perpetual joy. These enthusiasts seem to believe we can disregard human nature, the experience of the ages, the environment of life, the conditions under which God Almighty planted human beings on this earth, and that all we have to do is to pass a bill, and all will be serene and lovely. Unhappily the epitaph on all such ventures is failure! failure! failure!

In the past at least the authority of the government stopped at the threshold of the home. An officer could enter only when armed with a warrant of law issued by the court. . . .

Now the thin edge of socialism is to be introduced, the home is to be invaded, and a band of spinsters will be appointed to take charge of the mothers who have always so tenderly, so devotedly, and so well, reared the children of America. It will end in failure; let us hope it will not bring disaster.

(In his race recently for renomination to the Senate, Senator Reed was attacked violently for his opposition to federalization measures, chiefly the maternity bill. He won.)

Agitation for that bill brought a new and insidious appeal for the expansion of Federal activities. It is the "If-for-hogs-why-not-for-anything?" appeal.

Long ago the Federal Government brought the welfare of hogs more or less within its jurisdiction, as it did virtually all other domestic animals and plants. The theory was that any measures tending to the production of better and cheaper animal and plant life would conserve the interests of humans who are dependent on them for food, and thereby life.

It was left for the supporters of the maternity bill to class babies with hogs grown for food. But the comparison had tremendous effect—and is being used in agitating for further and much more far-reaching federalization than comprised in any of the "50-50" measures yet passed.

A reluctant Congress passed the maternity bill, which brings within the jurisdiction of bureau officials in Washington, the most sacred events and affairs of domestic life. It was so reluctant that the appropriations were made for only five years and not—as yet—in perpetuity as in the case of most other "50-50" measures. Congressional reluctance is now finding repetition among governors and state legislatures, several of whom have refused to accept the terms of the bill.

The jurisdiction of the Federal Government over motherhood and babyhood as established by the maternity bill is, as in the case of other like measures, very velvety. It comprises only what would seem a last-resort supervision over the way the funds are spent.

But in all such undertakings there is a progressive tendency toward complete Federal jurisdiction. This was indicated not long ago by Dr. Samuel Paul Capen regarding the proposed national education bill:

"The government establishments for the promotion of child welfare, for the improvement of individuals, for scientific research and for education have all started off in the same way. Originally, all were designed to secure information to serve as foci for leadership and mold great national interests by the authority of facts and ideas. Generally these original purposes have been overlaid by a group of administrative functions involving the enforcement of laws or implying the control that inevitably follows Federal subsidies."

In line with that, it is common belief that it is almost if not quite impossible to find in Washington a single bureau which is satisfied with its authority or the funds allowed it for the enforcement of its power. And it will be almost as difficult to find one that will hesitate to use power and funds for the augmentation of both.

And as the bureau in Washington becomes more assertive, which it generally does, the co-operative agencies supplied by the states becomes less so.

The "50-50" way of extending Federal aid amounts substantially to subtle bribing of the states, local governments and the apparently benefiting groups and classes for the surrender of power to the national government.

"Bureaucracy at Washington is always alert to extend its power," declared former Governor Lowden, of Illinois, recently. ". . . . Hitherto it has found the states jealous of their rights and capable of resisting this tendency. So the bureaucracies now seek to gain by bribes what they failed to gain by other means . . . . They seek to salve the wounded pride of the states by large Federal appropriations. Propaganda is being carried on day by day, under the guise of liberal contributions to the states, which will result in taking from the Treasury hundreds of millions of dollars for objects which must remain in the care of the state if the state is to remain an entity in our system."

It is doubtful if any propaganda of that kind has been put forth more insidiously than that for the so-called national education bill. That measure with one swoop would take $100,000,000 a year out of the Federal Treasury for distribution among the states. Openly and candidly it dangles before the people of a majority of the states the deceptive lure summed up in the following taken from a specimen of that propaganda: "The wealthier sections of the country would pay more than they would receive and less wealthy sections would receive more than they would pay."

The bill proposes to set up a Department of Education headed by a minister of cabinet rank.

No less an authority than President Hadley, of Yale, has denounced the proposal "as a long step in *the Prussianizing of American education.*"

Yet it is supported by a score or more of the strongest organizations of the country, led by the big National Education Association.

Throughout their propaganda runs the thought and frequently the words, "think nationally." Though the bill lines with velvet the Federal jurisdiction it would establish, the venture clearly would lead to an agency whereby, as was demonstrated by certain war activities, in a little while *a few officials in Washington could press a figurative button and make the country think, not temporarily but permanently, anything they might want it to think.*

And the propaganda for the education bill frequently makes use of the "If-for-hogs-why-not-for-anything?" appeal.

Thus because government scientists evolved a hog-cholera preventive, it is contended by even thoughtful people that there should be virtually no limit on federalization.

They naturally find support in Washington because it means more jobs and more power for those already there. They get support from big elements of the general public because of the bulging Federal Treasury and the way its funds are collected.

"The great task of legislation today," said Senator Borah, one of the few men in national life who fights most proposals of Federal expansion, "is to ascertain how one class may benefit at the expense of another class—the taxpayer always the victim."

Why Silver Is Retained as Money

NOMINALLY upon the single gold standard, the United States still retains silver as a standard basis of value. The reason is not generally known, nor is the fact that the illusion of ultimate redemption, that myth which leads many to hesitate to follow their conviction as to the real function of money, does not apply to silver, which is its own redemption and also the redemption of every dollar of paper money in the hands of the people. Only the gold certificate and obligations expressly specifying gold redemption are redeemable in gold at the option of the holder, redeeming agencies retaining the option of using silver or lawful money in all other cases.

There is no question of the utility of silver in our currency system; if the fiction that a commodity redemption is necessary continues to obtain, silver is the only metal which can supply a currency of proper denominations for popular service; and as long as silver and gold were coined on the same basis, the elasticity of the money volume was more accurate than it has been under the various laws provided to bring about that capacity of automatic expansion and contraction deemed necessary for equitable performance of contracts. Argument on this point is useless. Economists, whether supporting monometalism, bimetalism, or no-metalism, are agreed on it.

The difference since demonetization of silver is that only gold is a metal privileged to free coinage, or coinage on private account. The government owns no gold, buys none; but owners of gold are privileged to deposit the same with the government and take in return gold coins or their representatives (certificates), the government stamp merely certifying the fineness and weight of the metal disc. The real issuer of gold money is not the government, but the owner of the gold. If he takes the certificate, the government merely stores the metal free of charge for him. What makes the gold dollar money is not the stamp, but the law which makes it the unit.

Bimetalism as a theory proposed to make a double unit of value, by restoring to silver the privilege of free coinage, or coinage on individual account. This system began with the fiscal history of the government, and obtained until demonetization.

Demonetization was palpably the result of a corrupt influence of the money lenders; it inured to their financial benefit and to the injury of all others. It aroused universal indignation and its perpetrators sought to, and did, evade the impending storm by a makeshift which pacified the people but played into the hands of the usurers. Coinage of silver on government account furnished the so-called silver ring—really the advocates of gold—a market for the metal without investing it with any benefit to the people as a whole.

This makeshift was wiped out under President Cleveland, the first occupant of the White House with the courage to do it. However much we may believe him to have been in the wrong, or to have broken his platform pledges, Grover Cleveland carried his convictions to the extent even of wrecking his party.

During the World War the United States aided England, threatened with an Indian uprising because Germany had shut off her supply of silver, by selling the silver coins in the treasury. There was something like $300,000,000. It did not belong to the government to sell. It was private property, owned by holders of silver certificates and stored for them. It might have been a serious matter but for one thing: silver had been made available for cash-bank reserves, and the notes in circulation were quietly absorbed for that purpose. Then came the Pittman Act, to restore the metal dollars required for certificate redemption.

Here is where the fine hand of the mine owners again came in, and when mine owners are referred to, it might as well be understood the manipulators of our fiscal laws are the mine owners: Silver in the market at the time of the enactment of the Pittman law was worth as a commodity less than 60 cents an ounce; foreign silver now is around 65. The Pittman law provides that the government buy domestic silver at one dollar an ounce and proceed to coin silver dollars until the amount sold England shall have been replaced. Thus the money kings are given a subsidy on their metal while pretending to satisfy the people, who are not benefited because there is no added volume of money in circulation.

At the present rate of purchase and coinage (the authority quoted should be noted—N. H. Lowrie, managing director of the American Gold and Silver Institute), it is estimated that the silver dollars will have been replaced by November of next year, when the Pittman Act is to expire if not renewed. "To protect their interests," Mr. Lowrie says, "silver producers should be guided in their operations and plans for the future marketing of silver by the minimum life of the Pittman Act."

All of which is illuminating, *both as to the class legislation by which the country has paid tribute to the Money Trust, and to the general public when approached to invest in silver mining.*

Plucking

SLOWLY the army plucking board is accomplishing its mission. Twenty-five hundred officers must be stricken from the active list in obedience to the hit-and-miss economy program of the present Congress.

The members of the board selected for the unpleasant task of dismissing from service their brother officers are endeavoring to clothe it with as much of mercy as possible. High-ranking officers have volunteered to retire prior to the date on which they reach the age limit. A few free-will resignations have aided. But for the most part, the board must proceed coldly, ruthlessly, relentlessly, to do the duty which each member in his heart abhors.

Two courses lay before the board, to drop the officers lowest in rank, and reduce the others by the number of grades necessary, or to pick by the merit plan the officers to remain in the army. The first method would have been the less harsh, the second was the one which plain military efficiency demanded. It was the latter which was adopted.

The army, the clergy, and medicine are three professions whose members are not well paid. There is little opportunity for the average army officer, clergyman, or general practitioner to save money sufficient that, at middle age, he may retire and live in comfort. Each is a life work, and the training for each is of a specialized character. The hardship faced by officers thrown out of their places can readily be appreciated.

But the saddest thing is the humiliation they must bear. No man can face with equanimity the decree that he is wanting in the qualifications necessary for a place in his chosen life work. It will be difficult for the officers retired to face with heads up the task of seeking new jobs.

Congress, in making haste to economy, could have manifested a little more wise consideration. It could have cost only a little more to have enacted the army appropriation bill in such a manner that gradual reduction in the number of officers would have been possible. But the harm has been done. It remains only for the army board to temper its hard task with the maximum of kindness.

Just Doesn't Fit In

THE United States Supreme Court should be one place in which mystery does not abide. It is the theory that the justices of the highest tribunal in the world are selected because of their unsullied probity, their clear intellects, their deep legal learning, their breadth of understanding, and their purity of patriotism.

Their opinions and utterances are supposed to be the lucid interpretations of the matters before them. Ulterior motives and hidden meanings are not looked for in their words.

Therefore, the circumstances of the resignation of Justice John H. Clarke are peculiarly disappointing to the country. The resignation was announced with a suddenness that startled the country. But there must have been prior knowledge in the White House, as the announcement of the resignation was coincident with the naming of Justice Clarke's successor.

There have been various published hints as to the reasons which inspired the resignation. The retiring Justice in his letter explained broadly his desire to assist his neighbors in some public enterprises. There was a news dispatch from his home town, intimating that he desired to work in behalf of the League of Nations cause, and Washington correspondents filled in a dull day by suggesting him for the presidency. None of the reasons advanced is wholly satisfactory. There seemed to be an absence of the frankness the country has the right to expect in the retirement of a member of its most important court. It is a law of human nature that those things which are not clearly explained furnish the ground for the widest speculation. Speculation on such a subject as a Supreme Court resignation gives rise to rumors and gossip not consonant with the well-being of that great tribunal. It is to be hoped that candor will surround similar events in the future.

And Who Rule Russia?

ALMOST incredible are the official Bolshevist reports of the number of persons put to death in the name of liberty. Dispatches to the London *Times* from Riga indicate that the total number of those executed by the orders of the Cheka is 1,766,118.

In the French Revolution the number of executions totaled 17,000, only one per cent of the number of lives those now in control of Russia have exacted. The possession of brains is a major crime under Soviet rule, if the circumstantial reports of the slaughter are to be believed. Professors put to death numbered 6,775, and priests to the number of 1,243 were killed. Recently has come the announcement of the banishment to lonely islands of the Arctic of more hundreds of those whose only crime is intellectuality. Doctors killed in Russia were 8,800 while under the cold listing of "other intellectuals" were 355,520. The other executions by the Cheka included 54,650 officers, 260,000 soldiers, 12,950 landowners, 192,350 workmen and 815,100 peasants.

There has been some attempt at criticism of the failure of the United States to assume diplomatic relations with Russia. In the light of the cold record of official massacre, it is difficult to understand how this agitation can continue, as long as the present influences control Russia.

Poor Judgment

THE United States gained an unenviable distinction when it declined to ratify the St. Germain Convention for the private traffic in arms and ammunition. The decision of this country was the chief influence in making a dead letter of a proposal of the League of Nations to safeguard life.

China, Chile, Brazil, Finland, Guatemala, Greece, Haiti, Peru, Siam and Venezuela had ratified the convention. But as none of these countries manufacture arms in large quantities, their ratification was immaterial. Other countries, including Great Britain, France, Italy, Japan, Poland, Canada and Czecho-Slovakia had notified the secretariat of the League of Nations of their readiness to ratify the compact when the Allied and Associated Powers had assented.

The United States is not a part of the League of Nations, and presumably there could be no binding force in a compact of that organization. But that gives us no ground for declining to assent to the wisdom of wise proposals of the League. We need not assent as a constituent part, but we may approve as a nation friendly with the particular aims expressed.

However, there was a more potent influence in our refusal to ratify the convention than the fact that we are not in the League of Nations. There are powerful and influential interests in the United States engaged in making money out of the manufacture and sale of arms and munitions. Until the country is aroused to the peril the business presents, there can be no consideration of the purely academic issues involved in whether or not we are in the League.

Mr. Ford's Page

THE contrast that exists, especially at this season of the year, between the world of men and the simpler world of nature, is very suggestive. When man was given the measure of freedom which he has, it was consequent upon a certain regularity of nature. Seed time and harvest are not subject to Congress or committees. Resolutions neither hasten nor retard the productive processes of the soil. Turning away from the world of men, snarled as it is into a thousand tangles, we behold another world that seems to rebuke us for our childish ignorance and temper. Morning and night, sun and rain, frost and heat, come in their turn regularly without any thought of lockouts or strikes.

Were it not for this constancy of the natural world, man's experience of inconstancy would be impossible. It is because the planet is steady that man's unsteadiness falls short of destruction. Even the most frightful war of history did not suffice to make this globe miss half a minute of its destined work. There is great uncertainty about everything with which mankind has to do, but the earth that holds us all is trustworthy.

One has only to think what it would mean if man's temper could be transferred to nature, to see what fools we mortals are, and how the consequences of our folly are tempered for us. Here we are, common heirs of the riches of this fruitful earth. We have nothing that did not come to us from the common soil. Take an automobile or an airplane—not a single element of their make-up that did not come from the soil. Take the substance of the finest book the scholar holds, the finest canvas the artist admires, the jewels on the bosom of beauty—all metals, all woods, all fabrics; all colors, all finishes, all propulsive powers—they come from out of the earth, as corn comes or wheat. We discover generation by generation yet richer stores of wealth ready to our hand. We have never seen the beginning of exhaustion in any of the precious substances necessary to happy and prosperous lives. Nature has never threatened mankind with rationed supplies. Nothing that the impudence and stupidity of man can devise, can for a moment swerve abounding nature from her free-handed mood. The universe is fool-proof—all but the little circle where man is free to impose his own will.

Turn to the world of men and what a different temper confronts us! Here are groups organized to hinder and interrupt as far as possible the orderly course of supply. Men have taken it upon themselves to decree that the flow of food and fuel and communication shall not be free. Men have set themselves up as gods to turn natural results back upon themselves. In this most prolific world, nations face hunger. In a land richly stored with defense against winter, nations face the peril of cold. If for one moment of illumination the eyes of mankind could be opened to see the figure it cuts in the face of the provision made for it, what a mess organized society would present—what a horrible, irrational mess!

What is lacking? What has caused this state of affairs? While harvests pour their riches upon the world and the work of nature proceeds unhindered by human blunders, what occurs to cheat men of the progressive life that might be theirs?

More men are asking this question today than ever before, and answering it in various ways. Some of the answers are as artificial as the condition they seek to explain. Of course, the system under which we live is wrong, but who made it wrong? Of course, the money system is more a device of restraint than of uberation, but who first assented to it? Of course, there is a ruthless profiteering class who control the means of compelling multitudes to be their victims, but who first allowed them to practice their stranglehold on humanity? The answers usually given are themselves in need of an explanation that goes still further back.

NATURE has endowed mankind richly with all material blessings. But Nature did not choose for man, leadership. Everything of which man makes use, everything to which he applies his mental and physical energies, is Nature's product. But man must pick his own way toward the goal of complete understanding of the ways to use these material favors which are at his hand. With all the wealth of the world at hand, there are human beings who hunger, whole nations who suffer cold. The judgment for this condition, for misusing Nature's gifts, is the judgment upon man's failure, man's unsteadiness. Leadership is the thing. The mass of the people have not been able to do for themselves the things that should be done. But the people can effectuate their impulses. Small groups of men still control the world's doings. But the people will control, and control wisely.

It is ultimately futile to blame classes. When all are analyzed all are found to be victims of the same fear. Those whom we call the beneficiaries of the present system are no more emancipated than the others: indeed there are strong indications that the beneficiaries are more deeply enslaved by the wrong than are those whom we call the victims. To know that a system is wrong and to be afraid that it will change to better, is a terrible form of bondage. If we were to dispense pity instead of assessing blame, the result would be very different from what we casually suppose. But if we limit ourselves to blame, then assuredly those are most to blame who form the class called victims. There are no slave-owners save where human beings are capable of being slaves. There are no stock swindles save where human beings are greedy and dishonest enough to be swindled. No evil can flourish without those upon whom it flourishes giving it the opportunity. There are no vultures gathered save where there is carrion.

The great lack, of course, is the social sense among those who have been given the talent to organize life. Perhaps the plain people are most vivid in their joy in the thought of everybody prospering. But most of the organizing, the planning minds of the past have not put themselves out to the service of those who cannot plan for themselves. The helplessness of the people as sheep without a shepherd has aroused more of the wolf instinct of exploitation, than the shepherd spirit of service.

If we took our cue from the bounty and impartiality of nature, we should see that the whole right to direct rests on the ability and the practice of doing for people, in their best interests, what they cannot do for themselves. Any aristocracy, any royalty, any managing mind, any magnetic leadership that has not laid itself out to be a road-builder for the plain people, has met its day of judgment: it has fallen because it has not magnified the high place of Servant.

It is almost heresy to say so, but the experience of mankind seems to indicate that the mass of the people, as such, have not been able to do for themselves what ought to be done. The people have this sacred distinction—they know what is right, their innate faithfulness enables them to fall in with what is right, and their judgment upon a leadership or a system as "not right" is final. It is just there pre-eminently that "the voice of the people is the voice of God." They are custodians of the mass moral instinct by which all things stand or fall. The responsibility is not entirely with the people, for while they are the depository of power, they have not been the depository of leadership: that has been given to individuals: and it is upon individuals gifted to serve the people, but using their gifts to fleece the people, that the judgment falls.

Slowly mankind is learning. Any one 50 years old can see the fruitage of experience in the world. It seems a slow process; with a little more alertness in the common mind, with even a little exercise of primitive intelligence, some of the more bitter details of experience might have been rendered unnecessary. But the fact is what it is.

The world has just witnessed the slaughter of millions, yet the people of France and England and Germany and Russia and Mexico and the United States are just as far apart as they ever were. A small group of men, all of whom could be contained in one moderate-sized room, still hold the fate of nations in their hands. Could that condition exist if the people themselves were ready to take over that task? And does not the fact of their failure to do it, argue their inability to do it? But by the same token, does not their recent bitter experience tell us plainly that they are traveling to the place where they can do it? It is coming, but mankind travels slowly. The best of all is, it travels.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Eternal Eloquence of the Mighty Dead

In Silent, Beautiful Arlington Hovers the Dauntless Spirit of America

By STEPHEN S. POOLE

ACROSS the Potomac, upon the heights, reposes beautiful Arlington—the resting place of America's heroic dead! From the parapet of the dome of the Capitol, westward in a straight line, one sees the imposing Grant Memorial; next, the stately simplicity of the Washington obelisk; farther on, the magnificent Lincoln Memorial and, beyond the river, Arlington. As in no other place in the land, the spirit of a great country unites in Arlington. In the last camp of our martial heroes there is "No North, no South, no East, no West!" Men who fell in the Revolutionary War; patriots of the struggle in 1812; brothers - in - conflict in the war between the States; soldiers of humanity in the war with Spain; and those stalwart sons of liberty who fought on the fields of Flanders — sounding names on the pages of history, and multitudes of the unknown—all rest in the sacred soil of Arlington, as a constant reminder that the tissues and sinews of a great nation have been reunited in the hearts of our people!

Standing in the midst of this white forest of memorial stones, which bear the names of our illustrious dead, one feels what James A. Garfield meant on the occasion of the first Memorial Day, May 30, 1868. As he stood on the portico of the old Arlington mansion, surrounded by 54 little orphan children whose fathers had sacrificed their lives in the war, and these in turn surrounded by such illustrious personages as Grant, Hancock, Howard, Emery, Porter, Babcock and their staffs, he uttered this great truth:

"If silence is ever golden, it must be here beside the graves of 15,000 men whose lives were more significant than speech, and whose death was a poem the music of which can never be sung."

There were 15,000 then: the ranks have since increased until, in last July, there were buried in Arlington 32,964, out of which number 4,220 were of those who died overseas in the late World War. From the Great Lakes to the Gulf of Mexico, from the Atlantic to the Pacific, are found the homes and relatives of those who have found sepulture at Arlington.

The history of Arlington is a most fascinating page in our American chronicle. On October 21, 1669, Sir William Berkeley, governor of Virginia, granted to Robert Howsen 6,000 acres of land in Alexandria County, Virginia, which included all of the present Arlington tract. This grant was in consideration of the services which Howsen rendered the state by bringing a number of settlers into the colony. Howsen soon sold the estate, however, to John Alexander and was paid in colonial money the sum of six hogsheads of tobacco. The Alexander family possessed the property until December 25, 1778, when Gerald Alexander sold the Arlington portion, of approximately 1,100 acres, to John Parke Custis, who paid for it in Virginia currency the sum of £11,000. It remained in the possession of the Custis family until taken over by the United States Government during the early days of the Civil War.

The first member of the Custis family to occupy Arlington was George Washington Parke Custis, the adopted step-grandson of George Washington. Upon the death of his grandmother, Martha Washington, in 1802, he moved from Mount Vernon to Arlington and began the erection of the splendid old mansion that stands upon the heights. It was modeled after either the Temple of Theseus at Athens or the Temple of Paestum near Naples, and was completed in 1803. He married a descendant of the Randolphs of Virginia, Mary Lee Fitzhugh, and lived a beautiful life of a real Virginia gentleman. He was famed for his hospitality and his spacious home was often filled with guests. The patriotic influence of Washington, who had reared him, was manifest throughout his life. Upon their death, Custis and his wife were buried upon the estate in the grove near the mansion.

Sarcophagus erected over tomb of 2,111 unknown soldiers who fell all the way from Bull Run to the Rappahannock.

Shaft erected to General Joseph Wheeler, with Sheridan monument in the background.

At right—Confederate Memorial erected in center of Jackson Circle, the Confederate section of Arlington Cemetery.

The Arlington estate then passed on to the only child of Mr. Custis, Mrs. Robert E. Lee, wife of the illustrious general of the Confederacy, and for 30 years they made it their home. An interesting story is told of the marriage of General Lee. The drawing room at Arlington was the scene of the celebration. Lee had just been graduated from West Point, and six of his young friends, lieutenants in the army, were the groomsmen. The ceremony was performed by Bishop Meade, of the Episcopal Church. It is said that the Reverend Mr. Meade was late in arriving for the ceremony, due to a heavy rain storm, which had thoroughly drenched him. The bridal party waited while he hastily sought for a dry change of clothing. He was given a suit of clothes belonging to Mr. Custis, the master of the house, who was short and stout. The parson, however, was a tall and slender man, and when dressed in the clothes of Mr. Custis he presented far from an elegant appearance. Feasting and dancing, in which the slaves joyfully participated, followed the ceremony.

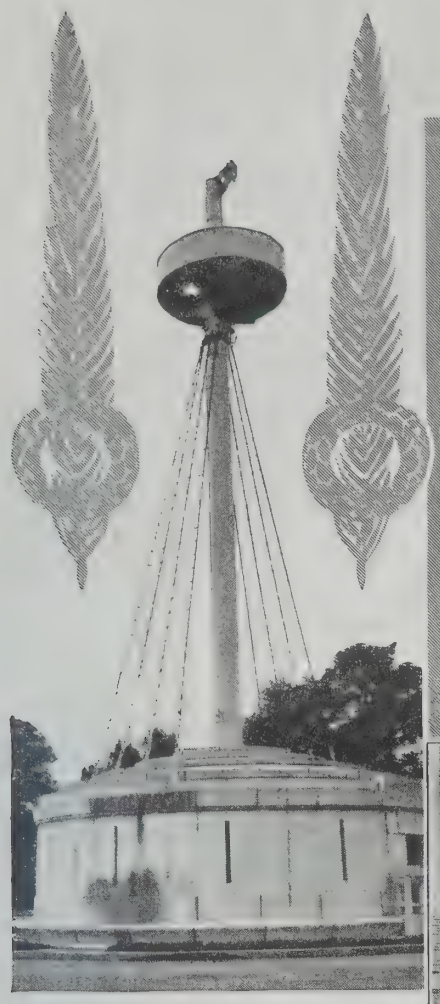
The story of how the property came into the possession of the government is told in these few official words:

"By an executive order by the President of the United States dated January 6, 1864, the entire tract of 1,100 acres, more or less, was 'selected for government use for war, military, charitable, and educational purposes,' under the provisions of the Acts of Congress of June 7, 1862, and February 6, 1863. By the same order it was directed that the property be sold to meet the payment of $92.07, direct taxes due thereon. This was done January 11, 1864, and the property was bid in for the United States for the sum of $26,800. Mrs. Lee having died in 1873, legal proceedings contesting the legality of the tax sale were instituted by George Washington Custis Lee, as heir under the will of his grandfather (the property having gone to his mother for her life, and then to him in fee), George Washington Parke Custis. The cause was heard in the United States Circuit Court for the Eastern District of Virginia, and verdict rendered in his favor, which, upon appeal, was affirmed by the decision of the Supreme Court of the United States, December 4, 1882.

"Congress, by Act of March 3, 1883, appropriated the sum of $150,000 for the purchase of this property and on March 31, 1883, George Washington Custis Lee conveyed to the United States by deed the title to the property in question for the sum appropriated."

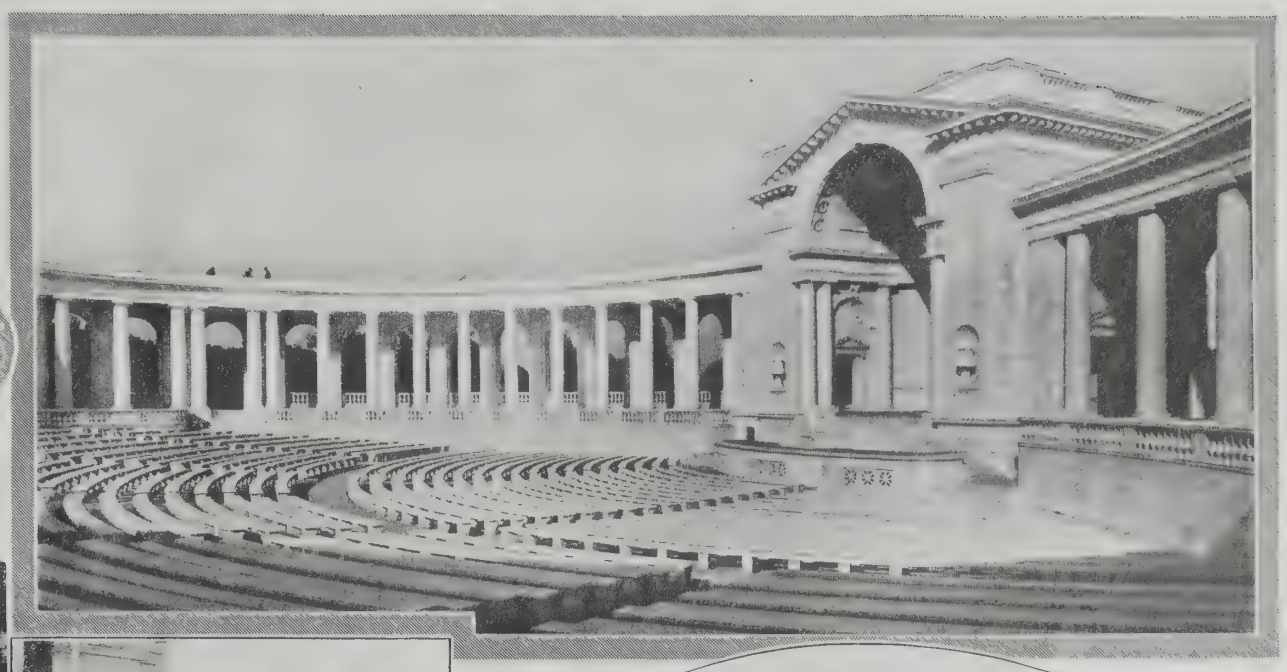
How did Arlington come to be selected as the burial grounds for the nation's dead?

A chain of events and circumstances brought about the selection, the first of which was probably the recognition by General Scott of the strategic importance of Arlington Heights in the defense of Washington. Orders were issued on May 3, 1861, to seize and fortify Arlington Heights. The order was fulfilled May 24, when the advance into Virginia was begun.



Arlington next became a point of interest after the defeat of the Union forces at Bull Run and their precipitate retreat upon Washington. The fleeing army reached Arlington and there entrenched upon the heights. On July 23, 1861, President Lincoln went across the river to encourage the troops. Arlington was made an armed camp. A chain of forts was erected, one of which, Fort McPherson, still remains within the boundaries of the cemetery. The Lee mansion became the officers' headquarters, and during the whole of the war Arlington remained an armed camp and a hospital base.

The war wore on and many bloody battles were fought. Camps and hospitals sprang up all around Washington and the dead and dying mounted into the thousands. The burial ground at the Soldiers' Home was selected as the appropriate and logical place for their interment. However, by 1864 there was little space left there, and deaths were increasing rapidly. Army officers made a careful examination of all the eligible sites near Washington and decided that Arlington was the most desirable.



General Montgomery C. Meigs, quartermaster-gen-

An Arlington funeral for a World War veteran. Funerals such as these were held about once a week, while the bodies were being brought home.

"Remembering the Maine" memorial to those who lost their lives when the battleship was blown up. It is surmounted by one of the masts of the ship.

Tomb of the Unknown Soldier of the World War, to the east of the amphitheater.

The view above is of the Arlington Amphitheater where the great memorial exercises are held. In the oval is shown the burial place of L'Enfant. General Sheridan is buried at one side of the flagpole, Admiral Porter is buried an equal distance away at the other side.

eral of the Army, realized that something had to be done, so he assumed the responsibility for the first interments at Arlington. The story is told that it happened this way: On May 13, 1864, General Meigs was accompanied by President Lincoln in a drive through Arlington when they came upon a squad of soldiers carrying some dead bodies on stretchers to another part of the grounds, there to await transfer to the burial grounds at the Soldiers' Home. He stopped them and inquired as to how many men were awaiting burial. The reply was that there was a dozen. He commanded them to set down the stretchers. He turned to a commissioned officer and ordered him to have a burial squad brought out "and see that all the bodies at Arlington are buried on the place at once." The order was promptly carried out.

The same authority states that the first body to be interred was that of L. Reinhardt, a Confederate prisoner of war, of the Twenty-Third North Carolina Regiment. His body was subsequently removed.

All of Arlington, with its gentle slopes of green, is a place of beauty. Great oaks of forest growth stand everywhere as silent sentinels over the dead. There are, however, spots of particular interest.

Just to the right of the mansion is the beautiful flower garden, and in the center of this garden is the Temple of Fame. The stone pillars which support the temple were taken from the Patent Office after that building's destruction by fire in 1877. Just to the west of the Temple of Fame is the tomb of the Unknown Soldiers whose remains were gathered from the battlefields of Bull Run and on the route to the Rappahannock. This tomb was constructed by digging a circular pit about 20 feet deep and 20 feet in diameter, which was lined with cement and divided into compartments. The fragments of all the bodies were then placed and covered up. A large, but simple, granite sarcophagus was mounted over the pit. It bears these words:

Beneath this Stone Repose the Bones of Two Thousand One Hundred and Eleven Unknown Soldiers Gathered After the War from the Fields of Bull Run and the Route to the Rappahannock.
Their Remains could not be Identified, but their Names and Deaths are Recorded in the Archives of their Country; and its Grateful Citizens Honor them as of their Noble Army of Martyrs.
May they Rest in Peace!
September, A. D. 1866.

There are only three vaults in the entire cemetery, those of Dewey, Miles and O'Sullivan. The Dewey Mausoleum was built by Mrs. Dewey after the death of the Admiral. While it was being built his remains rested in the receiving vault built as a memorial to the heroes who lost their lives on the battleship *Maine*. The Dewey Mausoleum contains two crypts, in one of which the body of the Admiral is placed, and the other is intended for Mrs. Dewey.

The receiving vault, erected in memory of the men who lost their lives in Havana Harbor when the *Maine* was blown up, is built of marble in the shape of a turret. Mounted upon it is one of the masts of the old *Maine*, and the names of the heroes are engraved around its walls. When the *Maine* was finally raised from her berth of mud, the mast was brought to Washington and thus erected as a token of remembrance.

Another point of interest is that portion of the cemetery known as "The Field of the Dead." Jackson Circle, the Confederate section, lies over on the western side of the cemetery, next to Fort Meyer. In it are buried the bodies of Confederate soldiers, most of whom died in Federal prisons situated in the environs of Washington. There has been erected therein one of the most imposing of all the monuments in Arlington. It was designed by the artist, Moses Ezekiel, who based his design on the idea conveyed in that scripture in Isaiah which says: "They have beat their swords into plowshares and their spears into pruning hooks." The artist died in Rome, and his body was brought back to America and laid to rest at the east side of his masterpiece—the Confederate Memorial. On the north side of the Memorial is found this touching inscription:

"Not for fame or reward:
Not for place or rank:
Not lured by ambition,
Or goaded by necessity;
But in simple
Obedience to duty,
As they understood it,
These men suffered all,
Sacrificed all,
Dared all—and died."

As you stand on these slopes, memorial stones in every direction inform you of the presence of the great soldiers of our history. Near by is the tall shaft to the memory of General Joseph Wheeler. To the right is the simple monument to General Phil. Sheridan.

Just in front of the mansion, in the center, near the flagpole, are buried the remains of L'Enfant—the French surveyor and friend of Washington who designed the "magnificent distances" of the city of Washington—and whose plans are preserved in the growth of the city—adorning the National Capitol in artistic beauty. Near by is the resting place of Admiral David Dixon Porter.

The memorial amphitheater, a vast marble structure of indescribable grace and dignity, is now the dominating creation at Arlington. Last Armistice Day was the occasion for its first use in a large way. A chapel is built beneath the structure, and has been used as a receiving room for the bodies of the over-sea soldiers while they were awaiting burial. These burials were held once a week, usually on Thursdays. At the east side of the amphitheater is buried the Unknown Soldier.

Leaving the bustle and politics and intrigue, the enthroned greed and selfishness, which honeycombs Washington today, the visitor who makes his way to the slopes of Arlington finds again his contact with the Spirit of the Nation. A nation grows great, not by men who fatten off its privileges and power, but by citizens who live, and who, if necessary, will die for the invisible glory of the American Destiny.

Rushing Headlong Into Bond Issues

TEN years ago Michigan was without public debt. This was recently acknowledged by Representative George Lord, of Detroit. Today the interest on the public debt of Michigan is nearly equal to the total cost of government in Michigan 20 years ago. It is self-evident that the voters of Michigan have adopted a policy of contracting public debts that is contrariwise to that of the voters of the preceding generation. Mr. Lord is quoted as stating the essential features of this new policy with regard to bonding the commonwealth. "It's a favorite plan," he says, "to issue bonds to keep the tax rate down."

It is the favorite plan of the office seekers. The voters have been found pliant to the extreme, under the persuasive rhetoric and oratory of the "public servants" who are responsible for Michigan's debts. "I sometimes think," Mr. Lord says, "we have gone wild in Michigan about bond issues." This does not mean that Mr. Lord is in favor of putting an end to the bond issues. "Many bond issues are necessary and proper," he contends.

What troubles the representative, who is at present chairman of the committee that is studying the subject of taxation, is the fact that taxes have increased 156 per cent in Michigan in five years. In other words, the day of reckoning with the voters is at hand. At least promise of the day looms large on the horizon. "There must be money some time from taxes," Mr. Lord even warns, "to retire all these bonds."

But the upshot of the matter is, that the taxes are now running out of bounds, because the drag of interest-payments is telling heavily upon the people long before the job of retiring the bonds is tackled. City taxes, Mr. Lord himself finds, and acknowledges publicly (that the figures may go before the commonwealth), have increased quite 300 per cent in 10 years—this since the adoption, 10 years ago, of the plan "to issue bonds to keep the tax rate down!"

Under the circumstances, Michigan gives signs of casting grave thought on the play of interest upon the mounting tax rates. When Mr. Lord, after 30 years in political service, points the issue as follows, the people are almost ready to take things into their own hands. Mr. Lord says:

"You can't have economy without efficient service and the average man is too busy to go to the polls primary day. And the very men and women who do not go to the polls are the ones that howl about high taxes."

The fact that the "howling" has begun, however, and with reason, is a sonorous word-picture of Michigan's dawning enlightenment.

Small-town Politics of Yesterday and Today

Grafting Largely Gone and Service Is Attempted by Those Seeking Office; The Saloon, the Gambler, Patronage, Vote-Buying, Superseded by Efficiency

By an Observer

SMALL-TOWN politics is personal politics. There the candidate is known for his true worth. His private life sometimes has more to do with his success in seeking public favor than his ability to hold the office. It is practically impossible for a man with a stain on his private career to be elected to any position of trust; fortunately few attempt it.

Small-town politics is changing—and for the better. The politician of today may be the same man as 10, 15 or 20 years ago but he is a different politician and he has adopted new tactics to keep pace with the changing sentiment of his clientele and with the new army of women voters.

A dozen years ago the campaign in the small town revolved about the saloon. It was the hub of the wheel and every candidate relied upon the so-called saloon vote to win for him the nomination, if there was a primary, and the election. The church vote, or reform vote as it was sometimes called, was all but ignored. The candidate visited every saloon in his territory several times during the progress of the campaign and, each time, every one got free beer and free cigars. And if a voter had a party at his home all he had to do was to notify a candidate and he would have the brewery send down a keg, free of charge.

But those days have gone and with their passing the candidate takes on a new coat. He will go before the brotherhoods and organizations of the different churches and appeal for their support. He will appear before the women's city club or other organization and before the different community centers and improvement associations and tell them what he will do or attempt to do if elected. He invites questions and makes an honest effort to answer them. He promises as much as did the candidate of years ago, but unlike the old-time nominee, he attempts to keep his promises.

When Factions Warred

A MUNICIPAL election or campaign, in which only the mayor and other officials are to be chosen, is of far greater moment in the lives of the people of the small town than the state or national election. What these officials do affects them directly. Their property values, tax rate, and to a certain extent the public morals depend upon the local officials.

Factional wars play no inconsiderable part in the politics of a small town. This is especially true where one party has an overwhelming majority and where there is a constant fight for jobs.

In a small town in Ohio, one party had, a number of years ago, so much preponderancy in the vote that the opposition would not nominate for a local election. This caused the major party to split into two factions and the result in the elections has not always been happy.

For instance, some 15 years ago, there was a fight on for city council. One faction, at the general election, obtained a majority of one. All seemed well until the new council was to take office, when the bomb fell. The rival faction had, in some way, obtained information that one of the councilmen, a merchant, had sold something to the value of $2 to the city. The city paid the bill. It is against the law in that state for a city official to sell anything to the city. On the night of organization, the stage was set and a resolution to oust the councilman was introduced. The decisive vote was up to the vice-mayor and he favored the resolution. The case reached the courts and it was a year before there was a decision without an appeal.

The result was that municipal activities were curtailed and only necessary business transacted. The people suffered because one faction sought to control the purse strings of the town and a few jobs. There may have been a few contracts involved but this did not come out at any of the hearings.

In a municipal campaign a year ago leaders of one party were gathered together in a small room discussing the two mayoral candidates. In the group were a judge, a financier and one or two professional politicians. After reaching a decision they sent for the candidate they had decided to support.

Defying the "Pap" Custom

WHEN he arrived he greeted all of the men pleasantly; he knew them and they knew him. The chairman told him of the decision of the organization, and he replied that he would be glad to have its support.

"Of course," said the chairman, "we will expect that you will permit us to name all appointees."

"Of course," answered the candidate, "I will not let you do any such thing."

There was considerable confusion among the leaders. They had always been permitted to make appointments for their successful candidates and they could hardly believe that the young man to whom they were offering their aid would refuse them this privilege. But he stood firm and told them that he would listen to their recommendations as he would listen to the recommendations of any other group of men.

He was a strong candidate and eventually was voted the support of the organization by the membership and not by its leaders. He knew the value of the organization and knew that he could hardly hope to win without its active help but he was not ready to mortgage his administration to them.

Twenty years ago, a candidate had to beg for the support of the organization and was tormented to torture for jobs and favors if elected. The job craze, however, hasn't abated much for there are always many eager to attach themselves to the city pay roll.

Each faction or party in the campaigns of yesterday had tremendous campaign funds. These were obtained in devious ways. School teachers would give a certain percentage of their salaries to help elect men as members of the board of education, an office that paid no salary at all. City employes were required to contribute, candidates gave liberally to the organization backing them, besides spending large sums individually. Many a local scandal has developed from these campaign funds. Many a candidate has faced bankruptcy after the election. He had expected victory (they all do) and with victory recuperation of his finances. With defeat came loss of prestige and a hard time of it. More than one candidate has charged that he contributed large sums to the "gang" and that at the last moment he had been "thrown" in a certain deal and his money used against him at the polls.

The Day of the Paid Voter

SAMPLE ballots would be marked and distributed by the workers. The usual procedure for this on election day was for the worker to give the voter a marked ballot, watch him go to the polls and when he came out hand him two or three dollars. Sometimes the voter would demand his pay before going to the polls. This was invariably the case with "floaters" or men brought in from other cities especially for the election. They would be herded in certain precincts. They would register at three or four precincts and cast as many votes during the day. Buying votes was common practice in those days; today one seldom hears of it in the small town.

State laws now require that candidates and political organizations file expense accounts. It is even against the law to give away a cigar. But campaign funds are raised in much the same way. There is no levy made against school teachers because the schools have in many states been taken out of politics. The members are elected on a non-partisan ballot.

Candidates contribute to the support of the organization and make individual expenditures. They are limited in this but they do not always keep within the limit and there is no way to check them up, provided any one had the desire to do so.

Prior to an election now workers take a house-to-house poll of each precinct and make every effort to get out a full vote, provided, of course, they believe the voter will support their candidate. There are some cases, too, where if a voter is required to lose time from his work to get to the polls he will be reimbursed. This is an exception, and the "gangster" who would offer outright to buy the vote of a resident of a small town would likely find a fight on his hands. So they don't try it. They try argument instead.

Advertising vs. the Saloon

THE candidate and the politician seek today also to reach the people through advertising, mostly in newspapers. For weeks prior to the election, columns upon columns are devoted to the praise of the "ticket." This is proving of far more value to the candidate than the time and money spent in the saloon.

Recently a candidate at a local election was discussing the campaign of today with a candidate of 15 years ago.

"Practically every cent that I spent went into newspaper advertising," he said. "The policies for which I stood were not very well known. The fact that I stood second in the count and only a few votes behind the winner who had the support of the 'organization' proves to me the worth of printer's ink when properly used."

The old-time candidate agreed with him.

"But in those days," he answered, "we visited the saloon and thought we didn't have a chance unless we got the so-called saloon vote. I spent enough in one campaign to pay the mortgage on my home and yet I lost. After all these years I have come to the conclusion that the saloon vote was not worth the effort put forth to get it."

Politicians of the olden days in the small town built their organization on promise. The politician of today is trying to strengthen his organization on performance.

About two years ago there was named as head of an important department in a certain small town a professional politician. He had held other appointive offices and had never made much of an impression.

The official making the appointment was condemned from all sources. Even members of his own party believed that it was a poor political move, while members of the opposition seized upon it as the great opportunity for the following election, a few months away. They admitted that the politician was shrewd but they did not believe that he was industrious or had the necessary business experience to conduct the department.

Within a month all criticism had stopped. The politician was too good a politician for all of them. He got on the job at or before seven a. m. and he worked long hours. Complaints of taxpayers received prompt attention. Petitions for improvements were given consideration at once. Every one was treated courteously. His department became a department of service in the true sense of the word and while he has played politics he has played it in its broader meaning.

He probably knows that he could not be elected to an office; but he also knows that he can be kept in office by appointment if his organization backs the right candidates and meets the new conditions.

He typifies the new idea of the modern small-town politician. He plays politics, of course, and when it comes to filling positions his political friends are favored and if he can force a few jobs for them he will do so, but when it comes to real public service, he knows no political distinction.

Graft, jobs, and an unusual personality were the strong features of the small-town politician of 15 years ago.

Their organization was built upon them. They collected funds without regard to their source and expended them with due consideration to the effect it would have upon the election. Many kept considerable of the money turned in and are now quite wealthy.

But they were all generous and kind-hearted—if and when it paid them to be. If a politician heard that a family was in destitute circumstances, he would send out a load of coal or some groceries or clothing. Then he would see that the news was properly disseminated throughout the city. It was good advertising. It helped him politically.

When his candidates were elected to office, he was happy in the award of huge contracts and the expenditures of large sums of money. It helped the city, of course, but the taxpayer probably was paying $2 for $1 worth of work. His successor delights to spend money, but the taxpayer is getting more for the dollar he pays into the treasury.

The Bootleg Disease

SMALL towns must not be held up as paragons of virtue—not yet. The bootleg germ permeates it as it does the great city. Protection is paid for, and thousands upon thousands of dollars are being collected by enforcement officials monthly. There is plenty of rumor in every small town but there is little actual evidence. People generally have taken the attitude that all dry officers are crooked. Some are but most of them are straight.

One, just a few weeks ago, was called to the office of a very prominent lawyer. He was informed that a certain sum was being collected from the bootleggers every week. He himself kept a third. Another third was offered to the officer. He, the lawyer, took it for granted that the dry man was crooked and when the offer was spurned, he found himself in an embarrassing position. But there was no evidence of an attempt to bribe and he was safe. The offer would have netted the prohibition officer close to $10,000 a year had it been accepted and it was only for affording protection to bootleggers in one small town! If this holds good in other small towns, one can easily figure that it would not require long for a crooked officer to become wealthy.

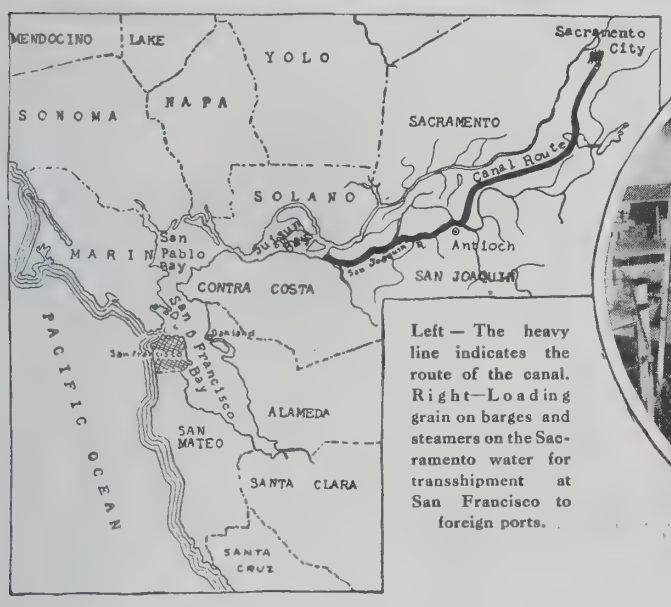
This evil, however, is gradually being eliminated in small-town police departments. It was no uncommon report a year or two ago of policemen being in league with Volstead violators. It was for months taken as a matter of course. Police even were sent to guard bootleg stores and the police patrol was often used to deliver whisky to bootleggers' customers. Policemen, many of them, began to sport big diamonds and drive high-priced automobiles. As a result all policemen were condemned.

Purifying Police Departments

CONDITIONS reached a climax when the orgy of crime swept over the country and small towns were the scenes of daring holdups and raids. Policemen under suspicion gradually were dropped from the rolls, and greater care was used in appointing their successors.

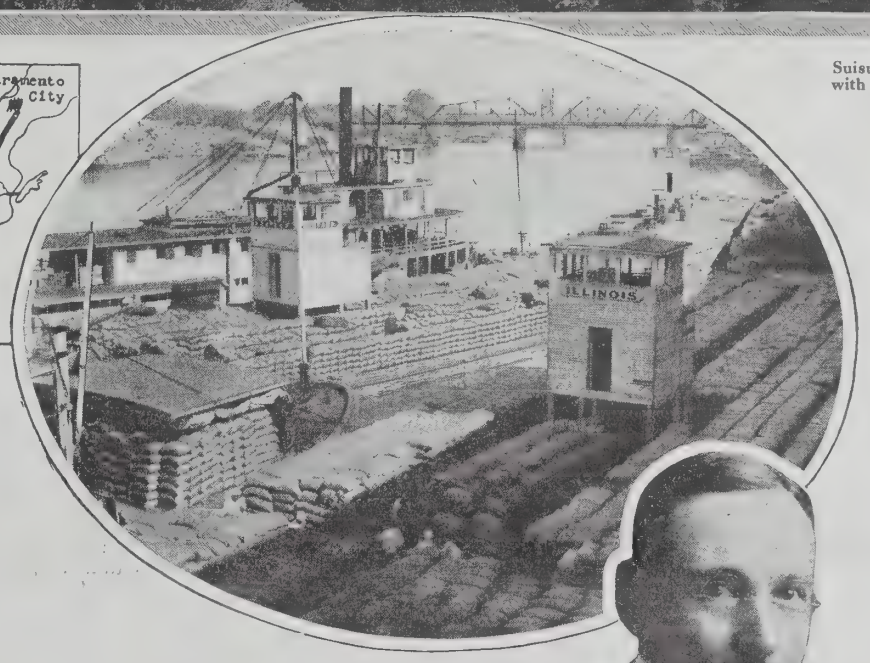
This is attributed largely to the new view of the politician, who has an eye on the women's vote. He knows that he cannot get this vote unless faulty conditions are corrected. He does not seek a blue-law town, but neither does he seek the ire of a public which wields a powerful influence and whose chief interest is in a "clean" town, with the proper safeguards for their sons and daughters.

Small-town politics always has been and always will be interesting and fascinating. Graft in the award of public contracts practically has been eliminated as a source of revenue for the politician; bribery and paid protection for illegal activities soon will pass, and service, without fear or favor, is near for the long-suffering and over-burdened taxpayer.



Trust the small-town politician to know his people; trust him to know that it's time to call a halt on vague and meaningless promises and start the performance; trust him, too, to know that it's time to stop unnecessary expenditures; and trust him soon to learn that the women will not vote men in office who wink their eye at resorts, gambling and violation of the protective codes.

Capital of California to Be a Deep-Sea Port



Public Construction, Ownership and Operation of Canal Planned

Suisun Bay, an arm of San Francisco Bay, with very deep water, into which the ship canal from Sacramento would run.

Left — The heavy line indicates the route of the canal. Right—Loading grain on barges and steamers on the Sacramento water for transshipment at San Francisco to foreign ports.

HERMAN DAVIS,
Chairman of the Ship Canal Committee of the Sacramento Chamber of Commerce, the prime mover in the project for the canal.

By HARRY H. DUNN

SACRAMENTO, capital of California, located on the Sacramento River, about 90 miles from San Francisco, has completed surveys and estimates for the conversion of its river port into a deep-sea port, to which steamers of draft up to 27 feet can come for cargoes directly through the Golden Gate. Sacramento will construct a canal which will give direct connection, by means of 35 miles of new channel, with the deep salt-water of Suisun, San Pablo and San Francisco bays.

Surveys and estimates made under direction of Herman Davis, chairman of the Ship Canal Committee of the Sacramento Chamber of Commerce, which has the project in hand to present to the Federal Government, show that there are no difficult engineering problems; that water is assured from near-by and connecting rivers and streams; that the silt-bearing sloughs and streams can be cut off, so that dredging will be virtually eliminated, and that the water-borne traffic of the Sacramento Valley—already the largest of any river of similar size in the world—will be practically doubled by the direct shipment of freight to outside markets, made possible by the bringing of deep-water vessels to Sacramento's wharves.

Northern—and, to some extent, Central—California counties, to the number of 29, are giving all support to the project, because it will enable them to get their products into Pacific Coast, South American, Oriental, Atlantic Coast, and even European markets several days ahead of the time required for such shipments at present, by eliminating transshipment from barges and river steamers to ocean-going vessels at San Francisco. The expense of such transshipment also will be removed, and it is believed that this cutting down of transportation costs will be sufficient to pay for the canal in 10 years.

The new Sacramento Ship Canal will be constructed with public funds, except for such aid, if any, as given by the Federal Government; will be publicly owned for all time, and publicly operated. The western railroads are interested because it creates a deep-water port 90 miles nearer the sources of the Pacific and Orient-bound traffic. The department dealing with highways is interested in the canal, because it will make Sacramento the natural terminus of any transcontinental highway at this latitude. The Vancouver-San Diego Highway passes through Sacramento, connecting all points of importance north and south on the Pacific Coast, and the junction point of these roads becomes the center of national highway interest. The advantages of the proposed port for embarkation point of ocean-going transports in the service of the War and Navy Departments also is being emphasized in applying to the Federal Government for aid.

A report made by Major Paul M. Norboe, of the state engineering department, describes the course of the ship canal as follows:

"A consideration of topographical conditions leads to the conclusion that a ship canal should start at the southern part of Sacramento City, follow substantially the line of the city drainage canal to Snodgrass Slough, thence down the latter channel to a point near its junction with Mokelumne River; thence it should cut through into Georgiana Slough, which stream would be utilized by shortening bends and otherwise straightening it until near its junction with the Mokelumne. At this point the natural channel should be abandoned, and a straight cut made south to a junction with the San Joaquin River."

This is virtually the course decided upon by the city of Sacramento, and is clearly shown on the accompanying map. The low water depth in the San Joaquin River at the point of entry of the canal is 31 feet, and all the way down to Antioch this depth is maintained, though much of the water is 60 to 80 feet deep. The depth at Antioch—which will become an important port on the canal—is 54 feet, but a short distance below this place, the channel divides, and the smaller channels shoal to an average of about 18 feet, though the southernmost branch, called New York Channel, varies from nine to 48 feet of water, the greater part of its length being more than the required 30 feet of depth. The other two branches bear to the northwest and unite with the Sacramento near Collinsville. Both will be important "feeders" to the canal at Antioch, as they are now to the river traffic on the San Joaquin.

The length of the Sacramento Ship Canal, starting at the corporate limits of Sacramento, is to be 35 miles, divided approximately as follows:

Section 1—Sacramento to Snodgrass Slough	17 miles.
Section 2—In Snodgrass Slough	5 miles.
Section 3—Cut to Georgiana Slough	2 miles.
Section 4—In Georgiana Slough	9 miles.
Section 5—Cut to San Joaquin River	2 miles.
Total, Sacramento to San Joaquin River,	35 miles.

The great majority of the ports of the world have less than 30 feet of water at their wharves at mean low tide, less at low tide, and more at high tide, but it is believed by maritime authorities and experts that the port which can offer a minimum water level of 30 feet can handle traffic for virtually all ports and on practically all steamship lines for the next 25 years.

Within a 50-mile circle around Sacramento are produced rather more than 80 per cent of the deciduous fruits grown in California, and approximately 85 per cent of these fruits are sold in markets outside California.

Comparative Sizes of Some of the World's Great Canals

Canal	Length miles	Width at bottom feet	Width at Surface feet	Depth feet
Suez	100	108	254	36
Manchester	35½	104	220	28
North Sea	60	164	394	32
Kaiser Wilhelm	61	144	361	35
Welland	22	150	275	25
Sacramento	35	150	350	30

Swindlers Bait Traps for Small Investors

Legitimate Investment Leaves Wage Earner Prey to the Sharkers; Rich Pickings Left for Crook After Business Canvasses the Wealthy

By WILLIAM A. M'GARRY

This is the third of several articles by Mr. M'Garry, in which will be related some of the many forms of crookedness in which the public suffers.

WHEN bankers and brokers in the legitimate fields of investment are led into discussion of the legalized stock swindles that take millions of dollars every year from wage earners, clerks, merchants and professional men, they are fond of explaining the whole phenomenon by quoting P. T. Barnum's famous saying, "There's one born every minute." Doubtless it is true that the proportion of "suckers" in the population is tremendous, and certainly it is not confined to any one class. The rate is just as high among millionaires and bank presidents, executives and engineers, as it is among boilermakers and plumbers. Therefore, it becomes obvious that if other classes are swindled to a less degree than wage earners, there must be some other reason than the cynically superficial one given by financial experts.

A great philosopher with a deep knowledge of human nature once remarked that "man is eternally gullible." He did not refer to workingmen alone. Other writers and thinkers have gone beyond that to assert, indirectly at least, that man is inert until he finds Opportunity. Biographies of great men in all nations are filled with references to repeated failures made before the turning point was reached. The man with the largest number of failures in his record might be looked on as an outstanding example of ambition in that he was constantly trying, instead of playing always safe. Relatively few men achieve success by simply sitting down and waiting for it. They must take chances.

Rich Alone Protected

ONE of the advantages of civilization is the supposed protection it gives against loss from taking chances. In some phases of life that protection is quite complete. It is no longer necessary for man to risk his life in combat with other men and with wild animals to obtain food. He has reduced to a minimum the dangers of travel on the water. Regulation has gone far toward assuring the worker steady employment. But in the field of finance everything that has been done in the way of setting up safeguards to protect the investor has been done only for those capable of investing from $1,000 up at one time. In other words, it has been done, generally speaking, only for that class of Americans whose incomes are $5,000 a year and up. Many members of that class have been swindled by bucket shops and dishonest promoters, but the proportion of the total is not nearly so large as the proportion of wage earners cheated out of their savings, and the victims suffer less by reason of their losses than does the workingman who loses a few hundred dollars.

The reason is quite plain, once stated, but even the financial experts rarely think of it. One of America's leading authorities on stock swindles, Einar Barfod, formerly a newspaper reporter and now head of the Investors' Protective Service, Incorporated—which is not a stock-selling organization—has stated that reason. A little summary of Barfod's remarkable career may be of interest. In 20 years devoted to running down fake promoters he has yet to fail to prove his case. One of his first triumphs was over the old International Lumber and Development Company, a six million dollar swindle. He sent the promoters to jail. To do it he made an exposure that resulted in a house cleaning in the postal inspection service. Certain officials of that service refused to act against the promoters. He broke up also the Story Cotton Swindle, sending a half-dozen men to jail.

The Investment Classes

BARFOD'S headquarters have been in Philadelphia, but the range of his operations has been the country. If you happen to be approached by a man selling stock in a patent fish-catching machine in Bangor, Maine, in Tucson, on the Pacific Coast or even in Alaska, ask him if he knows Einar Barfod and if he is a professional of any experience his answer will be in the affirmative, provided he does not lie. Crooks that have never seen the nemesis of dishonest promoters know him by reputation. The wisest of the swindlers quit cold when they learn he is on the trail of one of their promotions, for Barfod's record shows that he never quits. I have known him personally for ten years, and during half of that period covered the same line of work. From contact with stock swindlers, I know that Barfod could be worth millions if he had been willing to drop some of the cases he has prosecuted, but he is relatively a poor man.

Here, then, is what Barfod says of the wholesale swindling of wage earners to whom he refers as "little investors":

"To say that the American public wants to be swindled and is the most gullible public in the world is the most popular explanation for the stock swindles which take hundreds of millions from little American investors every year. But this popular explanation is not true and readily is dissipated by an examination of a few statistics bearing on American investments. The figures used in these statistics are those of normal America before the war.

"The total incomes of all Americans then amounted to fifty-three billion dollars a year. This total was divided into three main groups, as follows:

Incomes over $5,000 a year totaled $7,000,000,000
Less than $5,000 but over $2,000, totaled 6,000,000,000
Less than $2,000 a year, totaled 40,000,000,000

"In general, with due allowance for exceptions, the last forty billion dollar group with annual incomes of less than $2,000 each is not an investment group, but a savings fund group. The second group is our middle class of small merchants and professional men and should be a strong factor in the legitimate investment field. But as a group, this middle class is no factor whatever in American investments. There is a reason for this.

"Legitimate American investments are sold on a commission of not more than three per cent. The American salesman of legitimate investment securities, therefore, aims to sell not less than one thousand dollars' worth of securities a day. In order to do this, he cultivates the acquaintanceship and trade of people with incomes of more than five thousand a year. He joins clubs and societies which put him in touch with these desirable prospects and can manage generally to put his proposition before five or six of them a day. He has no time whatever for the smaller investors because to sell them one thousand dollars' worth of securities a day, he would have to solicit fifteen or twenty of them, a physical impossibility.

"The legitimate investment field is thus left almost exclusively for the upper seven billion dollar earning class of incomes, more than $5,000 a year each, and for the ordinary investment purposes of the country, this one class has been sufficient."

Bear in mind that Mr. Barfod refers in the above only to legitimate investments. The type of security offer to the type of buyer he describes is a safe, sound investment 99 times out of 100. Thus the man who has money to invest and could afford to lose is protected in that the opportunities brought to him are virtually all good ones in which he cannot lose more than a small proportion of the funds he may invest. There is rarely any danger that he will lose the entire investment.

Where Big Commissions Lie

"THE fraudulent stock salesman, however, does not work on a three per cent commission," says Barfod. "Illegitimate securities are sold on commissions running as high as 60 per cent. When the fraudulent stock salesman, therefore, sells one hundred dollars' worth of his securities, his commission is twice as large as that obtained by the legitimate salesman selling one thousand dollars' worth of good securities. The fraudulent stock salesman, therefore, does not have to limit himself to the upper seven billion dollar class of incomes more than five thousand dollars a year. He can well afford to canvass the second or middle class of six billion dollars with incomes between five thousand and two thousand dollars a year.

"That is the real American sucker class, not by choice, not by inclination, not because it is more gullible than investors in other countries, but because it is practically abandoned by the legitimate investment business for the exclusive exploitation of the frauds. In no other country is there an upper class with the enormous annual income of seven billion dollars or with an income sufficient to absorb all ordinary investment securities. In other countries the investment bankers have always been obliged to reach into the lower classes for the smaller investors. We were obliged to do that in this country, too, during the war when the government alone needed $14,000,000,000 a year. We did it then by selling bonds in denominations of $50 and $100 and accepting monthly installments of as little as $5. That is no more than other countries do right along, to lead the little investors into good investments instead of abandoning them to the exploitations of frauds.

Governmental Guides

"IN FRANCE and England, machinery for little investors not only conserves his capital but gives the little investor an interest in the business of the country which makes him part of the solid, substantial, middle class balance. To put a stop to the American stock swindles which mulct the little investors in this country for hundreds of millions of dollars each year, it is not enough to expose and prosecute them. They will continue until some machinery is provided, a mutual investment company or something of the sort, for taking care of the little investors, canvassing them, soliciting them and selling them good securities. That is all that is needed, an active, aggressive competitor for the millions of investment funds that are wasted on frauds every year because nobody but the frauds makes any bid for it."

It will be noted that Mr. Barfod refers only to the second class of wage earners, generally the victims of bucket shops, or of salesmen operating in conjunction with promoters using bucket shops as the main outlets for their fraudulent stocks. What he says, however, applies with even greater force to the wage earner drawing $2,000 a year or less. A glance at the figures he gives of total earnings by the various classes is enough to show where the real wealth of the country lies. More money is earned and spent by wage earners than by all other classes, which include the country's multi-millionaires. It is true that the margin of funds left over after paying living expenses is smaller in the case of the wage earner, but when it is considered that total earnings of that class are three times more than the aggregate earnings of the two other classes, it is evident that the funds available for the house-to-house swindler, the bulk window operator and the ballyhoo crook run into the richest pickings known.

All that is hard on the wage earner. The banker and broker shrug their shoulders and deplore his losses, completely overlooking another factor of vital importance to themselves and to American industry. They say they would like to help if they could, but they cannot quite see their way clear to do it. The fact is that the day is coming when it will be necessary for them to get into active competition with the crooks, not only to get the investments of the wage earner, but to curb the animosity to business which they find in so many places and which is so surprising to them. Here is how Mr. Barfod explains that animosity.

Must Popularize Business

"HERE in America it sounds almost like an attack to say that a government is friendly to business. Unfriendliness to business is popular in America because business has not been popularized. Anybody here may propose confiscation of any private corporation's property without arousing any popular protest. Nobody is directly concerned except that over-solicited, over-invested, upper class of big investors with incomes over five thousand dollars a year. And all the time, the more numerous class of little investors with incomes of from five thousand to two thousand dollars a year is entirely ignored by the legitimate investment houses, exploited by crooks only, given no direct, financial interest in the business securities of the country, and, therefore, constitutes no strong, well-balanced conservative middle class in America as in England and France. And the same is true to an even greater degree of the wage earner drawing less than $2,000 a year."

The problem more and more engages attention of sound business men. One thing that has helped is the movement among various great industries to permit employes to buy stock on installment payments, and under such safeguards as to make it increasingly difficult for the crooked promoters to get that stock away from them. In that connection it may be noted that millions of wage earners who bought Liberty bonds lost them to the thieves. Those that have held out so far are still listed as possible victims in the files of the promoters. When some of the bond issues were selling around $90, crooks were willing to accept them at par in payment for their useless oil, gold mine and invention stocks.

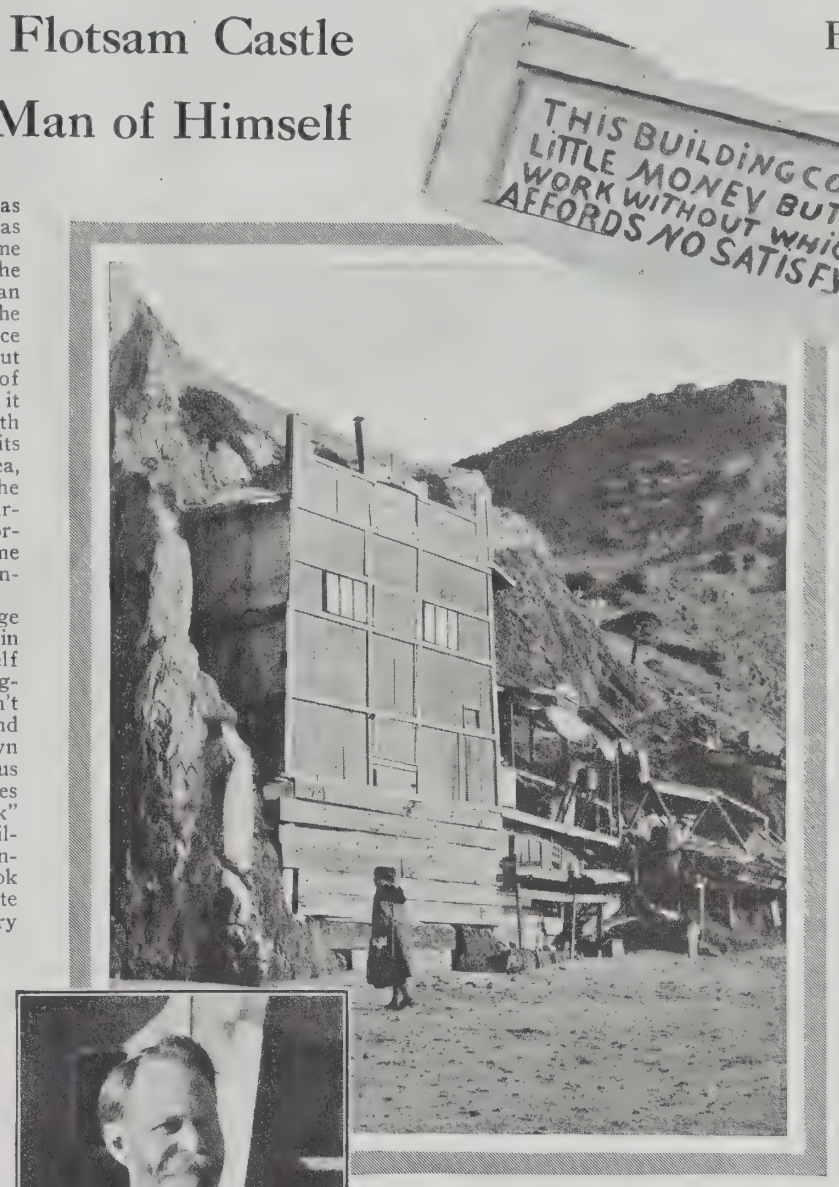
Should Limit Speculation

CERTAIN forms of investment trusts have been suggested, and will be described in the article to follow. Legislatures can help by passing blue-sky laws, but mainly by checking up on their own laws governing the incorporation of new companies, and the operation of corporations chartered in other states. It will not help to perfect home laws so long as the outsiders are permitted to do business under charters giving them wide latitude, such as those issued in the East in Delaware and in the West in Arizona. Delaware's corporation mill will be described in the article following. It constitutes an amazing story of the fortunes to be made in legalized swindling.

One of the things that every wage earner should remember at all times, when he is asked to invest and is told of the fortunes to be made by taking a chance, is that the big investor never risks more than a small part of his income in speculations. A flier of two or three hundred dollars may represent all the savings of a working man. It should be kept in the savings bank, or in some standard bond passed on by the bank officials. Speculation should be avoided. Few wage earners, heads of families, would think of throwing all their earnings into a chance game of dice, on a single throw. But the possibility of winning is considerably greater in such a game than it is in buying stocks based on a phantom hope. If the wage earners of the country can be taught to limit their speculative investments as rich men do, the business of getting the money will be made more difficult for the crooks. The real solution, however, is for industry and finance to take a definite hand in offering protected securities to the small wage earner.

Wreckage on the Seashore Now Reclaimed

A Cast-off Builds Flotsam Castle and Makes New Man of Himself



By JOHN L. VON BLON

THE cost of building, high or low, has no significance to Louis Dart. He has demonstrated that it can be overcome though material men boost prices to the limit. At the edge of the Pacific Ocean above Redondo Beach, near Los Angeles, he has reared himself a towering citadel, thrice reconstructed and enlarged it, and laid out but 20 cents in actual money! Because of the character of its composition he calls it Flotsam Castle and it carries the name with dignity. Everything that entered into its make-up he culled from the booming sea, and the same element cast up not only the exterior trimmings but all the interior furnishings. It afforded Mr. Dart the opportunity to prove the adage, "All things come to him who waits." His evidence is conclusive.

Not only did Mr. Dart acquire a strange but comfortable driftwood domicile but in the course of its assembling he built himself up from a physical wreck to a man so vigorously healthy that he avers he "couldn't be killed with an ax." His health shattered and his savings in doctors' pockets, he lay down to die in the very cove where his amphibious home now is nestled by the rock buttresses of a lofty sand-hill shore. He "came back" and likes to relate this experience to the pilgrims seeking his door. It has been an inspiration to many; and his visitors' book shows that they have come from every state in the Union except South Carolina, every great city of the world, and various remote countries—for through the tourists the fame of the bizarre castle and its philosophical laird was swiftly spread afar. Pie had something to do with it, too, that being the hermit's specialty.

Louis Dart, graduate of an Iowa law college, practiced his profession in Nebraska and the Middle West until he fell ill, lost his voice through weakness, and no longer was able to plead before the bar. Then the doctors had their inning for years, he says. They told him he had Bright's disease and gave him up when his funds were exhausted. He drifted farther west, cooked in mining and construction camps when able, even serving the army in this capacity at Camp Funston, and finally going to work on a great Southern California rancho. There, on the sands near Redondo Beach, came his crisis when unable to toil longer. Hopeless and "broke," barely able to stand, an old Spanish woman looking for clams found him on the beach. Pointing to a little spring that gushes out of the rock she told him to drink plenty and he would get well.

He decided to try this simple treatment, found a shabby tent somewhere, pitched it near the spring, drank often and ate nothing—because he had no food.

LOUIS DART and Flotsam Castle.

He lived a month on spring water and sea air, his system got a housecleaning, and the sickness disappeared. Goaded by a fierce appetite he found strength to climb the bluff, came upon some ripe tomatoes growing wild in a grain field, and physical salvation! He ate his fill, then and many times afterward, and soon was sound from head to feet. That was three years ago, but he's still at the wonderful spring. He determined that it should be his home, and there he built his house. The breakers brought the lumber free for the taking—free as the air-lanes followed by the pelicans winging their way with ponderous dignity as they pass and repass before the structure that soon arose; first as a rather tiny habitation reminiscent of a Sicilian peasant's precipice-hung hut but since expanded into a four-story pile. Lithe, upstanding, muscular and powerful, Mr. Dart labored with prodigious energy from dawn until night, placing even the heaviest timbers alone.

Coastwise vessels pass in numbers about 10 miles out, and many lumber carriers dock at Redondo Beach, but when it came to furnishing the picturesque castle there was dearth of flotsam that would serve the purpose. About this time the 45-foot yacht *Genevieve* of Los Angeles, a fine craft well equipped, was wrecked a few hundred yards offshore from the Dart house, and a wealth of necessaries virtually was tossed into his arms. In the debris—and this appealed to him particularly—was the frame of a small stove from the galley. Piece by piece the various parts rose from the ocean's bed, but a patient wait of nearly two years ensued before an extremely high tide rolled up the last lid, rusty but serviceable. Neptune's "white horses" laid it at his very steps.

Because beach strollers, and there are hundreds, pass the castle, of necessity it soon attracted much interest. The Boy Scouts, always climbing and signaling alongshore, made it their rendezvous. Artists came to paint it. They wanted something to eat. Mr. Dart, being a cook, began to make and serve pies, "for a fellow has to make a living," he remarked. The pies "took." He has baked nearly 8,000, three at a time, in that one little galley stove. Of these he admits he has himself consumed 500 and not only survived but thrived, hence they must be good. He serves them on huge circular tables made of the four ends of two cable spools still bearing the stamps of ports on all the oceans, and which were washed up just when most needed. And so with everything, from paint to window glass, stairs to stools—even canvas for awnings. The 20 cents expended on the castle was for shingle nails, needed in a hurry to roof some exposed portion when rain threatened. The billows brought all the other spikes and nails requisite for solid construction.

Flotsam Castle boasts a comfortable living room on the second floor, where the laird oft sits at his window to enjoy the organ-roll of curving waves and restless tides, watch the sun sink in a cauldron of molten gold or see the sails of a distant boat flash silver in the quivering moonlight. Under this window is a homemade, homely sign that reads: "This building cost but little money but much work, without which life affords no satisfying kick." It is a typical bit of Dart philosophy. His only home companions are a large gray cat, ever ready to unsheath ugly claws, and a smart, friendly guinea pig. A sign introduces these to visitors thus:

"My family—
Outside its appetite—
Is not so very big.
Just a brindle Thomas cat
And a black-nosed guinea pig."

The hermit of Flotsam Castle thinks of many things, as his placards indicate. Conspicuously displayed in the "dining room" is a print of a pretty, laughing mother fondling her babe, and in a corner of the rude frame, in Mr. Dart's bold handwriting, these lines:

"Parenthood is a physical thing;
Motherhood a state of mind.
There are but few mothers these days."

This appealed so forcefully to a prominent California club leader that she expressed the wish that every woman in the world could read it.

"Don't pay someone else to do your thinking," was Louis Dart's advice to a group of his Boy Scout friends. "Do it yourself. You have been provided with a brain. Develop it and you will command all the forces of nature. Don't be a mental clam and close up at every approach. Think! And life for you will be one long, drawn-out joy. Think for yourself and think of the other fellow—not for him."

Fear often has been expressed that Flotsam Castle and its doughty master would sometime be swept out to sea but he is unafraid, and it has withstood the severest buffetings without a tremor. When storms come the water swirls about its foundations and the spray flies over the roof, but it is so substantially set between the rocks and so strongly re-enforced at the base that the ocean cannot well reach behind it. "The sea can't hurt me no matter how far it comes," says Dart. "The waves would simply push me up against the rocks, and there would be no danger of drifting away." Serene and snug he dwells beside the Pacific, believing, like the crippled but splendidly virile poet. Henley,

"I am the master of my fate,
I am the captain of my soul."

Things in the Making
SILK

By FRANK DORRANCE HOPLEY

SILK is the product of a little caterpillar, being the substance of which the cocoon is formed, in which it reposes in its chrysalis state.

The moth of the silkworm is a quiet grayish moth, with no beauty to recommend it, its sole business appearing to be to lay the eggs which are to furnish the next crop of spinners. These eggs are about the size of a grain of mustard seed, and care has to be exerted in hot climates to see that they do not hatch before the time when their natural food is ready for them.

The silkworm in its wild state feeds only on the leaves of the mulberry tree.

In hatching eggs on a large scale, for silk manufacture, they are placed in a room, the temperature of which is gradually raised, until the tenth day, when it reaches 82 degrees. When the eggs turn whitish it is a sign that they are nearly ready to be hatched. Sheets of perforated paper, or pieces of clear muslin are placed over the eggs, and the little worms as they come out of their shells climb through the upper surface of the paper or muslin.

Small twigs of mulberry are placed on the paper, and as the worms climb on to them they are carried away to the rearing house, and other twigs are laid on.

Little artificial hedges of twigs are formed on the shelves on which the worms are fed, and when they are quite ready and have no longer any inclination to eat, they climb among the twigs and seek a convenient place for forming their cocoons.

They first spin thin, loose threads and inside of these they form a hollow ball, firm and elastic, which can be unraveled into one continuous thread, varying in length from 300 to 600 yeards.

The emission of all this silk, which has been secreted in two spiral vessels contained in the stomach of the worm, greatly reduces its size, and when, at the end of three or four days, the cocoon is completed, it rests for a while. Then it changes its last caterpillar skin for the chrysalis form and would, if undisturbed, emerge in about 15 or 20 days, a moth.

To reel the silk a little machine turned by hand is employed, which contains a large reel to form the skein of silk. This is usually about one yard in circumference, with a wheel which guides the thread to and fro in the same manner in which sewing cotton is wound on reels. Attached to this is a small boiler, about eighteen inches long and six inches deep, under which there is a small charcoal fire. Into this boiler the cocoons are thrown when the water is nearly boiling, and after a few minutes their gum is sufficiently softened for the loose filaments to float off.

The reeler takes four or more of these in her hand and twisting them together they adhere by means of the softened gum, and when attached to the reel, are wound off as one thread. By this means their strength is greatly increased. When the thread from one cocoon breaks it is not necessary to tie a knot, the stickiness of the silk being sufficient to unite the ends.

After reeling, the silk is sent to a mill where it is worked.

How the Banks Multiply the Dollar by Twenty

People Finance Agents and Latter Take Peoples' Money From Them; The Public Furnishes Fourteen-fifteenths of All Bank Resources

By FREDERIC C. HOWE

This is the second of three articles by Mr. Howe; the third will appear in an early issue.

IN A previous article we showed how the banker multiplies the dollar by ten through provisions of the banking laws that permit the banker to lend ten times as much money as he keeps on hand as a "legal reserve."

We will now approach banking from another point of view; we will discuss it as a business proposition, much as a promoter might discuss it, who was seeking to interest men in a new banking proposition. We will show, as a promoter might show, that the banker multiplies the dollar that he invests by 20 by the use of other people's money. For the banker gets most of his capital from the people. He gathers in the savings, the wages and the profits of 105,000,000 people and then uses them. For every dollar that the banker invests the people invest $13.90, which he uses as though they were his own.

The following table has been compiled from the report of the Controller of the Currency for the year 1920: (page 251)

Type of Bank	Number of	Capital Stock	Surplus Fund	Other Undivided Profits	All Deposits	All Loans	All Resources
State and private banks	22,109	$1,478,473,000	$1,423,962,000	$429,473,000	$23,664,753,000	$17,171,091,000	$29,667,055,000
National banks	8,030	1,224,166,000	986,384,000	546,788,000	14,018,810,000	14,085,056,000	23,411,253,000
Total	30,139	$2,702,639,000	$2,410,346,000	$976,261,000	$37,683,563,000	$31,256,147,000	$53,079,108,000

Let us see what this table tells us. There is startling information in this group of figures.

(1) The total capital stock of the 30,139 national and state banks of the country amounts to $2,702,639,000. This is the money *invested by the stockholders* in the banking business. It is the same as an investment made in any other business.

(2) The surplus fund appearing in column three amounts to $2,410,346,000. This surplus is made up in two ways. A part of it, but not a very large part, has been paid in by the stockholders at the time of the organization of the bank to create a surplus for organization expenses, for building, fixtures, and so on, so that the bank may start as a strong institution. Should any losses occur, they could be paid out of this surplus and not impair the capital stock of the corporation. The great bulk of the surplus, however, has been accumulated out of earnings. It is profits that were made but not distributed to the shareholders as dividends. In the case of the national banks, the surplus amounts to about 75 per cent of the total capital paid in. This surplus belongs to the stockholders. It could be distributed in dividends if the stockholders so desired.

(3) In the fourth column, other undivided profits appear. They amount to $976,261,000. These, too, are earnings that have not been distributed in dividends. They, too, are owned by the stockholders. They, too, can be paid out in dividends if the stockholders so desire.

People's Share, 37 Billions

HERE, then, we have capital, surplus, and other undivided profits amounting to $6,089,246,000, which is the property of the owners of the banks. Of this sum $3,386,607,000 has been contributed by the people in the form of earnings which are now the property of the stockholders.

(4) We now come to the individual deposits—to "other people's money" placed in the banks as savings, as trust funds, or as commercial deposits. These deposits represent the combined contributions of the entire population. They amount to $37,683,563,000. They are the wages, savings, and currently created wealth of 105,000,000 people. The universality of these deposits is indicated by the fact that in 1920 there were 20,520,177 depositors in the national banks alone. This is approximately one depositor for every five persons. The number of depositors has increased rapidly in recent years. The number has grown by 11,439,374 since 1910. Quite obviously, the average deposits are not large. These deposits are owned by the entire population of the country. Almost every family is represented in the deposits of the national banks alone. The depositors in the state banks, savings banks and trust companies are probably in excess of 20,000,000 more or 40,000,000 in all.

(5) The loans and discounts of the banks amount to $31,256,147,000. This is the money that is out on interest, on promissory notes, bills of exchange, mortgages, and so on. It is made up of capital, surplus and deposits.

(6) The thing that stands out in this table is the fact that for every dollar invested by the stockholders of the banks, the people of the country have invested $13.90 in the banks. Thirty-seven billions of banking resources belong to the people. In other words, the bankers use not only their own money but the money of the people, in a ratio of 1 to 14. In no other business is this true. In no other industry of any kind do the owners have at their disposal at no interest, or at a low rate of interest, 14 times as much capital as they themselves invest.

In the national banks, the percentage of resources owned by the people is even higher. And it has been growing with great rapidity.

In 1899 the deposits in the national banks were 5.71 times the capital stock. In 1914 deposits were 7.72 times the amount of capital stock. In 1919 the deposits were 15.14 times the capital stock. In recent years, owing to the consolidation of banks and other causes, deposits have increased much faster than in any previous time in the history of our country.

Herein is one explanation of the economic power of the banks and of the profitable nature of the business. Whereas other business men pay from six per cent to eight per cent for their money, bankers pay nothing for commercial deposits, and two per cent, three per cent or three and one-half per cent for time or savings deposits. Controlling the situation as they do through clearing house associations, and so on, they fix without appeal the interest they pay to others, and in turn fix the interest which all other persons shall pay to them. The thrift, the savings, the sacrifices of the people are remunerated by a small return, while the bankers double and treble the interest they receive at no sacrifice or manifestation of thrift on their part. The difference between the interest paid by the bankers and the interest received is one source of the bankers' earnings. It is a wholly arbitrary profit. It is not regulated by law. It is not regulated by state banking commissioners. The usury laws are ignored in many parts of the country, while a great part of the deposits and savings of the people are, as will be shown later, used against the people.

Why Deposits Are Sought

NO OTHER business gets its working capital at so low a cost as does the bank. It gets it on its own terms. This is why bankers struggle for deposits. The earnings they make are the difference between what they pay the depositors and what they collect from those to whom they make loans.

Were banking organized as it should be, those who invest 14/15 of the resources of the bank would be treated as partners. They would have some control over their own money. They would share in the management of the bank as they do in the co-operative banks of Europe, as they did in the mutual savings banks of New England, where all the earnings go back to the depositors. More than this, if they shared in the control, they would decrease interest rates. They would increase the returns paid to depositors. But what is far more important, they would dedicate their own money to their own needs, rather than permit it to be used against them, as it frequently is today.

The Brotherhood of Locomotive Engineers Co-operative Bank of Cleveland recognizes this principle. It is the only bank in the country that does. It limits the dividends to stockholders to 10 per cent; it pays four per cent interest to depositors, and at the end of the year it distributes a consumers' dividend to the depositors out of the net earnings.

If we think of this a moment, we will see why the people have a right to be interested in banking; why they have a right to protest against many banking practices. For it is their money that the bankers use. For this reason the deflation of the farmer with the farmer's own money is particularly reprehensible. For this reason the use of the people's money for speculation and stock jobbing, rather than for production, is particularly censurable. For this reason the conspiracy by the bankers to break up organized labor and crush unionism and to reduce the standards of living of labor by the use of labor's own money is especially indefensible.

There are many strange things in the world in which we live, but that the people should turn over their money to agents that they themselves have permitted to exist; that they should permit these agents to use the people's money to take their own property from them, to throw them out of employment, and even to bankrupt them is the strangest fact of all.

The people have forged tools in the form of banking credit to build a wonderful civilization. They have created an agency of wonderful possibilities. Having done this they have turned these agencies over to private individuals, and permitted them to use them as they will. And they have gone so far in recent years that they have reduced hundreds of thousands of persons to poverty; they have made millions of men walk the streets needlessly, and in the industrial regions they have reduced men to personal slavery. For the miners of West Virginia, the steel mill workers of Pennsylvania, the tenants on the farms of the great West have little more freedom than had their forefathers in Europe a century and a half ago. And the servitude under which these classes are suffering in America is the product of a credit power, created by the people for their own well-being, but used by the bankers for their own private gain.

The Pyramiding Marvel

THE loans and discounts of the banks are not their only assets. On examining the table referred to, we find that the total resources or assets of the banks in 1920 amounted to $53,079,108,000. This is the total credit resources with which the banks do business. It consists of loans and discounts, and also of stocks, bonds, and other securities and properties owned by the banks. The grand total amounts to approximately 20 times the capital stock of the banks. In other words, for every dollar invested by the banker he has $20 of property working for him.

If other business men were able to pyramid their investments as the banker is able to pyramid his, a man with $10,000 invested in a farm would have assets of $200,000 to work with. The man who invested $5,000 in a store would have $100,000 of resources to work with; the worker with $1,000 invested in a truck would have $20,000 to work with; the tenant farmer with $500 of tools would have $10,000 of assets to work with. In no other business do men get control of such a colossal working capital as do the bankers. In no other business do they get their working resources on such easy terms.

Here is a second reason why the bankers are opposed to co-operative banks and the organization of more banks. Here is another reason why Wall Street has made such bitter attacks upon the State Bank of North Dakota. It has been subjected to every conceivable assault by the bankers and by the press. Yet it has withstood them all. The State Bank of North Dakota threatened to disclose to the farmers of the West not only the wonders of credit when dedicated to service, but the power which can be wielded for the betterment of the people, when the people control their own banking agencies.

Great Inventions

IT CAN be said that the invention which has done more than any other to revolutionize the practice of the business world, is the typewriting machine. Less than a century ago all documents, letters, the daily correspondence of great business firms, were written by hand with a pen.

Looking backward on this method of inscribing, it appears almost a primitive one, now that the typewriter has come into daily use.

The first attempt on record to produce a mechanical writing machine appears to be a patent issued in England in 1714. No model of the machine was submitted, however, only a drawing, and there is no record that the machine was ever constructed.

In 1829, an American, W. A. Burt, obtained a patent on a small machine which he called a "typographer," while in 1833 a typewriter was patented in France, which had a separate key lever for each letter.

During the years 1844 to 1846 several machines were invented in England, which were designed primarily for the use of the blind and produced embossed characters.

In 1843, Charles Thurber, an American, got out a machine which had a set of type bars placed in a vertical position around a horizontal brass wheel. This wheel revolved about a central post, the characters being brought into position by hand from either direction. The lower end of the type bars were fitted with ordinary type.

In 1856, A. E. Beach took out a patent for a machine intended to print embossed letters for the blind. The principle of this machine was destined to become that of the modern typewriter, that is, a basket of levers arranged in a circle.

S. W. Francis some years later added to this circle of type bars an action of keys similar to that of the piano.

About 1867, Charles L. Sholes, Samuel W. Soule and Carlos Glidden, of Milwaukee, began to experiment in making models of typewriters. A year later they obtained the financial aid of James Densmore, who purchased an interest in the machines, and continued the experiments.

In 1873, the gun manufacturers, E. Remington & Son, of Ilion, New York, became interested in the machine and, after a year's work by their skilled mechanics, produced a model which they put on the market in 1874. This model retained only the principles of the original construction.

From that time down to the present, improvements in typewriter machines have been varied and numerous. All sorts of attachments have been added; the backspacer, the tabulator, the two-color ribbon attachment, a subtracter, an adder, and many others.

The Figure at Labor's Crossroad: the Alien

One View of the Crisis Which the Strikes of 1922 Have Brought; Must Organized Labor Become Reorganized Labor? Is the Inquiry

By LEWIS HARPER

THE strike summer of 1922 may mark a turning point in the history of the American labor movement. Organized labor must become reorganized labor—but who is going to reorganize it?

Ignoring the labels, tags and shibboleths, the two forces now contending for the mastery of the labor movement are fundamentally racial in character. They represent ideals which grow out of different sorts of race consciousness and traditions. It is one of fate's subtle ironies that Samuel Gompers, a man of another stock, is the titular and actual leader of the forces within organized labor, which correspond to the North European racial strains, and their ideals of social and political action. It is also true that the leaders of the other tendency—the revolutionary, disruptive and internationalist faction—are quite frequently of old American breed.

But history takes little account of the geographical origin of formulas and creeds, and less of the accidental roles of individuals who may be cast in dramas out of joint with their genealogy. Essentially the old line leaders of organized labor today are dominated by the social and moral conceptions of North European civilization. The other faction is nothing more nor less than the successors of the leaders of the countless but futile servile insurrections which have rocked the Mediterranean world from prehistoric time. That the division between these forces is on the lines indicated is proved by their antagonistic attitude on the subject of immigration restriction. This is the unfailing reagent which will precipitate the different elements in any mixture of labor factions. Their REAL attitude on this very practical and concrete issue is the key that reveals their opposed philosophies in their entirety. It is in regard to immigration that the revolutionist, the syndicalist and the internationalist will always be found to be in irreconcilable opposition to laborites of the other school, no matter how radical the latter may think themselves to be.

America's Debt to Leaders

THE psychology of this is interesting and inevitable. One cannot be a genuine disciple of socialism, syndicalism or any other form of the servile cults which underlie the alien labor movement, without repudiating utterly the very existence of superior biological values. The belief in such values is the death of equalitarian theories, but it is this very belief, long since confirmed by science, that gives validity to the American purpose which has so long demanded immigration restriction, and has at last succeeded in achieving a considerable measure of it.

It is well worth noting by the American people that this issue, which divides the forces at present contending for the control of the American labor movement, is the issue which organized labor long ago made its very own. The long fight of organized labor for immigration restriction is its greatest service to America —even to all humanity when the ultimate issues are considered. If the fight is crowned with final success, America will literally owe its future to the pioneer work for race preservation done by the leaders of her workingmen. Even today the West owes the fact that it is American and not Chinese to humble agitators of the San Francisco sand lots, especially to Denis Kearney. This fact was recognized as long ago as 1897 by Theodore Roosevelt, but even at that late date he was practically the only "intellectual" to appraise the true value of that service. The "educated" classes, immersed in the false equalitarian metaphysics and the grad grind economies of the period, heaped contumely on the heads of the humble men who halted the yellow tide and made of American unionism something more than the "rear guard on the march to cooliedom."

From all this, the reader may be inclined to think that the writer is a "friend of labor." In the ancient meaning of the phrase the writer would be glad to claim the distinction, but in view of its abuse, must repudiate it. *It has come to pass that "friends of labor" are the only enemies that labor need fear today.*

The Poison Within

THE "friends of labor" appear to be increasing their deadly work. More and more labor leaders are being inculcated with the poisonous futilisms of our "kept liberals." The alien hordes, whose admission labor has always fought, are no longer accepting the leadership of the native leaders after they become organized over here, but are forming their own units and are industriously preparing to wrest the leadership from the men who have heretofore guided the movement.

The "friend of labor" today is too often the man who will not tell labor the truth. The political demagogue and the newspaper publisher frantically seeking mass circulation to sell to department stores, now as never before, are telling workingmen what they think they like to hear. They are not only misrepresenting present conditions, but trying to falsify recent history. They are even trying to make labor ashamed of the fact that it was patriotic and supported its government in the war.

Point and effectiveness has, of course, been given to all these wiles of the "friends of labor" by the senseless and indiscriminating abuse of unionism by professional labor baiters such as the financial press and some eastern newspapers. The immigration question will soon be the keynote of the whole fight for control of the labor movement. The radical element is appealing more and more to the alien rank and file of many unions to throw off their old leaders and is using the sympathy of the aliens for their compatriots back home as a wedge to drive in their ideas of world revolution, international class struggle and proletarian dictatorship.

Aliens on Free List

THE history of the American labor movement has been one of constant effort to keep up American standards against alien armies imported by employers blind to everything except immediate profit. Big business and much of little business has been more international in its attitude than Marx or Lenin, when it comes to the free movement of labor. *In the days of the highest tariffs, aliens were on the free list. Americans were driven not only out of whole industries but out of whole areas. In Western Pennsylvania, once the home of workingmen descended from a stalwart Scotch-Irish pioneer breed, who made the steel industry, they were driven not only out of the mills but out of the country. The American miner first, and after him his first supplanters, the Welsh and Cornishmen, were driven westward by fresh alien hordes imported to break down decent standards as soon as they were set up. The successive strikes in the coal industry up to John Mitchell's time were desperate rear guard actions fought in the westward retreat of the American miner from Pennsylvania to Oklahoma.* The war is still on in West Virginia, and is bound to take on an even deeper racial tinge as the resistance of the mountain folk stiffens year by year.

After each importation of aliens in any industry the leaders of organized labor have sought to retrieve their losses by organizing the newcomers and affiliating them with the remnants of their old forces. Their success in this line is a tribute to their remarkable ability. To this day the leadership in many of the most polyglot unions is the same as it was when the rank and file of those unions were English speaking.

The writer recalls one night in the National Hotel at Washington when all the district leaders of the United Mine Workers of America were present. Although the bulk of the miners today are Slav or Mediterranean, and interpreters speaking over a dozen languages are sometimes necessary in a single mining county, nearly all of these district leaders were Irish, Scotch or American.

The Strike Cause

BUT there is a limit even to all this resourcefulness and ability. The old-time labor leaders are finding it hard to keep the movement on American lines. Slowly they are altering their tactics. For a long time the railroad unions were the most conservative in America, and they are today less alienized than any. Proportionally, there are far more Americans working on railroads than can be found in business on city streets. But the rail unions are beginning to change their attitude. They are going in for political action and political propaganda, and more and more this propaganda tends to take on a syndicalist or soviet hue, largely because of the fact that the unions have hired corps of "publicity" men, "experts," "economists" and "social workers" who are fresh from the most fetid and fecund breeding grounds of socialism—the universities and the social settlements. These are beginning to exert a tremendous influence on union labor and have, in fact, radically altered the tone of the labor press in the last year or two The older labor ideals are going to the pot fast.

Several recent strikes, which have intensely irritated the consuming public, were partially if not wholly due to internal conditions wrought by these new men and new ideas. The public is beginning to realize that *strikes are often the outgrowth of internal union politics. Sometimes a labor leader is driven to a strike just as a monarch used to be driven to declare war to avert revolution. The coal strike of 1919 was partially due to an internal struggle between the radical and conservative forces, both being also somewhat under the sinister influence of groups of unscrupulous operators who had their own ends to serve by the strike.* The steel strike of 1919 was partly an effort of the radicals to unhorse the Gompers faction and partly an attempt to stage a revolutionary strike on the European model. This phase of the struggle was, however, unknown to the majority of the men, *certain groups of aliens only were let in on this plan and many of the leaders knew little or nothing of it.*

Labor Asks Social Reconstruction

ANOTHER factor that complicates the problem for the leaders who are trying to keep the labor movement on its old lines, is the obsolescence of many of the old forms and weapons of agitation. Formerly the appeal to the worker was very simple. He was told that his demands could be paid out of the boss's profits. When a demand was won, of course, the boss passed the cost on to the public—of which the men were a part. As long as organized labor consisted of a very small minority, usually of skilled specialists, it was possible for the organized groups to make great gains, while the cost was spread out over a large number of consumers. But as unions have grown, the fact that wages are paid out of production, and that one man's wage raise comes out of some other workingman's pocket, has become increasingly apparent to the leaders, however little the rank and file may have yet begun to realize it.

Recent statistical studies of national income, which have shown that *capital takes only about 30 per cent of production for profits, rent and interest, out of which the replacement and expansion of the nation's industrial plant must come,* have had a disturbing effect on many labor leaders. In Britain, as is well known, these facts, knocked into the workers' consciousness in the coal and rail strikes, have profoundly altered the course of the labor movement there. They have had no such effect here as yet, but that the limitations of what may be achieved by the labor movement under its old system of tactics, which involved demands as to distribution only and ignored the productive side, are beginning to be realized by labor leaders may be seen in the argument to the Railroad Labor Board made by the striking shop crafts before the recent wage cut. In that remarkable document the labor leaders went on record as recognizing that the industry could not pay what they believed they were entitled to demand, and frankly avowed that they now favored a complete reconstruction of industrial society.

Immigration Crucial Thing

OF COURSE, labor was bound sooner or later to reach the stage where it would have to consider the reorganization of the movement with a view of adjusting itself to some plan for increasing production to maintain and enhance the living standards of its members. It is now approaching that point in the midst of a struggle for control which will turn the whole movement either toward plans for industrial co-operation with capital or toward the revolutionary gold of syndicalism and "seizure of the means of production." Let no one deceive himself into believing that the Russian disaster has proved a deterrent to the radicals. Sovietism is a cult, not a scheme for industrial management. Like all other fanaticisms like Mohammedanism, witch-doctoring or any other brain paralyzing creed, facts will have no effect on its course. If there is anything certain in human affairs this is, and students of mass psychology have demonstrated that no race, clime or country is immune from such waves.

The immigration question will probably prove to be the point upon which the struggle will turn. Organized labor has long shared with Professor Williford I. King, and other economists, the belief that, with immigration shut off, the American living standard may be raised until poverty is practically eliminated. But the restrictions on immigration are the most terrible form of sacrilege to those who believe Marx gospel.

When organized labor wavers on the immigration issue, Americans may just as well make up their minds that the revolutionary idea has triumphed in American unionism, and that the movement is no longer one of men who draw their inspiration from Plymouth Rock and Runnymede.

Sargent's Latest Paintings in Boston Museum

Five Years' Work Expressed in Wonderful Decorations of Dome of Rotunda

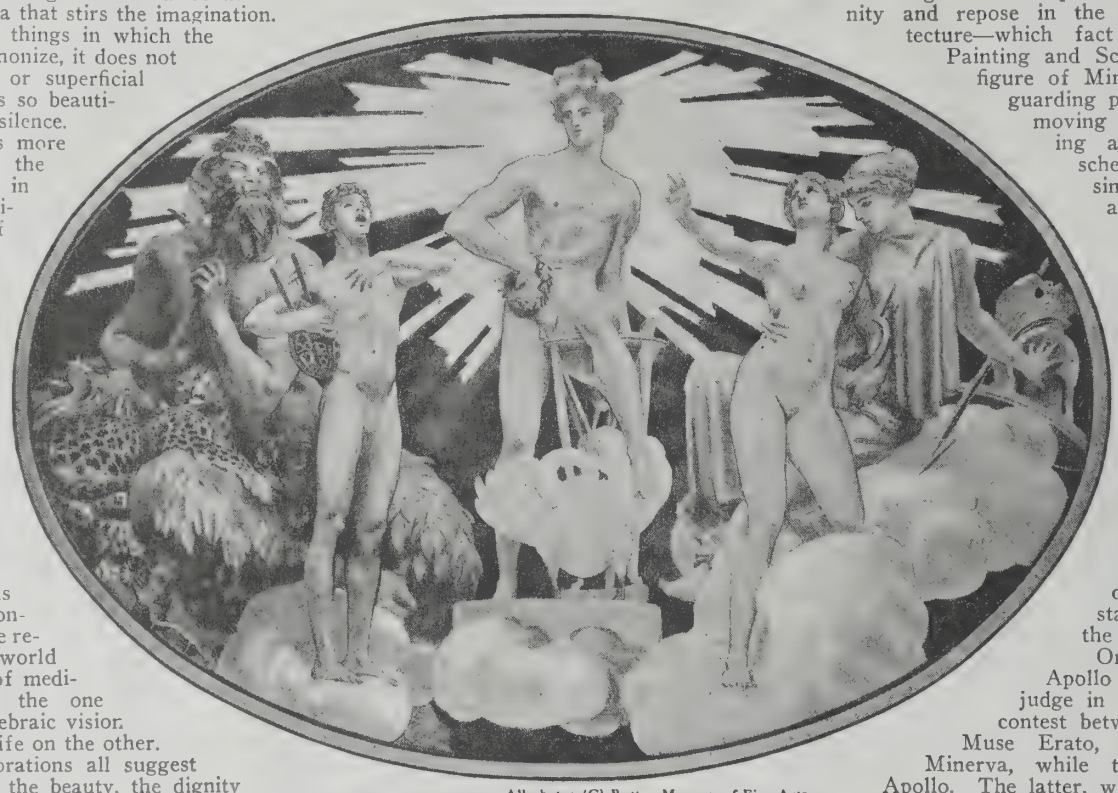
By F. N. HOLLINGSWORTH

THERE have recently been unveiled in the dome of the rotunda at the Boston Museum of Fine Arts, at the head of the main staircase, the latest works of John Singer Sargent, the wonderful decorations in combined painting and sculpture, on which the artist has been at work for five years. At the unveiling they were viewed by a throng of citizens, in that sort of hushed silence which is the first tribute of intelligent appreciation. Those privileged to see the decorations first were the subscribers to and supporters of the Museum.

There is nothing sensational about these Sargent works—nor is there, for that matter, about any of Sargent's work—no confusion of the mind or sense in looking at them; nothing hectic or bizarre; nothing meretricious or modern. Nothing except beauty of line or color, of form and of composition such as one gets from a beautiful flower, a face or a vista that stirs the imagination. And like all beautiful things in which the parts balance and harmonize, it does not lend itself to sudden or superficial analysis. The work is so beautiful that it commands silence.

While the world is more or less familiar with the Sargent decorations in the Boston Public Library, about one of which, entitled "The Synagogue," there has been so much recent controversy, naturally one would look for something reminiscent of these. But no. There is little in common between them, except that both are the creation and work of the same master—the same superb, versatile genius. The library decorations take one through the confusion and terror of the regions of the ancient world up to the calm faith of mediæval Christianity on the one hand and up to the Hebraic vision of an ultimate, fuller life on the other. But the Museum decorations all suggest or give expression of the beauty, the dignity and repose, and breadth of understanding with which the Fine Arts have suffused the imagination of all the ages since man began to think and to create things of beauty.

Mr. Sargent has been working for five years on these decorations although not constantly. He has done an immense amount of other work in the meantime, but this particular work has been on his mind all the while, whether he was sketching at the front during the war, or resting and sketching out in the Canadian Rockies. He was told to take his time on this work, and he did. One feels the calm of thought in every line of the work.



And it was work that required calm thought, much study and much preliminary sketching. The rotunda is in plan, an ellipse with its major axis in the line of approach from the main staircase. The dome is suspended on four piers separated by arches, three of which open into rectangular recesses containing galleries on columns. The surface of the dome is divided into four main sections by ribs, each section containing a large elliptical canvas by Sargent above the arch. Each rib displays three different subjects. Just beyond the rotunda in the tapestry room is a model of the inside of the dome, one-eighth size, on which Sargent planned out every bit of the work he did in the larger dome. On this model he experimented and it will be noted that here four larger paintings were worked out in low relief. At first he thought he would make four compositions in relief with a colored background, but he changed his mind and decided to paint these and carry out a scheme of relief decorations in other parts of the whole design. There are 16 pieces in the whole decoration.

And it is unique in that it actually shows more relief of sculpture than painting. In these decorations Sargent demonstrated that he is a great sculptor as well as painter. What is more, he changed the interior architecture of the dome to meet the requirements of his decorative scheme. Every bit of molding, tracery or framework is as much his as the paintings and the sculptures.

The predominant color of the figures is a golden tone against a blue background. Although the brilliant coloring first attracts the eye and enlivens the somewhat austere surroundings of the Museum, the great feature of the decorations is the successful use of this bas-relief. It has been said that here he composed a symphony of the three arts—Painting, Sculpture and Architecture. With all the brilliancy of the work, there is no attempt at over-emphasis of color in his paintings. In fact, the color scheme, when studied, is found to be very chaste and simple, with only an occasional blend of warmer colors with the blue, white and gold. He pleased himself and was fancy free in this work.

He did not work out a theme. Rather he expressed some thoughts and feelings regarding art. As the visitor mounts the staircase, the subject of the large oval before him represents Architecture, Painting and Sculpture protected by Athena from the ravages of Time. The painting on the right shows a group that personifies Classical and Romantic Art—in the center, Apollo; on the left, Pan and Orpheus and on the right Erato and Minerva. The painting on the left shows Apollo surrounded by the Nine Muses and the painting over the stairway entrance is called the Chimera and the Sphinx, showing a winged nude female figure descending and as if about to kiss the lips of an inscrutable Egyptian Sphinx. In many ways this is the most enigmatic and remarkable of the four large paintings.

Then there are four smaller circular paintings depicting Music, Astronomy, Prometheus attacked by a vulture sent by Zeus, and Ganymede carried off by Zeus in the form of an eagle. Above these are four relief sculptures, framed—Cupid and Venus; the Three Graces; Venus and Psyche and the Three Dancers. There are also four unframed relief sculptures showing the education of Achilles by the Centaur Chiron; Amphion, one of the twin sons of Zeus, who became a great musician; Satyr and Maenad, and Fame. Besides these there are four open lunettes in the dome, each of which is treated in such a way as to fall into the general decorative scheme. Other subjects treated are: Astronomy; Amphion, the great poet and musician, rescued by a dolphin; Aphrodite and Eros.

Pan, Apollo and Orpheus. Sargent's group personifying Classical and Romantic Art.

In the group of the Arts, the three main figures make a stunning composition. The make figure, typifying Sculpture, showing a nude torso, is both graceful and powerful. There is fine dignity and repose in the central figure, Architecture—which fact also embraces both Painting and Sculpture. The helmeted figure of Minerva in watchful and guarding pose contrasts with the moving figure of Time swinging a scythe. The color scheme in this group is simple, but very effective and harmonious.

There is a wonderful circular sweep in the group which shows Apollo and the Nine Muses, all Greek in line and character. The draperies on the Nine Muses are well managed and the heads, arms and hands are in just harmony with the rhythmic movements of the figures. The statuesque figure of Apollo with the lyre stands in the center of the moving group.

One painting shows Apollo acting as a sort of judge in a singing and musical contest between Orpheus and the Muse Erato, who is guarded by Minerva, while the god Pan guards Apollo. The latter, with the shafts of light radiating behind him, is partially seated on the prophetic tripod with a swan in front of him instead of a snake—holding a wreath in his right hand, which is resting on his hip as he gazes at Orpheus, who is singing. Even Pan, the greatest Pan ever painted, seems to be spellbound by the singer, and the Muse Erato on the other side, holding a lyre in one arm and lightly embraced by Minerva, seems to be overcome by the Orphic voice, Sargent calls this Classical and Romantic Music.

But the strangest fancy of all is expressed by the painting which is entitled "Chimera and the Sphinx." This has aroused a great deal of curiosity. Whether it is a mere whim of Sargent's or whether it has some deep, symbolical meaning, is a question that the artist alone can answer. He has said very little to anyone about the significance of these various groups of paintings and sculptures. In this particular group is the nude figure of a winged woman, her face hovering over the stone face of the Sphinx as if about to ask the question which only the Sphinx can answer.

The Chimera to the ancients was at first an unsightly figure with the head of a lion, the body of the goat and the tail of a serpent. Sometimes it was pictured with three heads—that of a lion, a goat and a bear. But in Roman times the Chimera—a figment of the imagination—took on the form of a voluptuous female. Says one critic: "It may be that this imaginative figure of a winged female expresses Sargent's idea of the modern woman who has broken the golden shackles that held her and flies freely about the world, only to be arrested in her flight by one great question which the Sphinx suggests: 'What does it all mean?'"

Two of the larger paintings are in the form of upright ovals; the other two larger ones are horizontal ovals. The smaller paintings are circular, with the sculptures in the ribs or space between the four larger paintings. The sculptures at the top are in much higher relief than those at the bottom. It was originally intended to have three large lunette paintings, but a study of the problem convinced Mr. Sargent that this was impossible because of the shadows thrown. He then turned his attention to the surfaces of the dome itself, but this involved a

Medallion representing "Music."

Above, left—Architecture, Painting and Sculpture, with helmeted figure of Minerva and Father Time with his scythe. Center—Medallion representing Astronomy. Right—Chimera and the Sphinx. Below—Apollo and the Nine Muses.

very different treatment of the decoration, and some semi-structural changes. Finally it was decided to adopt a rib treatment as being of a constructive character. In the four large paintings it was necessary to meet, in the drawing and painting, the requirements of a curved surface seen at a considerable height from the floor. So well did the artist meet this requirement, that one is not conscious either of the curve or of the height.

The work was done in three periods. First the scheme was developed by Mr. Sargent on the model and the building made ready for the application of the reliefs, molding and the decoration; second, all the reliefs, moldings and enrichments were made and applied. Third, all paintings, the large oval canvases and the medallions were put in place and the finishing touches applied by Mr. Sargent. It is of great interest that not only the paintings, but all the reliefs and even the moldings have been done by the artist's own hand. He made several hundred charcoal drawings for preliminary work on the paintings before he started work on the final composition.

Why Man Chooses His Particular Job

WHAT makes a man choose one calling in preference to another?

Is money the chief consideration? Or is it natural interest, a feeling of special fitness, or a love of humanity?

Joseph K. Folson, a graduate student of Columbia University, has attempted to answer these questions by a statistical investigation. He selected the names of 206 distinguished Americans from "Who's Who" and prevailed on them to reveal their vocational motives. Then he made similar inquiries of the juniors and seniors of an eastern college. Altogether 423 questionnaires were filled out and the results probably are typical enough to warrant the attaching of some importance to the conclusions.

The eminent men who responded were identified with all the principal professions. Preachers, doctors, lawyers, editors, actors, teachers, chemists, architects, engineers, musicians and artists were represented. The students expressed preferences for some occupations besides these.

About one-half of both the distinguished men and the students indicated that *intrinsic interest* in a particular line bore the greatest weight with them. In other words, men most often choose the line which they think will give them the largest amount of personal satisfaction. One significant thing about the answers was that the results from both groups tallied pretty closely.

Natural liking for their actual or intended occupation or the prospect of deriving satisfaction from it was most numerously indicated as a motive by farmers, musicians and artists. Musicians do not play for money nor do artists paint for dollars primarily; 90 per cent of them are dominated by sheer love of their work. Sixty per cent of the technical men also were predisposed to their callings by interest.

It is only the rare individual who chooses his work because he displays an outstanding fitness for it. Only two per cent of the "Who's Who" crowd and seven per cent of the students indicated this as a reason for their choice.

Money was the first consideration with eight per cent of the eminent men and five per cent of the students. Perhaps the difference between the two groups on this point shows that older men are more practical and frank than their juniors. Youths are more often given to idealistic impulses.

The opportunity motive, "there's a big field for this work today," was strongest in evidence with technical men.

"Like father, like son," did not seem to be borne out strongly by the investigation. Doctors' sons seemed more inclined to follow in their fathers' footsteps than was true in any other profession.

The results are indicated in the following table. Altruistic ideals and the spirit of service are called Moral Motives below; pressure by parents or relatives is referred to as influence or tradition; where there is a lack of interest in any one thing or an occupation is the last resort, the term elimination is used. Figures are in terms of percentages.

Motives	Eminent Men	Students
Intrinsic interest	47.3	45.9
Satisfaction not intrinsic	13.1	18.4
Moral motives	8.6	9.2
Fitness	2.1	7.1
Opportunity	7.1	8.5
Money	8.2	5.4
Influence or tradition	5.6	4.3
Elimination	8.0	1.2

BRIEFLY TOLD

The ice bill of the people of the United States is about $1,000,000 a day, the northern lakes furnishing one-fourth of the total production of the country.

An automobile, packed in knocked-down form, was shipped from Detroit to Cleveland by aerial freight.

Work has begun on the first of a chain of 20 hotels for motorists, extending from Vancouver, British Columbia, through Washington, Oregon, California and Nevada. These hotels will be one day's automobile run apart and will be constructed on the unit plan. They will provide the motorist with comfortable quarters and food supplies, auto equipment and repair shops.

During the 10 years' life of the treaty for the limitation of armaments, the United States, the British Empire and Japan will realize savings of from $500,000,000 to $800,000,000 a year.

The editor of the Boston *News Bureau* writes of "the failure of our public school system to give proper education as to money and the functions of money."

A project is on foot to rebuild the Bank of England because the old buildings are hopelessly inadequate to hold the enormous staff which it now needs and which is scattered about the city of London. The project is meeting with much opposition from sentimentalists who view the move as sacrilegious.

A plant has been discovered in India which is an effective remedy for malaria and blackwater fever.

Latvia has decided to give her printing presses a rest, retire her paper rubles, and establish a new unit of currency with a gold basis—to have the same value as the franc and to be known as the lat.

Cannon balls, abandoned by General John C. Fremont in his expedition to California in 1844, were uncovered recently by a prospector searching for gold in a small ravine not far from Fales Hot Springs in Mono County, California. Fremont's diary records that on January 28, 1844, he was obliged to leave his howitzer at a point in Deep Creek. This is eight miles north of where the cannon balls were discovered. It is supposed General Fremont abandoned his howitzer ammunition as of no further use.

Fully two-thirds of the 45,000,000 inhabitants of Bengal have hookworm and more than one-half of the 300,000,000 inhabitants of India are victims of the disease.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

A young German engineering student experimenting with motorless airplanes rose to a height of 600 feet, remained in the air more than two hours and sailed six miles in a straight line.

"There will one day spring from the brain of science a machine or force so terrible in its potentialities, so absolutely terrifying, that even man, the fighter, who will dare torture and death in order to inflict it, will be appalled, and so will abandon war forever," said Thomas A. Edison in a recent interview.

Every new book issued in Great Britain has to be sent to the university libraries of Oxford and Cambridge and Dublin, to the Advocates' Library, Edinburgh, and the Welsh National Library at Aberystwith.

A colossal statue of a Franciscan father which would eclipse the Statue of Liberty in New York Harbor is to be erected on Yerba Buena Island, facing the Golden Gate, if the proposal of the San Francisco Chamber of Commerce carries. It is believed that such a statue, built by small popular subscriptions, would dominate the imagination of every person in the San Francisco Bay region and invest the bay itself with an outstanding characteristic.

The Savannah River is carrying 135 carloads of Georgia farm land into the ocean daily, because the wanton destruction of forests has given the heavy rainfall a better chance to do its work.

Only 16 out of 142 institutions in the United States formerly known as "drink cures" are now conducting a business similar to that which they pursued before the advent of national prohibition of the liquor traffic.

Aroostook County wants to sever connections with the state of Maine and become the seventh New England state. The county is located in the northeastern part of the state and occupies about a third of the state's area. The county has grown more than 30 per cent in population since 1900 and 300 per cent in valuation.

The fashion of plucking the eyebrows has long been popular with the Araucanian Indian women of South America.

Agriculture constitutes the chief source of the power and wealth of the Japanese people in spite of the rapid strides made recently in the manufacturing and mining industries. Sixty per cent of the population of Japan is rural.

Gold bars to the amount of $31,780,000 have been received from abroad by Kuhn, Loeb & Company, New York, this year.

In Sandhurst, Bendigo, Australia, it is not uncommon to see old prospectors and tramps prospecting "for a color" after a heavy rainstorm. Gold is found by road menders and a barrow load of this storm-sluiced sand has been known to yield half an ounce of fine gold.

The interest rate in Russia is now 12 per cent a month or 72 per cent a year. The Soviet government pays 36 per cent a year on foreign funds. These facts have a bearing on the propaganda of money for Russia.

The ancestral home of Miles Standish is to be brought to America. Within six months the four rooms of the Standish home, now located in the parish of Standish, near Wigan, Lancashire, England, will be fitted into the house for some American whose family history in this country goes back to *Mayflower* days. The Standish house has been occupied by the Standish family since the Norman Conquest.

The full amount of the national debt is approximately $23,000,000,000. The annual fixed charges against the United States Treasury on account of the public debt are $1,300,000,000 and not $41,300,000,000 as has been stated.

The average life of a $5 bill is 10 months through the country as a whole, and but eight months in dense centers of population.

In Jerusalem, within 100 yards of the grave in the garden where the Saviour of the world lay after His crucifixion, there is a movie showing revolting and sensual pictures of American life, according to a report from a missionary.

Within a few years the all-rail route from Cairo to the Cape will be completed.

DEPENDABLE INFORMATION

After reading this copy of THE DEARBORN INDEPENDENT you will have observed that the information it contains is based on fact. There is no room for half-truths and misinformation in this publication. THE DEARBORN INDEPENDENT believes that the people of this country prefer facts to buncombe, substantial information and wholesome ideas rather than sensational appeals to the emotions. If you are not yet a subscriber, become one today. If you are, do a good turn by urging your friends to subscribe and become readers of America's foremost non-fiction weekly. How Banks Multiply the Dollar by Fifty

The Bookkeeping That Has Done Away With the Use of Money

Chronicler of the Neglected Truth

Are You Bidding the Housebreaker Welcome?

Light, Noise, a Little Care and You Will Insure Your Belongings

By COURTENAY SAVAGE

IF YOU were to walk up to an acquaintance and ask him if he made a practice of welcoming burglars, he would probably smile and say, "Go on, I'll bite, what's the joke?" Convinced you were quite serious, he would indignantly assert, "Of course not, who ever heard of welcoming a burglar?"

Many persons, not consciously, but by one careless method or another, invite burglars in. The result is the loss by burglary in the United States of millions of dollars each year. Burglary insurance paid out in 1920 totaled $10,189,853—a figure that represents only a small part of the total loss, for the average household is not insured against the thief.

Too bad, did you say? Yes, it is too bad, for fully 95 per cent of that loss was preventable, and occurred because carelessness caused the "welcome-to-the-burglar" sign to be hung out.

The average person will decide that he has never welcomed a burglar. Such decision is arrived at because the precautions that keep the burglar away are so common that they are not considered important. In what condition, for instance, are the hinges on your back door? And in what condition do you leave your house when you go out for the evening? Do you know anything about the chatty man you met at the paper store? You, lady of the house, what do you know about the woman you so frequently meet at the market—that nice woman who wears such a good-looking tan suit? You don't know her name, but you have gossiped with her on several occasions. Such matters as these may not seem to have any connection with welcoming a burglar—but in reality they have.

How have they? It is because the burglar deals in trifles in gathering information and in watching for the weak spot in your home. Why the burglar is successful is one of the most interesting of studies. The burglar is not an individual of great brains, but he *uses* his intellect, while you, who may be far more clever, do not bother to use yours.

When you picked up your paper you probably noticed the report that the Smith family, on Elm Place, went to a church bazaar, and returned to discover that the house had been robbed of nearly $5,000 worth of silver, jewelry, and wearing apparel. The newspaper report had a sentence, "The burglar gained entrance through a cellar window."

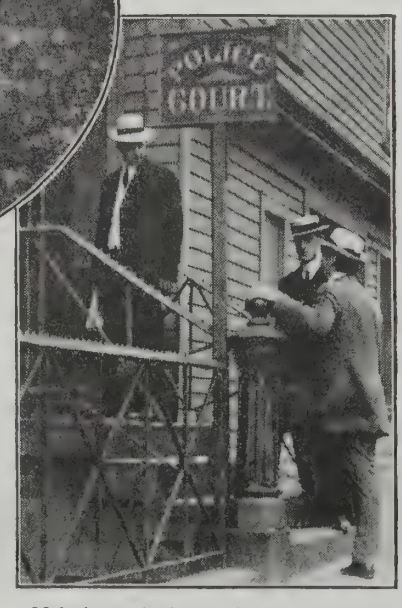
A cellar window! Nearly every home has a cellar or porch window that is easily reached, and might be pried open—or left unfastened, as is so often the case. There are simple precautions that will guard a home during the absence of the family. One of these is a dog—*but far more effective are two or three lights!*

Light and noise! They are the two things of which a burglar is really afraid. You may not own a dog, some families do not like dogs, but you can leave a few lights going, and a burglar will hesitate long before entering. Lights puzzle and frighten the crook. Any type of a light means that someone is awake, and moving about. It is exceedingly rare that a night prowler will force his way into a house that shows signs of occupancy. He prefers the dark house.

It will cost you only a few cents, to leave your house lighted while you are away for an evening, but you will be more than repaid if it insures your belongings. The dark house is not the only way in which you welcome the burglar. Your milk bottles tell him to come in. So do your daily newspapers, the mail, ice, and so on. Such signs are visible when the family is away for a couple of days, and no one has taken the trouble to stop deliveries. The paper boy leaves the evening news-sheet on the front porch, and the milkman delivers the milk—and they are not taken in. The burglar, with a mind trained to notice trifles, reads "family away—good chance." Make it your business to stop deliveries, or ask a neighbor to care for them.

What about your hinges? Did you put a good lock on the door at the top of the cellar stairs? Cellar windows are easy to reach, and the burglar who crouches in the shadow of the house has time to work. It is almost impossible to prevent a burglar from cutting the glass from a cellar window. Even if you cover the windows with a wire mesh the burglar can cut it. Glass, reinforced with wire, is the best preventative, for it is hard to cut, and will probably take more time than the thief cares to give to a job. Burglary is a nervous profession—if it takes time to rob, the crook becomes frightened, and leaves without completing the job.

There is more than one police record of burglary where a hundred dollars had been spent on the bolts on the doors and windows, but only a few dollars on hinges. Most persons think that as long as the door swings that is all that is necessary. Yet the average cheap hinge is the burglar's joy. All he needs is a good screw driver, and he can take the back door right off. If the hinges are on the outside, he just unscrews them, and if they are of the common kind, fastened with an iron pin that holds the two parts of the hinge together, he uses his screw driver to lift the pin.



The burglar seldom needs resort to lifting the door hinges. We are careless, nearly always in a hurry. The average family leaves home in a flurry. It may be a short vacation, an evening's entertainment, or for weeks, but at the last minute there is a rush. In the turmoil no one examines the kitchen window.

Such a dwelling as this affords easy access to the burglar. He can swing himself from the porch to the second story.

The loss from burglary is such that many cities are forced to train bloodhounds for the steady warfare against the crooks.

Make it your business to know the quickest way to reach the police station.

However, there are many occasions when the burglar is clever. The house burglar, or "prowler," as he is known to the police and among his own profession, generally works with a confederate, frequently a woman. They go from one small city to another, settling in places where there are many comfortable private homes, and possibly a number of prosperous-appearing two and three family apartment houses. They don't look like crooks—that is one of the disarming qualities of the modern criminal. The modern burglar wears a dark suit, and a soft white shirt with a neat tie.

Well, the crook and his confederate settle and start to study the various neighborhoods. The woman makes friends, and by gossip soon finds out the people who have money, jewelry, and fine silver. The butcher and baker unconsciously help her, so does the nursemaid, and the woman of the house, for as she stops to say "how-do" to the children of the family the woman-crook skillfully gathers facts regarding the family's habits.

Don't tell your business to strangers. The efficient crook is an adept at minding other people's business, and if you are not careful you will soon be offering him such valuable data as the names of your best friends, when the servants are out, when your husband will be away, or how, now that the family is out of town, you spend your evenings at the club, leaving the house alone.

As an example of how the criminal world gathers information a series of robberies on Long Island can be mentioned. During a single month about 15 homes were entered, always at night, by two men, who would set to work systematically to rob the home of all its valuables. In a great many cases the people robbed were elderly couples, or women whose husbands were not at home that night, and in several instances, the robbers woke their victims, poked a pistol in their faces, and threatened them with death if they did not disclose the hiding place of their valuables.

One night the police were attracted to a certain section of Flushing, Long Island, by the cries of a woman. It turned out that she was a patient at a sanitarium, who had got away from her nurse and was wandering about the grounds, but when they went there, they saw a man slinking along in the shadows. They watched a minute, and discovered he had a companion. The men started to run, but one was captured. Under severe questioning he disclosed their hiding place, and his confederate was arrested. Under further examination both men admitted that they had been aided in their robberies by a painter—a man who as he worked in various houses made it his business to learn the plan of the homes, and the wealth of those who lived there.

All the information that the burglar gathers about you is valuable for another method of robbery—and that is by the use of the fake telephone call.

Not so long ago a police commissioner of a prosperous manufacturing city, a bachelor of considerable private income, and known to be fond of jewelry, was summoned to headquarters one night by being told that an important criminal had been captured. This police commissioner lived in an apartment house, and had one personal servant. The servant was out for the night. When the message arrived the commissioner went at once to headquarters. There, to his astonishment, he found that he had not been called. Something was wrong. He went home again. His apartment had been robbed of nearly $20,000 worth of his belongings, the thieves coming down the back fire escapes, cutting away a window, and leaving in the same way.

Never answer a hasty summons unless you make sure that the summons is genuine. It is very easy for the clever crook to call you up from a telephone booth, and say that he is an attendant at a hospital or police station, inform you of an accident to some member of the family or close friend, and ask you to come right over. The natural inclination is to rush right out. Don't do it. Wait a minute, and then call back the police station or hospital—and learn if there really has been an emergency call for you.

Such incidents as the use of the "fake call," and a careful study of your home, show intelligence—but when you display money, or jewelry, you invite someone to take it away. And he will.

The two great foes of the burglar are light and noise. Get acquainted with the policeman on your beat—and know your way to the police station.

Home protection really resolves itself down to this: *Don't bid the burglar welcome!*

How the Banks Multiply the Dollar by Fifty

The Bookkeeping in Banking That Does Away With Use of Money

By FREDERIC C. HOWE

This is the third and last article by Mr. Howe.

IN THE preceding articles we have shown three things from the reports of the Controller of the Currency. These things are:

(1) That the laws of the land make it possible for the banker to lend ten times as much money or credit as the banker has money or "legal reserve" on hand.

(2) That the people invest $13.90 in deposits to every dollar invested by the stockholders of the bank. The people contribute $37,683,563,000 in deposits while the bankers contribute only $2,702,639,000 in capital stock.

(3) Finally, the bankers are able to accumulate $53,079,108,000 of assets or resources as against their $2,702,639,000 of capital stock, and in addition are able to lend and invest this colossal sum with only $1,076,378,000 of actual cash on hand. In other words, the bankers have 50 times as great resources as they have actual money with which to do a banking business, which we assume to be the business of lending money. And they have 20 times as much in assets as they themselves have invested as stockholders in the business.

The bankers enjoy many other privileges, but these are the privileges that give them power, for this pyramiding of business resources on a small amount of investment and a small amount of cash is authorized by law. The people themselves have conferred these rights upon the bankers.

This pyramiding of banking resources is possible because money plays a very small role in modern life. Credit has taken its place.

Two centuries ago the banker was a money merchant. He was literally a "money lender." He received actual money and loaned actual money. Today the banker usually gives the borrower credit on his books. When he receives a deposit the deposit is usually the same credit that he has just given to the borrower. The banker has become a bookkeeper. He swaps bookkeeping entries most often on his own books, but also on the books of other banks, clearing house associations, and now on the Federal Reserve banks. Literally hundreds of billions of dollars' worth of transactions are carried on by bookkeeping entries.

To make this as clear as possible, we will follow the pyramiding of bank loans and bank deposits as they take place in the daily transactions of the bank.

Let us assume that John Smith has $10,000 that he wants to lend. He finds a borrower. He takes a promissory note and receives $600 a year interest upon it. He has now lost control of the money.

What Happens on Loans

BUT suppose John Smith has heard of the profits of banking and wants to enjoy the social position and power that only the banker enjoys. He decides to organize a bank. He secures a charter from the state superintendent of banking or from the Controller of the Currency at Washington and opens his doors for business. He becomes the John Smith Bank.

John Doe appears and asks for a loan of $10,000. The credit of Doe is good. He has a reputation for honesty. His business standing is of the best. The bank makes the loan.

Doe is told, however, that the bank makes loans only to its customers. It expects a borrower to keep a balance with the bank of at least 20 per cent of the amount of the loan. As this is customary John Doe agrees to it, so that he gets the continuous use of only $8,000 although he pays interest on $10,000.

Now the cashier does not hand $10,000 of cash over the counter. Instead he makes out a pass book in the name of John Doe and enters in it a deposit of $10,000 to his credit. In the evening the bookkeeper makes four entries in the bank ledger. He first credits the bank with the loan; he then debits John Doe with the amount of the loan. He then passes to the opposite side of the ledger and credits John Doe with a deposit of $10,000 and charges or debits the bank with its receipt.

No money has left the bank. At the end of the day the accounts of the bank show $10,000 of loans and $10,000 of deposits. The only thing that has happened is that John Doe is now paying from $600 to $800 a year interest for money that he has never received and in nine cases out of ten never will see.

Any banker will admit that this is true. It is being done by thousands of banks every day all over the country.

But the creation of phantom money has only begun. The next day Richard Roe asks for and receives a loan of $10,000. He, too, is advised of the rules of the bank. He, too, signs a note; he, too, receives a pass book; he, too, agrees to pay from $600 to $800 a year interest. At the end of the second day the accounts of the bank show $20,000 of loans and $20,000 of deposits. Still no money has left the bank.

The following day Peter Robinson borrows $10,000. He also gives a note and receives a pass book. At the end of the day the bookkeeper makes the same entries. The accounts of the bank show $30,000 of loans and $30,000 added to the deposits. Still no money has left the bank. Twelve bookkeeping entries have been made and that is all.

These loans and deposits may have taken place during the same day or the same hour. They may continue and do in fact continue until different persons have secured loans in a total sum of from $60,000 to $100,000 and have deposited from $60,000 to $100,000 in the bank. Each one of them has in effect borrowed the same $10,000 with which the bank began business.

Day by day the deposits and the loans balance each other or nearly so. Neither the one nor the other is money. We talk about a loan of money but in reality we receive a loan of credit. And the deposit that we make is the same credit that we have just borrowed. The reports of the banks show that this is true. On June 30, 1920, the deposits of the 8,030 national banks of the country amounted to $14,018,810,000 and the loans and discounts on the same day amounted to $14,085,147. THE BANKERS REALLY LEND OTHER PEOPLE'S CREDIT.

But it will be asked, Suppose these borrowers should demand actual cash? They have a right to do so. But if a borrower went to a cashier and told him that he wanted money over the counter for his loan or if he withdrew actual money as soon as he had made the loan he would probably have difficulty with his next loan. For the withdrawal of actual money immediately reduces the bank's reserve. It impairs its ability to make loans.

The bank expects the borrower to keep a substantial balance in the bank. It expects him to draw checks against his loan, but it does not expect him to call for actual cash. There is *only a billion dollars of cash in the banks,* and *only $6,087,555,087 of money in circulation* in the entire country. Yet the 31,000 banks, state as well as national, have *more than $37,000,000,000 of deposits.*

The Bookkeeping Processes

ONE of the largest of the New York banks recently described the banker as "a bookkeeper, and a settling agent for the community in its relation with the outside world."

Let us follow the bookkeeping processes as they are carried on behind the grill work that separates us from the banker. We will use the characters with which we are already familiar.

John Doe, the first borrower, begins to check against his loan of $10,000. He pays for labor, he buys supplies. If there is only one bank in the town, and the men who receive the checks all live in the town, these checks are redeposited in the bank on which they were drawn. In the evening the bookkeeper charges the account of John Doe with the amount of the checks he has drawn and credits the accounts of the other depositors with the checks they have deposited. See how simple the situation is if all of our banking was done through a single bank and all of our transactions were confined within the same community. No money need leave the bank at all, except small change for our daily transactions. John Doe would have reduced his loan account by a certain sum, but other accounts would be increased by a like sum. There is just as much money in the bank as there was before. All that has happened is that a number of bookkeeping entries has been made shifting the debits and credits from one merchant to another. The bank has some actual cash, it is true, that passes back and forth over the counter. But an examination of the reports of the bank from day to day shows that very little actual money leaves the bank.

But there may be a half-dozen banks in the town. Surely money has to be carried back and forth to settle the hundreds, maybe thousands of checks that are depoisted each day in the banks. Not at all. Each day the bookkeeper of the bank makes up a deposit slip just like those made by the individual depositor. A messenger carries the checks which the bank has received as deposits to the bank on which they are drawn and gets credit at that bank for the same. Each bank has a deposit account with the other banks. The accounts of the two banks are balanced. The creditor bank may receive actual cash for the balance due it or it may leave the account open and draw interest on the balance as it often does. Or the bookkeepers of two banks may get together and debit and credit one another with their respective checks and settle the balance in cash or by check. This is the procedure followed in a small town where there are only a few banks.

What the Clearing House Is

IN THE larger cities, which contain a great many banks, the clearing house has been organized to obviate the necessity of carrying checks from one bank to another. The clearing house is a bookkeeper for all the banks, just as a single bank is a bookkeeper for all of its customers. The clearing house is a voluntary organization. It is usually a partnership. A fee is charged for membership. Frequently the clearing house makes rules, *which rules are often for the purpose of compelling the banks to pay as low a rate of interest as possible to depositors;* to keep open only a certain number of hours in the day; and otherwise to prevent competition among the banks. But the clearing house performs a very useful function. Every day, every bank that is a member makes out a deposit slip containing the checks which have been deposited with it on other banks in the city. These checks are totaled. Between twelve and one o'clock a clerk from the bank takes these checks with the deposit slip to the clearing house. There the checks are deposited, the same as in a bank, and the bank is credited with the total amount of the checks drawn on other banks which it has received the previous day. But other banks have checks drawn on this bank. They, too, bring them in with deposit slips, and receive a credit on the books of the clearing house. The checks in favor of and against each individual bank are totaled and the balance is struck. It may be only a few hundred dollars. It may run into thousands. But whatever the balance, it is settled on the books of the clearing house by a cash or check payment by the representatives of the various banks who are present at the clearing house for this purpose.

In actual practice the credits and debits nearly wash one another. The cash balances to be paid are very small. Each bank keeps its cash unimpaired. For just as only a certain amount of cash is needed as a bank reserve, so experience has demonstrated that the credit and debit checks of a bank balance each other. Only a small amount of money is needed to balance the daily transactions.

But the shifting of money by check does not end with the clearing house of the local city. Out-of-town checks are cleared or canceled in the same way. Every bank in a small town has a correspondent bank in a larger city. It keeps a deposit with it on which it receives interest. This correspondent bank in turn has a correspondent bank in Chicago and New York, and keeps a deposit with it. The small-town bank in Nebraska which receives a check on a bank in some other town sends it to an Omaha bank, which gives the small-town bank credit for it. The Omaha bank then sends the check to its correspondent bank in Chicago, which bank sends the check to the clearing house along with its own checks. When the check has been paid, it credits the Omaha bank with the checks sent to it and the Omaha bank in turn credits the country bank. Many bookkeeping entries have been made but no money has passed from bank to bank or from town to town. Items have been entered on the debit and credit side of the ledger. Such bookkeeping entries may run to New York, they may and often do run to London or Paris. But even in international exchange the process is as simple as the process performed in the John Smith bank which swapped debits and credits at the end of the day.

Banking is bookkeeping. It is for the most part very simple bookkeeping. And this bookkeeping structure is the same in the complicated transactions of today as that followed by the storekeeper when in colonial times he credited the neighbor who brought in money as if he brought in eggs, and charged the neighbor with money which he withdrew just as though he had bought sugar, potatoes, or any other merchandise.

Billion in Cash; 50 Billions of "Money"

THE New York Clearing House does the bookkeeping for 31,000 banks all over America and thousands of banks all over the world. Its "clearances" amounted to $252,333,249,466 in the year 1920. They were the debits and credits of individuals and banks all over the world. Yet the total amount of balance differences between all the banks that cleared through it was only 9.99 per cent of the total. The great bulk of the transactions washed one another, and these balances were practically all paid by checks on the Federal Reserve bank. But very little money passed from bank to bank. For practical purposes the vaults of the average bank might almost be sealed up from one end of the year to another. Money is needed only for small change. The bank makes bookkeeping entries for the community.

In these transactions, the loans which the bank makes are assets. The deposits which it receives are liabilities. Neither one nor the other is money. They are merely bookkeeping entries made from day to day by thousands of bookkeepers and cashiers all over the country. The John Smith bank, however, is collecting interest not on $10,000 but possibly on $100,000. In addition it often requires the borrower to keep a balance of from 20 per cent to 25 per cent against the money borrowed. So that even where no commission is charged for the loan the borrower gets only $8,000, but he pays interest on $10,000.

These bookkeeping devices, the clearing house, and the Federal Reserve banking system perform most useful services. The world would stand still if these bookkeeping entries were to stop. The world would collapse if its credit structures were forced back to a money basis. The evil is not in pyramiding credits, it is not in the struggle of banks for money, the evil lies in the way these colossal powers are being used, and the unnecessary tribute which the banks are permitted to take for doing the bookkeeping of the country. For the processes described are simple. They are performed for the most part by underpaid clerks. They make entries such as they would make in a shop or a store. Yet they enable the country to do business running into the hundreds of billions of dollars without the necessity of handling much money at all. The cash in the community remains the same from day to day. It remains untouched from month to month.

Herein is the explanation of the fact that *the banks have been able to erect a pyramid of fifty billions of money on one billion of actual cash.* This is how they have multiplied the dollar by fifty. And while each one of these fifty billions of dollars is not earning money every minute of the day, still there are very few banking transactions that do not take some tribute from the public. There are no holidays for the banker's dollar. It works in bad times as well as in good. It is not laid off by strikes or lockouts. It does not lay by for repairs or inventory. When the community gave these privileges to the banks, it took back no guaranty that its credit resources would be properly used, or that the gains that come from this wonderful organism should redound to those whose credit resources are being used.

Massachusetts' Blow at Bureaucracy

FROM the Old Bay State, where the Boston Tea Party, Lexington, and Bunker Hill once testified to Massachusetts' firm stand for human liberty, comes the move to halt the onrushing sweep of Federal bureaucracy.

Massachusetts has filed a petition in the United States Supreme Court, asking permission to begin suit to restrain those charged with enforcement of the Sheppard-Towner maternity law. This law was passed at the present session of Congress, because of the vehement emotional support of a group of professional women's organizations, because of the subservience of political-minded Congressmen to that sort of group agitation, and finally because of the absolute apathy of the general public in face of the legislation designed to limit liberty and pile up taxes.

Massachusetts in her petition to the Supreme Court contends that the Sheppard-Towner Act would impair and violate her sovereign rights and the sovereign rights of her citizens.

"Congress," asserts the petition, "in enacting this legislation unlawfully assumed a power not delegated to it but reserved to the states by the Tenth Amendment to the Constitution."

Massachusetts points out that to participate in the apportionment of funds, a state must accept the provisions of the law and submit plans for carrying them out, and must appropriate amounts equal to those contributed by the Federal Government.

"Federal aid," says the Massachusetts petition, "or the appropriation of funds by Congress for objects which are not national but local, is believed to be an effective means of inducing states to yield a portion of their sovereign powers for *a consideration offered.*"

Other bills of similar nature, pending or proposed, include the Sterling-Towner bill to create a department of education, and a bill to create a department of public welfare.

"Unless checked by this court," the petition asserts, "on the ground of unconstitutionality, no limit can be foreseen to the amounts which may be thus expended for matters of local concern, by statutes providing for the establishment of large Federal bureaus with many officers for the performance of duties which are entirely beyond any authority conferred upon the United States by the Constitution."

Forty states have already submitted to the Children's Bureau detailed plans for carrying into effect the provisions of the Sheppard-Towner law. But that weight of numbers does not in any degree detract from the wisdom of the cause being fought so courageously by Massachusetts. There are some persons who may argue sincerely on behalf of the particular object sought by the maternity bill; there is none who can reason long in support of the general proposition of vastly enlarging the Federal bureaucratization. The "fifty-fifty" method of taxation whereby state feelings have been anesthetized while state powers have been extracted is a national drug which the Supreme Court can well deny to the country.

Massachusetts has taken the case to the court. But the country's trouble cannot be settled until a united public opinion stiffens the backbone of Congress against the group influences, ever demanding more bureaucracy.

Non-partisan Nonsense

THERE is much discussion among financial publications, and some by the news press, of the matter of appointments to the Federal Reserve Board, and the composition of the appointive commissions and courts vacancies in which the President is called on to fill. The discussion is as to whether the selections be made from the ranks of the dominant political party, or the semblance of non-partisanship be kept up by appointment of nominal Democrats where the vacancy occurs by resignation or expiration of terms of office, when the retiring incumbent has been a supporter of the last administration.

Based as it is on party lines, as parties now are organized and controlled, the discussion is nonsensical. The real test of non-partisanship should be on principles in which the present major political parties are in neither case a unit. In every case the dividing line really is between the people and the interests. Where courts, commissions and boards are composed of men of different parties, care is taken that they be a unit for the interests, who care nothing about party affiliation, but seek control of both parties, that none but their own supporters shall serve. No one would be so foolish as to deem it possible that a Progressive leader, although a Republican, could by any chance be acceptable to represent that party in an executive capacity. Indeed, in every case, administration influence has gone the limit to defeat such men for renomination to offices bestowed on them by the people. In appointments, repudiated leaders have been named and will be named, if followers of the interests.

In the matter of a successor to Governor Harding, of the Federal Reserve Board, the President is apparently halting between two opinions, and the interested publicists are engaged in a sham battle as to whether the pretense of non-partisanship shall be retained or the appointee be a partisan.

The careful observer will note, however, that none but active partisans of the Federal Reserve System are mentioned on either side. It is a question of policy entirely. Will the appointment of the individual strengthen or weaken the President and his party at the polls? As far as the administration of the system is concerned, there will be no change whether the Republicans or Democrats predominate.

What does it matter to the people whether it is Harding or Glass, for instance, or Meyer or Crissinger, who will be governor of the Federal Reserve Board? It would not matter to the interests, and it could not to the people, for the identical policies of the original board, appointed by a Democratic President, have been followed under a Republican President, and will continue until a clean sweep is made. This will not come from any purely party change, but from a realignment of the electorate.

That such a result is possible is a fact; but its probability is not so certain. That the electorate is ready for such a change is indicated by primary returns throughout the country; but here there is also great danger. How much of the feeling between those who favor the change is fomented by the interests; how many leaders of the revolt may be the tools of the interests, can be ascertained only by actual test. Some who are now in favor of those interests may deem it wise from a selfish point of view to recant—the size of the victory may determine that—but most of them will prefer the fruits of servile action to martyrdom for principle.

The battle, except for office, is not between the Republicans and Democrats as parties. The real struggle is between the Progressives and the Reactionaries in both parties. The bellwethers of both parties are selected by the interests, and the sheep are expected to follow as they are branded. All are shorn alike, and the big interests take the wool.

The Veneers That Crack

AMERICANS are accustomed to criticize countries in which bullfights are permitted. The cruelty of the days of the Roman Empire when gladiators fought, and lions devoured prisoners before vast audiences, is a thing which we have smugly relegated to dim history.

Yet, Belvin W. Maynard, widely known as the "Flying Parson," died a few weeks ago that American citizens might have a Roman holiday. Before 30,000 spectators at the fair grounds in Rutland, Vermont, he gave his life. A few hours later, a parachute jumper fell to his death before the same crowd.

It is probable that not one of that crowd consciously wished to witness a human sacrifice. Yet they had been brought to the fair grounds by appeals, one of which was aimed at their desire to witness death-defying aerial stunts. Lieutenant Maynard was doing what is known in aviation as stunt-flying, the manipulation of the airplane in such a manner that its gyrations in the sky would afford the maximum of interest to the spectators on the ground, while they simultaneously afforded the flyer the maximum of peril.

Flying is a science, the mastering of which has cost many lives. Loss of life is accepted as in some degree necessary to scientific advance. But human sacrifice in purely foolhardy stunts for amusement of amusement-seeking crowds is inexcusable. The governmental agencies permitting such events deserve censure, and little is to be said in favor of persons who give their implied approval by attendance at such exhibitions.

Judge Gary's New Degree

ALBERT H. GARY, head of the United States Steel Corporation, was voted an honorary degree by Northwestern University after his address at the annual commencement of that institution. The address was along political lines and has been printed and widely distributed since delivery. It is not likely the complimentary honor was bestowed with any thought of endorsing Judge Gary's views, but the presentation has aroused a strong feeling of protest among the clergy and laity of the Methodist Episcopal church on that ground, and on the further ground that a representative college should not seem to take sides on disputed issues.

The impropriety of the university's action is demonstrated in the claim by one of the bishops of the church "that in no sense does it represent the feelings of the church membership generally."

It may be said the act has been productive of good, since, had it not been taken, the sentiment against Judge Gary's position might have remained dormant. As it is, the church membership has been aroused, which is worth while.

Wanted—an Author

AN ARTICLE syndicated through American newspapers, purporting to give an interview with Rudyard Kipling, contained the following quotation:

"Before 1860, America was a nation. But at that time Abraham Lincoln went into a war to determine whether the Negro should be worked or not, and lost 2,000,000 of the best citizens. They were of the pick of Europe. They were people whose ancestors had braved the long journey in sailing ships. They represented the courageous and the strong. After the war, steamships were invented and instead of 80 immigrants, 800 come in every ship and in more ships. America was flooded with aliens of the wrong type. America—the real America—died in 1860."

Mr. Kipling quickly denied authorship or authorization of the interview, which contained also a criticism of the part played by the United States in the World War.

The copyright being off, there is opportunity for any person to apply for credit for the thoughts expressed. No person hampered by diplomatic or political considerations need apply, but if any other is intrigued, he may acquire title to a Kiplingesque statement, un-Kiplinged. It would be unfortunate if the utterance passed into oblivion through anonymity. It has all the courageousness of a Kenneth Roberts' paragraph in "Why Europe Leaves Home."

Reduce the Overhead

THERE is a world of wisdom in the simple recipe for reduction of taxation in the two words: "Cut expense." The trouble with almost every proposition for public improvement is not the actual cost of the project, but the extra cost for interest and upkeep, to which may be added sometimes an additional outlay to make old things correspond with the new.

Another cause for high taxes is the expense of administration of public affairs. No successful private business is conducted with so great an "overhead" as is public service. Employing more help at higher wages than the private business, there are few official departments which could not give as efficient service at half the current expense; yet ever we hear the call for more machinery in government, more help, and higher salaries.

A paper in Boulder, Colorado, uses its cover page as an editorial megaphone, printing its leader in large type. It has recently elaborated on the theme of "Cut the Overhead" by illustrating public expense from its poor fund, an insignificant amount, but in which the cost of distribution was $2 for every dollar of relief extended. It also gave comparisons which indicated a very large percentage of waste in all public activities.

The lessons, however, seem hard for the people to learn. Even actual demonstration fails to last long in the public mind.

More than 30 years ago a party of enthusiasts determined to break up a political ring in a Northern Michigan county and succeeded in getting control of the principal offices. The budget was reduced to half its previous total, and every phase of government was cared for more efficiently. One would naturally expect such a record would be appreciated by the taxpayers, but it was not. True, the ring was broken and its members scattered over the country, but partisanship ruled the next election and since then the former offices have been rotating with little show of change, save as Father Time has removed one occasionally. Of course, taxation again has reached new records.

Taxes will never be reduced by adding to the machinery of government.

Mr. Ford's Page

BY THIS time the country has grown rather tired of the attempts of certain classes to ignore the Constitution of the United States. There has never been a time when the attitude of disrespect to our fundamental law has been so widely encouraged among people who should know better, than since the amendment which removed the government from partnership in the commercialized liquor traffic.

There is need today for a careful distinction between the question of prohibition and the dignity of the Constitution of the United States. Attempts have been made to draw a still finer distinction between the Constitution and the Volstead law. Endless propaganda of lies, and appeals to scornfulness of men against right conditions, have marked every hour of the period since the people by a most decisive and unmistakable action and in concert with their governmental agencies abolished the alliance between booze and Uncle Sam. And the treasonableness of this propaganda lies in the fact that its purpose has been a wholesale and public contempt for the Constitution.

It needs someone to make clear at once several points which have been badly handled by the enemies of the Constitution. First, the action of the American people in destroying the artificial legal character of the liquor traffic, was a deliberate action. It was not undertaken hastily nor under stress of emotion. It was not "put over" by a lot of anemic saints while all the red-blooded men were fighting in France—as a certain argument to the returned soldier would have us believe. (The soldier knows that the government put him under prohibition before the rest of the country got it.) The enactment of the prohibitory amendment was the culmination of 75 years' agitation and deliberation on the part of the American people. If the War between the States had not intervened, the liquor traffic would have been de-legalized 50 years ago. But the Civil War came, setting aside the growing national sentiment against liquor. And then the hold of liquor was greatly strengthened by the taxing of it—the so-called "licensing" of it—a shrewd move which made it one of the pillars of government support, and harder than ever to throw down. So that, the action of this people in acting after a discussion lasting 75 years, ranging all the way from the moral to the economic aspects of the question, can hardly be said to have been hasty or inconsiderate. Neither can it be said to be the imposition of a minority opinion upon the majority. Prohibition came by the votes of people who took a drink when they wanted it. The liquor business alienated its own customers. There were not enough teetotalers in our citizenship nor in our legislative bodies to vote prohibition merely on the ground of personal aversion. The nation was set in its mind to do what it did, and it is done. It was the majority opinion that carried.

Another point to make clear is that the thing which was done has a certain element of finality about it. That point is not clear to many professional agitators as yet, but it will become so. What was done was done. It will remain as long as the present agitation against it remains. That is not to say, however, that the present form of prohibition is final. It is even possible to think that prohibition itself is an artificial thing made necessary by an artificial condition. That is to say, in the commercialized liquor traffic with its politico-saloon combination, there arose in this country a situation so monstrous that it required an equally monstrous antidote. The thing that had grown up in this country had to be destroyed. It required heroic measures to destroy it. But to constitute the destructive measures a permanent fixture does not logically nor wisely follow. However, to forestall any possible chance of interpreting that statement as a support to the present "wet" agitation, let it be repeated that what was done in the prohibitory act was done with finality; it will stand; there will be no modification; "wet" agitation will only serve to make prohibition stronger; the present system of prohibition will endure until the last vestige of the old liquor system has vanished. Then, if any change takes place, it will come not in response to a "wet" propaganda, not with any reference to the commercialized liquor system which has been abolished—it will come as a new and sane use of the natural laws of fermentation. Those who have spent their lives bringing about the freedom of the country from the bane of bad liquor and worse liquor-places may not be ready to visualize the situation which shall succeed a universally accepted and universally triumphant prohibition; but they may have this fact to comfort them, that whatever does succeed will not in any way be a surrender to any demand, or any part of any demand, made by the "wet" agitators.

> *WHETHER prohibition in its present form is final or not, what it did is final. It abolished a commercialized liquor traffic that lined up with a commercialized political traffic, and those two evils have gone beyond hope of return. The evil was monstrous, and it may be that the remedy was monstrous too, but it was sufficient; it will hold until the last remnant of the old system is dead. The best thing to do, therefore, is to respect the Constitution of the United States. The prohibition amendment was the result of 75 years' deliberation on the part of the American people. The "silly season" with regard to the new order of things is past. It is time to insist that the fundamental law of the land be accepted as such.*

Upon the clear understanding of these two points depends obedience to the law. It was but natural that the adventure of breaking the law with a drink should appeal to many of the reckless classes. It was to be expected that the liquor brokers—most of them aliens, all of them kin to the International Financiers—should exploit the appetites of the weak and reap a grand harvest from the remaining stock which a complaisant government so considerately left in their possession. It was quite in line with the rest of the situation that professional secretaries should organize associations for "personal liberty" and the like and flaunt certain well-known names as sponsors of booze in the post-booze era. And it was necessary to the completion of the picture that all the forces of darkness should combine and use all their engines—theaters, press and business—to make war on the so-called Blue Laws which had destroyed "personal liberty" in this enlightened twentieth century! They have all been marched out one by one and paraded with due ceremony. The home-brew outfit and the home "still" and their various poisonous products have had their day, and are gradually disappearing. The recess period is over. The "silly season" is past. The time has come when people with sense ought to frown upon all attempts to make the Constitution a joke and ought to withdraw from those public functions which get their whole zest by surreptitious lawbreaking under the table.

It has been unfortunate that the enforcement of the law has sometimes been intrusted to opponents of the law. But even that has served to uncover the essential lawlessness of the thing which the prohibitory act has outlawed. It was just as lawless in the days of its power; it was just as contemptuous toward the laws that gave it its life as it now is toward the law that decreed its death. Enforcement of the law is not alone an official matter; it is a duty of the individual citizen. And the first element of enforcement is observance. There is now offered for sale no alcoholic beverage which anyone can with safety drink. It is becoming a duty in industry, in the public health service, in every department of public safety, to prevent the poisoner's profit which is taken at the cost of the buyer's character or life. Employers can do a great deal, and ought to do a great deal, to stiffen their men's backbone with regard to the dignity of the Constitution of the United States. The devices of the exploiters and poisoners ought to be exposed that every dupe may see. This whole conspiracy to make money out of the breakdown of law and the victimizing of the people should be shown up, and in the showing up every American citizen of self-respect should lend his aid.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Mobile's Industrial Dreams Are Coming True

Port Improvements Made, Shipping Interests See Splendid Future

By ROBERT H. MOULTON

FOR many years the dream of Mobile shipping interests was a million tons a year. In July, 1920, the dream was realized, the total tonnage for the year, dating from July, 1919, reaching 1,173,874 tons, with a total of 843 vessels entering the port. The high mark for Mobile, however, was reached in 1921, when approximately 1,500,000 net tons of freight passed over the docks, piers and wharves in Mobile harbor, while ships sailed from the port for the West Indies, the United Kingdom, France, Belgium, Holland, Italy, Spain, Portugal, Japan, Honduras and Guatemala, exclusive of the coastwise shipping to points on both the Atlantic and Pacific oceans.

Probably nothing else so forcefully stresses the growing importance of Mobile as a seaport as these items. As a matter of fact, shipping interests of Mobile believe that the port is now well started upon a growth which ultimately will give the city rank among the first ports, not only of the South, but the entire country. With the improvements recently made, including the construction of coaling terminals and much-needed additional dockage room, and with others either in the building or planning, the future of the port of Mobile looks extremely bright.

Barges that floated downstream on the Alabama, Tombigbee, the Black Warrior and the Tenesaw rivers brought Mobile its first commerce and its first real prosperity more than a hundred years ago, the preceding century of the city's existence having been spent as a colonial step-child of France, England and Spain. Barges that travel under their own power from the coal, iron and manufacturing fields of the Birmingham district, down through a complete system of locks and dams, by way of the Warrior and the Tombigbee rivers to Mobile are the bearers of the new and greater prosperity for Alabama's only seaport.

The canalization of the inland waterways of Alabama was the keystone which made solid its structure of commercial prosperity. From the Birmingham district to Mobile the Tombigbee-Warrior river system is navigable for 452 miles, said to be the longest canalized river in the United States. The government has been almost half a century building the lock and dam system on these rivers and has expended approximately $13,000,000 on their construction and on the maintenance of the locks and dams.

When Alabama's rivers and seaport afforded the only means of transportation for the state's cotton and other products destined for the world, no man thought or contended that port development was a local question. The subject was not then and is not now of greater importance to Mobile than to the rest of the state. It was in recognition of this fact that the Alabama legislature of 1915 created the state harbor commission, which took over the duties that before had devolved upon a local board. New and greater powers were given the commission, and the act provided that several of its members should be appointed by the governor from interior counties. Since that time, more rational systems for adjusting freight rates having been devised, the shippers of the state, great and small, have been made to realize the practical benefit to themselves from the development of the Warrior River and the port of Mobile.

The first direct result of the completion of the Warrior River system, giving slack-water navigation from Mobile to the mineral district, was to make Mobile the greatest shipbuilding port of the Gulf and South Atlantic states. In October, 1917, work was started on the clearing of the swamp from a tract of 13,000 acres, just north of Mobile and along Chickasabouge Creek, preparatory to the construction of the plant of the Chickasaw shipbuilding plant.

The land along the banks of the creek was as wild as when viewed by Bienville's explorers, 208 years before. A morass of scrub growth, palmetto and swamp cane grew to the water's edge. The dredging of the creek from its junction with the Mobile River to the ship site necessitated the removal of 1,500,000 cubic yards of sand and earth. Six miles of canal was dredged to drain the swamp area, 20 miles of railroad track was constructed, and permanent housing provided for an army of workers.

In March, 1919, 18 months after the work on the plant was started, the first keel was laid, although this was not done until the shipbuilding berths, permanent structures within which to house the power plant, gas plant, the various shops, mound loft, rigging and sail loft, and numerous storerooms, had been completed. On December 29, 1919, the first steamship, Chickasaw City, of 9,000 tons, was launched amid scenes of greatest rejoicing. Mobile knew that her great day had arrived, by the barge route, for the greatest part of the steel from which this and the succeeding vessels constructed by the Chickasaw plant were fabricated came down the river. Altogether, 18 vessels ranging from 9,600 to 10,000 tons, and valued at more than $1,500,000 each, had been launched by this plant up to the time that the government ended its shipbuilding program.

An important factor which helps Mobile to retain its position or pre-eminence as a ship-repair port is a 10,000-ton drydock of the most modern construction. The capacity of this dock is really 12,000 tons, and it is the largest on the Atlantic coast south of Newport as well as the largest on the Gulf of Mexico. The dock has played a conspicuous part in attracting vessels to Mobile for repairs. It will lift any vessel that can negotiate the 30-foot channel at Mobile. It has a length of 480 feet, a width of 116 feet and a clear width between the wings of 90 feet. There are 10 pontoons, each 116 feet long, 41 feet wide, and 13 feet deep.

Above—Steamship loading full cargo of grain for Europe at Mobile. In oval—Barge "Birmingham" of the Mississippi-Warrior Service loaded with government coal for Mobile.

A feature of the dock is that it can be used as two separate floating docks for smaller ships, being divided into two sections of equal length. By adding two additional pontoons the lifting power can be increased to 12,000 tons. Submergence of the dock is accomplished by pumping water into the ballast tanks placed in the wings of the submerged water line of the dock which, being built entirely of wood and therefore lighter than water, would not otherwise sink. Five pumps on each side of each section, the pumps being 12 by 12 inches, are used. Each group is driven by an electric motor of 150 horse power, the distribution of the power being made through horizontal and vertical shafting. Approximately 45 minutes is required to pump the dock for a full lift.

A practical illustration of this shipbuilding and repair plant is shown by the varied work turned out during the war. Boats of the Ferris type were built for the government; mine sweepers complete, including propelling machinery, deck fittings and riggings, and radio installations; the building of 7,500-ton steel barges for the Panama Canal; and the construction of the 10,000-ton drydock for the Shipping Board.

Another shipbuilding plant, operated by private interests and which has played a conspicuous part in the growth of Mobile during the past few years, built a dozen 5,000-ton steel steamships for the Emergency Fleet Corporation during the war, eight being launched within one year. These vessels, all oil-burning and each provided with 10 tanks of a combined capacity of 330,000 gallons of fuel oil, were sent to all parts of the world, causing a new page to be written in the history of industrial Mobile.

As a great first step toward guarding the terminals at Mobile against private or corporate monopoly and control, the city has acquired water-front property, built docks of steel and concrete, and is now engaged in constructing an immense quay and breakwater, known as the Arlington Docks, at the southern extremity of the harbor. The acquisition by the municipality of water-front property began more than 50 years ago, and the wisdom of this course has been amply justified, both by the good accomplished at Mobile and the evils that have arisen at other ports by reason of their failure to protect their harbor and marine trade against the manipulations of private interests.

The city has purchased all the wharves that could be obtained and has acquired 1,500 feet in the heart of the business section of the city besides some scattering lots. Upon this central property has been constructed a steel shed with concrete floor 1,250 feet in length by 100 feet clear span and 15 feet overhang, covering 142,000 square feet immediately adjacent to the quay line, which lies about 15 feet outside the shed. The aggregate berthing space under corporate or private ownership in Mobile harbor is approximately 15,000 lineal feet. Owing, however, to the increased length and number of ships entering the port since the channel to the Gulf was deepened to 30 feet, additional berthing and warehousing facilities will soon have to be provided.

The Arlington mole, or pier, is below the mouth of the Mobile River and is protected on the north and east by a chain of islands created by the dredging and straightening of the main channel. A $600,000 bond issue was provided for this work which, when completed, will consist of a railway-served pier and dyke, projected eastwardly into the bay 8,300 feet, with a width of 300 feet, and a quay line on the northern or protected side of 5,800 feet. In addition, there is a quay of 1,400 feet at right angles with the northern quay line, the two together giving a berthing space of 7,200 lineal feet in a protected haven, all immediately reached by rails.

This project is one of the most ambitious that has been essayed along the entire Gulf Coast.

Mobile's new ship channel, of sufficient depth for ships of the largest tonnage, is one of the best and deepest channels on the gulf coast and a most valuable asset to the port of Mobile. The present channel is thirty-three and one-half miles in length and extends from the outer bar to a point five miles up the river from Mobile. It has a depth of 30 feet and is 225 feet in width. This 30-foot channel project was adopted by the rivers and harbor committee in August, 1918, and work started a month later. The channel was completed June 12, 1920, after a struggle of 94 years with the sands at the bottom of the bay. The United States Government has expended approximately $9,000,000 on this project.

As evidence of the progressive spirit of the people of Mobile, it is worthy of note that about a year and a half ago citizens of the city, acting through the Mobile Chamber of Commerce, purchased for $37,500 and turned over to the War Department Inland Waterways Division, the site on Blakeley Island which later was used in the construction of the government's coal terminals.

This plant, which has a dock frontage of 500 feet and storage capacity for 40,000 tons of coal or ore, was officially tested and accepted May 11, of the present year. It can handle from barge to storage, or from

(Concluded on page 13)

McDonogh—Or the Miser's Philanthropy

All He Gave Was Happiness, Comfort, Good Name, for Posterity

By GEORGE E. BRYAN

IN THE late forties of the nineteenth century a visitor to New Orleans might have noticed upon the streets of that city an elderly man of an uncommon appearance. If that visitor were superficially curious, he would remark the tall figure, spare and straight; the neat but well-worn clothing of a bygone mode; the hair brushed at the back to a kind of queue; the old umbrella of blue silk. If, however, he were truly an observer, he would especially regard the strong, sharply carved features; the austere expression; the striking brilliance of the brown eyes, which seemed fixed not so much on an immediate destination as on some distant and mysterious goal.

Had the visitor inquired of a casual native who the distinguished looking elderly gentleman might be, the answer would probably have been, "Why, that's John McDonogh, the miser." Then might have followed an instance or two of John McDonogh's reputed meanness: how he was never known to buy a newspaper; how little he spent in the market, and that for soup-bones and potatoes; how, in order to save the ferry-toll of five cents, for more than a quarter century, in all seasons, on fair days or ill—save only once, during a violent storm—he had crossed the Mississippi between the city and his plantation on the west bank in an open skiff rowed by one of his slaves. It was thus that most men spoke of John McDonogh in those days. Yet New Orleans had once spoken otherwise, and New Orleans speaks otherwise now.

A singular story is that of John McDonogh—even for a town that has been the scene of so much that is romantic and strange. Born in Baltimore in 1779, in the home of a well-to-do brick manufacturer, McDonogh received a good education of the common school sort, and when not more than 17 entered the employ of William Taylor, whose large mercantile business maintained a fleet of vessels trading with the West Indies, Spanish-America, and Europe. In 1800 we find him at New Orleans as Taylor's agent—a sufficient testimony to the confidence placed in his ability and character. At that time commercial routes in the United States were, of course, chiefly water routes. With no rival for the trade of the Mississippi basin, New Orleans had, so many thought, a business future more promising than that of any other American city. So, apparently, thought John McDonogh.

Having quickly adapted himself to the climate, he became a Spanish subject. He managed Taylor's affairs with rare good judgment during that difficult period of shifting political relations and of commercial risks when Louisiana was transferred from Spain to France, from France to the United States, and when two wars between France and Great Britain occurred in swift succession. In 1803 he went into business on his own account; and with the expansion of trade that followed the Louisiana Purchase, he greatly prospered. He became one of the prominent merchants of the place, and in 1805 a director of the Louisiana Bank. It was also in 1803 that he made the first of those investments in land that, continued for nearly 50 years, placed him in possession of the most extensive private holdings in the United States, if not in the world. By 1806 he had so prospered that he retired from active mercantile life and gave his entire time to the management of his increasing property.

The McDonogh Monument, Lafayette Square, New Orleans, unveiled in 1898.

"Jane Bay Cottage" in which pupils of McDonogh School live.

The Main Building of McDonogh School, McDonogh, Maryland.

One of the 34 McDonogh school buildings in New Orleans.

John McDonogh was a man of culture. He acquired a good working knowledge of Spanish and French, and used both readily in his correspondence. Preserved among his papers was the list of a consignment of books sent to him in 1806, including such titles as the works of Burns, Dryden, Pope, and Young; Plutarch's "Lives" and other volumes of biography; Gibbon's "Decline and Fall"; William Robertson's "History of America"; and even selected drama. The text of his letters, as published, reveals a clear, vigorous, expressive English style. Imposing in presence and polished in manner; handsome, refined, and respected—such was John McDonogh then. Being such, and being also a man of worldly position before he was 30, he was naturally welcomed to the conservative yet colorful social life of New Orleans. He seemed to have had quite an ample establishment of his own, and to have entertained generously.

In after years, legends came to be woven about this portion of his life. It was said, for example, that, having fallen in love with the daughter of Don Pedro Almonastre y Roxas, he sought the lady's hand, but failed to win it by reason of religious differences—he being a strict Protestant, the lady as strictly a Roman Catholic. Or it was said that about 1814 he paid his addresses to a Miss Johnson, who would have accepted them, but her Romanist father vainly demanded a change of faith on the part of the Presbyterian lover. Thereupon Miss Johnson entered an Ursuline convent, and McDonogh abandoned his town house forever. Thirty years passed, and the lady became the superior of the convent, with the privilege of receiving visitors. Then, every New Year's Day John McDonogh called to pay his respects; it being noted, as one writer has recorded the story, "that he dressed carefully and appeared not at all the old man he was, but the old man that his youth had promised to become."

Such legends were of the nature of elder New Orleans, and they are told there to this day. To verify them, Colonel William Allan, painstakingly collecting the facts about John McDonogh, found nothing in McDonogh's letters and memoranda; and all the ancient beaux who might have thrown light on the matter, had long since departed. Certain it is that the daughter of Don Pedro Almonastre became the Baroness de Pontalba; that John McDonogh was a marvellously reticent man and continued a bachelor; and also—Colonel Allan admits it—that among John McDonogh's effects was found after his death a woman's faded slipper, though none could rightly say whose.

McDonogh assisted in the measures taken for the defense of New Orleans against the British, and in the battle of Chalmette (January 8, 1815) he was a member of Beale's company of volunteer rifles. In June, 1817, his friends realized that a change had come upon the spirit of his life; for it was then that he removed from the city to his plantation in Jefferson parish, on the opposite side of the river. There for the rest of his years he dwelt in a small, simply furnished house, frugally but not meanly, as folk said, in comfort, and cared for by faithful servants chosen from his numerous slaves. He forsook all social gayeties; he entertained no more. It is not altogether surprising that in those rather lavish times New Orleans, intolerant of simplicity in its citizens of wealth, grew to misunderstand and misrepresent him.

For 33 years he went his way. Naturally reserved, he kept his own counsel and had no confidants. Blessed, as he once wrote, "with spirits of great elasticity"; capable of vast labor; systematic, exact, clear-thinking, he moved through the world of men as if he were hardly of it, making no explanations. With ever-waxing ardor he collected acres—acres, as has been said, "sufficient to have made a duchy or a kingdom"; particularly suburban and waste acres—lands around growing towns and villages, back-lands of river plantations on whose frontage improvements were being made. His purchases in the vicinity of New Orleans at last entirely surrounded the city on the land side. Those who in the course of his affairs caught glimpses of him, beheld a man precise and rigorous, toiling 18 hours a day over vouchers, accounts, deeds, legal documents, and correspondence with lawyers and overseers. They beheld a man insistent on his rights, involved in lawsuits, seemingly little interested in current charities. As for the multitude, it saw John McDonogh naught but a symbol of avarice.

His method of dealing with his slaves was set forth by him in 1842, in a lengthy letter to the New Orleans *Commercial Bulletin*. The Negroes were well lodged, fed, and clothed. Offenders were tried by a jury of their peers. For approximately 20 years their overseers and foremen were selected from their own number. Not only that, but (he stated) Negroes "were my clerks, transacted all my affairs, made purchases of materials, collected my rents, leased my houses, took care of my property and effects of every kind," with an honesty and fidelity that won his admiration. He arranged a plan by which they might through their own labor purchase their freedom and that of their families; and in June, 1842, a shipload of 80 persons, thus set free, sailed for Liberia. During the closing years of his life, McDonogh urged a scheme that contemplated the purchase of slaves from their owners by the United States Government and the transportation of the freedmen to Africa; believing that thus a way might be opened to the permanent, peaceable settlement of the slavery question.

On October 24, 1850, befell an event so out of the ordinary that passers-by stopped to gaze, and the press made report of it. The tall, old gentleman with the blue-silk umbrella paused on Canal street, hesitated, entered an omnibus. It was declared to be the first time that he had ridden in an omnibus within the limit of the general memory. The rattling omnibus halted; the old gentleman alighted and disappeared in the courthouse. Whatever may have been his business there, it was his last. Gossip learned that because of faintness he had taken the omnibus; and soon, that he had passed away.

When his will had been probated, gossip learned more—much more. It was a long will, perhaps among the longest ever drawn up; yet there were five scripts of it in McDonogh's handwriting—one kept by himself, while the other four had been intrusted to as many different depositaries, from each of whom he had taken a triplicate receipt. It was a will that set New Orleans agog; yet between its lines it carried a peculiar pathos. It devised the bulk of his estate—about $1,500,000—in equal parts to the cities of New Orleans and Baltimore for the establishment of free schools for the education of the poor. In it he directed that his funeral be "plain, without parade, and with the least possible expense," and asked that "it may be permitted annually to the children of the free schools (situate the nearest to the place of my interment) to plant and water a few flowers round my grave." In memoranda attached to the will he mentions his especial indebtedness to his parents for "the care they took in instructing me and having me instructed in music"; and of his devotion to investments in land, he says: "For the basis of a permanent revenue . . . . I have preferred the earth, a part of the solid globe. One thing is certain, it will not take wings and fly away as silver and gold, government and bank stocks often do." He likewise declares: "I have much, very much, to complain of the world, rich as well as poor. It has harassed me in a thousand different ways. Suits at law, of great injustice, have been carried on and instituted against me, to deprive and take from me property honestly acquired (for I have none, nor ever would have any, that was not acquired by honest industry and the sweat of my brow); and when obliged to seek justice through courts of law, it has often and often been refused me."

(Concluded on page 13)

Etchings Are All the Vogue in Art Today

Yesterday It Was Steel Engravings, Tomorrow Woodcuts May Be Fashion

By H. G. SALSINGER

FASHIONS change in art as well as in dress. In art the change is not so sudden but still it cannot be described as gradual. The style shifts rather rapidly at times.

Some of the changes in styles of art are natural, others are forced. As there are dictators of fashions in dress so we find dictators in the matter of taste in art.

Women wore dresses short last year; they are wearing them long this year. A certain artist's work was the rage last year, another's has the call now.

If women wore the same style of dress two years in succession, less dresses would be sold and if the same style continued in art, the market would suffer.

In art there is a powerful commercial factor. And there is advertising, a most vital factor in commerce.

An art dealer acquires a large output of the work of one man. He places the output on the market. By liberal advertising and lavish publicity he creates a vogue for that particular work of art. There may be one or two or even three dozen artists as good and some better but the advertising for one will carry his work above the others in popular recognition.

In the commercial field art is a gamble. What is regarded as great today will probably be called ordinary in the light of future reasoning, study and development, and work that is overlooked today will be in demand in years to come.

Millet, painter of peasants, sold some of his best works for the equivalent of $2 and $3 of our present currency. Millet also etched. One might even say that Millet was first an etcher and second a painter; he painted after his etchings. Millet's etchings are in greater demand today than they were 10 and 20 years ago. They have grown steadily in value.

Not long ago steel engravings were in vogue. These were generally large pictures and you still see many of them. Some were landscapes but the most popular were those of animals. You may find prints showing a stag at bay, two stallions engaged in a fight, dogs in the field, horse drinking water, a mule munching hay, dogs resting, a black and a white horse, rearing, registering fright because of lightning that is forking from black clouds in the background, a team of horses being led to the auction block.

These subjects sold. Some of them brought $200 and more, while $90 was considered a moderate price. An art dealer told me recently that he had bought steel-engraving prints for $90, confident that if he held on to them long enough they would bring anywhere from $500 to $1,000. He cannot get $10 for them today and most of them cannot be given away.

Prints of steel engravings are still sold. These sales are rare. Engravings of historical subjects find occasional sales. Educational institutions and museums buy them and, on rare occasions, individuals want them as matters of curiosity or record, but the general public will have none of them.

At the time that the subjects, steel engraved, were selling for more than $100 wholesale, it was possible to buy etchings of Rembrandt, Millet, Whistler and others for considerably less, but few availed themselves of the opportunity.

In prints there are, besides engravings, etchings, aquatints, dry-points, mezzotints, wood engravings, lithographs. Most popular among them today is the etching.

At the important summer auction sales in the East, the call was for etchings. In the list of art objects offered for sale, etchings brought the highest prices and some of the rarer prints offered went under the hammer at new record prices, something remarkable at auction sales. No bargains were secured in etchings of the better class.

To illustrate the difference between prints this explanation is offered:

Etchings—These are made, nearly always, on a copper plate. First the plate is heated and then a composition, chiefly of wax, is melted upon it, smoothed and cooled. After it hardens it is smoked, by holding it over a candle. The surface is blackened. The etcher draws upon this blackened surface with an instrument known as an etching needle. He uses it as he would a lead pencil or pen. The needle cuts through the thin, blackened surface into the copper beneath. When the drawing is completed, the plate is placed into an acid solution. The acid eats into the copper, where the needle has exposed it.

Dry-Points—Made by digging into the bare copper, using a sharp-pointed instrument like in etching. The copper is not covered and no acid is used. The pointed tool throws up the copper on the sides of the lines. It holds the ink in printing.

Aquatints—The covering of the plate is of a sandy nature and unlike the wax surface of the etchings. In aquatints the acid is laid on with a brush, the artist working as he would in making a wash drawing. When the covering is removed and the plate printed it gives the impression of a drawing made upon paper with brush and ink.

Mezzotints—The copper plate for this process is first prepared with an instrument that has a curved edge, and fine teeth. It is known as a mezzotint rocker. It is run over the surface of the plate until a mass of dots is formed and a uniform black surface would result if the plate were printed. The artist then uses a scraper and scrapes away part of the surface. The part scraped will print lighter and the more he scrapes the lighter it will print. In etchings the artist works from white to black, in mezzotints from black to white.

Lithography—In its ordinary form a crayon drawing on stone. It is practically the same as crayon drawing on paper. The crayon sinks into the stone. After the drawing is finished the surface of the stone is covered with acid. The acid fixes the drawing so that it resists well in printing.

Wood Engravings—A hard and close-grained wood block is used. The engraver cuts away all parts of the block that are not to be printed from. In cutting he may use any sharp instrument, including a knife, any instrument, in fact, that will cut into the surface of the wood.

Color Printing—When color prints are made from wood engravings or lithographs a number of blocks or stones are used. Each stone or block has that part of the drawing that is to be printed in a particular color. The sheet is run through the presses as many times as there are colors in the picture. The stones or blocks are changed each time. Some artists make color prints from one plate. If this is done the artist must apply the color with a brush and paint the same picture upon the plate each time.

You have often heard these names used in describing pictures and comparatively few people know how to differentiate; therefore, the explanation given briefly above. Books have been written upon each subject and each process but here brevity is necessary and the object is to give a general idea.

Modern science has helped modern art. Years ago the artists who etched often had reverses. Some really great etchers were poor printers. They spoiled many prints. There was also the plate; they became useless often after only a few prints had been made.

Years ago the matter of printing was provided with a solution when professional printers did the work. Nearly all the artists, instead of printing from their own plates, took the plates to a professional printer and had him do the work.

The science part in the matter of prints is not among the ancient things. Steel has been the saving help of many fine plates. Nearly all etchings now are steel-faced. It is possible today to print 1,000 copies from an etching that is steel-faced. Without the steel facing an artist would be lucky to get 200 good prints, frequently not that many.

Many great dry-point etchings were lost. The dry-point was the most delicate of all plates and the lines often crumbled after two or three prints had been made. Often a dry-point plate "fell to pieces" on the first impression. All dry-points are steel-faced and have been for several years.

Steel engravings used to be the thing, but, as remarked earlier in this article, they passed from vogue. So, in the matter of prints, it is possible not alone for the artist to go out of style but likewise his method of portrayal. Historical subjects still sell but they have historical value while the steel engravings "after paintings" are valueless.

Etchings that were passed by during the rage of the steel engraving are commanding high figures today. Millet's, as pointed out, are selling for larger sums than ever before. One of the leading art dealers in the country told me, "Millet is just catching on." Why should Millet be just catching on today when his paintings have brought fabulous prices for years?

The price of a print depends on several things. The fame of the artist, the condition of the print, the rarity of the print, its value from the standpoint of workmanship, its artistic merit. A good copy of Whistler's *Nocturne* has sold for $3,900; a copy of the same artist's *Garden* brought $2,300; Cameron's *Five Sisters* sold for $2,300; good prints by Rembrandt have sold at prices ranging from $6,000 to $8,000; Dürer's best prints sell from $3,000 to $7,000. Dürer, the Bavarian, engraved upon copper but two of his etchings were made on zinc. The old masters who etched preferred copper. They got more delicate lines and the copper was easier to cut into.

When working into zinc a broad, deep line can easily be secured. The acid eats into zinc much faster than into copper but in copper it is possible to secure anything from the finest hairbreadth line to a strong stroke.

The price of a print is also determined by its state. An artist makes an etching. He gives it the acid bath and makes a few prints. It is not satisfactory. He decides to take out some lines and add new ones. He fills the lines he wants to remove and works in new lines. Then he prints again. He may want to make further alterations. He will probably make several more. Each time he makes alterations the etching is in a state.

The etching, *Peasants Going to Work,* passed through 10 states before it was finally finished. You conclude that the finished state is the only one of value but the reverse is true. The first state sells for $970; that is what the last sale brought; while prints from the plate in its final state sell for $70. In the first state only three or four prints were made while in the last state more than 350 prints "rolled" off the presses, or were lifted off the presses, for in making prints from plates, hand presses with flat "beds" are used.

The first impressions are generally the best, for the line wears down with each successive print or impression. The brilliancy of the line is lost. The prints become fuzzy and mussy. The ink smears because the surface of the plate is worn.

Before the steel facing was used plates were a long gamble. A plate would collapse at a most unexpected moment. This collapse, however, kept the production low and low production of good prints means high prices.

Prices change rapidly in etchings. Today the vogue is in etchings and certain etchers have the call over others. Among the old masters the works of Rembrandt, one of the greatest painters of all time, still bring fabulous sums and unquestionably always will. Millet, peasant painter and painter of peasants, is in greater demand than ever before; Whistler, classed among the modern painters, is sought after or, rather, his work; Dürer etchings are precious.

Among the etchers of our own generation a greater demand exists. Pennell, one of the best etchers, is in vogue. His work finds probably the greatest demand today. In the last two years the prices of Pennell etchings have doubled.

A few years ago etchings and lithographs by Brangwyn were much in demand but this demand has greatly decreased. Etchings by Zorn are still sought after but not so much as a year ago. Recently a print by Meryon, considered by some to be the greatest of all architectural etchers or etchers on architectural subjects, sold for $2,000. Works by McBey, Cameron and Bohn are being pushed. Francis Seymour Haden, one of the leading etchers of modern times, did some fine work but there is not the demand for Hadens today that there was a year ago.

There have been hundreds of artists who made etchings and dry-points, mezzotints and aquatints, woodcuts and lithographs. Thousands and thousands of such prints have been offered on the market. Some of them (and the percentage is astonishingly small) have become popular but hundreds of others, splendid works, never became well known, because of lack of publicity.

Prints of etchings used to be sold in Europe as picture post cards are sold today. When you travel today (as many people do) you are apt to send post cards to the folks at home, bearing a photographic impression of some point of interest in the spot you are visiting. A great many people keep albums and collect these post cards. In Europe they used to send etchings in the same way, as souvenirs of a visit and, instead of a post card album, people kept portfolios for their etchings. Some of the highest-priced etchings today have come out of the portfolios kept in some European homes.

Again, a great many etchings sold today, came off a modern printing press. We have seen counterfeit Zorns, Millets and Rembrandts that would fool even some experts. It is easier, it seems, to duplicate an etching than to fake a painting. Printing has made it easy.

An expert on paintings said once that he would never buy a painting unless he watched the artist paint it. He admitted that he had been fooled by fakes on several occasions. There is also the chap who said that Corot, one of the greatest landscape painters of all time, had painted not more than 10,000 canvases during his lifetime and that of these 30,000 were hanging in American homes, art galleries and picture shops.

Relating just a few of the facts among the thousands that can be told in connection with the art:

One hundred years ago the European etchers were all going in for landscape subjects. Before that they were doing portraits. Landscapes are a drug on the market today. The style constantly changes.

Twenty years ago color prints were much in demand; today, it is the black and white etching that is asked for.

Artists, whose work brought large prices 10 years ago, are forgotten today. There are a few exceptions and we have named practically all of those who are exceptions. The works of Rembrandt, Dürer, Millet and a few others will continue in demand, undoubtedly.

In a few years mezzotints, woodcuts or lithographs may be the style. Lambs may be lions; lions, lambs.

Across the Lake From Zorn to MasOlle

IN THE last few years there sprang up a craze for etchings by Anders Zorn, the Swedish master. Zorn passed to the beyond. His etchings continued selling, bringing larger prices than ever. But now there come the stories of one greater than Zorn. His name is Helmer MasOlle who, like Zorn, is a Swedish peasant. Zorn and MasOlle were born on opposite shores of the Siljan Lake. They painted the same people but in slightly different manner.

Here, in the most recent instance, the style swung from one side of a lake to the other and where yesterday Zorn had the call of the public, it is now being turned to MasOlle. And, tomorrow, who?

Etching Style Does Not Mean High Prices

WHEN etchings are mentioned the layman has visions of prices in three and four figures, chiefly the latter. This due to the reported sales of some rare prints. But, original etchings can be bought for prices as low as 25 cents. The curator of one of the largest and most important museums in the country, has a large collection of etchings. Some of them are regarded as valuable; all are good. This collector has never paid more than $1 for an etching for his collection. When he started collecting etchings he set the limit of any one print on a single dollar and by adhering to this limit he has still been able to purchase an immense number of prints.

Biographies of the Letters of Our Alphabet

Did You Know That "A" Was Once an Ox-head, That "N" Was a Fish?

By CARL SCHURZ LOWDEN

EVERY day we read and write A, B and C and all the rest. We use them automatically. We use them because our forefathers handed them down to us. But what is the meaning behind the letters? Why are they drawn so? Whence did they come? How long have they been employed by man for communication?

The alphabet developed in a haphazard fashion. Consequently some of our letters are of little use. K may be substituted for C without disturbing the pronunciation. Neither Q nor X are of more service to us than they were to the Romans. Though we have 26 in the alphabet, only 23 letters really work; and these have the heavy task of handling 32 sounds.

Did you ever see a slim man wearing a fat fellow's suit? The vaudeville character was no more ridiculous in his ill-fitting garment than we are with our cumbersome mechanism for writing and speaking. Perhaps you can visualize what a building would be like if it were made by Phoenicians, Greeks, Romans and Anglo-Saxons each with their own ideas of architecture and of construction. Well, that's our alphabet.

When Topsy in "Uncle Tom's Cabin" was asked about her birth she gave the information, "I s'pect I grow'd." She knew nothing of her origin. We know more, of course, concerning the alphabet; yet we have little knowledge on the subject that can be called absolutely right. In a rough sense the Phoenicians contributed 19 letters; the Greeks, four; the Romans, two; and the Anglo-Saxons, one. We commonly ascribe the origin of our alphabet to the Phoenicians, but they may have copied from the Egyptians who had a system of their own.

The Egyptians adored birds; in fact, they worshiped them and therefore used them in their pictorial writing. A was represented by a rude drawing of an eagle, B was a crane and C was the throne of a king. The human hand, mouth, lion, sieve, shutter and lasso were some of the other symbols.

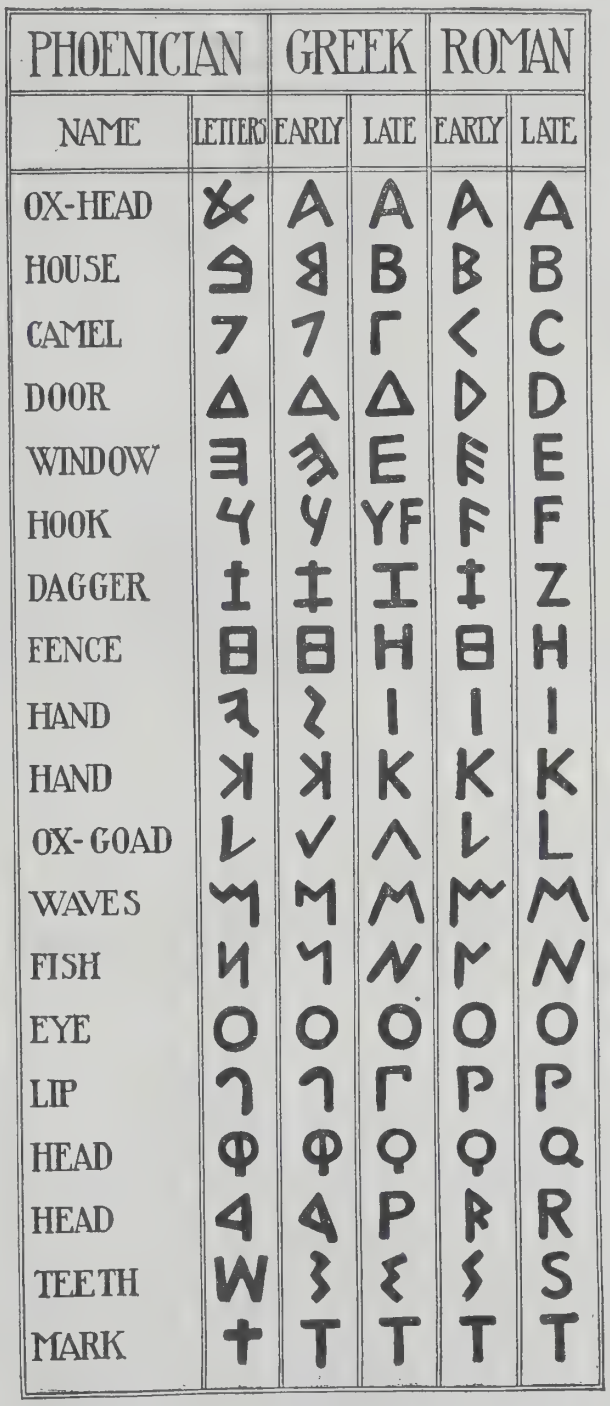
Whenever a native of Egypt wished to record the sound of M he scratched on a slab of stone a frontal picture of an owl. The sons became careless and left off a part of the outline; their sons became even more careless, and eventually with the coming and passing of the generations only the ears of the poor old owl were used. Face an owl and draw his ears with a touch of exaggeration. Do you see the resemblance to M? Some philologists tell this story of the letter's origin.

But there is another story. The Phoenicians were a seafaring people and therefore the ocean figured prominently in their thoughts. Their character, *Mem,* was a series of lines connected to represent a cross section of the waves; it looked much like our M that we use today. The story is logical, as the Mediterranean constituted that ancient nation's highway of trade. The Greeks and Romans accepted both the form and sound of the letter; thus they jointly transmitted it to us.

Until very recently the hieroglyphic writing of the Egyptians was considered to be the parent of all the alphabets in the world. In a general sense, it may be; but with 19 letters rather definitely traced to the Phoenician system of writing it must truly be regarded as the daddy of ours. If the Phoenicians borrowed the idea, they probably got it from the Egyptians.

Phoenicia was a nation of traders whom Huxley called "colossal peddlers of the ancient world." They had little creative ability but they manufactured and sold their wares in many countries. A people so commercially active needed some method for recording their transactions. There were contracts to be made and receipts to be issued. For a long time they cut notches in sticks for numbering their articles, and they marked their prices with various symbols or pictures. With the continued growth of their industries something better was demanded. Out of the need there developed a system of communicating thought silently.

Did some Yankee of the ancient East invent the Phoenician alphabet in its entirety and hand it ready-made to his fellow citizens? Or was it a slow progression to which many scholars contributed? Certainly the 22 pictures of familiar objects was a workable alphabet defective only in its scarcity of vowel sounds. Certainly the complicated system of their African neighbors with probably 15 times as many signs or symbols thrown together in a deplorable mix-up could by no means be considered really workable.



Little is known of the origin of the Phoenicians and their primitive migrations. Herodotus said they were a Semitic race "dwelling upon the Erythrean Sea" which apparently was the ancient name for the Red Sea or the Persian Gulf. He said also that some of them "passed over and dwelt in the country along the sea-coast of Syria." Then he explained that this section of Syria "and all as far as Egypt" was "called Palestine."

Other authorities agree that these ancient sea rovers sold their products in Egypt where a crude system of keeping records was used. It is reasonable to suppose that the crafty traders took the general idea. The mass of evidence, though largely circumstantial, indicates that they discarded the crude Egyptian symbols for others more intimately connected to their own home life.

"The Phoenicians," Eusebius asserted, "did not claim to be the inventors of the art of writing but admitted it was obtained by them from Egypt." The same tradition is current in the classical works from Plato to Tacitus. The credit for the invention of the alphabet should not be given wholly to either nation: The Egyptians made a bad start and nothing more, but the Phoenicians assimilated the idea and developed a concise system far better than the sign-symbol chaos.

Perhaps it was about 1500 B. C. that these traders of the Mediterranean brought into Greece their merchandise. Some of the newcomers settled in the new land. The Greeks acquired alphabetic writing. There is a story to the effect that Cadmus, the Greek hero, brought the precious characters into the country of his birth; but little credence is attached to it now.

"The fall of Mycenae gave to Phoenicia her opportunity," declared one historian. "She was quick to seize it by establishing depots throughout the Aegean and by securing the overlordship of the Mediterranean. But through her lack of political unity and her dependence on mercenary aid when troubles came, finally she succumbed to the strong arm of the reinvigorated Greek. Between their rise and decline the Phoenicians had put the alphabet into its present form and secured its adoption by the Greeks."

This tablet indicates the evolution of the 19 letters derived from the Phoenician.

At first the Greeks used only 15 letters but later they took others and added some of their own designing. They made some changes in the form of the letters. The greatest change of all, however, came when they ceased writing from the right to the left and adopted the left-to-right style which we employ today. They clearly evinced a preference for angles and straight lines to curves.

The Roman Empire obtained the alphabet from the Greeks but made it over into two kinds of characters, the capital and cursive. The capitals we have today; we use them, as the Romans did, for inscriptions and other writing demanding prominence. The cursive or running characters, prototypes of our present small letters, were employed for correspondence or where rapidity of writing was essential. The Romans substituted curves for many of the Greek angles.

There are teeth in our alphabet. Perhaps you never thought it had this savage aspect. The word "possess" has a goodly number of teeth and "scissors" also has an ample sufficiency; really there are eight in each. The mystery disappears before explanation. The S of the Phoenicians looked like our W, represented two front teeth and was called Shin. It resembled saw teeth.

The evolution of the apparent W into S closely illustrates the Greek and Roman peculiarities. The Greeks turned it on its side and elongated it; then they reversed it when the direction of writing changed. The early Romans cut off the bottom line, thus creating an angular S. The Romans of a later period modified it by making it in the form of a continuous in-and-out curve.

In this age a man or woman who cannot write, makes a mark. Invariably it is an X. In the days of old the cross served as the sign of identification. The Phoenicians made it as we make our plus symbol in mathematical calculations, but the horizontal line was elevated above the middle of the perpendicular. It was the last letter in their alphabet. They called it Tav. From it the Greeks derived their Tau; when the Romans received it they gave it the name of T. The raising of the crossbar to the top of the perpendicular has been the only alteration the letter underwent.

Presumably the Greeks added a flock of four letters to those they obtained from the traders on the Mediterranean. These are U, V, X and Y; amplified from the parent character they designated Upsilon; this in turn had developed from Ayin, the Phoenician word for the eye.

Pythagoras, the Greek philosopher and geometrician, drew a moral from Y which received the name of the "Samian letter" because he was born on the isle of Samos. He told his pupils that Y represented the parting of the ways inasmuch as it began with a straight line which diverged both to the right and the left at a point comparable to the time in life when the choices of a career and of conduct are to be made. In making the letter it is manifestly impossible for the pencil or pen to proceed continuously along both lines of divergence; one must be chosen and the other abandoned for the moment. Wherever the student beheld Y it put up to him the moral question, "What choice are you making in life?"

The earliest friend of man among the brutes was selected as a symbol of the first letter in the alphabet. The ox was harnessed to the plow centuries before the horse became domesticated. His body supplied strength-giving meat, and the cow contributed the inestimable boon of milk. With the aid of the ox, man subdued the wilderness. The beef, dairy and leather industries were made possible by this animal.

Aleph was the name of the ox, also of A which pictured the head. Turn the modern A upside down and let the bar project beyond the triangular sides. The top ends are the horns, the sides are the ears and the pocket comprises the remainder of the head with the nose at the point. Careless scribes gradually turned the character around, shortened the ears until they disappeared and sharpened the nose.

When the Greeks made this letter they called it Alpha instead of Aleph. The Phoenicians pronounced it much like Eleph which must have been the word for a gigantic ox; with this as a root or stem some people added three letters to obtain our modern designation for the largest animal the world knows.

The outline of the eye constituted O. The ancient alphabet-makers gave it the name of Ayin; if you drop the latter syllable you will notice how closely it approximates our word eye. It may have contained a central point to represent the pupil, but that has not come down to us. From it the Greeks got two letters, Omicron, little O, and Omega, great O. The Greeks of a later period shifted great O down to the end of their alphabet so that "Alpha and Omega" has ever afterward signified "the beginning and the end."

Do you see any connection between P and the pouting lower lip of a pretty girl? Note the profile from the point where it touches the teeth to the point where it begins to recede. Then remember that with the change in the direction of writing consummated by the Greeks they reversed the character. The Phoenicians called it Pi but pronounced it as we do today. Every time you see the letter you look at the symbol of that feature of the human face which ranks next to the eyes in expressiveness; the eyes are first, the lips second.

Q is the back of the human head together with the neck. The inventors of the symbol let the line bisect the circle so that one gets the uncomfortable feeling that the neck is a driven nail. The Greeks ceased to draw it in that style, eliminated the bisecting part of the line and retained only the tip as an appendage. The early Romans accepted Q as the Greeks gave it to them, but those of a later era pushed the tail over to the lower right of the circle.

Resh, the Phoenician term for R, is a profile of the head. The face looks to the left, but nobody knows whether the one big angle represents the nose or the chin. Apparently the head has no back and none of the usual rounding out that characterizes the cranium. The Greeks flopped the letter over and curved its projecting part. The Romans added a short diagonal at the point where the curved line strikes the perpendicular; later this mark was doubled in length.

The Thanks of the Country After 25 Years

Code Word, Forever Secret, Sent Lieutenant Rowan on With Message to Garcia

By HARRY H. DUNN

OUT in a high frame house, perched on the summit of Russian Hill, lighted at dawn by the sun's first rays pearling across the summits of the distant Sierra, and bathed in gold by the last rays of the setting sun laying a lane of liquid fire through the Golden Gate, lives a man who waited nearly 25 years for the thanks of the United States Government for a deed of heroism performed in war. His name and the tale of his deed have been placed in the hands of more than 40,000,000 young Americans.

He is Lieutenant Colonel A. S. Rowan, U.S.A., retired. He was Lieutenant A. S. Rowan, U.S.A., attached to the Bureau of Information at Washington, when, in August, 1898, he carried a message—since become world-famous—to a sandal-shod, machete-armed Indian named Garcia, hidden in the jungles of the Pearl of the Antilles. Lieutenant Rowan set out on his errand through the deadly Spanish lines as a matter of duty; when he returned he had united the insurrectos of Cuba with the army and navy of the United States for the final blow at the power of Spain in the New World. He did that which he did because it was to be done; he did not expect any thanks for the doing of his duty, and he received none. He did not expect any thanks at this late date, but his friends thought that this republic should give to him some mark of recognition—even though after a delay of 24 years—and they moved swivel-chair Washington to award Colonel A. S. Rowan, retired, a special Congressional medal, since no medals were regularly authorized at that time.

Elbert Hubbard welded Rowan and Garcia and Cuba into a short book—"A Message to Garcia"—which thousands of corporations, firms, commercial and civic organizations and individual employers placed in the hands of millions of workers throughout the United States, the idea being, "if you have a deed to do, do it now!" Most employers today will agree that, whatever may have been the condition in 1898, there are very few Rowans left in the world to carry messages to Garcia, or to anyone else. Yet Colonel Rowan, as we sat in the tall house on the top of Russian Hill, out beside the Golden Gate, the other day, impressed me as still being well able to seek, aye, to find another Garcia in another Cuba, and deliver to him any sort of message that it might be necessary to deliver.

Indeed, Colonel Rowan, though he has had a third of a lifetime in which to consider it, holds that what he brought back from Cuba was far more valuable than the message he took with him.

"We might have got along very well without Garcia," he says, "and it is possible that Garcia might have won out without us, in a long time, but we could not have done what we did without the information, the maps, the data on the Spanish forces, which the revolutionary leaders gave to me, and which I carried back to Washington. It was the 'come-back,' not the 'go-in,' that was valuable."

Straight, rather tall, with a silvered thatch of hair, and still in the pink of health, Colonel Rowan, to all appearances, is still the army officer on the job. Sitting straight like an arrow in one of his high-backed chairs, this most celebrated of all messengers told me, with remarkable memory for men and places and times, the story of the bearing of the message to Garcia; more than this, he told me just what that message was, how and where it was delivered, how he made his way through the Spanish lines, in and out, and why he did it. To me, the most remarkable feature of the entire story was the fact that the then Lieutenant Rowan did not ask a question from the time he was instructed to find Garcia, until, after delivering his message to the revolutionary chief, he said:

"Where are the Spaniards?"

He had traveled more than 2,000 miles on a mission of which only three men in the world knew, with a memorized message that only three men knew, and his first question was one to which the whole American nation wanted the answer. But, here is Colonel Rowan's story, briefly told:

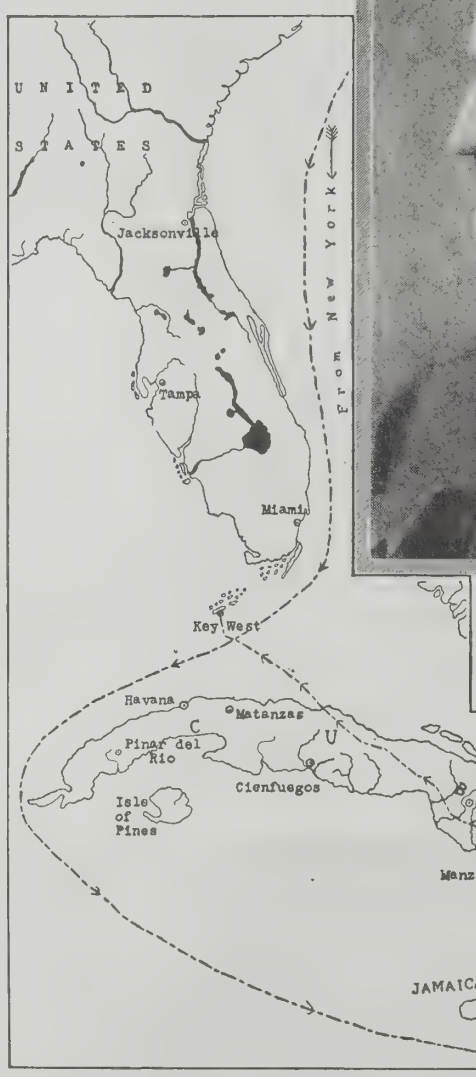
"When Colonel Arthur L. Wagner, who was in charge of the Bureau of Information of the War Department in Washington, informed me that I had been selected to find General Calixto Garcia, chief of the Cuban insurrectos, and say to him:

"'The United States has decided to declare war on Spain,' he warned me to remember the fate of Nathan Hale in the Revolution, and of Lieutenant Richey in the Mexican War, but the method of my finding Garcia was left to me; I was told to find him. I decided to take no papers of identification with me; indeed, to carry no documents of any kind, since, as I had previously learned the Spanish language while engaged in map-making in Central America, I believed I could persuade Garcia of my identity as a representative of the United States Government, and could compel the belief that my message was official.

"Leaving Washington ostensibly on a vacation, I went quietly to New York, and there took steamer for Kingston, Jamaica, where I confided my desire to see Garcia to the American consul. I did not tell him of the official nature of my errand, or of the message I carried filed in one of the 'pigeonholes' of my mind. I believe he thought me to be an American soldier of fortune, seeking to join the Cuban insurrectos, and, as his sympathies apparently were with the revolutionists, he asked no questions and I told him no lies. Kingston, as well as all Jamaica, was literally alive with spies for both sides in the Cuban conflict, and my greatest necessity was secrecy, for it was as dangerous that I be revealed to the agents of the Cubans, as that the Spaniards learn my purposes. To be seen with the Cubans would have meant that I was an enemy of Spain, and to be seen with the Spaniards would have marked me for the bullet or knife of some fanatic revoltoso. And that was the hardest job I had on the whole trip—keeping clear of everybody but the American consul in Kingston.

"Then, after four or five days in the Jamaican capital, waiting for word that President McKinley was ready to let loose the army and navy, I received a cablegram containing one code word. I shall never forget that word; neither shall I tell you what it was. It was and is enough that I received it in time. Hiring a carriage, with a driver recommended by the American consul, and dressed in linen suit and straw hat, such as that affected by prosperous planters, I drove slowly northward, out of Kingston. On my person there was not a card, letter, tag on clothing, or other mark by which I could be identified. If I met death in the Cuban jungle, at the hands of the Spaniards, or under the muzzles of the rifles of over-hasty Cubans, I would be listed as 'missing,' and that would be the end of my story.

"We drove northward, across Jamaica, sufficient funds having been supplied to silence the loquacious lips of a Latin-American driver. When we reached the northern coast, I instructed the driver to wait at the side of the road for me for one hour; at which time, if I did not return, he was to go back and report my 'disappearance' to the American consul at Kingston. I may say, in passing, that, though I never returned to the 'coche,' the cochero likewise never reported me as missing to the consul. If he had so reported, he would have received another ten dollars, so I considered his inaction merely his own loss, and, possibly, my gain.



"Unarmed, save for money, and a small pocketknife, a pipe and tobacco, I slipped into the jungle, found a thick tangle against a tree, and rested there until I heard the coachman starting back to Kingston. Then I took to the road again, and loafed along carelessly into a small fishing village, whose whereabouts had been fixed in my mind by maps in the consul's office. There, after careless questioning of the natives, I found a boatman whose main source of revenue was the carrying of adventurous spirits across the channel between the northern shore of Jamaica and the southern coast of Cuba. He guaranteed no deliveries on land; one waded ashore into Cuba from his boat, anchored out as far as the wading was good, but his name—which I shall never forget—was Xavasio Sabio, and he lived up to the last word of that name, in silence at least, for it means 'Wise Man,' or 'Wise One.'

"We embarked in a 20-foot boat, with one small mast, and two other men as sailors, with no conversation except as to destination and price, purpose being left out of the discussion. Both being agreed on, we left, nominally on a fishing trip, late one afternoon, and, the following afternoon, I saw about one hundred yards from the boat, a broad strip of sandy beach, backed by a solid green wall of jungle, the southern shore of Cuba. I waded to land, waved my hand to the boatman, who already was coming about to return to Jamaica, and slipped under cover of the jungle, to watch the beach, for I had been informed that through this section of coast, the revolutionists were receiving arms and ammunition.

"If I remember correctly, I waited about an hour, when an unarmed man slipped out of the jungle, walked up and down the beach a few minutes, and signaled with his hand back into the forest, from which almost immediately emerged some 30 other dark-skinned individuals, all armed with several varieties of rifles, machetes and knives. I walked out on the beach and was instantly covered by half a dozen rifles, but, seeing that I was unarmed, and an American, or an Englishman, they allowed me to approach, soon lowered their rifles, and, after hearing my story, took me to their camp and to a *teniente*, or

Bourbon Prince's Chateau Forfeited to France

Chambord Possesses Rare Architectural and Historical Attractions

THE SOUTHERN FACADE OF THE CHATEAU DE CHAMBORD.

By ADRIENNE RICHARD

ROMANCE, linking the far-off days of Francis the Magnificent and the Field of the Cloth of Gold with prosaic police investigation of a present-day attempted burglary, gives vivid contemporaneous human interest to a description of that splendid reminder of royalty in France's Golden Age, the Chateau de Chambord in Touraine.

Until a few years ago, the Chateau was the unquestioned property of Prince Elie of Bourbon-Parma, a cousin of the Duke de Orleans, whom thousands of French people regard as the rightful King of France. Prince Elie, however, having married an archduchess of the Austrian blood-royal, adopted his wife's nationality. He was given a captaincy in the Austrian army at the outbreak of the war and promoted to colonel at its close. Soon after these facts were brought to the attention of the French government, and an order was issued by the court sequestrating the Chateau and its extensive landed appanage. This sequestration was sustained by a ruling of the First Chamber of the Court of Orleans on an appeal by Prince Elie from the order of the court at Blois refusing his request for the removal of the sequestration. But Prince Elie has again appealed, this time to the Court of Cassation (or last resort) at Orleans. This appeal is still pending, the trial having been several times postponed through the activity of the Prince's very able lawyers who claim to have discovered important new evidence bearing on the actual national status of the appellant. The case has been a bit complicated by the intervention of the Princes Sixte and Xavier of Bourbon-Parma, half brothers of Prince Elie and brothers of the Queen of the Belgians and of the ex-Empress Zita of Austria. This Prince Sixte, it will be remembered, played an important part in the secret negotiations with the Allies in Switzerland in 1917 for a separate peace with Austria, the prince at that time serving as an officer in the Belgian army.

All this, of course, has sharpened speculation and gossip over an alleged attempt to burglarize the Prince's apartment. Possibly, it was only an ordinary attempt of a second-story man to make a haul of loose silver; but many are inclined to link it up with a daringly dramatic attempt to obtain or to destroy important evidence in this celebrated case. Altogether, the incident sharply emphasizes the successive steps in a historic contest over a historic castle that might well provide thrills for "movie" audiences—a contest which may have grave political consequences.

On the final decision of the Court of Cassation hangs the future fate of the Chateau: Whether it shall belong to Prince Elie, to the Princes Sixte and Xavier, or—and this is the big question—whether it shall remain permanently sequestrated by the state in conformity with the Treaty of Versailles, to be liquidated for account of the reparations due by Austria. In this last case the masses would see in the event the exemplification of a tardy justice that should long ago have restored to the nation this ancient and historic royal palace making it public property as are the palaces of Versailles, the Tuilleries, Fontainebleau, Saint Germain and St.-Cloud.

To understand the present legal status of the dispute, we must go back to the year 1907, when its then owner, Robert, Duke of Parma, died in Vienna, leaving his estate to his 18 children by two marriages. The Princess Zita, later Empress of Austria, and Prince Elie were children of the first marriage. The matter of a partition of the estate was brought before the Grand Marshalate of the Court of Vienna, which tribunal, under the inspiration, it is said, of the old Emperor Franz-Josef, awarded to Prince Elie, as the eldest son, almost one-half the entire heritage, including the Chateau de Chambord. Although the final settlement was not made definite by court order until 1916, Prince Elie, before the outbreak of the war, had boasted of his exclusive rights of proprietorship. But in 1915 the president of the Tribunal of Blois put the Chambord estate under a writ of sequestration, at the same time making express reservations as to such rights of succession as might later appear. As a matter of fact, no public record was made of the sequestration at that time.

During the war, however, Prince Elie re-affirmed his Austrian nationality, while his two half brothers, the Princes Sixte and Xavier, domiciled in Paris, enrolled themselves in the Belgian army, their royal blood barring them from obtaining commissions in the French army. Among other decorations, however, they gained the French *croix de guerre*. It is to be noted further that the Princes Sixte and Xavier never accepted the regulation to the succession to their father's estate fixed by the Austrian court. Resting their claims on French law, they put in a claim before the court at Blois that the Chateau should remain the undivided property of all the heirs of Duke Robert. Prince Elie, who within the past year has become a naturalized Spaniard as a descendant of Philip V and cousin of the reigning sovereign, opposed this claim of his brothers, at the same time objecting to the competency of the Blois court's jurisdiction.

The private office of Francis the First in the Chateau.

As early as the twelfth century, the counts of Blois were lords of a sort of manor in the Chambord country which they used as a hunting rendezvous. About this manor hang legends stranger and more numerous than facts genuinely historic. But it is known that King Francis I chose the spot for the site of one of the most magnificent edifices that could be planned, even in an epoch in which architectural luxury in both construction and embellishment knew no limits. For hundreds of years, the Chateau de Chambord has remained one of the most beautiful monuments of the French Renaissance.

When the construction of the Chateau was begun under Francis I, no fewer than 1,800 skilled and unskilled workers were employed upon it under two "Masters of the Works," Messieurs Pierre Nepveu or Trinqueau and Jacques Coqueau, also called Coquereau. The work was continued throughout the reigns of several of his successors, but it was not until after Louis XIV, *le grand Monarque,* came to the throne that the edifice received its finishing touches. The historians generally assume that the "Masters of the Works" were also the architects who designed the building, although this point is not undisputed. Its importance lies in the fact that they bore undeniably French names, so lending force to the affirmation that Italian art did not figure in the design. One thing certain is that Chambord stands out quite distinctly in its differences of architectural style from that of the many edifices erected during the prevalence of the taste for the Italian Renaissance, its entire plan recalling rather the touch of Gothic in the French castles of the Middle Ages.

The plan of the Chateau is substantially a parallelogram in which the four corners are each flanked by a round tower, on one side of which leans a construction equally rectangular also flanked by a round turret. The mass of this auxiliary construction, in fact, constitutes the donjon which forms so important a feature of all the old French fortresses. This donjon is really the principal part of the whole edifice; that to which the architect has given the greatest care and elaboration of detail.

The most striking feature or the interior is a massive stone staircase occupying its center and giving access to the four wings of this immense fortified palace. It is approached from four spacious halls or corridors, *the salles des gardes,* arranged in the form of a cross. This stairway is so wide that two persons may ascend and descend it side by side simultaneously without touching each other.

The body of the main building is surrounded on three sides by constructions which originally were not uniformly elevated above the first story, but which were

Delaware, Where Corporations Are Unconfined

Ten Cents a Thousand Brings a Charter, Then Let the Buyer Beware; Revenue From Incorporation Amounts to Half Million Dollars Annually

By WILLIAM A. M'GARRY

This is the fourth of several articles by Mr. M'Garry, in which will be related some of the many forms of crookedness in which the public suffers.

A STATE in which ex-convicts jailed for stock-promotion swindles can obtain legal authority to unload more worthless stock on the public for the ridiculously small fee of 10 cents a thousand dollars is largely responsible for the flood of frauds that has inundated the United States, and that is still engulfing the savings of working men in every other state in the union. That state is Delaware, the second smallest commonwealth in the entire 48.

Since 1899, Delaware has been in the business of giving legal sanction to frauds. Profits to the state are so large that in recent years nearly one-half of the revenue accruing to the general fund of the commonwealth have come in the form of fees or franchise taxes on corporations. Back in 1902 the business was already showing signs of growth. In that year Delaware incorporated 1,407 new companies at its bargain-counter rate of 10 cents a thousand dollars, or one hundred dollars for the right to sell a million dollars' worth of stock. By 1919 the number of companies incorporated had grown to 4,776, and that average has been maintained ever since, despite deflation, hard times and the closing down of industries. Last year 4,568 charters were granted.

Too Busy to Renew Charter

THE very fact that the number of charters has not increased during the last few years is also significant. Many of the promoters doing business in store windows, in house-to-house canvasses and in factories and mills employing large numbers of workingmen are still operating on the old charters. They have found it so easy to get the money and the risk of arrest so negligible that as soon as the entire million dollars' worth of stock is sold for the first time, they move on to another part of the country, get another batch of stock printed and go right on selling it in small lots; in amounts so small that it will not be worth while for the victim to pay the expenses of hiring a lawyer and going into court to collect. Others, more careful, make provision in the initial charter for total stock issues of five to ten million dollars. Then all that is necessary when the first million dollars' worth is sold is to vote authority to issue another million, and keep on selling.

Statistics of Delaware's income from her legalization of all sorts of fly-by-night promotions offer still another interesting new development. In addition to the initial fee for the issuance of the charter, Delaware has an annual franchise tax of $50 for the first million dollars of stock, and $25 for each additional million. The franchise tax is not collected in the year the charter is issued. Heretofore there were hundreds of corporations that had simply disappeared by the time the franchise tax was due. That was fairly good evidence that such corporations were in the fraud class in their origin. In recent years the death rate of the frauds has grown less. Promoters have discovered that it is safer to keep their charters alive, and that discovery has meant a tremendous increase in the revenue to Delaware from the franchise tax.

Despite that relatively new trend the official records of the corporation death rate offer the best possible proof of the kind of business Delaware is doing. Those records are rather hard to get at for recent years, due to a change in the bookkeeping system. But it is possible to get enough of them to show what is being done. Some years ago a group of citizens got together in Delaware to establish what they called "The Clearing House of the Delaware State Program." All of those associated in the movement were civic leaders and big business men. They issued a booklet entitled, "What Delaware Makes and Spends," and in it appeared the following:

For Revenue Only

"NO OTHER source of the state's revenue has been so critically discussed, inside the state and outside, as the corporation revenue. Favorable provisions of the corporation law of Delaware result in the incorporation here of many new companies representing interests outside the state. Although the number varies from year to year, still, as the revenue shows, the tendency has been indubitably toward increase, both in the number of corporations and in the amount of capital.

"'But each year also,' the state treasurer pointed out in 1906, 'A number of corporations allow their charters to become forfeited, many without making a single payment upon the annual franchise assessed against them.' Those that do not pay for two years are 'proclaimed' out of existence by the governor. There were approximately 1,550 corporations whose charters became void in March, 1919. That is the largest annual total to date, but the total for some years past has frequently exceeded 1,000.

"This means that in the case of every corporation whose charter is voided there has been a two years' loss to the state, if only the revenue feature of the situation is considered."

Note the point of view. Those Delaware citizens knew that the jailbirds flocked to Dover for their charters and that many of the corporations created there were frauds. They knew, or should have known, that failure of the promoter to return to pay his franchise tax was partial evidence that he had sold all his stock and was through, and that the victims were left "holding the bag." Yet they are concerned mainly with the "revenue feature of the situation." They are mourning the loss of, say, $75,000 to $100,000 in franchise taxes that might have been paid by those 1,500 corporations. But what of the millions of wage earners who paid several hundred million dollars for the stock of that same group of companies, and got nothing?

It might be argued that Delaware takes official recognition of the kind of business it is doing. Read this from the same booklet: "The attorney-general is empowered to recover from proclaimed corporations their arrears of taxes, and many appoint for this purpose special deputies who receive thirty-three and one-third per cent of the amount of taxes collected by them. Probably in most cases the thirty-three and one-third per cent is not easily earned, when it is earned at all."

In other words, Delaware pays a blue-sky rate of commission for the collection of its franchise tax.

"Governors and other public servants have had a good deal to say from year to year about the precariousness of the corporation revenue and the folly of counting too largely upon it," the booklet adds. "'Careful legislators will recognize,' the governor's inaugural message of 1909 points out, 'that the large sums we are now receiving annually from corporations may not be permanent. If many states should enact a law similar to ours, it would mean a great reduction in the revenue received by us.'"

Corporation Death Rate

AUTHORITIES are agreed that the amount of money lost by little American investors every year in fake stock promotions runs above three hundred million dollars. It has been my opinion for some years that the amount is really very much greater. Take the Delaware charter record of 1921. In that year the state received in initial fees $585,932.82. At the rate of 10 cents a thousand dollars that sum indicates that Delaware authorized total capitalizations for all those companies of $5,859,000,000. The death rate for the year is not at hand. But the figures for earlier years show that corporate mortalities run up to a billion dollars a year, and higher. In some years 90 per cent of that amount is dead loss to wage earners who have been induced to buy fake stocks with nothing back of them.

At that rate the small investor could take over the Steel Trust in a year or two if some method could be devised of stamping out the promoter and putting the funds he is getting into steel stock. And that brings up the question of what is to be done about it. Various financial authorities have devised schemes to let the little investor into the legitimate investment field. It was explained in the previous article why it is not worth while for the legitimate security salesman to attempt to sell direct to the wage earner. He could not reach enough men in a day or make enough sales to pay his expenses, when the rate of commission is the legitimate three per cent. Obviously, the answer is some form of group security buying, and in every plan that has come to my attention that idea is used in some form or another.

It is not my purpose to advertise any broker's pet scheme. Without being laid open to that charge, however, I can point out some of the possibilities of group buying. Every wage earner knows how the group idea has been applied to insurance. Nearly every modern industrial plant carries it in some form. The public is familiar also with the movement to permit employes to buy stock in the corporations for which they work. As a rule that buying is done individually, and the aggregate power of the market is not brought home to the attention of the wage earner.

Mr. Mitten's Idea

THE Philadelphia Rapid Transit Company handled the idea differently. Rather it was the workers of that company. A fight developed in the board of directors for control. Thomas E. Mitten, president of the company, had a co-operative agreement with his men. Through their co-operative association they sold government bonds to the value of $240,000, the savings of several years, and bought 10,000 shares of the company's stock. That gives them the largest single block of the security. They got the stock at $24 and since then it has climbed to $32, giving the co-operative association a net profit of more than $80,000. In addition, it is estimated that fully 20,000 shares were bought individually by the workers, so that their total profits are more than a quarter of a million dollars. What is more, from their point of view, is that they now have representation on the board of directors.

The problem can hardly be solved, however, by individual corporations. Bankers must take an interest. All authorities are agreed that an era of great industrial expansion is ahead, and it is quite within the bounds of possibility that if the country is to develop as it should the present class of protected investors will not have sufficient funds to supply the nation's needs. Then it will become imperative for the bankers and brokers, the Federal Government and the governments of all the states to furnish protection and guidance for the small investors in exactly the same degree as they are furnished to the man with plenty of money. Various forms of trust agreements have been suggested and there should be no particular difficulty in working out a safe and practical plan. The wage earners may be reached in groups through their employers, as they are by group insurance.

Federal Incorporation

BEFORE that can be done it will be necessary to curb Delaware. That part of the problem can be solved by each state for its own citizens. It is simply a matter of passing laws that will take into consideration the tremendous risks inherent under the Delaware system, and that will make it too expensive for the promoter to operate. Of course, there are legitimate corporations doing business under Delaware charters. Some of them may object to the passage of protective laws in other states, but their interests cannot stand against those of the whole public. And for that matter it should be simple enough to make exceptions for the legitimate companies that are really producing something. Many authorities believe the easiest solution is a Federal incorporation law, and Delaware officials themselves have said that such a law would end their monopoly of blue-sky charters.

Just why Delaware is chosen by the promoters is partly a matter of price, but not altogether. The more cautious of the dishonest promoters would be quite willing to pay higher rates if they could get any more latitude than Delaware allows them, or more chance to get away. It goes without saying that since most of them choose Delaware it must be that Delaware offers the best terms available. That could be proved, but it would require a long and tedious comparison of Delaware's corporation laws with those of other states. One thing, however, is easily explained. That is the matter of the annual meeting. In virtually all other states it is required that the meeting of stockholders shall take place in the state of incorporation. Delaware permits its promoters to call a meeting anywhere they choose.

That means that if any of the actions of the promoters are questioned they can send out notices of a stockholders' meeting to be held in San Francisco. The session can be held quite in accordance with law and the chances are one in a thousand that enough of the stockholders will turn up to interfere with anything the promoters may want to do. Such precautions are quite unnecessary in most of the blue-sky promotions because after the stock is sold no attempt is made to do anything but get away. The promoter follows the usual method of selling in small lots and making quick sales, which are virtually all profit.

Safe in Delaware

WISE promoters do not attempt to sell much of their stock in Delaware, for the reason that the state has provisions in its corporation laws to protect its own citizens. A few months ago I attended a meeting of stockholders at Wilmington in a concern referred to in a previous article in this series, operated by a promoter who has built up a fraternal organization to help him sell stock in his schemes. It did not take long for the authorities to get an injunction against him in Delaware and in other states to prevent him disposing of any of the property of the corporation.

That happened to be one of the few cases in which there was any real value back of the stock. Judging from what had taken place, the promoter did not think he had anything in the way of real value, at the outset. His stock in trade was an oil lease. He had also some hopes of natural gas. Perfunctory efforts were made to produce, and much to his astonishment a regular flow of both gas and oil was obtained from the wells. At that point the promoter started to do some jockeying to get the leaseholds away from the corporation in which he had been selling stock, and into the hands of another one in which he held the stock control. A few of the stockholders happened to have enough means and time to look into the matter. They discovered what was going on and blocked him.

Wage earners solicited by stock salesmen might bear that case in mind. The chances always are in the case of such promotions that there is no real value. If value should unexpectedly develop it is quite within the bounds of probability that the greedy promoter will try to shift ownership, perhaps by a perfectly legal sale for a purely nominal sum, and nine times out of ten he will get away with it and the investor will be cheated just as though there was nothing back of his stock.

Mobile's Industrial Dreams Come True

Concluded from page 6

The municipal grain elevator at Mobile.

storage to ship, 400 tons of coal per hour. A creosoted timber wharf, on pile foundation, 33 feet wide and 500 feet long, extends the entire length of the plant. A structural steel unloading bridge travels the length of the wharf and operates a four-ton coal or ore bucket. A structural steel reloader also travels the length of the wharf, being able to pass under the unloading bridge and work on either side of that structure. The storage floor, which is parallel to and in the rear of the wharf, is 80 feet wide and 500 feet long.

The unloader, which removes the coal from the Warrior River barges, operating the four-ton bucket, transports the coal to the storage in the rear. In transferring coal to ships for bunker or cargo the process is reversed. The unloader bridge bucket lifts the coal from the storage pile and deposits it in a bin on the bridge pier. There it passes through an automatic weighing device, thence to a belt conveyor paralleling the wharf, and so to the waiting ships on which it is loaded through telescopic chutes.

Admiral W. S. Benson, who visited Mobile with two other members of the Shipping Board, thus estimated the situation from Mobile's commercial and strategical point of vantage:

"Alabama's river system, leading into the northern section of the state with its iron and coal and steel, and developments yet to come, necessarily means that this business will pass through the port of Mobile. From Mobile it is a straight run through the Yucatan channel to the Far East, to the west coast of South America and to the islands of the Pacific. Then commerce bound for other points can be handled from Mobile direct through the Panama Canal.

"In view of these facts, I am impressed with the tremendous development made and would strongly urge every effort for a continuance of the work already begun and that it be carried out with a view of meeting the demands that I believe the future will make on the ports and to take advantage of the natural geographical position of Mobile as a port. This refers not only to the channel, but to warehouses, cargo-handling facilities, and ship-repair facilities, to care for present trade and for the tremendous demand that may rise."

And Mobile, proud and happy in this expression of opinion from the Chairman of the United States Shipping Board, is girding herself to the task of providing all the facilities needed to make her one of the chief seaports of the country.

McDonogh—Or the Miser's Philanthropy

Concluded from page 7

The will solved the secret of McDonogh, the miser. He had come to look upon himself as but a steward of "the little riches of this world" which Providence had been pleased to confide to him for a high and beneficent purpose. It was in the execution of that purpose that he had been so frugal, so consistently and unsparingly zealous and absorbed. Because he had regarded it as a duty to keep intact the wealth consecrated to that purpose, he had stood without compromise for his rights in the courts. That he might not be diverted from this central aim, he had held less strong the claim of many other worthy benevolences. Gradually it was brought to light, however, that for years he had been giving time, money, and intelligent thought to the education of many protégés—brothers, a sister, nephews, nieces, white orphans, Negro youth.

In spite of judicial contests, natural depreciation, costs of administration, and the havoc of war, the two cities had in 1886, according to Colonel Allan, a larger amount of valuable property than John McDonogh left. Baltimore's share has been applied to the establishment and development of the finely housed and well-equipped McDonogh School, at McDonogh, 12 miles northwest of Baltimore. There, on an estate of 835 acres, in a beautiful region, poor boys of Baltimore may receive instruction in English, geography, history and mathematics; business practice (with office work); farming and gardening, woodworking and printing. Adequate preparation for entrance to college is also provided for such boys as "show the ability and ambition necessary for one who must make his own way in obtaining higher education." "Boys admitted on the foundation," says the catalog, "have no fees of any kind to pay, the entire expense of their maintenance and education being borne by the school as long as they are connected with it." New Orleans' share was used for public school buildings; up to May, 1922, so Superintendent Gwinn informed me, no less than *thirty-four* such buildings had been erected, either wholly or in part, from the McDonogh fund—thirty in Orleans parish, four in Jefferson. About $200,000 remained, administered by a McDonogh commission. For a time, at least, the fund was drawn upon not only for building, but also for furniture and repairs.

"McDonogh, the miser"—it was, after all, a mistaken by-name! Exacting and rigid he indeed was, but no misanthrope. It may have been that he was eccentric; that (as Severn Wallis suggested) his mind hovered "perilously near the point at which men mistake their desires and convictions for direct and divine inspiration" . . . . But he was neither a speculator, nor a usurer, nor a profiteer. Strangely grim his life had been; but at the end its meaning burst forth like sunshine after a clouded day. Men who would not choose the path he trod, may join to honor the work he wrought.

Bourbon Prince's Chateau Forfeited to France

Concluded from page 11

topped by mansards in the seventeenth century. This addition has the defect of masking the graceful outlines of the façades, so allowing only the campaniles of the stairways to be perceived from the outside.

The Chateau contains 440 rooms, every room being provided with a chimney and fireplace, while 13 wide stairways run from the ground floor to the roof. It is to be noted that none of these rooms were furnished in the old days. According to the custom of the time, when the king decided to pass a few days or weeks at the Chateau, he had a crew of carpet and tapestry workers sent on ahead to furnish the apartment chosen for occupation by the court.

Not until the arrival of Louis XIV on the scene do we come to the most important chapter in the annals of the Chateau de Chambord. And this importance, for the modern mind, is due less to the presence of the king than to the fact that Chambord became the scene of two celebrated *premières* given there by Moliére and his company: the first representations of "Monsieur de Pourceaugnac" in September, 1669, and of "Le Bourgeois Gentilhomme" in October, 1670.

Following the Revolution, the first republic confiscated the Chateau and made it a national domain, seeking (but failing) to find a purchaser willing to pay a price that would substantially replenish the national treasury. So it came about that one of the first acts of Napoleon after he was crowned Emperor was to bestow Chambord on his favorite, Marshal Berthiér, Prince de Wagram, with an annual income of 500,000 francs. On the restoration of the Bourbon monarchy, Louis XVIII having suppressed this Napoleonic pension, the widow of Berthiér obtained, as a favor, the right to sell the domain, as its upkeep constituted a burden too onerous for her to sustain.

So it came about that in 1820 Adrian de Calonne, an ardent royalist, conceived the idea of raising by popular subscription a fund for the purchase of Chambord that it might be offered as a residence to the newly born son of the Duc de Berri, and named Duc de Bordeaux. Despite the protests that arose on many sides against this idea, the subscriptions to the fund amounted to 1,542,000 francs, which sum was deemed sufficient for the redemption of the estate. Thereafter, the Chateau belonged during half-a-century to the Comte de Chambord, Legitimist claimant to the throne of France. On his death in 1883, he bequeathed the domain to two foreign princes belonging to the House of Bourbon; Robert, Duke of Parma, already mentioned, and his brother, the Duc de Bardi. In France, this bequest was severely criticized by an almost unanimous public opinion.

Biographies of the Letters of Our Alphabet

Concluded from page 9

From the hand we have derived three letters. I is the profile of the open palm, and J is the same with the fingers moved a third of the way toward the palm. K represents the profile with two fingers bent at a right angle to each other. The Phoenicians called it Kaph. The Greeks christened it Kappa, and finally reversed it. Since that time it is practically unchanged.

Which of our letters symbolizes a fish? You might guess a long time without hitting upon the correct answer. The ancient sea traders gave it the name of Nun. It is N. Originally the back and open mouth of the fish was suggested by the lines, and apparently no dot was ever used to represent the eye. The character went through a succession of changes but it is made now almost as it was at the beginning.

Lamed was the goad or whip which these merchants of old used to accelerate the movement of their oxen. The symbol started as an upright line with another thrust upward from the base to the right. It experienced some ups and downs as did N, but today it is the same as at first with the exception that the base line forms an angle of 90 degrees with the other. Have you guessed this one? Half of "well" consists of ox goads, but "parallel" contains three.

The famous "ship of the desert" holds the third place in the alphabet. The camel was the favorite animal of the ancient world. The Phoenicians employed great caravans of them in their business on land. They gave to the valuable beast of burden the name of Gamel or Gimel which the Greeks corrupted into Gamma. At first the letter was merely a silhouette of the animal's head and neck; then it had the appearance of our 7.

Nearly every letter of the alphabet has much interesting lore and legend in its history. E is no exception to this general rule. At least one of these bits should be quoted inasmuch as it cleverly describes the fifth character as

"The beginning of eternity,
The end of time and space,
The beginning of every end
And the end of every place."

The windows of the ancients were closed with a lattice; glass was not then used in them. These openings played an important part in the home life of the people. Backyard gossip had not come into style; so the city residents exchanged confidences from the vantage point of the latticed space. The letter was originally made with the left side of the window off; the only change of any consequence came with its reversal. That's the story of our most-used symbol.

Pioneers of writing drew H much like E. They probably left the side off the representation of the window in order that it might not be confused with the other sign; they were similar with that exception. H pictured a section of a fence comprising two posts linked together by three horizontal boards. It was called Cheth. The Greeks designated it Eta, retained the original form at first, then omitted the upper and lower boards. When the Romans borrowed it they gave it the sound it possesses today.

There are hooks in our alphabet. "Fife" has two of them. These hooks or nails with a hooked top may be taken as the symbol of architecture or of shipbuilding to which they were indispensable. F differed slightly from E only by a base line.

A weapon graces our alphabet but was nearly crowded out of it. This is the dagger or short sword which the Phoenicians manufactured in large quantities from bronze and sold to the nations with which they had commercial relations. A Phoenician blade was considered the best obtainable; it bore the name of Zayin.

The Greeks made use of Zayin but rechristened it Zeta. For some reason the Romans moved it along to the end of the alphabet where we keep it still. Nothing more than the handle was pictured. In order to trace the letter rapidly without lifting the brush the Romans employed a diagonal line to connect the two bars; they first made it in its present form.

The houses of the ancient traders were open in front and closed only by curtains, if at all. They made a cross section of the house for their second letter. It received the name of Beth, their word for house. It has survived in a modified form as "booth," a curtained flimsy structure for voting or used in street fairs. So the word has come down to us with some of its ancient meaning. The Greeks transformed Beth to Beta; later they combined it with Alpha, the first letter and thus created "alphabet." Literally "alphabet" is the head of an ox and a house; probably in those days the oxen were stabled in a section of the human habitation.

The Phoenicians chose Daleth, door, for their fourth letter. They drew it as an equilateral triangle. It may have represented the entrance to the tents of the caravans that traded with them; or it may have been derived from the openings in their own houses, as these had a triangular shape since the curtains were partially pinned back except during stormy weather. There are these two similar theories regarding the birth of D.

For some reason the Greeks prolonged one side of the triangle; the later Greeks, however, restored D to the form given it by its inventors. The Romans tilted it so that its left side was perpendicular; later generations preferred curves to angles, so they smoothed its right into a semicircle. Thus we have it today.

Many interesting facts and side lights may be found in the history of the alphabet; there is room here only for two. The twenty-first verse of the seventh chapter of Ezra contains all the letters in the alphabet except J; it is therefore known as the Bible's "alphabetical verse." Eighteen or twenty words of the English language contain all of the vowels; but there are just two, "abstemious" and "facetious," that have them in their proper order of A, E, I, O and U.

In the Land of Lightning and the Chickadee

Of the Lying Titmouse and Old Doc Thunder, Indians and Rattlesnakes

Where "water cannibals" lurked on top of Lookout Mountain.

Grand canyon of the Tennessee River near "The Suck."

Looking down at the haunt of "Brass."

By HARRY E. BARNET

THOUSANDS of automobile tourists traveling north and south know "The Suck," near Moccasin Bend in the Tennessee River at Chattanooga. It is the most picturesque highland section along the unbroken highway between Mackinac and Miami, and probably it is the section on which the most sensational engineering work was done. These aspects of it create curiosity, so that, "Why do you call it 'The Suck'?" ask the tourists. So far this question never has been answered. Here is practically all there is to be said:

Peaks and valleys of the Blue Ridge, the Indians said, were ranged by a woman monster. Because her skin was as hard as rock, and no weapon could dent it, she was known as "Stone Dress." No one knew her real appearance. She could assume any shape as quick as a flash, and the one that helped her most at the time was the shape in which she showed herself. Usually, she was a very old squaw.

But "Stone Dress" had strength enough to tear cliffs in two and to carry the pieces wherever she wanted to take them. If she struck two rocks together, the blow cemented them. To get over the rough country between "Tree Rock" and Whiteside Mountain without climbing steep hills and wading streams, she gathered immense bowlders, and undertook to build a bridge across the space with them. It was a solid structure as far as it went, for "Stone Dress" pushed each piece of it in place with a bang, and it stuck there like a leech. Lightning struck and shattered the bridge, however, when it stuck out like a spur from "Tree Rock" halfway to Whiteside. The fragments still cover a ridge in that neighborhood.

Human livers were the food of this monster, and she got them by stabbing Indians with the forefinger on her right hand. It was very long, commenced at her wrist, and was shaped like a spear. Hunters made themselves scarce when they saw a beautiful young squaw going through the woods, singing:

"Uwe la na tsiku. Su sa sai.
"Liver, I eat it. Su sa sai."

The song was tuneful, and the sight was pleasing, but whoever saw the girl knew she was "Stone Dress" on the hunt for food. In defense against her, it was decided to trap her in a pitfall, where all the warriors of the mountains could attack her at once, and be safe from the thrusts of her spearfinger.

Now while "Stone Dress" roamed everywhere in the Blue Ridge, she spent most of her time at the headwaters of streams, and in dark passes. Her favorite haunt was in the neighborhood of a gap on a trail at the foot of Chilowee Mountain. A huge hole was dug across the trail there, and artfully covered with grass and twigs. Near it, the Indians built a big brush fire, and hid themselves among some laurel bushes. Presently, the hidden warriors saw an old woman approaching. She looked like a squaw who was well known in that part of the mountains—but she had her right hand concealed beneath her blanket. "Stone Dress" kept her right hand out of sight to hide the spearfinger. On that account, a few of the old warriors wanted to shoot the woman as she neared them. Younger warriors interfered.

While the Indians were arguing, the old woman stepped on the pitfall, broke through it, and fell into the hole. Instantly the feeble squaw was "Stone Dress" in a rage, thrusting her spearfinger in every direction like a lance. The warriors rushed out of the laurels, and surrounded the pit. They shot from every direction, but when their arrows struck the skin of the monster they splintered, and fell at her feet. The monster taunted her enemies, and tried to climb out to get at them. She was unsuccessful, and the Indians were wasting their arrows.

A little titmouse perched on the limb of a tree overhanging the pit when the battle commenced.

"Un, un, un," it shrilled.

The Indians thought the bird was attempting to say "unahu," (heart), and to tell them to shoot at the heart of "Stone Dress." They shot their arrows where her heart should be, but the shafts and flint points were shattered as before. This angered the warriors. They stopped the battle, climbed the tree and caught the titmouse. When they got it to the ground they cut off its tongue, and turned it loose. Since then, it is said in the mountains that the titmouse is the liar among birds.

Later, a chickadee flew down, and alighted on the right hand of "Stone Dress." The warriors took this to be a marker, and they shot there. The monster doubled her hands into fists, and with the spearfinger held before her, she rushed furiously about the pit. Suddenly, she made an upward leap and opened her hands to grasp it. An arrow struck where the spearfinger joined at her wrist. The monster dropped back dead; her heart was there. The chickadee won, therefore, a reputation for truth-telling that still exists.

News of the death of "Stone Dress" traveled over the mountains, and Indians came from everywhere to look at her body as it lay in the pitfall. Even Thunder came to look down at the dead monster, and he lived for a while with the Indians in the neighborhood. Soon after he left there a child was born, and the

In the weird stories of Indian mythology, cannibals lived in the river bottoms, where modernized life looks like this.

Indians said he was the son of Thunder. When the boy was a stripling, sores appeared on his body.

"Your father, Thunder, is a great doctor," the boy's mother told him. "He lives far to the west, but if you can find him he will cure you."

The boy set out on the trail. At Moccasin Bend he came to the home of "Brass," reputed to have been the greatest gambler of that time, and the inventor of the Indian game that was played with a stone wheel and a stick. "Brass" challenged every traveler who passed his home to play against him. But he was tricky, and won the majority of the games, so that he had his cabin filled with furs and beads, and chunks of gold he won from Indians who lived in Georgia. Occasionally, "Brass" lost, and then he would bet everything he owned, even his life. But the winner had no chance to collect—"Brass" was a magician, and he could take on different forms.

"Stop and play with me a while," said "Brass" to the boy.

"I'm looking for Thunder," was the reply, "and I haven't time to stop."

"Why, he lives only eight miles down the river," said "Brass," with a smile. "You can hear him rumbling down there all the time, so we might as well play a game or two before you go on."

"But I've nothing to bet," argued the boy.

"That doesn't matter," replied "Brass" reassuringly. "We'll play for your pretty spots."

The boy refused, and went on. At Thunder's cabin he asked Thunder's wife for his father.

"Come in, and we'll soon know about it," said Thunder, who overheard the conversation. "I have traveled in many lands, and I have many children."

The boy entered the cabin, and Thunder told him to sit on a blanket. Under the eastern half of it were long, sharp thorns of the honey locust, points upward. The boy sat on them without knowing they were there.

"You're my son," said Thunder. "If you weren't, the thorns would stick you. Now, why did you come to me?"

"I have sores all over my body," was the reply. "My mother told me you were my father, and a great doctor, and you would cure me."

"Yes," Thunder said, "I am a great doctor, and I'll soon fix you up."

A large pot stood in a corner of the cabin. Thunder told his wife to fill it with water, and put it on the fire. When the water boiled, Thunder put some roots in the pot, and threw the boy in after them. The water boiled for hours.

"Now, take the pot and throw it in the river, boy and all," commanded Thunder, and his wife obeyed. The river surged and tumbled. At that spot it never has been quiet since the pot started the commotion. Indians named the place "Pot-in-the-water," because the surface of the river resembles boiling water in a pot. The whites renamed it "The Suck," because they found it to be a place of dangerous whirlpools. The vicinity was given the same name.

Steam came in a great cloud from the river. Where it touched trees and bushes on the bank it left them blotched and streaked. Thunder's wife peered over the edge of the bank when the cloud lifted, and saw the boy clinging to the roots of a tree that hung in the water. His skin was clean.

"When we go in the cabin," she said to the boy, after she helped him to the top of the bank, "your father will give you some new clothes. But when he opens the box, and tells you to pick out your ornaments, be sure to take them from the very bottom.

"Then he will send for his other sons to play ball against you," she concluded. "There is a honey locust tree in front of the cabin. When you get tired, strike the tree, and your father will stop the play, because he doesn't want to lose it."

Thunder spread a buckskin suit, a belt, and a headdress on the box. The boy put them on. Thunder opened the box. It was filled with every variety of mountain snakes.

"Pick out your necklace and bracelets," Thunder said. The boy plunged his hand to the bottom and pulled out a huge rattlesnake, which he wrapped about his neck. He twisted four copperheads about his wrists and ankles. Thunder gave him a war club.

"I'll send for your elder brothers," Thunder remarked. "You must play with them."

Thunder intended the game to be a fight for life. His brothers were older and stronger. The contest took place in the picturesque section called "The Suck." Thunder rolled, and the young Thunders kept pace. Lightning zigzagged at every movement of the boy—he was then a young Lightning. When he was tired carrying on the battle alone, and against the two, he aimed a blow at the honey locust tree. Thunder stopped the fight.

"You are brave and strong," was Thunder's comment.

Then Lightning told Thunder of the offer of "Brass" to play for the spots on his skin.

"Yes," Thunder responded, "he is a great gambler. But I'll see that you win."

He brought out a small gourd with a hole bored through the neck of it and tied it to the boy's wrist. A string of beads was inside the gourd. One end hung out of the hole; and there was no other end to the string.

"When 'Brass' sees you he will want to play for the beads. He will lose every game. When he stops to drink, strike a rock with your war club, and water will come. He will play until he bets his life. Then send for your brothers to kill him."

When "Brass" saw the beaded string he wanted to play for it. Lightning drew out enough of it to surround the playground.

"Brass" lost the game. He was astonished and proposed another. Play continued until noon. "Brass" lost steadily, and was discouraged.

"I'm thirsty," he said. "Let's get a drink."

Lightning struck a rock. Water gushed out, and they had a drink there.

When "Brass" lost his buckskins and beaded work, his eagle feathers and ornaments, he bet his wife, and lost her.

"I'll bet my life," he said.

Lightning won.

"Let me tell my wife," said "Brass," "then you may kill me."

He went into his cabin, then out through a rear door. Young Thunders were summoned, and they brought a horned green beetle. "Brass" assumed many shapes, but each time the beetle knew him. He was finally captured at the edge of the sea.

The brothers carried him far out. They drove a stake through his breast, and posted two crows as guards. But "Brass" never died. He cannot die until the end of the world.

She looks placid, but she can make your hair stand on end with stories of capers and spooks.

"Gran-pappy" is willing to let his primitive mill grind its grist while he regales the visitors with stories of ghosts and "sich like."

The Thanks of the Country After 25 Years

Concluded from page 10

capitan, who, after close questioning, led me through the mountains and valleys—having provided me with a mule to ride—for much of that night and the next day, to the camp of Calixto Garcia, the man I sought.

"My 'captor' marched me directly to Garcia, and told in a few words the story of his men's 'capture' of me.

"Garcia, a rather slender, light-skinned man, evidently a competent soldier, looked me straight in the eye for a moment, and said:

"'Well, what is it that you wish?'

"I replied: 'The United States has decided to declare war on Spain.'

"Though this meant success or failure, the freedom or the enslavement of his country, and, quite probably, his own life or death, Garcia did not show by so much as the movement of an eyelash, the effect of my words.

"'How do you know this?' he asked.

"Then I gave him my word as a man that what I had told him was the truth; explained to him my position with the Information Bureau, and verbally identified myself. He believed me, took me into his confidence, gave me information as to the size and armament of his own forces and of the Spaniards, the location of the troops on both sides, and furnished me with maps of nearly three-quarters of Cuba. He then supplied me, after we had discussed the situation for two days, with a horse, two guides, and a small guard of experienced men, sending as the guides two of his most valued officers, who later gave good service to the United States by guiding the American troops in Cuba.

"The ability of Garcia came home to me with renewed force when I found that he had arranged for a boat—though an even smaller boat than that in which I had crossed from Jamaica—to be waiting for me on the northeastern shore of Cuba, to carry me to Key West. In the Florida channel, one of the roughest bits of water in the world, we were wrecked, and, fortunately, picked up by Florida sponge-fishers, who took us to Tampa, Florida, whence I returned to Washington and presented the information collected in Cuba, virtually all of which proved, afterward, to have been correct, so thoroughly was Garcia informed of conditions in both armed camps."

Lieutenant Rowan was promoted in rank in the army, and was commended by President McKinley for his work, but it was not until July 21, 1922, that the War Department awarded to Colonel Rowan a distinguished service cross, in recognition of the service he rendered to the United States. The citation says:

"He secured secret information relative to existing military conditions in the region that was of such great value that it had an important bearing on the quick ending of the struggle and the complete success of the American Army."

In addition to this award of the distinguished service cross, the War Department, at the same time, also awarded Colonel Rowan a silver star, with citation for gallantry in action on Hudlon Mountain, the Philippine Islands, during the Filipino insurrection of 1900. The then Major Rowan placed and operated a field gun on this mountain under hazardous conditions.

THE LIBRARY OF THE UNIV. OF ILLINOIS

BRIEFLY TOLD

The Order of Railway Telegraphers will establish in St. Louis a mutual bank capitalized at $500,000.

Mrs. Mabel McKinley Baer, favorite niece of President McKinley, is an "insurgent" Republican candidate for the assembly in Westchester County, New York.

Without preliminary manifestations, a quiet pool, near the head of Obsidian Creek, in Yellowstone National Park, erupted recently and sent a column of hot mud and rocks 300 feet, inundating the automobile road between Mammoth Hot Springs and Norris Geyser Basin.

Indian girls picking huckleberries in the Cascade Mountains wear silk dresses, rolled-down socks, fancy lingerie, bobbed hair, short skirts, no corsets and use up-to-date flapper language. They do not, however, discard the primitive tribal mantle of an Indian blanket thrown over the shoulder, shawl fashion.

Anilin dye inserted at roots of living trees of a certain species completely and permanently colors the whole tree from the roots to the topmost leaf, within 48 hours after application. Two Dresden, Germany, firms have undertaken to exploit the patent. Cigaret cases, penholders, furniture and other articles are to be put on the market all made up in the new colored wood. Imitation of certain natural woods is declared possible.

What is believed to be the largest camera in the world is owned by a scientist in Chicago. The camera body is 9 feet, 4 inches wide, 20 feet long, when fully extended, and 6 feet high. The lens cost $1,500 and is 12 inches in diameter. All moving parts run on roller bearings. The plate weighs nearly 500 pounds when loaded and a derrick is used to put it into the camera. The plates are 8 feet long by 4 feet, 8 inches wide and weigh more than 200 pounds. A man enters the camera to dust the plates.

The first known advertisement appeared in a Greco-Roman drinking cup, it is said. It bears the inscription, "Made by Ennion. Let the buyer remember."

A vote was recently taken on the wet and dry question among the inmates of the prisons in the United States. More than 133,000 voted dry and only 909 voted wet, which shows that even the lawbreaker is capable of right thinking and dreads the results of drink.

The production of more than 6,000,000 bales of cotton was prevented by the boll weevil last year.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

A unique device has just been brought out that registers the amount of air pressure in each tire on separate dials mounted on the dash of an automobile. This allows the motorist to know the correct pressure whether the car is running or standing still.

To convey the size of the new *Majestic*, the largest ship in the world, the following statistics are given. Its tonnage equals that of the entire Spanish Armada which attempted to conquer England in 1588; the interior space equals that of 400 eight-room houses.

There are 95 million acres of land that can be reclaimed. They are swamp, periodically swamp or overflowed lands and tidal marsh. Rapid strides are being made in reclaiming, and, according to the United States Road Bureau, more than 54 million acres were reclaimed up to 1920.

The Duke of York is the patron of a boys' camp at New Romney. Half of the boys are apprentices and young operatives in mills, mines and workshops and half are from the public schools of England.

A New York physician reports a perfect case of a Negro who has turned completely white in the past three years. This uncommon disease rarely covers the entire body, but appears usually in spots. It is not annoying to the patient, nor is it contagious or infectious.

Mules that have remained in the mines far underground for 20 years without seeing daylight retain their eyesight when brought to the surface. This is vouched for by veterinarians in the anthracite region in Pennsylvania.

The first woman to be chief of a tribe of North American Indians, according to Indian historians, is Mrs. Alice B. Davis, of Wewoka, Oklahoma, chief of the Seminoles.

The coal fields of Pennsylvania contain 43,830,800,000 short tons of recoverable coal—sufficient to meet the demands of the next 290 years at the present rate of consumption.

The office of a gasoline service station is located where a storehouse of military supplies and a magazine existed when Bedford, Pennsylvania, was a frontier post in the eighteenth century. It is a little stone house almost hidden among several low, rambling frame sheds. During the Whisky Rebellion in 1794 more than 5,000 troops were quartered on the grounds adjoining it and President Washington and his first cabinet were once established a block away. The old house was also used as a detention place for escaped slaves who were caught on the underground railway.

A sealed copy of the 15-reel motion picture of the life and time of Abraham Lincoln has been offered to the United States Government and the National Lincoln Memorial Commission for deposit in Washington until the 300th anniversary of Lincoln's birth, February 12, 2109. With the film is offered a motion-projection machine, with full instructions how to operate it, the entire gift to be sealed in a steel vault. Directions are necessary because of the changes certain to come in projection practice.

To make children familiar with the basis of all real and incontestable prosperity, the city of Wichita, Kansas, is establishing, in its environs, a 30-acre farm, on which high school pupils will be instructed in agriculture.

In importations of pure-bred animals, by the United States, during the last fiscal year, foxes stood at the top in numbers, with dairy cattle and dogs next in order. Of a total of 2,639, there were 967 foxes, all from Canada.

A termite is causing serious damage to lead-covered cable at the locks of the Panama Canal. These termites work through the lead causing large openings. They then travel between the two wires of the duplex cable, eating the lead insulation.

With a frost-free period of only 95 days, a barley hybrid, produced in Alaska, matured in 80 days from seed. The new grain has stiff straw, long beardless head, hull-less grain, yields well and seems well adapted to the more extreme northern latitudes.

Facts Gone Wrong

It's Riley Day

The Real Turk

Coils That Choke

Why You Think the Turk Is "Unspeakable"

And the Turk as He Really Is to a Careful American Observer

By PAUL BOWERMAN

"SO YOU have been in Turkey! Are they really as terrible as one hears?"

I have answered this unvarying formula at least once a day since my return from the Near East. Without exception my questioners have entertained an identical opinion of the peoples among whom I was thrown: that the Greeks are an enterprising and worthy people, that the great majority of Armenians have been massacred, and that the Turks are the most villainous and detestable race on the face of the earth. The unanimity of belief would be almost incredible if I did not keep in mind that my own opinion was similar to theirs prior to the day that I disembarked at Constantinople. My change of viewpoint had begun even a few days earlier, for I had been reading Pierre Loti's "The Disenchanted" on the boat.

There was plenty of time and opportunity to puzzle over this after I had gone through my own "disenchantment," and the reasons were not difficult to discover. Very few Americans ever find their way to Turkey except as passing tourists, and those few are principally engaged in missionary work. Our information, then, comes from the following sources: from the English, who are intensely concerned, politically and commercially, in getting control of Constantinople and the Dardanelles, and who, for that reason, have supported the Greeks on every possible occasion, and who have lost no opportunity to justify their action by placing the Turkish people in an unfavorable light before the world; from our own missionaries who are often prejudiced in their ideas regarding religious differences, since their life work is devoted to the spreading of Christianity; from traveling correspondents who seldom spend more than a week in "getting up" their articles and who depend upon a dozen hurried interviews for their information; and, lastly, from the tens of thousands of Greeks and Armenians in our own country, there being practically no Turks to defend themselves by counter-propaganda. It is easy to see from this that whether the information is correct or incorrect, it comes from only one side of the fence and that is dangerous and unfair.

Conscious and Unconscious Dishonesty

THERE is no better way of setting forth the truth of the matter as I saw it than by recalling in succession the various reactions I experienced in and around Constantinople.

As an instructor in an American college, whose students were drawn from the wealthiest and most respected families, I was particularly fortunate in coming into close and intimate contact with young Levantines of every nationality. It was not surprising to find them almost universally dishonest, for here was the Oriental and semi-Oriental mind confronted by the incongruous ideals and austerity of our Occidental civilization. They all cheated flagrantly.

Little by little I began to discover that dishonesty could be separated into two different categories—conscious and unconscious dishonesty. Into the first category fell the Greeks, Bulgarians, and Armenians—all those, in fact, who lived nominally in the western fashion, who were Christians, and who claimed to despise the Mohammedan faith and civilization. These boys knew well enough the difference between right and wrong as we understand it, and deliberately chose the wrong. They would never admit cheating, even though I had caught them red-handed. One day an Armenian showed me a watch his father had given him for completing his studies, adding that his father had praised his cleverness in escaping detection during the examinations. Such instances were the rule rather than the exception. This, I decided, was conscious dishonesty.

The Turkish boys, on the other hand, were a novel experience. Quite as dishonest as the others, they could see no good reason for being otherwise, and were therefore quite free to acknowledge their guilt. They were openly amused at my attempts to inculcate in them the principles of personal honor. It was as if they were listening to a language which had no meaning for them. And, indeed, it had little. I was dealing with the Oriental mind, about which I knew nothing at the time. To them, I was a foreigner, a "Frank," a person who worshiped a strange God. To them, life was easy-going, a thing to be enjoyed with as little self-sacrifice and self-denial as possible. I had come from a distant and unknown country to speak about the delights of hard work, of clear thinking, of businesslike devotion to strange ideals. I might just as well have talked about the fourth dimension. This was unconscious dishonesty.

The Greeks and Armenians far outstripped the Turks in aptitude and adroitness. Very few of the latter were really good students. The former learned to speak English with astonishing rapidity; they absorbed elementary mathematics with avidity, for there they learned the essentials of business, which is their forte. The Turks were indifferent to commerce, preferring those studies which appealed to their emotion and imagination. Money was the unconscious prompter in the minds of the Greeks and Armenians; beauty was the inspiration of the Turks.

At my hand was the most fascinating and bewildering of cities, a seething caldron of racial hatred, the battleground of a dozen centuries, and the depositary of some of the most magnificent monuments which have come down to us from antiquity. Of the three smaller cities which make up Constantinople, I went first to Pera, the European quarter.

Pera is in the hands of the western peoples who have raised it in the likeness of their own cities, with department stores, hotels, women's shops, and all the other appurtenances of our mode of living. During the day it is banal and harmless enough. Under the cloak of evening, however, it is transformed into a riot of drunkenness and vice. Vicious cabarets and foul drinking dens appear in the dim-lighted streets, taking possession of Pera like a swarm of nocturnal harpies. Then it is that one sees brawling crowds fighting in side alleys, intoxicated women in the last stage of abandonment, and men knived or murdered by unseen hands.

Our much-vaunted modernity and progressiveness are found in Pera, but our weaknesses are still more apparent. And this is what we have brought to Constantinople, for the Turks are conspicuously absent from the activities of Pera.

Down the hill is Galata, the shipping quarter, inhabited principally by Greeks. There are no words adequate to picture Galata in the hideousness of its depravity. It is a festering breeding-place of white slavery, disease and opium dens. The worst of it has sprung up since the Allies took the control of the city out of the hands of the Turkish authorities. Before the war it was no worse than any seaport of the Mediterranean. Now it stands a terrible charge against the West—for in Galata the Turks are as little in evidence as in Pera.

The city of Stamboul presents a striking contrast to the two European quarters. The Turks have kept it much as it has been for centuries. Broad, shaded avenues lead to the magnificent mosques and monuments, many of which were erected before the discovery of America. The narrow side streets are humming with the noises of the shops and bazaars—the noise of industry rather than the noise of rioting. Here one sees the coppersmiths and carpenters and rug-weavers busy with their quaint tools, producing articles that delight the tourist by their fineness and delicacy. Here coffee shops take the place of beer halls, for the Mohammedan is forbidden by the Koran to indulge in intoxicating drink. It is a glimpse into a colorful life that has no counterpart in our civilization. Over everything hovers a delightful sense of well-being, contentment, happiness, and honest endeavor. No flaming cabarets jingling with cheap music, no street-women clutching at the sleeves of passing men, no brawling in obscure cafés. When night steals over Stamboul, the streets are deserted, and an unattended woman might walk in safety from one end of the marvelous old city to the other.

Now that I have left them behind, the three cities assume distinct personalities in the calmness of recollection. Pera brings to mind a picture of wealth, fast living, and gilded vice; Galata still provokes a shudder, and a sense of nausea sweeps over me as I recall scenes of depravity that are stamped on my memory; Stamboul returns like a soothing balm, a precious fragment of beauty atoning for the ugliness of the others, one arresting gesture in a mad plunge toward perdition. And Stamboul belongs to the Turks—the unspeakable Turks.

Their Pounds of Flesh

IN THE autumn of 1920 more than a hundred thousand Russian refugees descended upon Constantinople without warning, for the most part penniless, and suffering for want of food and drink. Fearing an epidemic, the Allied Control refused to allow them to land for several days, and the dirty crowded ships lay at anchor in the bay. Every effort was made to keep them alive by taking out bread and water, but the city was already overrun with refugees, making the task of adequate relief almost impossible.

One storming night I went out in a small skiff with a Russian boy who was searching for the ship that contained his family. We took with us as much bread as the skiff would hold. It was an unforgettable scene. In the blackness of the night one could hear the moaning and sobbing on every side from the dark unlighted ships that heaved at their anchors like looming ghosts. We discovered the water to be swarming with little boats similar to ours, and likewise crammed with bread and water. We came upon a dozen of them clustered about the lowered gangway of a refugee ship. We heard the voices of the boatmen and the hysterical shouting of the starving people on board. Then we discovered that the mysterious boatmen were bargaining with the Russians, offering bread and water in exchange for jewelry and gold—and the Russians, jammed in so tightly that they could not even sit down, frantic for a drop of water, crazed with hunger, were giving their last possessions, all that stood between them and starvation, if they should ever reach the shore.

The boatmen were Levantines, hybrid Greek and Armenian merchants. There was not a Turk among them. For hours we rowed about in search of the ship and came upon a dozen replicas of the same horrible scene. The fact was known the next day throughout the city, but the press, effectively muzzled by the Allied Control, made no mention of it. At that moment the British Government was interested in stirring up approval for another loan to Greece.

The European Powers have been meddling with Turkey for the past hundred years. Their battleships have been anchored in the Golden Horn, their diplomats have been weaving webs of intrigue under the very nose of the Turkish throne, and their peoples have been systematically fed with propaganda. And all because Constantinople and the Dardanelles are the key to Eastern Europe and the Near East. Jealousy and fear have been the motives.

They have looked longingly at the fertile fields and oil wells of Anatolia. They have watched each other like preying vultures, covering their greed under the cloak of the Christian banner. Colonies of Greeks have settled the seacoast with no intent to remain there as Turkish subjects, but with the idea of becoming powerful and rich enough some day to claim the country for Greece. It is as if France should suddenly lay claim to Quebec and Louisiana, or Spain to Florida.

It is easy for us to overlook the fact that Turkey is not a savage country. It is older than we are. It has a rich civilization behind it, a background of stirring history. Turkey is Oriental and indifferent to progress. They are skeptical of the blessings of our modern complicated system, and point to the many sore spots of our existence. If they do not have railroads and typewriters, neither do they have strikes and insane asylums and social evils.

They have maintained their empire for 500 years with fewer changes and less internal strife than any other country in modern times. It is their right to live as they see fit, to worship God through the word of Mohammed rather than through the word of Christ if it is more to their liking. The important thing is that they keep the faith as they see it. It is my belief that they are more devout than we—their mosques are full every day, while our churches are empty save on Sunday. The throngs of worshipers of the great Mosque of Suleiman during the holy month of Ramazan is one of the most inspiring things I have ever seen. Few people know that Christ is worshiped in the Mohammedan church as a minor prophet, as is Moses. They prefer to assign the rôle of chief prophet to Mohammed because he dictated his book in person. Our ignorance of the Koran leads us to unfounded prejudices against it; a study of it would reveal its greatness and a striking similarity to the Bible in many respects. It lacks the lofty ideality and sublimity of the latter, but the Turks claim that it is beyond possibility to attain the Christian ideal, and that the Koran, by emphasizing the same practical virtues without insisting upon the heights of self-sacrifice, is within the reach of those who lead the good life.

The Turk—Charming

THE Turk of the educated class is a charming and delightful person, a consummate master of the social graces which we associate with the status of a gentleman. His home life is quiet and retired, and in social intercourse he is noted for his invariable kindness and courtesy. Harems are practically a thing of the past, for the Turkish law requires a substantial property settlement on each wife. The unsettled conditions since the war have impoverished them to such a degree that but very few have the means to support more than one wife, even should they desire such.

But it is also true that the educated class is a very small fraction of the Turkish people. There is no middle class devoted to commerce and shopkeeping. The bulk of the people are artisans and farmers. Their education is slight, their mode of life simple and unostentatious, and their needs few. As I have brought out before, they have little aptitude for business and the small commerce of the country is in the hands of the Greeks and Armenians.

They are frugal, hard-working, and honest, according to their light. Until Asia Minor was stirred up by the intrigues of the European Powers, it was as peaceable and orderly a country as any in Europe. Unattended women used to make long journeys by caravan into the very heart of Anatolia, and were everywhere received with the most scrupulous hospitality by the wealthiest households in the village, where money was always refused for their lodging and where they always received a cordial invitation to return. The Turkish people of the interior have the guilelessness and simplicity of peasant-folk the world over.

The years of meddling by the European Powers have exasperated the Turks, at intervals, to the point of ferocity. It was an unequal struggle, for the Turk was baffled by clever diplomacy and unscrupulous bargaining for concessions. He saw his words twisted into unheard-of promises, he saw the battleships cleared for action in his harbor and ready to enforce the edicts that issued from the Allied embassies, and he suffered the helpless rage of one who knows he has been cheated and can see no means of redress. The Christian nations, carefully fed by propaganda, displayed a solid front against him, and, like an animal at bay, he sprang out in his wrath at whatever lay within his reach. The Armenian massacres were inexcusable, but the world does not know that equal excesses were committed on both sides, that one Turk has been victimized for every Greek or Armenian. That fact has been carefully suppressed by those who are interested in showing up the worst side of the Turk. I have seen countless photographs of Turkish men and women beheaded and piled in heaps. I have seen tens of thousands of Turkish refugees driven out of Thrace and Smyrna by the Treaty of Sevres which gave that territory to Greece, and I have listened to the ghastly story of their eviction. That, too, has been suppressed.

The Turk is no more perfect than the rest of us, but, like most of us, he is good enough when left alone. That is all he wants. Mustapha Kemal, directing an ill-organized and ill-fed army has been victorious over the trained troops of Greece that were equipped by the money obtained from Great Britain, and he has driven them from Turkey. The ragged Turkish army fought doggedly and courageously because they were fighting for their own land.

Meanwhile the Powers lie in wait raising the old hue and cry. It is the hands of the Allied Control that are bright with the blood of the innocent victims of their ambition and avarice.

"The Frost Is on the Punkin"; It's Riley Day

All Indiana Pays Its Tribute to Poet Who Made Boydom Immortal

By CARL SCHURZ LOWDEN

OCTOBER seventh is Riley Day in Indiana and in many other states. It's the day of all the year when the school children remember with readings and songs the departed poet of Hoosierland. But this year, 1922, the anniversary of his birth falls on Saturday when the teacher and pupils rest; so with the children, Friday afternoon was fixed as the time when "Little Orphant Annie" and the host of sweet simple characters will live again.

Perhaps the spirit of the bard, our Burns, will come back and listen in at the exercises. Who can know beyond the shadow of a doubt?

Friday afternoon happens to be particularly appropriate. In his school days, Monday, Tuesday, Wednesday and Thursday were to him only the preliminaries to the latter part of the school week's last day. Then it was that songs were sung and pieces spoken, that the boy with the poet's soul reveled like a pig in clover.

Why, years afterward, he looked back upon his school days and wrote a poem entitled, "Friday Afternoons." He dedicated it to his old pal, William Morris Pierson, who played with him as a boy and swapped stories with him as a man. He told how on Friday afternoon the "murmured hum of learning" subsided to be replaced by such melodies as "Good News From Home" and "Scotland's Burning." Then "elocutionary science" made vivid "The Speech of Logan," "The Old Arm Chair," "Cataline's Defiance" and "The Banner of the Free." There were comic pieces with the hennery "Cock-a-doodle-doo" and another with the refrain of "Does Your Mother Know You're Out?" Ah, it's a dear gem of pathos breathing fragrant memories.

His teachers, practically all of them passed on now, have told me of his avidity for the coming of each Friday afternoon. He was a real boy, yet markedly unlike other boys. From 1859 to 1861, the Rev. J. H. Stevenson was principal of the Greenfield Academy while the youth, James Whitcomb, attended that institution.

"The Friday afternoon literary exercises," the principal told me, "were Riley's delight. He was always prepared and eager to be called. His recitations were either pathetic or humorous, and were invariably anticipated with pleasure by both pupils and visitors. His keen appreciation of the sentiment of all his selections and his unfailing success in pleasing his audiences were foregleams of the genius that has made him 'the best loved American poet.' There was little else to show it."

This schoolmaster of the long, long ago then proceeded to draw me a picture of the quick-witted, good-natured, jolly, fun-loving, pudgy, yellow-haired little fellow who was a universal favorite with both the old and the young. His older brother, John, wanted to win high grades as a student; but James seemed averse to hard study as to all exertion either physical or mental. This disinclination to earnest, persistent, purposeful study, that led him in later years to refuse the college education which his father desired to give him, began to manifest itself early.

"When a boy of 12 years," the gray-haired man explained, "his predominant and distinguishing characteristic was to have a good, easy time. He was not a bad boy; but not being studious and being full of animal spirits, he needed watching. Yet withal his teachers liked him, for he was so full of innocent fun and so smart that they could not help it."

Even in his primary school days it became most evident to another instructor, Mrs. David Ulrey, that he could not confine himself to the regular routine. He kept the McGuffey second and third readers open on his desk while he perused his choice selections until he absolutely absorbed the thought and sentiment of them. He would take no interest in arithmetic and geography.

As a child he was sympathetic and emotional. He won Mrs. Ulrey so that she became lenient toward him and did not enforce perfect recitations. He would often bring a book to her and then would ask her to read his favorites. At the end of the reading he would frequently comment, "Ain't that purty!" On one occasion she gave Bryant's "Death of the Flowers," looked at the lad and observed tears running down his cheeks.

The poet possessed the deepest kind of real emotion. When he had become established, when Howells and Twain had acknowledged his genius, a woman told him that she had cried when she read about the little cripple who had "curvature of the spine." He answered, "You should have heard me bawl as I wrote it."

According to Mrs. Ulrey's account of the days when she instructed the budding poet, jingles were ever in his mind and he could express them easily. During the general exercises of Friday afternoons he usually had original verse. Once, however, Riley failed. When his name was called he remained silent though all were supposed to take part. Can you imagine the punishment meted out to him? He was required to come up Monday morning and do his bit; the alternative consisted of the fact that Dr. Montford would settle the matter with him if he did not. This gentleman probably had a beech gad concealed somewhere in the schoolroom. Anyhow the young Mr. Riley meekly came forward Monday morning and delivered this specimen of eloquence:

"You would scarce expect one of my age
To speak in public on the stage:
If I should chance to fall below
Demosthenes or Cicero,
Why, then I'll quit and say,
'Guess I ate too much yesterday.'"

The bad boy played a prank by reciting a verse from a book on elocution. He had, however, discarded the original final couplet, "Don't view me with a critic's eye but pass my imperfections by," and substituted one of his own. This cleverness caused Dr. Montford to spare the rod; and if he thereby spoiled the child, he certainly was helping in the making of a poet.

Above—Mr. Riley loved children, and children loved Mr. Riley. Below—The Riley homestead, West Main street, Greenfield, Indiana, where the poet spent his youth.

Lee O. Harris, a later teacher of Riley's, was himself a poet. He soon recognized the boy's rhyming ability and made a companion of him. There were no disagreements of any consequence; instead, the strong bond of sympathy between them allowed the lad to develop largely in his own way. Certainly this friendship of teacher and pupil, poet and poet, was a beneficial thing that came at the time it could do the greatest good; for there is a time, that of boyhood verging into manhood, when the right touch places one firmly on the high road to accomplishment. Harris may have contributed this precise touch. Anyhow, when he died the former pupil penciled a sweet and tender poem in memory of him.

"He seemed to understand him thoroughly," Mrs. Ulrey remarked to me about Harris and the verse-writing lad. "He told me that it was useless to teach Riley in the ordinary method; he was far beyond that. But I thought that after awhile he would become interested and would obtain an education. His mind must have been already full, but filled with Greenfield, her country byways, the orchard lands of long ago and other images far from the schoolroom."

Riley had bad-boy tendencies. He read novels that cost a dime apiece; you know the kind, sometimes called yellowbacks, always sensational, with the villain the darkest ever and the hero the pink of perfection. His last teacher captured the flaming literature. Then he substituted Cooper, Irving, Scott and Dickens. Riley admitted afterward that to this man he owed "possibly the first gratitude of my heart and soul."

The average kid, boy, I mean, will tease the girls with water snakes, baby mice and fishworms. He will show ridicule by twisting his face into queer shapes. He will fight, and he will fish, and he will swim. The towheaded Riley was that kind of a youngster. If any of these words should be placed in italic type, it is "swim." Riley could dive like a wild duck and shoot through the water like a fish. Swimming was his specialty though it may have been secondary to the writing of his jingles and rhymes. In fact, I am inclined to think that swimming held first place in his affections while the rhymes occupied third position.

He was your real boy. Nothing ranked next to swimming. Later as a man of 33 he paid a tribute to the fondest recreation of his boyhood by producing "The Old Swimmin' Hole." He located it "whare the crick so still and deep looked like a baby river." Those were the happy days when he "ust to lean above it on the old sickamore" while "it made me love myself" as he glimpsed "my shadder smilin' up at me with sich tenderness."

Three years more and the poet gave expression to his second choice in that nature classic of "Knee-Deep in June." He liked to "jes' git out and rest and not work at nothin' else." In June time "Plague! ef they ain't somepin' in work 'at kind o' goes ag'in' my convictions!" There he struck a universal note. Who has never had precisely that sort of a feeling? The poet's own laziness was intensified by the ardor of the "sapsucks gittin' down to biz weedin' out the lonesomeness" while the bluejay "in them baseball clothes o' his" acted "like he owned the premises." But if Riley could have his way he would lie in the orchard flat on his back "stiddy fer a year or two."

The real boy had become a man of 45 before he penned his famous fishing classic of "Up and Down Old Brandywine." I know well how happy he must have been as "with a dad-burn hook-and-line and a saplin'-pole" he swung along, for often I have walked the banks of the same stream while I carried my Isaak Walton paraphernalia. His mates would souse him and his "new straw hat off the foot-log" or "spill my fishin'-worms" and "steal my best goggle-eye"; but he would give most anything to be a boy again "up and down old Brandywine." Coming home the piratical crew swiped "wortermelons," some "pop-paws" and "jes' gorges o' wild plums."

Riley, the youth, was constitutionally opposed to labor. He "played hooky" from school, principally for two reasons I believe: these were arithmetic and geography for which he substituted swimming in season, fishing, if the water was too cold, and skating when ice had formed.

Dr. Pierson, to whom "Friday Afternoons" was dedicated, and Riley were playmates for years in Greenfield, Indiana. The family homesteads were not far apart. The boys co-operated in performing their various tasks. Before his death the physician loved to tell the story of how the pair of them went after a sleigh his father had bought in the country. They helped each other one Saturday morning to prepare enough cooking and heating wood to last each family through the week. They speeded up this usual week-end work and then threw the harness on an old gray mare the Piersons owned. The road was hard-surfaced with packed snow; so the boys put on their skates, Pierson hung onto the lines and Riley hung onto his friend's coat-tail. Can you picture this tandem performance? Anyhow, they got the sleigh and had a ripping time doing it. Furthermore, it was a typical stunt of James Whitcomb Riley's boyhood.

Ah, yes, if the bard could be transported back to his beloved Hoosierland to hear the schoolboy and the schoolgirl of 1922 honor him in these memorial exercises and he should be asked to name the poems of his to be read or recited, which of them all would he name? Perhaps "Friday Afternoons" would be one and "The Raggedy Man" another. The list would probably include "The Old Swimmin' Hole," "Up and Down Old Brandywine," "Knee-Deep in June," "When the Frost Is on the Punkin," "An Old Sweetheart of Mine," "The Little Town o' Tailholt," "Out to Old Aunt Mary's," "There Is Ever a Song Somewhere," "Leonainie" and "Lockerbie Street."

Riley had ample reasons for gratitude toward the homely "When the Frost Is on the Punkin." Once it saved him and then it made him, at Indianapolis and New York, respectively; a job lost was recovered, and a comparatively unknown became known far and wide.

When a new managing editor for the Indianapolis *Journal* decided to pare expenses, he looked about him, saw a reporter hanging around and straightway proceeded to fire him. That gentleman was James Whitcomb Riley, the budding poet whose "When the Frost Is on the Punkin" had recently appeared in print. The blow was a hard one for him. However, a few days later a nominee at the state political convention acceded to the chorus of "Speech! Speech!" and unwit-

The Collapse of the Coal Combine

FOR the present, industry seems to have put a crimp into the plans of the coal controllers for a wholesale looting of the public. A single protest brought the unholy edifice of price exploitation tumbling about the profiteers' heads. The protest was, as must always be expected, viciously misinterpreted. The sob cry was diligently persisted in by the capitalistic organs until it became positively nauseating. Interests, that had deliberately arranged to wring the last dollar out of the families of America by maintaining all through the winter the menace of empty bins and fireless homes, were suddenly consumed with sympathy for the poor workingman when industries closed down in protest rather than submit to the unspeakably wicked robbery which had been designed upon the American people. Interests that would have kept the country on curbed fires and would have made fuel the biggest item in this winter's family budget, pretended to be melted into pity for the poor employes who sacrificed $25 in wages to save $150 on their coal bill. It is the typical old bunk, but this year it was very badly stage-managed, in that it was directed against the wrong target.

The effect of the industrial protest was immediately felt. At the time the warning was given that in three weeks a mammoth industry would have to close unless coal conditions improved, coal was selling to manufacturers at as high as $9 a ton. When the announcement was made, the price wavered a little. Then came the cry that it was only "bluff," a cry which arose in the same quarters whence the "sympathy" cry afterward came, and for the moment the high coal price was strengthened again. Then, as the earnestness of the protest became apparent (nothing is harder for the exploiters to understand than a straightforward honest statement) a break became noticeable. Coal climbed down to $8 and $7. The Saturday of the shutdown it reached $6.50. On Monday, it was $5.50. On Tuesday it was $4.50. A week later, at this writing, it is offered at $3. If bought on contract (which also plays into the hands of the profiteers) it can be had at $2.50. And mountains of coal at that.

This rapid collapse of prices shows the artificial nature of the whole situation. There was always plenty of coal. The scarcity was make-believe. The only dangerous moment came when the government created a real scarcity by announcing "control" of distribution. The coal problem then became an acute transportation problem. When, as a further result of the industrial protest, the government took its hand off and ceased creating a situation which best suited the gougers' desires, the retreat became a rout, the decline became a collapse.

There still remains the domestic situation. Big Business could, of course, see that the domestic consumer gets just as immediate an advantage as industry has gained. It is hoped that coal dealers' associations will see the handwriting on the wall and not lean too trustfully on the helplessness of the unorganized and leaderless public. There is a way to make Big Business the friend of the householder in this situation, and if it is once necessary to do so, it will be goodby to some things that now exist.

The Twenty-four New Judges

AT NO time has a President faced a peace-time duty, requiring greater care, than in the practically simultaneous selections of 24 additional Federal judges. And at no time has the Senate's power of confirmation of appointments called for closer public scrutiny.

Congress would have shown wisdom if it had provided for each of the additional judgeships by separate act. Then each nomination could have been considered upon its merits. Only a few of the members of the Senate, who are charged with the duty of advising and consenting to the President's nominations, would then have been directly concerned with each nomination.

But with omnibus appointment, as with omnibus legislation, there comes inevitably the question of trading. This is said in no sense of criticism of the motives which will inspire the Senators in the confirmation of the judicial appointments. It may be granted that the members of the Senate, with almost no exception, are eager to select men of the highest qualifications for places on the bench. But the plain facts are that a Senator will be most vitally interested in the judge who will preside over his particular district. In the nature of things, the Senator's enthusiasm and interest in his particular district must detract from his attention to the qualifications of the other 23 nominations before the Senate. It may not be an actual trading of votes that will result, but the practical effect will be the same.

Nominations before the Senate should be considered on their several merits. The situation in connection with the judicial appointments precludes this possibility. There is left the opportunity of the Senate to consider the nominations in public rather than in executive session. The executive session has been the custom. The reason assigned for this is that a man's personal affairs might be aired, without good accruing to the public. But it would seem patent that in judicial nominations at least, the man chosen for confirmation should be above the shadow of any suspicion. It would be far better that a breath of scandal should injure an innocent individual, than that by any mischance an improper selection be made for a place of such vast power.

It is a tremendous responsibility that lies upon the President and the Senate. The choice of one member of the Supreme Court is frequently of a nature that precludes more than a half-dozen persons being considered. Their reputations are national, and the judgment of their qualifications is such that there is slight chance of confirming a dangerous nominee. But with sectional appointments of Federal judges, the situation is different. And in the last analysis these appointments may be considered more vital than the Supreme Court designations, because they are the judges who apply the laws the Supreme Court has interpreted; comparatively few of the cases heard before the trial judges reach the highest tribunal for review, and the litigants therefore must rely on the district court.

Public attention should be focused upon the judicial appointments. The tenure of office is for life, and the decisions of the 24 men chosen will exercise an almost incalculable influence upon the course of the Republic during the next half century. The public is entitled to know all about the nominees.

Bookkeeping in Savings

HAD the Treasury Department, early in July, chosen the honest part, and made no claim to the reduction of the national debt and the showing of a surplus for the fiscal year just closed, it would have avoided the criticism justly applied, now that President Harding has been compelled, in justification of his veto of the bonus bill, to disclose the fact that there was then really a deficit for that year and that it will be added to in the current year. That is, in cold figures, receipts for 1921-2 fell short of meeting expenses by a hundred millions, and will not meet appropriations for this year by $650,000,000, making a total deficit of three-quarters of a billion June 30, next. Even this, it is hinted, is too conservative an estimate, one Senator predicting the billion mark will be passed.

To make the favorable report of last year, funds were juggled to the limit, every dollar possible being drawn from funds created for current expenses and added to that "available for reduction of the public debt." That means of hiding the truth was exhausted at that time, and the Controller of the Currency naïvely admitted that unless in some way the actual revenues could be increased there was a prospect of a shortage of a third of a billion, and that three-fourths of the maturing obligations must be refunded.

With the degree of expertness in bookkeeping at the command of the United States Treasury, it is no wonder that the country was able to show a paper saving any time it was desired to transfer figures from one column of the ledger to the other. But such "savings" ultimately must be known by their true name. The country's pleasure at being told that "more than one billion dollars had been paid on the public debt and that there was a good surplus of revenue above expenditure," only made the shock greater when the announcement came regarding the deficit.

Neither public nor private business can survive the juggling of figures to show fictitious profits, and those who permit such juggling must pay the price in the diminished confidence they enjoy.

A Dangerous Financial Imperialism

IMPERIALISM is an institution which Americans have been taught to abhor. The very word is propagandic enough to stir our resentment against any nation whose policies are said to be imperialistic. In theory, we are ready always to lend our aid to any little nation, struggling under the strong arm of a powerful nation's imperialism.

Yet, all unwittingly, the hundred million and more freedom-loving Americans have now been placed in the position of imperialists.

We are financial suzerains over Hayti, San Domingo, Panama, Liberia, Bolivia, Nicaragua, Panama and Peru. This will be news to most persons in the country, to whom the vague memory of the political cry of imperialism back in 1900 conveys a suggestion merely of our colonial policy of expansion. But the fact is that without the approval or even knowledge of the vast majority of Americans, their country's future good will has been mortgaged that a few financiers might be made great. The power of the American people, without their knowledge or consent, is being used for private purposes, with possible consequences of colossal public ill.

American bankers have floated loans for the needy republics. The terms of the loans may have been harsh or liberal, according to financial ethics, whatever that is, but the security that was taken was always iron-bound and copper-riveted. American bankers handle the revenues of Hayti and San Domingo, and are therefore the real agencies which levy the taxes the residents of those dependencies must pay. In the recent debate in the Senate on the proposed Liberian loan, it was made clear that the grant would be dependent on American supervision of customs and business. Nicaragua's financing is under the control of American banks, and Paraguay and Peru each have financial advisers recommended by the State Department of the United States. Bolivia's revenue is controlled by a commission of three, of whom two are Americans.

The so-called freedom of Cuba has called for a great deal of supervision by the United States, and one of the powerful Wall Street banks is recognized as the practical dictator of that Republic's sugar crops, loans and other business affairs.

Nearly all of these relations which call for American overlords over high-strung peoples are financial, *and purely financial.* It bears no relation to the internal development of the country nor the real welfare of the peoples involved.

But despite the small number of these *interested* persons, *every American is affected.* The American marines who enforce our obligations with their lives in Hayti and San Domingo are Americans from all over the United States. It is all the United States which must bear the resentment when these dependent republics are called upon to pay the loans to the few bondholders.

Fragmentary reports demonstrate how deeply Haytians, Dominicans, Panamans, Porto Ricans and Cubans feel the injustice of taxation without representation. The record is less clear regarding the feeling among our other financial vassals, but it cannot be doubted that their faith in Uncle Sam as an altruistic individual is somewhat dimmed.

Polonius suggested that the loan oft lost both itself and friend. It seems clear that the United States is losing its friends, though the financiers have made certain that they don't lose the loans.

Potatoes or Kronen?

THOSE pessimistic persons who read the financial quotations and get the idea that the world is going to the dogs because it takes a lot of kronen or marks to make a dollar should learn to read another wealth barometer.

In Poland, which is in the center of those shaking European countries, approximately 5,400,000 acres of potatoes will be harvested this year. This is approximately 93 per cent of the pre-war area devoted to that product, and is 10 per cent in excess of last year's planting. The estimated production of the Polish potato crop this year will be 230,000 carloads in excess of last year's production of 1,680,000 carloads.

Poland consumed last year only 75 per cent of the quantity of potatoes consumed prior to the war, but this does not indicate an impoverishment of the country. Rather, it is stated, the Poles have eaten in greater quantities of other foods, such as meat, eggs and dairy products.

The country expects to export 225,000 carloads of potatoes as against 3,000 exported last year. These exports will be traded or used in other forms of barter.

The inhabitants of Poland seem to be getting along very well despite the fact the article called money is somewhat unstable throughout Europe.

Mr. Ford's Page

IT HAS been disclosed by recent events that the heart of the coal question is the separation of the consumer from the source of supply for the purpose of compelling him to pay more and ever more to the financial controllers of that supply. That is, the coal business no longer centers around coal, but around money. Money has not been regarded as a means of getting coal to the people, but coal and the necessity for coal and the distress which follows a lack of coal has been used as a triple bludgeon to get money out of the people. The natural course has been reversed, and what we have just witnessed in this country is the consequence.

This is not to blame the men at the mines, the owners of the mines and the workers in the pits. If the public were able to deal more directly with the men actually engaged in coal mining, the situation would be much better. And the reason it would be much better is not that middlemen are necessarily a useless group, but that the coal middlemen have been functioning as obstacles and not as aids. When a middleman assists in moving the commodity to the consumer, and his assistance is a convenience both to the producer and the consumer, then he justifies his place. But when he is a menace both to producer and consumer it is only a matter of time when they will both agree to get rid of him. Now, the legitimate middlemen in the coal business will admit that in the recent dislocation of coal service, the tactics of the profiteering middlemen constituted the only dangerous element in the situation—aside, of course, from the unwarranted government interference which served the profiteer's purpose better than could anything else.

The curious fact about the scare of a coal shortage was that it occurred when the country was full of coal. That fact alone indicates what fools the people of this country are considered to be. It shows how little real publicity there is as to the actual situation. When a whole people can be thrown into a panic and robbed by a mere statement that is untrue, but which is given a semblance of truth by newspaper and official action, it shows that we have trusted ourselves to agencies that have left us in a rather helpless state. The *fact shortage* was never more acute than during the alleged coal shortage.

The question now is, what is to be done about it? There is every kind of talk going around, much of it relating to "government control." We have just had a taste of "government control" and there is not a manufacturer nor a board of commerce in the country that has not formed a very strong opinion about it. One gain which the country has made is to get rid of some of the magic which centers around that term "government control." A government rises no higher than the experience and ability and moral courage of the men who comprise it. In the coal emergency the "control" most in evidence was the control exercised upon the government by the profiteering interests. All that a government in these big matters can do is to issue prohibitory laws upon the insistent complaint of the people. When it enters upon positive control and direction it can only go as far as its knowledge extends. Theoretically, the government ought to know everything. Practically, it knows only what the politicians and speech-makers and lawyers who comprise it know—and what they do not know about the economic affairs of this country is quite a considerable amount.

It is doubtful if "government control" is the place to begin. Merely the introduction of good business methods would correct most of the evils which have appeared in such startling form recently. When you consider the coal business you can see how it has enjoyed a monopoly and a rapidly expanding market ever since coal began to be used as fuel; you can see how its interior financial organization has grown greater and greater until it has become a power in the land; but you will search in vain to find an increase in service and a decrease in cost anywhere in the history of the business. Take such public services as the supply of water or oil—they all show vast increase in quality and service, together with a decrease in price. On the contrary the history of coal has been a decrease in service and an increase in cost. Because of the monopoly and the increasing market the managers of coal have not been driven to give their thought to anything beyond a higher profit from the people. And the worst of it is, it is doubtful if they have even got the profit they have aimed at. Their kind of method doesn't yield a big profit. They succeed in gouging the consumer without doing a great deal for the producer.

If they would turn around, change their tactics and for five years adopt the policy of making coal a drug on the market, enabling the householder to burn all the coal he needs and to burn it generously; if they would make coal easy to get so that everyone could always afford to keep ample stocks on hand, they would discover that they could not only enjoy public esteem but also make a clear profit above what their present tactics yield them. The people will pay for service, but if you give them service—if you make that your principal aim—you can always do so for even less than they are willing to pay.

THE coal business can be reformed by business methods. In progressive business increased service follows decreased cost to the public. The history of the coal business is an unbroken increase of cost to the public with a distressful decrease in service. To save itself the coal business has got to make coal a drug on the market—make it the cheapest, as it is the most plentiful, of all our natural products. The business ought to be put on a basis which would keep it busy trying to sell coal. It doesn't have to sell it now. It is too busy devising new methods to gouge people clamorous to buy. The business is doomed unless modern methods are adopted at once. Profits made out of the distress of the people are always much smaller than profits made out of the most lavish service of the people at the lowest prices that competent management can make possible.

Now this has nothing of "government control" about it, nor any other special "cure all"; it deals simply with the man who owns coal and wants to sell it to the best advantage to himself. He can do it by selling more coal at lower prices. With our coal stocks as Nature has bountifully stored them for us, no home in these United States should have to skimp on fuel. The whole winter long they should be radiant with light and heat. There is enough and to spare, more than enough, even if we were extravagant. And it is a pity that the coal owners cannot understand the a b c of business. The principle of highest service for lowest prices works in other lines. Coal is not an exception. Indeed, there are some circumstances that would make it easier to do this with coal than with some other commodities.

Suppose the coal industry were to turn its attention to making coal easy to get; suppose it should use its ingenuity to have everybody always keep a full coal bin; suppose it should set as a goal to eliminate every source of national worry about coal; suppose there should be such an extraordinary thing as a "Fill Your Bin Week." Other things would follow naturally: they could raise wages, they could install every safety device; they could raise the work of coal mining to the esteem it ought to have; and they could have more profit than would ever be possible under the old system. What the business of coal mining needs is to become modernized and progressive.

It may be, however, that, having failed in its duty so long, the coal business is to undergo severe discipline. It has been made so difficult for the people to secure coal that scientific men have been stimulated to discover ways of doing without coal. That is a natural reaction from the methods of the profiteer. You can take a profit so high as to kill the business. "All that the traffic will bear" is more than the traffic *can* bear. The time may come when coal will not be taken from the mines at all but burned underground and the power transmitted long distances. The time is already here when heat and light and power are being drawn from water. If coal is refused to warm the people's homes, the water power of the country may be widely utilized to supply the heat. Even Nature hates a profiteer who proves a hindrance to progress.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Facts Gone Wrong—Publicity vs. Propaganda

Great Movements Fail When Propagandists Lead Truth Astray

By A. C. LAUT

This is the second of two articles on propaganda.

IT WAS about 10 to 15 years ago that the writers on economic and industrial problems became subtly aware that an invisible hand was playing the game with marked cards below the table. A writer on oils, on water power, on tariffs, on fake patent medicines, on wool, on transportation, would issue an article. The name of the writer would be known to the editor as a specialist of exactitude and authority on his or her own special field. Immediately, the editor would be deluged with letters of protest, or statements of alleged facts proving the figures of the writer utterly wrong.

Now there is no human being so absorbingly busy with office routine as the editor of a big magazine, or a big daily. Routine duties, such as mail, or assigning writers to their special work, or meeting the public, who call and waste hours in long-winded talk, usually fill the office hours and overflow.

To high-grade editors, fake letters of protest are a joke, duly and politely answered, with corrections in subsequent issues if small errors have been proved; but to other editors these floods of letters of protest, bearing all the earmarks of independent origin, proved a nuisance and confusion. The subject would be investigated; but the investigation took time; and time was money. The editor with financial backing behind him usually pushed the probe all the more vigorously and relegated the protests to the waste paper basket as "masked propaganda." The editor without time, or financial backing for investigation to first sources, became gun-shy of controversial topics; and "when the salt has lost its savor," the magazine has lost its flavor, which was probably what the writer of the protests posted from a dozen different centers designed.

"We'll give them a run for their money, anyway," one such propagandist once remarked to me.

This curious phase of *sub rosa* journalism had its origin soon after the "muckraking" period of 15 to 20 years ago. One recalls how such great leaders as Roosevelt and Wilson gave their support to the probing of crooked business, when the movement began and was in the hands of responsible journalists and editors; but when muckraking degenerated into commercialized blackmail to swell circulation, to swell in turn the advertising sold on a purely circulation basis, those very leaders uttered warning against muckraking as insincere and dangerous.

We are largely paying for that illegitimate muckraking today in class antagonisms, which this country never knew before and which have no place in the structure of a pure democracy. When people speak of labor as "serfs" in a country where labor's earnings exceed the incomes of European princelings and aristocrats, or of "plutocrats" and "robber barons" of men, who were in their shirt sleeves 10 years ago—which applies to half the oil and rail executives in the United States; not to mention steel men, who began their careers in blue overalls 20 and 30 years ago—it is transferring the terms of the ignorant ghettos of darkest Europe to a democracy, whose history is not yet 150 years old.

At First, Legitimate

UNDOUBTEDLY, the business propaganda came into existence in the first place as a defense against aggressive and often unscrupulous muckraking.

The prober of industrial crookedness and the muckraker out for circulation or blackmail had insisted—and were right in insisting—that companies, which drew their capital from public savings and existed by virtue of public charter, ought not to conceal their operations in a mask of perpetual secrecy. That was selling stocks like "a pig in a poke." It too often led to swindles in which the inside circle got the profits and the outside investor took the losses. Oil stocks galore, old rail companies not a few, traction interests too numerous to be named, were conspicuous examples of this 15 and 20 years ago. One hardly needs to give the cases. They became household words for loss of hard-earned savings; so the legitimate big interests appointed to their staffs' publicity departments, whose duty it was to prepare and give out to the public accurate data on the number of shareholders in their concerns, the values which their properties represented, the cost of operation, the salaries paid to executives, the selling price to the public, and the exact profit on cash investment.

All this was good and a splendid move in the right direction. We all recall the electrification of Newspaper Row, when editors like Clarke and Lee and Guard and a dozen others were snapped up by the big corporations to take charge of their publicity departments in oils and steels and even grand opera.

If this course of open publicity had been followed far earlier, much of the probing and subsequent muckraking run wild would never have taken place. The facts on the table beforehand would have disproved many so-called revelations drawn from bills of complaint rather than the court's final findings. Oil is an example of this; so is Labor.

There probably never was a movement that enlisted the enthusiasm of the younger generation of journalists so whole-heartedly as Conservation. Roosevelt was the father of it; Pinchot, the directing hand, when Roosevelt went to Africa. All the younger journalists jumped into the fray, lance in hand, to defend Conservation as the *use*, not the *suppression*, of natural resources—gas, coal, oil, water power, irrigation waters, timber; but the young cohorts had not gone very far in their crusade when they discovered everything they wrote was being subjected to widespread attack from two flanks—(1) misusers of resources, and (2) the users of Conservation to make political hot stuff. The enemy was upon their flanks and sometimes a knife was in their ribs from the hands of their friends—the Conservationists. Irrigation land companies, selling so-called irrigation lands to eastern investors, who could not investigate for themselves, often in areas where the lands lay far above the possibility of getting water from the valley below, poured broadsides of contradiction into the magazines publishing the articles and in some cases instituted libel suits, which were never continued. On the other hand, the Conservation backers wanted eliminated out of copy all that reflected on their side politically, and wanted played up in the limelight all that hurt their political foes. It took the Conservation fighters at least six months of wasted, non-pay time to collect from government engineers proofs of the facts they had issued. In the interval, the biggest of the fake irrigation and land-selling companies had failed, and Conservation had degenerated into the sport of such petty politics that the young enthusiasts quit cold. They realized that the issue was being used to boom grooming candidates for the next elections; and that much of the so-called Conservation was being used as a club to lock up resources and not to develop them. Hydroelectric development stopped with a bang. Irrigation got a terrible setback. Lumber soared in prices. The same story could be told of Alaskan development. Alaskan development simply stopped, and population poured away from Alaska as fast as it had poured in, though the forests remained just as valuable, and the coal areas intact that should have been supplying cheap fuel to the Pacific states.

"Back to the Land"

IN THIS case, it was the invisible hand of the business propagandist and the party propagandist that confused the editors, disillusioned the enthusiasts and wounded a great movement almost to a dead issue. Needless to add, the threatened libel suits never came off. The propagandist did his assassin work well.

Or take the back-to-the-land movement, really fathered by Hill of the Great Northern. Hill foresaw that western railroads could not expand, could not lower rates to prosper the producer, unless there were greater traffic receipts, which meant more producers on the land. He also foresaw, as he told me shortly before he died, that a nation, with more than two-thirds of its people not producing food and less than a third producing food, was in danger of getting top-heavy industrially and upsetting its own system of civilization.

So the back-to-the-land movement was launched. Publicity made the welkin ring with "little success stories" that never happened on earth or sea, land or air. Land values soared—out of all proportion to the percentage of profits that could be made on costs. When apple lands soared to $2,000 an acre, six per cent on $2,000 an acre meant $120 an acre profit, independent of rain, winds that shook the fruit down, frosts that caught the blossoms, labor that raised the cost of barrels and boxes, gluts that drove prices down below the cost of freight. Land fakirs, irrigation fakirs, fruit fakirs, shoe-string real estate companies sprang up like mushrooms; and their propaganda writers—some conscious of the fraud, some unconscious, one who manufactured his book lying on a bed in a hospital and never saw a farm—let the reins loose on flights of fancy and sent thousands of townfolk with flabby muscles and no knowledge and less than no capital (usually debt) back to the land, which was to drop food in their mouths without the lifting of a hand, or an implement. All they had to do was to drive round in rubber-tired cars, or two wheelers, or ride on horseback, directing operations of which they knew nothing.

Of course, Mr. Hill saw the slimy trail of the propagandist serpent on the path of his own publicity and issued warning after warning against the folly. If all the fruit lands came into bearing, there would not be cars enough in America to carry the output to market; but the movement died aborning, I am sorry to say, and not a painless death. The back-to-the-landers came back to town richer in experience but lighter in worldly goods. The propagandists did their work so well that they will never be able to do it again; and the fake promoters got away with the profits. The leaders of the Farmers' Bloc exposed this kind of thing for all time by putting down in Congressional Reports an exact scientific tabulation of land values and land earnings from 1839 to 1921.

The Facts Wanted

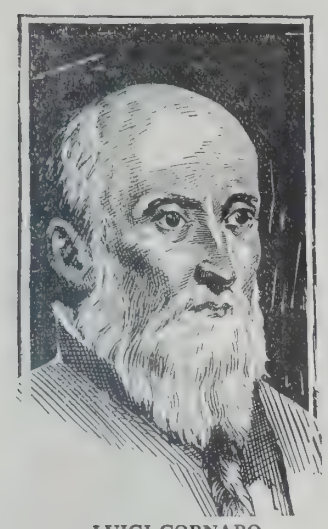
OR TAKE the tariff fight on dyes and wools dragging its weary length through the Senate in futile bickerings and arguments. The Farmers' Bloc is composed of loyal Americans, though some of the foolish arguments would prove they are both un-American and blockheads. If the farmers were convinced a tariff would help either the wool industry, or the dye interests, and not add to the cost of living, they would stand for a tariff; but instead of facts, they are deluged with contradictory arguments and special pleadings, for condemnation or commendation. Here is what the farmer wants to know.

If I vote for a tariff on dyes, will I increase the cost of my clothing and building paint? Give him the facts; not propaganda argument.

As to the wool tariff, give him the facts as to why when the United States produces only one-third of the wool it uses, wool at 20 cents a pound in the West comes back in $75 wool suits. Trace the wool from the sheep's back to the man's back and show him, in facts, where the increment of cost comes, and he will do his own arguing for himself; but while the publicity agent deals in facts, the propaganda agent deals in fiction and arguments; but each publicity agent is afraid to throw his propaganda agent off and to depend on the reporter's naked facts, for fear his rival in the game will not do likewise; so the bloodsucker, blackmail game goes on, to the curse of the editor and the cost of the business paying the colossal bill.

Practically the same story could be told of the perennial controversies between beef grower and packer, dairyman and milk company, implement buyer and implement seller. The publicity agent, or the independent reporter, getting the facts first-hand and setting them forth without argument or preamble, could have settled every controversy and allayed the bitterness that has divided producer and distributor into two hostile camps. The consumer must get his food products cheap enough to buy liberally of all the farmer produces, but he doesn't buy liberally when milk goes above 17 cents a quart, and beef above 40 cents a pound, and apples above $10 a barrel. The farmer could sell, at a profit to himself, milk at 7 to 10 cents, beef at 15 to 20 cents, apples at $3 to $6; but he doesn't get those prices. He has no objection to the middleman getting 100 per cent profit if he can, provided he, the farmer, gets a living return for what he sells; for the farmer knows if the middleman's profits go beyond a certain line the state will take 64 per cent of those profits in taxes; but here the publicity fact man again becomes a special pleader as a propagandist. There is a cloud of arguments, scarcely a raindrop of facts; and the controversy has now come to the point where the farmers of the nation have organized a bloc, not to club legislation by wielding a minority power, but to save themselves from financial bankruptcy. The farmer is not an advertiser; neither is he a shareholder in food products companies. He felt he could never get his case before the public when he was in the thick of a fight. After he had won his battles, help and commendation came to him in a deluge; but that was too late. Hence the farmers have formed their solid and often hostile bloc in the United States, in Great Britain, in France, in Italy, in Belgium.

Here the propagandists did their subtle work so well it defeated its own ends, and unified the opposition in an obstructive force. Again the old-time independent reportorial investigator could have put the facts before the public and averted controversy.



Wall Street's Misuse

WHEN we come to the story of stock raids on Wall Street and "bulling favorites," it would require a book of many chapters by itself. It is a more sinister story than the Bolshevik propaganda of Mexico, or Russia, which at most has never spent more than a few millions in its underground work. Here was irresistible temptation to the honest publicity man, who believed in his venture, to pay big money to the propaganda boomster; and I could tell of many cases, where it has been paid in cash up to $20,000 a year, with side tips that ran into the hundreds of thousands; but the trouble was he who secretly "boomed" today might as secretly "bang" tomorrow, of which Lefevre has given countless examples in his thinly veiled fiction stories. From paying for "boomsters," big business often found itself having to hold "boomsters" to keep them from becoming blackmailers. The drain became a curse from which the majority of the big companies are today shying off, particularly as since 1910, the majority of the big industrial concerns from oil to steel are three-fourths owned by the general public, and big money has taken to the more stable investments of tax-exempt bonds.

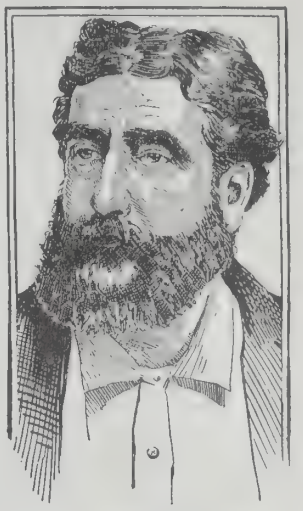
That we are swinging back to a more legitimate journalism based on facts is amply evidenced by many signs besides the public announcements of President Harding and Secretary Hughes. In the leading newspapers today all articles are signed by a real name or a nom de plume, that is a trade-mark of reliability. All financial articles are now verified by a corps of expert readers, and controversial articles always have the documents with the proofs accompanying the article. Too much space is still given to irresponsible charges on the floor of the House and Senate uttered with privilege in the form of questions or insinuations without proofs; but editorials usually discount these party fulminations and fireworks for cheap votes. As for freedom of dependence on advertising for revenue in the face of mounting costs in mechanics and paper, the trend is too self-apparent to be ignored. The newspaper in New York which today has the largest circulation—it is by no means the best news medium but it shows the trend of independence from advertising control—is the one, where mechanical costs have been reduced below sales returns. The print paper is of execrable quality; but it represents less cost than returns. Costs must come down, or subscription prices go up; and the various sections of the public will support both moves that will give them independent, undiluted news. The labor journals show the extreme of one trend—cheap costs. The financial journals show the extreme of the other trend—subscription $18 a year. Both spell independence of propaganda, of subsidy, of party, of advertising. Ten years ago, I took one daily at $8 a year. Today, I take two of different political stripe and policy, one at $12 a year, another at $18. I would gladly take one forever at $15 if I were sure of getting facts, not arguments, nor propaganda; and it seems to me those are the two ways out of the maze of propaganda that has hampered and muzzled and hurt the press in the last decade.

The Literature of Health and Optimism

Healthful Diet for One Person Declared Likely Not to Aid Another

LUIGI CORNARO

A FEW DON'TS



DON'T accept at face value all the old or new health advice that you may hear or read. Test all advice by a little common sense and then by carefully observed experiment.

Don't take it for granted that because one person regained his health on a certain regime you would have the same result.

Don't imagine that by Deweyizing your diet program, Fletcherizing your food, and Macfaddenizing your muscles you will necessarily accomplish what someone else is reputed to have done. Otherwise you may be disappointed.

On the other hand—

Don't get the idea that you can live in "any old way" and "get by with it." If you do, the foolkiller will be on your track.

MORTIMER COLLINS

By GEORGE HENRY HEALD, M. D.

PAUL'S statement, "We know in part and we prophesy in part," is as applicable in our day as in his. Our knowledge is punctuated with many guesses, and our insight is often hindsight. This is the thought that comes to one who has spent some time browsing over shelves of ancient and modern volumes —several hundred of them—all teaching how to be healthy and live long, and no two of them teaching exactly the same thing.

Many of these books seem to consist largely of compilation. Each author appropriates generously from his predecessors, and adds a little of his own.

Other books have been written from the personal experience of the authors, who have made the generalization that what has seemed to promote their own health and longevity ought to be good for everyone. Some writers explain how they have rejuvenated themselves, making themselves young at 60 after having been old at 40, or some similar stunt. They all accomplished this miracle of re-creation by exercise. One exercised his muscles in bed, another after rising; another exercised his jaws to the limit during meals; another exercised self-control in the use of whisky and tobacco, or in the amount of food intake, or in the character of the food; still another exercised his faith and optimism. But they all exercised, and to that extent they agree. Meantime, thousands who have exercised one or more of these virtues are wondering why they do not have better health. It is all a mystery, is it not?

Someone has said that the literature of optimism is the literature of self-deception. I do not know that I subscribe to that statement. It may be true. But what would we do without the books of hope that encourage us to look forward to a longer and happier life?

The writer is well aware that he is not likely to qualify for membership in the Centenarians' Club, and so the perusal of some of these books makes him feel the disgrace it will be to die before reaching the century mark. Yet since he has learned the age of some of these apostles of a long life, he realizes that he is in good company. Some of the authors are still alive, and no doubt are making strenuous efforts to prevent their obituary following too closely the publication of their book on longevity. Following are the instances in which I have been able to learn how near an apostle of a long life has approached the hundred mark. Possibly the first on the list, a translation from the German, does not belong to this class, for the author is dealing with treatment as much as with personal hygiene.

Christian Augustus Struve, M.D., who wrote "Asthenology: or the art of preserving feeble life; and of supporting the constitution under the influence of incurable diseases," died in 1807, aged 40 years.

In 1871, "The Secret of a Long Life" appeared anonymously. It was afterward learned that the author was Mortimer Collins, who died five years after the publication of the book, at 49. He was not more than 44 when he divulged that epochal information. Possibly it was remorse for having disclosed so profound a secret that caused his early demise.

"Long Life and How to Reach It" appeared in 1879. Seven years later, the author, Dr. Joseph G. Richardson, Professor of Hygiene, University of Pennsylvania, died at 50.

Robert James Culverwell, author of "The Art of Longevity: how to live a hundred years," died in 1852, aged 50 years.

Dr. John Brown Hamilton, Surgeon-General of the United States Marine Hospital Service, was 37 when he issued his "Lessons on Longevity: paragraphs on home hygiene and the art of prolonging life." Dr. Hamilton died in 1898, aged 51.

"The Old Man's Guide to Health and Longer Life," was written by John Hill, M.D., who was 59 when he died in 1775.

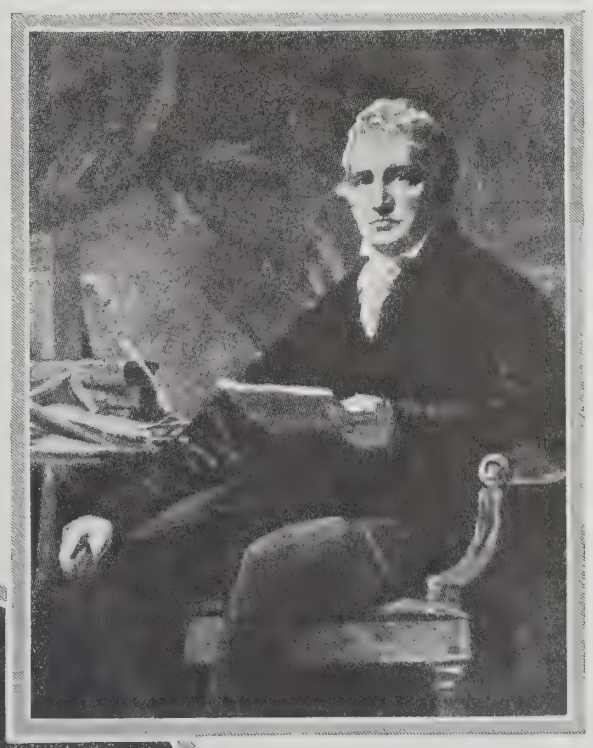
William Whitty Hall, A.M., M.D., who wrote "How to Live Long," died in 1876 when he was 66 years old.

Elie Metchnikoff, or Mechnokov, the great Russian bacteriologist and scientist, successor to Pasteur, and author of "The Prolongation of Life," who believed that by peopling the large intestine with friendly germs, a man might live to be 200, died in 1916, aged 71 years.

Christoph Wilhelm Hufeland, author of "The Art of Prolonging Life," another translation from the German, died in 1836 at 74 years.

John Gardner, M.D., author of "Longevity: the means of prolonging life after middle age," died in 1880 at the age of 76.

Sir John Sinclair, author of "The Code of Health and Longevity," published in 1807 in four volumes, died in 1835 at the age of 81.



Richard Henry Clarke, LL.D., who in 1887 at 60 issued his "Hints for Prolonging Life," lived to 1911.

Bernard Christoph Faust, who wrote "Laws of Health for the Use of Schools and Self-instruction," reached 87, dying in 1842. His was also a German work translated into English.

Luigi Cornaro, contemporary of Christopher Columbus, and the classical example of the attainment of old age through a change of life habits, was a physical wreck at 40. Adopting a simple regimen, he lived to be more than 100.

There were two Grahams, contemporary, who did much to encourage the practice of personal hygiene. Sylvester Graham, from whom we derive the name Graham bread, and whose influence was widely felt in this country, was born in 1794; and Dr. Thomas John Graham, of England, author of "Sure Methods of Improving Health," was born a year later. Sylvester died in 1851, aged 57. Dr. Thomas Graham lived a quarter of a century longer, dying in 1876. Doubtless Sylvester was as conscientious in his observance of health principles as was Thomas. The following quotation from Sylvester Graham's "Lectures on the Science of Human Life," page 468, paragraph 669, shows his strong faith in the hundred-year idea:

"Now, therefore, if individuals can be found at the present time, who are a hundred years old, the fact may be adduced as a demonstration that the human constitution has vital power enough to resist the causes which induce death, and to sustain health for a hundred years under whatever disadvantages may exist at the present period of the world, distinct from the agency of man. But we know that there are many individuals now living and enjoying good health in different sections of our country who are a hundred years old: and, therefore, it may with perfect accuracy be affirmed that the human species in the United States of America may average a hundred years of life." Unfortunately he did not reach much more than one-half of the average.

SIR JOHN SINCLAIR

PROFESSOR ELIE METCHNIKOFF

With the exception of Cornaro, I have found no person who has written a treatise on how to live long and himself lived to be more than 87. Those who live to be a hundred do not write about it. Doubtless in most cases they are as far from knowing why their funeral has been postponed as we are.

If asked what has kept them in the harness for so long, many of them will volunteer some answer. It may be simple diet, life in the open air, a care-free life, the habit of taking life with a smile, avoidance of excesses, abstinence from alcohol and tobacco—any one or more of these. The fact is, there is scarcely a thing that one can select as characteristic of those who live to a great age that may not be found in those who die younger—unless it be heredity. Doubtless many persons have followed Cornaro's régime and yet have not lived more than 60 or 70 years. On the other hand, those who have lived to be 100 have followed all sorts of régimes—or none at all.

W. W. Hall, in his "Health Maxims," published in 1875, displays keen insight when he says: "In looking over the habits of old people for the purpose of ascertaining the secret of their longevity, only one element is always present—a long-lived ancestry, and next to that, in frequency, is uneventful lives, involving moderation, uniformity, quietude."

Alexander Graham Bell, many-sided scientist, and inventor of the telephone, made an extended study of the Hyde genealogical records, including 8,797 names; from this, he showed a definite relation between the ages of the parents and the ages of the children.

The father's age has more influence than the age of the mother.

Professor John Bell, of the College of Physicians and Surgeons, Philadelphia, in his book "On Regimen and Longevity," has recognized that longevity is largely a matter of heredity, but not altogether so. He says health and strength will be readily lost by vice and idleness and that physical efficiency and longevity do not necessarily go together. The very active, strenuous life is usually a comparatively short life. But a man with an active brain and body would rather have 15 years of real life than 50 years of vegetation. Few who arrived at a great age were ever remarkable for Herculean frame or great bodily prowess. The car that runs 5,000 miles a year will last much longer, other things being equal, than the one that is run 20,000 miles a year.

Looking down the hills toward Frankfort. In spring these hills are ablaze with beautiful flowers and shrubs.

Kentucky's Westminster Abbey

State Cemetery at Frankfort a Show Place

By HARRY E. BARNET

"HAVE you been to the state cemetery?"

It is a strange question, almost a gruesome one. You scarcely expect it as a banality of early conversation, especially in the courteous South. Yet, in Frankfort, Kentucky, it is almost certain to occur soon after a native meets a visitor. And it implies nothing discourteous; rather it is a means of calling attention to the city's greatest show place.

Unique, indeed, is this solemnly beautiful place. Here lie the remains of the commonwealth's most distinguished dead—soldiers, statesmen, private citizens. Behind the idea of the establishment of the cemetery lay something of the thought that makes Westminster Abbey such a place of honor in England. In the Frankfort State Cemetery it was intended to bury those to whose memory the state desired to pay highest honors.

The original state cemetery is a mound, in the center of Frankfort cemetery, atop the highest hill on the edge of the city. It was chosen in 1847, and named "State Mound," by a legislative committee, appointed to select the location for a public burying ground, and the most fitting place for a monument to its soldiers of all wars. The mound was given outright to Kentucky by the trustees of Frankfort cemetery.

What is considered the finest monumental marble ever brought to the United States was imported from the Carrara quarries in Italy for the column erected on State Mound in 1849. Most of the carving was done in Italy, the remainder in New York. The monument is weather-worn, and stained with rust from the dowel pins which hold the blocks together. When it was put in position its color was uniform, and it was without a blemish. It was transported with great care. From New York it went to New Orleans by sea. A special barge was built and sent to New Orleans. The column blocks and carved parts were unloaded from the ocean-going vessel directly on the barge, and delivery was made by water.

Surmounting the column is a statue of Victory. It is guarded by four eagles. Bands encircle the column, and below them are panels. The principal battles and campaigns are inscribed on the bands, and beneath them are the names of the officers who fell. The names of her soldiers who died for their country are too numerous to be inscribed on any column. Kentucky acknowledges "gratitude equally to her officers and soldiers," and shows the coat of arms and state motto, as well as the date of erection of this "military monument." Names of 22 battles and campaigns are carved, with the names of 84 officers killed in action. Four cannons guard the monument. Two of them were spiked by the enemy before they were captured at Buena Vista.

Graves of soldiers surround the monument.

Captain Bacon was killed by General Bedford Forrest in a hand-to-hand fight at Sacramento, Kentucky, early in the war between the states. Lieutenant O'Banion led the charge under Captain Eaton, who was killed, when 15 Algerian pirate ships were captured. The lieutenant was 20 years old, and was serving under Commodore Decatur on the Algerian Coast. He was the first to go ashore, where he pulled down the enemy colors, and hoisted the American flag. Philadelphia gave him a gold-mounted saddle, and the women of the city embroidered a white satin cover for it, when he came back. Congress had his picture painted, and gave him a jeweled sword.

"Unknown Soldier" lies in an unmarked grave. He was a Shelby County boy, who was rejected on account of his age when Captain Benjamin Cave Milam was organizing a company of cavalry in Frankfort for service in the Mexican War. A few days later the boy appeared with his mother, who was a widow, and renewed his application. Mother and son pleaded with Captain Milam, and the boy was enlisted. He did a man's work in the campaign. At Buena Vista, the Frankfort cavalry was ordered to charge the Mexican Lancers. Captain Milam told the boy to stay behind, but he went forward with the company, "because I'll be called a coward if I don't." At the end of the battle his body was found, pierced by a lance. When the remains of Kentuckians killed in the Mexican War were brought to the state cemetery, and buried in the mound, the grave of this lad was overlooked, and it was unmarked for so many years that no one knows his name.

Daniel Boone, from a painting in the old State House.

Shortly after the arrival of these bodies, "State Mound" was renamed "Bivouac of the Dead—" the title of the poem written by Major Theodore O'Hara for that occasion, and embodying in it the greater part of the sentiment that is the reason of being of the state cemetery:

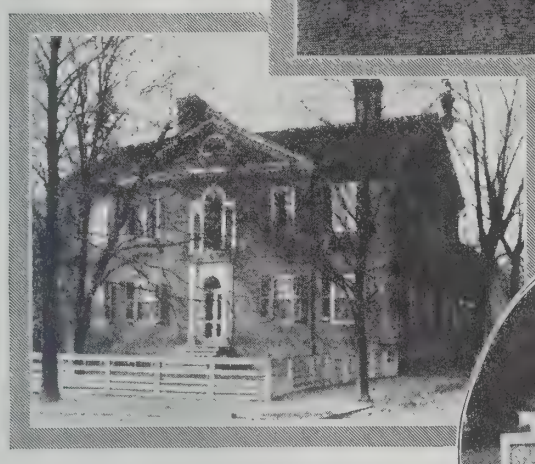
". . . Came down the serried foe;
Our heroes felt the shock, and leapt
To meet them on the plain;
And long the pitying sky hath wept
Above our gallant slain.

"Sons of our consecrated ground
Ye must not slumber there,
Where stranger steps and tongues resound
Along the heedless air.
Your own proud land's heroic soil
Shall be your fitter grave;
She claims from war his richest spoil—
The ashes of her brave.

"So 'neath their parent turf they rest,
Far from the gory field;
Borne to a Spartan mother's breast
On many a bloody shield,
The sunshine of their native sky
Smiles sadly on them here;
And kindred hearts and eyes watch by
The heroes' sepulcher."

No other poem so thoroughly arouses the martial spirit of Kentuckians. Major O'Hara is buried in the mound the name of which was changed to the title of his poem. He was a veteran of the Mexican War, and a member of the staffs of General Breckinridge and General Johnson. Confederate and Federal lie side by side in the "Bivouac of the Dead."

Six lots were added to the state cemetery in 1851. In them are buried "Kentucky's illustrious dead," not strictly military. Among them are the remains of Richard M. Johnson, a vice-president of the United States. He slew Chief Tecumseh. A carving on the south side of his monument pictures this exploit. An inscription also states he was the author of the law abolishing imprisonment for debt in Kentucky, and in the United States. Thirteen governors of Kentucky, seven ministers to foreign countries, 11 Secretaries of State, and 12 United States Senators are buried in these lots. In addition there are hosts of attorneys-general,



Rebecca and Daniel Boone monument.

Main street, Frankfort, Kentucky.

Monument to the author of "Bivouac of the Dead."

Type of residence in old Frankfort.

Log raft (of the type described in the John Fox stories) passing Frankfort.
Left—Monument to Joel T. Hart, painter and sculptor.

chief justices of the state, librarians, and adjutant generals, as well as historians, editors and inventors. Above a great many of the graves the state has erected monuments, one of them to Beverly L. Clark. He died in the city of Guatemala while minister to Central America. His remains were brought to the state cemetery at public expense. A small stone marks the grave of Governor James T. Morehead, of Kentucky.

Joel T. Hart, sculptor and poet, made the busts of Cassius M. Clay, Andrew Jackson, John J. Crittenden, and Henry Clay. His fame, however, came from his works of ideality—"Venus de Medici," for instance, and "Triumph of Chastity," which required 20 years to finish. Frankfort claims that it was the finest piece of statuary ever seen in the United States. It was destroyed in a courthouse fire in Lexington.

And the grave of Robert Burns Wilson, the poet, recalls his "Beside the Stream." A quotation from it exactly fits the state cemetery:

"The breath of fields—the song of birds,
The lifting leaf, the dancing beam,
The landscape wide, the grazing herds,
The moving music of the stream,
These do not call for wasted words;
These shall enfold me in their dreams."

Above the figures "30," a telegraph instrument, with a hand operating it, is carved on the east face of the monument of James Francis Leonard. Various inscriptions state that he was "born in Frankfort, Kentucky, September 8, 1834, Died at Columbus, Mississippi, July 29, 1862, Called home by the Grand Chief Operator to work the eternal circuit above, His comrades, the Old Time Telegraphers, have caused his remains to be brought back to his 'Old Kentucky Home,' and erected this monument to his memory, Ablaze with genius, and aflame with zeal, he caught the spirit of the electric force, The first sound reader, he interpreted the telegraphic alphabet of Morse."

Near the Leonard grave is the monument of Captain John Cannon, for a while the most famous man in America. He was the owner, and in charge of the steamboat *Robert E. Lee* during the race with the *Natchez*. Probably no other race created more interest throughout the world.

The course was from New Orleans to St. Louis. The start was at 4:59 p. m., June 30, 1870. By day the banks of the Mississippi River were crowded with people. By night the boats raced through a lane of glory from camp fires of spectators along the shore. Millions of dollars were bet—a man in Natchez bet his home and all of his cash against $30,000 on the boat of the same name. The *Lee* reached St. Louis in three days, 18 hours, and 27 minutes. The *Natchez* was three hours and 31 minutes behind her opponent.

"They sleep. What need the question now if they be right or wrong? They know ere this whose cause was just in God's, the Father's, sight. They wield no warlike weapons now, return no foeman's thrust. Who but a coward would revile the honored soldiers' dust?" is the inscription on the Confederate monument, erected by the Daughters of the Confederacy in 1892. Sixty-eight Confederate graves surround this monument.

In a quarter-acre lot, on the brow of the hill overlooking Frankfort and the Kentucky River, Daniel Boone, and his wife, Rebecca, are buried.

The legislature appropriated the funds to bring the bodies from Missouri, and they were re-interred in one grave, September 13, 1845. Thousands of people witnessed the ceremonies. At the conclusion, hundreds passed the grave, and each one of them threw a handful of earth down upon the caskets. The Boone Monument, erected by the commonwealth in 1860, was partially destroyed by relic hunters. In 1906 the state appropriated $2,000, and the Daughters of the American Revolution raised the remainder of a fund with which the monument was rebuilt, and the panels duplicated.

Georgia granite is the base of the monument. The stone is from Boonesboro. Rebecca Boone milking a cow is the subject of the east panel. On the south Boone is shown ending a fight with two Indians, one of whom has fallen while the other grasps his war club. Boone is shown, one foot on the dead Indian, and ready to strike the living one with his knife. The west panel shows Boone seated in front of his cabin, a slaughtered deer at his feet, while the north face of the monument pictures him in conversation with a boy.

Sixty-two varieties of trees shade the burial grounds, and many varieties of birds live in these trees.

Frankfort is the largest untouched bit of old Kentucky you'll find anywhere. High hills on all sides of the city shut it off from the world. In the spring, these hills are ablaze with redbud, and white blossoms of dogwood. With the blue of the sky above it, Frankfort nests in the national colors. At other seasons it is cupped now in emerald, then in the dazzlement of Nature's autumnal showing-off, and later in the evergreen-and-white of winter. You can enter Frankfort in no other way, except over pikes that wriggle down from slopes, from the east through a railroad tunnel, from the west across a railroad bridge, butt-joined to a deep cut through the hills, or lastly, on the river that comes out of a gorge.

And, for a city so often mentioned, Frankfort is another surprise. You expect to see a larger city, and a livelier one. Three blocks on two streets one way, and one block on one street the other way, is the business district. Crowded upon it is the residential section. The living and dead populations are each between 10,000 and 12,000. The railroad is in the center of the street in front of the old capitol buildings. Old Frankfort is north of the Kentucky River; south of the stream are the new capitol buildings, and the newer residential section. Frankfort is very quiet, though it has a record of repeated invasions by armed men. A few years ago a small army entered, prepared to start Civil War if necessary. Probably no other capital city had half the number of men killed in political fights, for Kentuckians work harder at politics than they do at any other pursuit. These affairs have been widely heralded, so that if it is your first visit, you're prepared to see picturesque fighters at every turn, to hear of street battles, and visualize dead men, crumpled and lying around. These sights, however, are mere cases of political delirium tremens. Frankfort is a peaceful city.

Curse of Midas Fatal to Mightiest Empires

On the Trail of the Golden Serpent—Egypt, Babylon, Greece, Rome, Spain; And Now America Embraces the Coils of Gold Which Strangle Industry

By J. V. NASH

PROBABLY everyone has heard in childhood days the story of Midas, the Phrygian king, who, as a reward for a service rendered to the god Dionysus, was granted the power of transforming everything he touched into gold. To the simple mind of the ancient king, such a gift seemed the most wondrous and blessed that the gods could possibly bestow upon a mortal. He hastened to put the gift to the test, and sure enough, it was true—chairs, tables, couches, humble pots and kettles in the kitchen, all were changed at a touch of the finger into dazzling, gleaming gold. In a few moments he found himself, as he thought, wealthy beyond the wildest dreams of avarice. Surely he, Midas, was the most fortunate of mortals.

At last, tired of touching innumerable objects in the palace and watching their marvelous transmutation, Midas called for his dinner. His faithful slaves laid before him golden trays loaded with steaming dishes. But lo, the appetizing viands, as they touched his lips, became indigestible yellow metal; so likewise the sparkling wine which he fain would quaff to quench his burning thirst. Then at last the horror of his predicament impressed itself upon Midas' mind. Surrounded by a bewildering profusion of gold, the specter of death—death by the slow torture of starvation and thirst—laughed ironically in his blanched and terror-stricken face. Rushing in desperation to the temple of Dionysus, Midas fell upon his knees and besought the god to take back the fatal gift.

A Timely Allegory

SURELY the wise old author of the tale of Midas meant to teach a lesson to men. The great truth to which the allegory points is the folly of looking upon gold as wealth and of seeking to transform nature's varied bounty into the treacherous metal.

But although generation after generation of mankind has heard the story of Midas, the world seems to have profited little by the lesson. As we look back over the long course of history, it is easy to perceive the sinister influence of gold in the corruption and overthrow of the mightiest empires of the past. Starting with the days of the Pharaohs we can follow the trail of the golden serpent and note how it poisoned and strangled, one after another, great civilizations built up through centuries of toil and patriotic devotion.

Egypt, Babylonia, Assyria, grew up from small beginnings into strong and prosperous nations through the development of agriculture, industry and trade. Then the lust for gold seized upon the rulers, who made war upon neighboring countries, dissipating thereby the national resources, in order to enrich the royal treasuries with stores of glittering gold seized as booty or levied as indemnities and reparations. And so, when the people, bending over the plow, saw the ox-carts laden with golden treasure wending their way to the palace vaults, they imagined that the king had acquired for himself and his people wealth in a permanent form, which would obviate the necessity of hard work in future. Hence, agriculture was abandoned, industry languished, and commerce dwindled away. From now on, the people would live on gold, like the king and his court, for was not the country rich in gold and the royal bounty inexhaustible?

Then followed a period of idleness and sloth, of luxuriousness and riotous living, accompanied by the decay of all the virile virtues which had made the nation great and strong. Eventually the population sank to such a depth of degeneracy that the country could no longer be defended from foes without, and submitted helplessly to invasion and subjugation by some young and hardy people from beyond its borders who had never fallen under the spell of the golden serpent.

The Long Sad Roll of the Lost

IT WAS thus that decadent Egypt passed beneath the yoke of the Hyksos or shepherd kings, hardy Bedouins from the Arabian desert. So Assyria fell before the pastoral Medes from the Iranian uplands and its opulent cities were destroyed so utterly that the ruins of the magnificent palace of Sargon II. have but recently been located and uncovered in the midst of a howling wilderness. So Babylonia, which had developed a civilization which is today the wonder of archeologists, expired wretchedly beneath the lash of Cyrus and the rising power of Aryan Persia.

Then Persia itself felt the sting of the serpent. With the inheritance of the gold of Babylonia, to which they became the residuary legatee, the Persians rapidly degenerated and in two or three centuries the great Persian empire was swept away by Alexander's army of young Macedonians. Alexander's empire in turn waxed rich in gold, lapsed into decay and corruption, and its dismembered fragments finally were absorbed into the great world-wide dominion of Rome.

The Roman people had risen to greatness through the exercise of those rugged virtues which had made the very name of *Roman* synonymous with integrity, self-denial, character and discipline. It was Republican Rome, whose only money was copper until after the Punic War—the Rome of stern and frugal old Cato—which gathered up the remains of the gold-wrecked empires of the Mediterranean.

So long as Rome spurned the gold of the effete East, she grew in strength and prosperity, bringing order and justice to all the lands under her tutelage, and under the *Pax Romana* a war-weary world enjoyed for the first time an era of genuine peace.

But the trail of the serpent—the shadow of the fatal curse of Midas—slowly began to creep upon Rome. Great stores of gold in the shape of tribute from the eastern provinces drifted to the city on the Tiber, and the corruption of the Roman people, once started, went on apace. The small farmers of the Italian countryside, who had been the backbone of the Roman commonwealth, flocked to the capital, where, with swarms of freedom and adventurers, they lived a hand-to-mouth existence with no visible means of support. It was the old story. Why should they work? Were they not the children of Rome, the proud mistress to which the whole East paid its tribute of gold? So agriculture, industry and trade were abandoned. The products of the whole known world streamed daily along the great Roman roads into the Imperial City, which sent back nothing in return but carts loaded with dung.

Thus the Roman mob, constantly recruited from without, grew in numbers from year to year and finally became so powerful that it dominated the government of the empire. The emperor could remain in power only by flattering and contenting the fickle mob which lived in idleness. *Panem et circenses!* (Bread and circuses!) was the daily cry of the populace, and the government kept it pacified from day to day by free distribution of grain and spectacular contests in the Colosseum—graced by the emperor's presence—in which gladiators and wild animals were butchered amid hoarse shouts of delight from the surging multitudes.

So Rome went the way of Egypt, of Assyria, Babylonia, Persia, and the empire of Alexander. Rotten to the core through the corrupting influence of gold, the great empire of the Caesars fell apart and its fairest provinces were overrun by the fierce Teutonic barbarians from the northern forests. Rome itself was given over to sack and pillage. The long night of the Dark Ages settled down upon the world and civilization was set back a thousand years.

Gradually the barbarian invaders of the empire settled down and, under the guidance of the church, began to acquire the rudiments of culture and the practice of the arts of civilized life. Out of the ruins of the ancient Roman provinces—Gaul and Spain and Britain—new nations began to emerge.

Then came the discovery of America. The gold mines of the Old World had been exhausted for centuries and the stock of gold in Europe had dwindled to small proportions. But in the New World—in Mexico and Peru—the Spanish conquerors discovered huge stores of gold and silver as well as mines of unprecedented richness.

Spain's Golden Fall

SPAIN, at this period, was the leading power of Europe. Her empire embraced the fairest provinces of Western Europe, from the Netherlands in the north to Sicily in the south; in addition, she now held, by right of discovery and colonization, the greater portion of the New World, and in Asia the Philippine Archipelago, to which were added later the valuable trading ports of Portugal in Africa, China, and India.

The trail of the serpent was now about to make a new twist. At the very time that we are now describing there was growing up in Europe a theory of economics known as the Mercantile System. The Mercantile System was adopted and upheld by practically all the European nations at this period, but by none more firmly than by Spain. Despite the plainest lessons of history, the sophistry of the Mercantile System was not only accepted by the economists of the sixteenth and seventeenth centuries, but still has its passionate supporters in our own day.

The Mercantile System would have appealed strongly to old Midas before his disillusionment. In short, it held wealth and gold to be identical. Its supporters believed that the wealth of the country depended upon the amount of precious metal which it possessed. Accordingly, it was considered to the interest of national prosperity to obtain from other nations as large a quantity of gold (and also silver) as possible, and, when once secured, to keep it at home! To accomplish this, it was necessary that there should be a maximum of exports and a minimum of imports, pay for the surplus of exports being taken in gold. This was called "the balance of trade," and it was religiously believed that no nation could long endure unless it maintained a balance of trade that was "favorable," that is, that brought gold into the country.

It was on the rock of the Mercantile System—the theory that gold and its satellite, silver, constitute the national wealth—that the great Spanish Empire went to pieces. The story is graphically told by the eminent English historian:

"To state this doctrine (the Mercantile System) in its simplest form, it was believed that all wealth consisted of the precious metals, and that therefore a country was necessarily impoverished by every transaction which diminished its metallic riches, no matter how much it may have added to its other possessions . . . .

"FROM THESE PRINCIPLES THREE IMPORTANT PRACTICAL CONSEQUENCES WERE DRAWN WHICH CONTRIBUTED GREATLY TO THE DOWNFALL OF SPAIN. In the first place, the whole energy both of the government and people (of Spain) was concentrated upon the gold mines, and manufactures and almost all forms of industry sank into neglect. In the next place, the colonies were speedily ruined by an elaborate system of commercial restrictions and monopolies, devised with the vain hope of enriching the mother country, and some of them were at length goaded into successful rebellion. In the last place, an undue amount of gold was introduced into Spain, which had the very natural, but, to the Spaniards, the very astonishing effect of convulsing the whole financial system of the country. For the value of gold, like the value of other commodities, is governed by the law of supply and demand; and the fact that this metal has been selected as the general instrument of exchange, while it makes any sudden alteration in its value peculiarly dangerous, does not in any degree remove it from the law. When it suddenly becomes too common, its value—that is to say, its purchasing power—is depreciated; or, in other words, the price of all other articles is raised . . . .

Industrial Paralysis

"THE stream of gold that was directed to Spain after the discovery of America produced nearly the full measure of evil, while the economic error of the age deprived the Spaniards of nearly all the good that might have been expected. The temporary evil of a violent change in prices could only have been abated, and the permanent evil of the decay of national industry could only have been in some degree compensated, by the free employment of American gold to purchase the industry of foreign nations; but this would involve the export of the precious metals, which the government under the severest penalties prohibited. It is true that, as no prohibition can finally arrest the natural flow of affairs, the gold did issue forth, but it was in the manner that was least advantageous to Spain. Charles V. and Philip II. employed it in their wars . . . . The only other mode of egress was by infringing the law.

"After a few years the full effects of this policy were manifested. Manufactures had languished. Prices were immensely raised. Confusion and insecurity characterized every financial undertaking. The Spaniards, to adopt the image of a great political economist, realizing the curse of Midas, found all the necessaries of life transmuted into gold, while, to crown all, the government prohibited its export under pain of death!"

So it was that, through the old Midas-like lust for gold, disguised now in the habiliments of an economic theory, Spain became hopelessly enmeshed in the coils of the glittering serpent. Industrial paralysis crept over the nation. No less than 17 branches of industry, which were the real source of Spain's wealth, were killed or driven out of the country. One by one she lost her great provinces in the Old World, and her richest possessions in the New, until the close of the nineteenth century saw her stripped of the last remnants of her empire, East and West, bankrupt at home, and reduced to the status of an insignificant second-rate power.

During the past year or two we have witnessed in America a recrudescence of the discredited Mercantile System which bankrupted Spain. We have cornered the world's gold supply, and now we are going to keep it here by putting up a high tariff wall around the country to kill off foreign trade, meanwhile keeping our currency on a strictly gold basis. The latest champion of the Mercantile System seems to be none other than the Federal Reserve Board. This board was created for the express purpose of giving elasticity to our currency. But in the face of the growing prosperity of the wage earners of the country through that expansion of the currency which the Federal Reserve Board itself had made possible, the board, in unaccountable alarm, announced that a policy of "deflation" must be put into effect; in other words, that THERE IS NO REAL WEALTH EXCEPT GOLD, and that our currency must be strapped down tightly to a gold basis. In short, the people must remain in bondage to the gold kings of Wall Street!

And Now America

MEANWHILE, the importation of gold into the United States was increased to fairly staggering proportions. According to the recently published International Year Book covering 1921, the production of gold in this country during 1921 amounted to $49,105,500. But in the same year there was shipped into the United States from abroad total imports of gold to the amount of $691,267,448, whereas the total amount of gold exported last year was only $23,680,043. This represented an excess of gold imports over exports to the tune of $667,587,405 in 12 months. Spain, in the palmiest days of the Mercantile System, was a piker by comparison.

For the preceding year (1920), toward the close of which the present economic debacle overtook us, the ratio of exports and imports of gold shows a striking difference:

Imports	$417,068,273
Exports	322,091,208

This reveals an excess of gold imports amounting to only $94,977,065.

The year before that—1919—was one of the most prosperous in our history. Industry was booming, there was no unemployment, and labor was receiving unprecedentedly high wages. Yet in that year, according

Carpets and Quilts and Pillow Tops and Batik

Old-fashioned Woman and New-fashioned Woman Hold to Arts of Needle

By WYMAN SMITH

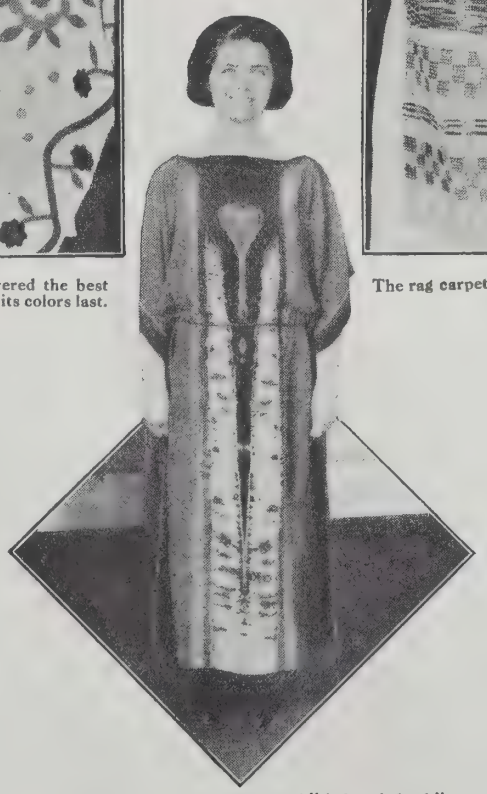
ALL our pewter ware has been sent to the museums or to the chimney corner, all our three-legged stools have been abolished, and crewel work no longer decks the window sashes, the counterpanes or the chair backs, but here and there in America still lingers the touch of handicraft which woman throughout the centuries has employed to create her home. She may purchase all those articles of refinement which she adores at the shops on the avenue or on Main street, but she still insists that the work she does herself is better and more beautiful for both her person and her home.

Some woman said philosophically: "I can think better when my hands are busy," but whether that is the reason or not, in the summer cottages on some inland lake, in the mezzanine of the hotels, in quiet home living rooms or on the veranda, on observation car and on shipboard one may see still the faint hints of woman's creative instinct for beautifying her surroundings. Very leisurely and with no ostentation she attends to her embroidery, her crocheting or her knitting, and sometimes if you ask her she will say, "Oh, daughter is going to school in the fall and she'll need this new sweater," or, "I am making this for my son's wife—she liked mine so much last year." Nor is this the "old-fashioned woman," but rather the one who will talk politics, literature, art, travel or what you please and will astonish you with her intimate knowledge of those things which constitute education.

This is the woman who can appreciate both the art and labor of a Chinese rug, or the delicate expression of a Beauvais tapestry, for by her own contrivances she has learned their innermost meaning and intuitively understands the will and effort of the artist she has never seen. She herself is an artist and were she to count her followers she would find a great army of women who are preserving handicraft in all its rare designs and with all its marvelous influences.

This quilt sewed by hand and covered the best bed in a log house 75 years ago, yet its colors last.

Sample from art class. Batik is very popular nowadays.



The rag carpet still is popular in these days of a million machines.

Machinery has done much to make life more livable and it will continue to do so, but woman endows her handiwork with part of herself, with a portion of her aura, and thus she encourages in herself and in her children that careful fineness which can be expressed only in handicraft. Machinery has removed the drudgery and much of the inconvenience, but woman still perpetuates the creative desire of the human race in her furnishings and in her own dresses. And even though she does not succeed in exerting a great art influence, she herself gains, from the employment of her fingers, self-expression. Who knows just how many of our artists have learned their color values from their mother's home, and from watching the painstaking deftness of their mother's fingers, the carefulness and thoroughness which makes them a genius?

Nor is it only the mothers who are working but the daughters have learned also the methods of crocheting, knitting and embroidery. Sometimes they wear their handiwork. On the street corner, I watched two men pause to observe the neckties in a window display. One asked the other: "Where did you buy that corking necktie you are wearing these days?" The other blushed and finally stammered, "I didn't buy it——. My fiancée crocheted it for me."

Not an important university or college in America but has introduced courses in art and design when the value of color harmony, batik, and "tied and dyed" handiwork is being taught.

"Our classes in art and design," says the chairman of a course in one of the middle western universities, "are increasing in size every year, and besides the regular students in home economics who are electing the course, many others from other colleges come to our department for training. Our graduates are introducing courses in high schools and are meeting with unusual success, and many of them also are using their knowledge to decorate their own homes or to assist friends in working out delightful patterns. I know of no university which does not have classes similar to ours and hundreds of high schools throughout the country are introducing the simple methods among their students. The wonderful effects obtainable with batik and with "tied and dyed" are perhaps responsible for the increasing interest but all the various lines of handiwork are becoming more and more popular."

She makes her own silk gowns of "tied and dyed."

So popular indeed are these two methods that they promise to become a fad before they become a substantial addition to the art resources of women. "The word 'batik,'" according to Gertrude Lewis, of Lindbloom High School, Chicago, "is Javanese and means to paint or draw or design with wax on textiles so that when placed in the dye the wax prevents the part covered from taking the color. The wax is then removed by hot water or gasoline, leaving the parts thus covered of the original color. From early times these designs have been made. But the process reached its highest development in its application to woven fabrics. Wax seems to have been used thus in Southern India and probably in some other parts of Southeastern Asia for centuries. Buddist books of the ninth or tenth century refer to a wax-painting process, and there are preserved in Japan ancient Indian cloths, colored in this manner. This process of wax-painting, however, reached its highest development in Java, where it was introduced about the twelfth century. The work was done by men, and plant and animal motives were largely used in the designs. After Mohammedanism spread over the island, the industry developed rapidly and many new and original patterns were added.

"The highest development was in Central Java where the work was carried on by women, especially those of the leisure classes who could give time and care necessary to the production of the finest work. Some designs were so elaborate and difficult that only the nobility could afford them and a few designs were reserved for the use of royalty.

"Tied and dyed" work is found among many primitive peoples. In old Colonial days our grandmothers made their shaded wool by this method. They wrapped their skeins of woolen thread with corn husks and wound these round tightly with cord to give the necessary pressure. The portions covered with husks remained the original color of the wool while those exposed became the color of the dye bath. Legend even credits the ancient Greeks with tying the borders of their robes to produce waving lines.

"Two main methods in tie-dyeing are either to develop the pattern by tying the threads of warp or woof, or both, before weaving or to tie the goods before dyeing in such a way as to protect spots of the cloth from the action of the dyes. The first method is found in ancient Peruvian work, in Central India, and in parts of the Philippines, and the second method is used to a large extent in Central India and a few examples are also known from Peru."

But however promising these new lines of endeavor may be, back in the small villages and towns still thrives the old-fashioned art of making rag carpets and patchwork quilts. A delightful old lady, one of those I saw making rag carpets, showed me all the workings of a loom which had often intrigued me by its effectiveness and its simplicity. She was more than 60, and although there was no reason why she should make rag carpets for the entire village, so enjoyable has she found the making that she still continues to oblige her friends. By varying the color of the warp, and by clever manipulating, she introduces such a multitude of patterns that no two rugs are ever the same, unless some special order asks for duplication. From a heap of old rags she will make a marvelous carpet of pinks and white, or blue and gray.

And in another corner of another village I found an old woman who sat piecing together bits of cloth which her neighbors brought her.

As I went from village to village I found more signs of a returning interest in handiwork, and then fearful that I had overestimated the importance and had seen only exceptional towns and people I decided to test my conclusions. It was several days afterward before the opportunity presented itself, but one day on the interurban a woman entered who wore a lace network so delicately woven and so minutely perfect I thought it time for a question and asked her, after I had explained my purpose, if her lace had been crocheted or if she had purchased it. Undiplomatic as the question might have seemed to her she understood my purpose and answered, "Why, yes, I made it because I have always liked to crochet and I have time to do it in odd moments."

Handicraft in all its refinement and beauty is being revived by the gentle artistic taste of woman.

An American Kimberly? Down in Arkansas

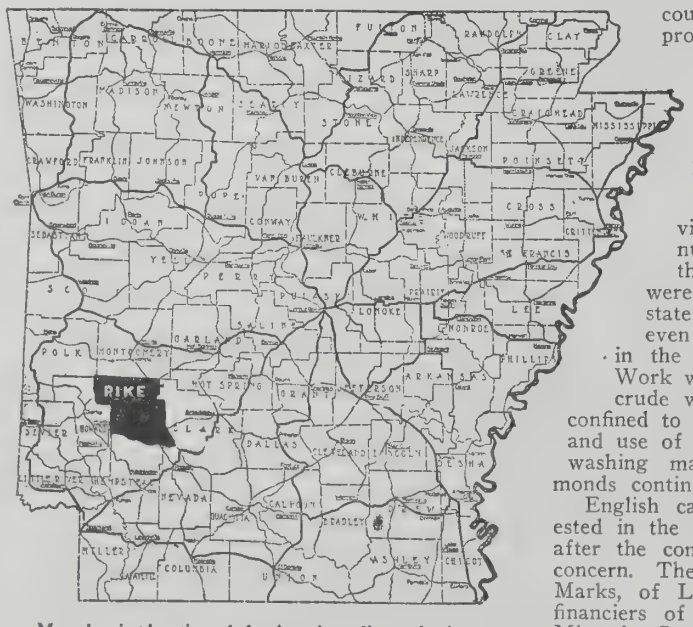
Real Diamonds Mined in Pike County Where the Slow Trains Run

Washing peridotite into sluices in which the earth and rough diamonds are separated and the stones picked out.

By C. E. COLLINS and T. A. WRIGHT

COMPARATIVELY few persons know that diamonds of pure water are mined in Arkansas. When the American Legion annual convention was held in Kansas City and the newly elected commander, Hanford MacNider, was presented with an "Arkansas diamond" by former Governor Charles H. Brough, of Arkansas, many of the delegates imagined it was all a joke and one newspaper ridiculed the idea that real diamonds were found in Arkansas. But the diamond that was given to Commander MacNider equals in color, brilliancy and hardness any diamond that comes from the great mines of South Africa. And it was mined in Pike County, Arkansas.

It is related that the children of early Dutch settlers in South Africa played with diamonds as they might have done with valueless pretty bright stones before the first diamond was identified as such in 1869. The discovery that the "pretty stones" really were diamonds was made by accident. In like manner, the first diamond found in Arkansas 15 years ago was picked up and kept merely as a "pretty stone."



John W. Huddlestone, a farmer, made the find. He picked up a stone in his field one day but had no idea of its worth. He had formed a habit of collecting odd crystals and various specimens of minerals with which the neighborhood abounds. But the stone that he found on this particular occasion was so different from any he ever had seen and gave such sharp glints of light that he decided to take it to Murfreesboro the next time he went to see if someone there could identify it. Several days later, riding toward Murfreesboro on a mule, he noticed another stone alongside the road which appeared much like the one he had in his pocket. He dismounted and picked it up. With the toe of his boot, he kicked at a small pile of pebbles and uncovered another one. He took the three to a bank in Murfreesboro. None of the officials knew what the stones were although one of the men did admire the larger one enough that he offered Huddlestone 50 cents for it. Huddlestone declined to part with it, saying he would rather break it up and see if he could not identify it. Standing in the little group of men in the bank that day was Judge J. C. Pinnix, circuit judge in the district of which Pike County is a part.

"Why don't you send them to a good jeweler and see what he says about them?" suggested Judge Pinnix.

So Huddlestone proceeded at once to wrap up the stones and send them to Charles S. Stifft in Little Rock.

The three stones were immediately recognized as diamonds by Mr. Stifft. But to get other opinions, he forwarded the specimen to a firm of diamond importers of New York, had them inspected by Dr. George F. Kunz, recognized as one of the authorities in America on precious stones, vice-president and diamond expert for Tiffany's and also gem expert for the United States Geological Survey. The stones were pronounced diamonds and the experts declared that they appeared to be as hard and as brilliant as the average African diamond in the rough.

Dr. Kunz was not especially moved by the news of the discovery. He pointed out that diamonds had been found in several states in America, by single stones, and these were accounted for as "stray stones," the theory being that they had been left after the shifting of glaciers thousands of years ago. He so informed the Little Rock jeweler, discouraging any extravagant hopes until a thorough investigation might be made. On learning, however, that the stones had been found in ground apparently of volcanic origin or nature, Dr. Kunz made a special trip to the Arkansas field and was greatly impressed with the fact that it appeared to have diamonds "in place" in their native peridotite.

Map showing location of the American diamond mines in Arkansas.

It was explained that diamonds were found in two locales, those of volcanic origin being found only in a blue earth called peridotite. Carbon at intense heat, it is supposed, is subjected to tremendous pressure and suddenly cooled by the influx of water, probably in volcanic upheaval. The other locale of diamonds in quantity are certain river beds but it never has been definitely determined just how they got there.

The search for information that might throw light on the Arkansas field brought out the fact that many years before, State Geologist Branner, in an official report, had called attention to the presence in Pike County of peridotite similar to that found in the South African diamond fields. But while diamonds "in place" always are found in this volcanic peridotite, it does not follow that all peridotite contains diamonds. The contrary is the rule, more volcanic "pipes" containing non-diamond peridotite than otherwise. In any event, the Branner report did not create any interest and no one ever thought of prospecting for diamonds there, although many prospected for asphaltum, silver and other minerals in that region.

Meanwhile, additional finds of diamonds were being reported and the experts were convinced that Pike County contained a real diamond "pipe." There was no way of determining if the stones existed in paying quantities except by developing the field, and mining, under the conditions, was an expensive undertaking. With the prospects seemingly very good, however, a small company with $25,000 capital was organized under the name, "The Arkansas Diamond Mining Company." In it were Mr. Stifft, the Little Rock jeweler; Sam W. Rayburn, then president of a bank in Little Rock but now general manager of Lord and Taylor in New York; A. D. Cohn, department store owner in Little Rock, and J. C. Pinnix, the circuit judge of Pike County.

The little company gave Farmer Huddlestone $35,000 for his farm—much more than its ordinary worth—after informing Huddlestone of plans which entailed the prospective sinking of a considerable sum of money with the chance of no returns. Huddlestone relinquished ownership with the understanding that he could remain upon the property and that he would be given employment with the company.

Progress in development of the property was very slow. It was almost impossible to convince even a limited number of Arkansans that real diamonds were to be found in the state and that there were even remote possibilities in the Pike County field. Work was undertaken in a crude way, however, being confined to "surface scratching" and use of the crudest sort of washing machines. And diamonds continued to be found.

English capital became interested in the "find" a short time after the company was a going concern. The firm of Lewis and Marks, of London, owners and financiers of the Roberts-Victor Mine in South Africa, also of the Veerspoed Mine which afterward was sold to the DeBeers syndicate, sent representatives to America to investigate and make a report dealing with the new field. Harry D. Lewis, son of the head of the firm, and B. Oppenheimer, their diamond expert, who afterward was created a baronet by the British Government, were selected for the mission.

The two men visited Arkansas and were so impressed with conditions as they found them that they expressed a wish to take half the capital stock of the company, which at that time had increased its capital to $1,000,000. The prospects gave the company renewed hope and the capitalization was further increased to $1,250,000. It was arranged that representatives should go to England for a conference with the English syndicate and Messrs. Stifft, Rayburn and Cohn were soon afterward in London. It was impossible to close a deal, however. The London concern insisted upon a controlling interest in the company which the Arkansans declined to give and the three officials returned empty-handed.

Lacking the capital for the purchase of adequate machinery and rapid development work, the project went along with little change for several years. Two years ago, eastern capital became interested, and a holding company for the "Arkansas Diamond Corporation" was formed. It became possible then to buy machinery. The making of this, linked with the difficulties of getting materials to the new field, then almost in the wilds of Arkansas, held up operations until last fall, when the new machines finally were in place, and operations were begun under modern methods.

Much of the work now being done in the Arkansas field, aside from the mere recovery of the gems, is of a test nature. As yet it is not known how many carats per load nor what the exact cost of getting stones will be. It is not possible to ascertain until later the average cost per carat nor the average size, color and value of them. It has been determined, however, that the field in Pike County embraces 62 acres. Compared with the Premier field of 80 acres in Africa, the Arkansas "pipe" is the second largest in the world.

In the matter of quality, the Arkansas diamonds are said to average, in the higher grades, even better than the output of most of the South African mines. The first lot sold brought an average of $120 per carat, a much better price than those not familiar with the handling of diamonds might understand. The low-grade stones used for manufacturing and mechanical purposes range as low as $4 a carat at the mine and from that low figure diamonds range upward in worth according to color, hardness, and perfection. There is, however, a large margin between the mine value and the retail value, or between the rough diamond and the cut gem, but it is easily accounted for.

A diamond in the rough may lose two-thirds in cutting. A six-carat stone in the rough may not produce more than a two-carat cut diamond. The cost of cutting and polishing is one big additional charge in getting the final marketable gem.

South African diamonds in the rough are subjected to a tax that ranges from 36 to 60 per cent. The rough stones are sent to London where the great diamond syndicate handles them. There is a charge for sorting and selling. The stones are divided into "parcels" in London and are sold to the cutters, only a selected few of whom are allowed to buy. The syndicate needs no salesmen. The cutters in Amsterdam, Antwerp and New York are notified by telegraph or cable that parcels of diamonds await them. The buyer goes to the seller—not the seller to the buyer. The buyer cannot haggle over prices. Nor can he pick and choose. He cannot reject some of the stones in a parcel and have them replaced with others. He must take the parcel allotted to him or go without. It may be, and usually so happens, that all diamonds in a given package or parcel are not suitable to the buyer's trade. He must take them nevertheless, and sell what he does not want to other cutters, not on the syndicate's list of buyers.

The buyers of the parcels almost invariably are cutters who make a business of converting the rough stones into cut and polished gems. The stones which are brought into America bear a duty of 10 per cent, if in the rough, or 20 per cent if cut and polished. From the cutter, they go to the broker and the jobber, then to the manufacturing jeweler and from him to the wholesaler or the retailer and then to the individual. From the time the diamond leaves the mine in Africa until it gets to the buyer, whether by way of London and Antwerp or Amsterdam or New York, every process and every change in hands entails added costs and profits so that the mine value of the stones is but a small portion of the eventual price paid for them.

The Arkansas mine now has a capacity of from 300 to 500 loads a day, this to be increased gradually to 5,000 loads a day, if present work is satisfactory. The results in handling the peridotite already disintegrated have proved very satisfactory but in a measure they are aside from what is expected in the hard peridotite. Up to the time the new machinery was installed, the Arkansas field had yielded 2,000 good diamonds.

American Gold Standard at British Mercy

Free Market, Hinted by Chancellor, Would Destroy Gold's Value; Tourists Exploiting European Currencies While Inhabitants Pinch

By A. R. PINCI

A VISIT just concluded in 10 representative European countries, where I handled as many differing currencies for the purchase of such commonplace commodities as lodgings, food, transportation and newspapers, each and all without frills or trimmings, has justified the arguments and conclusions anent the gold fiction of the gold standard threshed out in these columns. What determines the value of money in all of those European countries is not the artificial price of gold, but the value of any commodity. This value reveals certain discrepancies when compared to the American dollar, but in relation to the monetary unit of the country where it is either manufactured or purveyed it obeys the law of supply and demand.

Russia has been excluded from the sphere of these observations for the reason that the strife-ridden former empire not only has no economic stability at this moment, but because it lacks, in reasonable quantities, the very commodities that determine values and prices. A billion Russian rubles, series 1922, may mean something and may mean nothing. The ratio of face value has attained comical aspects—and money at this time is too serious a subject to be considered on the basis of ruble levity.

In my recent experience, the high and low moneys handled were represented by Swiss francs in the one case and Austrian kronen in the other case. In effect, however, the price I paid for what I required remained about the same. It was only the face value of the money handled that differed. And this difference proves one thing—that the face value of a bill or a metal token is as artificial as the gold standard.

Tourists Dodge Switzerland

ONE of the first things one hears in Central Europe is that "few Americans and English travelers" are visiting Switzerland because the Swiss franc is "so high." So these tourists prefer Germany or Austria where they can deal in thousands or tens of thousands of marks or kronen, respectively. In the end, however, the purchasing value of the pound sterling or dollar remains the same. If they can buy more for the latter it is not because of devalued money but for no other reason than 10 years ago, with money at par—which means on a gold basis—European economic standards meant lower prices. Gold had nothing to do with it; it has nothing to do with it today. It is the modern banking theory that would have us believe otherwise.

Quite recently a prominent official representing an important American banking association made a speech in the course of which he referred to the "worthless" money of certain countries that had nothing else to show for their money units because they are without gold to cover their paper issues. Such ambiguities on the part of supposedly intelligent persons are amazing, and one may account for them as due to a desire to protect the banking trade, unaware that today the United States is virtually helpless with the billions of gold reposing within American strong boxes, because England still dictates international values and has it in her power to destroy American gold prosperity through the simple expedient of establishing a free gold market. This expedient, obviously to save England's interests, and collaterally Continental Europe's, would proportionately lower our own gold wealth.

That the value of foreign moneys has nothing to do with the value of commodities, except theoretically, is proved by the case of the French franc. The French franc is quoted today at less than eight cents. Its true value should be about half, and I have heard a banker abroad say that it ought to be even less. It is pegged up where it is by some sort of international manipulation that is banking upon a false hope—that Germany's reparations and indemnities, if settled in accordance with wishes of a calculating few, will save it from a fall that, in truth, is expected. In other words, the French franc is an unsound monetary unit today because it is artificially pegged up, with the French Government, meanwhile, adopting tactics that will win only so long as London will acquiesce. The Austrian krone may be worth no more than its current quotation, a difficult thing to believe, but at all events it is not sailing under false colors, and that is the case of the mark, too.

Speculating in Money

I HAVE seen Americans in Vienna and in Berlin and in Rome feverishly wanting to exchange their dollars for what their bankers back at home call worthless or nearly worthless money. What will the bankers say to that? How will they explain it? Now these Americans, or, to be more exact, these owners of American currency, are not investing in the money of this or that nation, but in the goods or services that can be bought with said money—and each country places a value upon either commodity that has nothing to do with the gold standard. A few are buying such money for speculative purposes—but thousands and thousands are daily buying stocks and bonds with the same object in view.

There have been reports of exasperated Americans who have strenuously objected to the German export tax and permit regulations. Has the American banker who vociferates for the gold standard realized what a sorry figure his fellow citizens are cutting when they write letters to the American newspapers that are being published abroad, protesting against the German's idea of self-protection? What does the German export tax—aimed, I admit, against Americans at first and now against the French especially—mean except that Germany is endeavoring to establish values in accordance with the gold standard? The average American tourist considers it good sport to enter a hat shop and buy an all-wool cap for 100 marks—at this day about six cents—that he would consider a bargain at $2 in his own country, but because German authorities deem such exports devitalizing to the nation, and correct it by compensating duties, the purchaser proceeds to acclaim the government officials as robbers. And that is the sample of anti-German propaganda that Americans circulate, unaware that the American-valuation tariff idea which was long pressed at home, sprang from the same motive.

I stopped at three places in Switzerland for a hurried glance about—Americans were scarce indeed. Train conductors, cab drivers and innkeepers blamed high Swiss money for their absence. The very persons whose bankers hanker for the gold standard and warn that the world cannot live without it turn their backs upon the one European country that at this time goes the American dollar almost one better. It looks to me as if this means that this gold standard is an excellent thing in America so long as it is advantageous to Americans and a thing to get angry about if it protects the foreigner.

This problem of values is exceedingly serious, because it conceals perils that might well mean another war, and to expose its truth the best method is to set forth its amusing sides. Take so simple a thing as taxicabs. In Rome you pay what the meter reads; in Vienna you multiply by five thousand; in Berlin only by fifty. The number of ciphers on a bill mean nothing. Of course, they have a one-sided mesmerizing effect. The tourist likes to receive but he is not so willing to give.

He goes to great pains to show that a thousand marks, for instance, happen to be less than a dime, and regards the crepe-like bill with smug disdain, but he is very careful in subdividing it, mentally, because he reasons that it is a great deal of money for a German. A lira? That's a nickel—and this modest coin seems to have been eliminated from the traveling American's mind.

"I have had, finally," said an American to me at Brünn, "the pleasure of being for once a millionaire and lighting my cigaret with money. I used a ten thousand kronen bill just like that!"

This American realized his ambition, futile as it seems, but did he ever stop to think that he could have made the armless veteran asking alms along Karntnerring quite happy with half that sum—all of 15 cents?

Cheap or Dear?

TAKE a look at the menu of the Grand Hotel, Vienna. Half fried-chicken, 15,000 kronen. The day I was there this amounted to about 22 cents, and I leave it to the tender imagination of the reader as to how much fried chicken can be purchased for the latter sum in one of the leading hotels of Washington, D. C. Yet that is not a fair comparison. The number of Americans who can afford the time and money to go to Vienna are not many, although at this time there are entirely too many. The true comparison is to determine what 15,000 kronen mean to the average Austrian wage earner. And if we do this then we can realize that 15,000 kronen of chicken in one of Vienna's leading hotels looks to him as a $3 steak looks to the average American wage earner.

But that is not the only difficulty. There is another, which proves that this money problem is regarded unilaterally.

I went to Vienna from Rome. In the latter city I obtained slightly more than 22 lire for a dollar. The average Italian resents the lira being so low or the dollar so high and will not forego an opportunity to let the dollar-owner understand what his feelings are in the matter. Yet the Venice-Vienna train was occupied to standing room only all of the way, a run of 36 hours. All Italians were going to Austria to spend lire—and what Italian could resist the temptation of getting 2,800 kronen for a lira? You cannot eat a meal in Italy for a lira but you can get one in Austria for 2,000 kronen, if you know how. Thus the Italian who dislikes the dollar's supremacy has no feelings when it comes to letting the Austrian know that a lira is a lira and kronen "mean nothing" in his young life.

It requires courage and self-control to withstand deals of this kind—and it is only just and proper that both the Austrians and the Germans, respectively, should be given credit for maximum equanimity, courtesy and resignation in the face of countless unethical deals that are daily perpetrated in the name of the gold standard.

France is circulating tokens of a brass alloy that resemble pallid gold coins, issued by the Chamber of Commerce, and "good for" one franc, or more or less. Italy is doing the same thing. They are not money; they are evidences of money—media of exchange, accepted and paid out solely because they can be converted into commodity on demand—and one commodity that is not in demand is gold. France says so, because her only need of gold at this time is to repay her foreign debts in gold. If France knew how to be self-sustaining she would have no use for gold—and probably she will not have it anyhow.

Last spring secret consternation reigned in New York banking circles because Sir Robert Horne, British Chancellor of the Exchequer, hinted at the advisability and possibility of establishing a free gold market. Within 24 hours this official tempered his statement somewhat and Wall Street breathed more easily, but I found in London that the idea looks more and more attractive—and England is known occasionally to move swiftly.

The Americans who are lulled into a sense of security by their gold hoards should know just what it really means. The mint value of gold is $20.67 per ounce; it is fixed value—so long as England in turn retains a corresponding fixed value. The moment gold is placed in the open market and the Bank of England gives whatever it is worth from day to day, the American mint value would have to break. There are bankers who believe that gold would drop within a year to 25 per cent of its present market value.

This would mean that by refusing to buy gold except at a much lower price than now prevails, England would force the value down and down by merely boycotting it. What would be the feelings of American international bankers who manipulate gold if they found their three billions of today shrinking to a paltry 750 millions?

Such an occurrence, however, would be more serious for the bankers themselves who have speculated in gold than for the country at large, whether it be England or the United States. It would destroy the so-called gold wealth but it would not destroy any other kind of wealth, although it goes without saying that such a devaluation of gold would be accompanied by more or less panicky conditions.

At Odds With Nature

ONE can go from London to Warsaw, from Vienna to Copenhagen, which means roughly about all that there is to Europe today, industrially, and what moral can one draw from the experience? Certainly not that which the banking world would have us believe and that it catechizes us about. One can play statistics in every conceivable manner and attempt to prove that each country's standing is in relation to its gold supply, but the fact is that that standing, instead, is in relation to self-sustenance and hardly any country is self-sustaining, theoretically or actually.

In Germany one may denote a tendency of the men to want to take up farming. But such is the joke of nature that Germany's farm lands are inconsequential, with most of the ground unfit for agricultural development. In Italy, where nature intended that agriculture should be the mainstay of the land, a faulty taxation system plus absentee feudal landlordism caused a growing exodus that today has denuded, so to speak, the country of all its farm workers. Nearly every country, in some way, is working at cross-purposes with its natural trend, destiny and resources. To the extent that this contradiction continues, the financial and industrial weakness of a given nation must continue. Gold does not figure at all.

There is a belief, especially in New York, that England's financial supremacy is on the decline because her gold stocks are almost down to nothing. The average individual is hardly aware with what constancy England is exporting gold to the United States. This apparent indifference to gold bullion is beginning to alarm a certain group of financiers who profess to see in it sinister motives, and attempt to couple it with that country's hope that all debts arising out of the late war should be cancelled. But what is most disturbing, at least in the gold-standard school of thought, is that, despite this uniform diminution of English gold stocks, the pound sterling should continue to remain the prime international bill of exchange. Here and there one notes dollar exchange quotations, but the London bill of exchange is still the bill of exchange *par excellence*.

London Keeps Its Head

IF THE world truly hankered for the gold standard, and if gold were the prime commodity that is alleged, every business man the world over would clamor for gold, and as it is evident that London has no gold, the dollar should be the substitute. But no such thing has happened. Wall Street has waited three years for this miracle, which is just as far away as ever. And what does it mean?

Merely that London sells service and not gold; that before the war the word gold, so far as London was concerned, was a synonym for service as it is today. New York, on the other hand, attempts to sell gold and very little service. England's financial task today is to rehabilitate Germany, but only recently has it dawned upon certain governing officials that the last thing that Germany needs is the very thing that they have wondered how to get for her—that is to say, gold. Goldless England and goldless Germany, once come to an understanding, would be no economic cripples. They remain just what they were before the war—predominantly the financial and productive nations of Europe. The one obstacle just now is that the United States expects Great Britain to repay several billions of dollars in gold and France expects Germany to do the same thing, in either case this being an impossibility, since there is no such available amount of metal available. Is it any wonder, therefore, that England is considering the one alternative, for the sake of England and Europe, of bringing gold down to its true value once

(Concluded on page 14)

"The Frost Is on the Punkin"; It's Riley Day

Concluded from page 3

tingly aided the reporter with this telling response:

"Gentlemen, I thank you for this nomination. I can't make a speech, but I can tell you one thing, the ticket you've nominated today is goin' to win 'when the frost is on the punkin and the fodder's in the shock.'"

A thunder of applause swept over the house. The speech became the talk of the capital, and it was evident that the majority of the people had read young Riley's poem. The managing editor then wisely reached the decision to keep the reporter who wrote rhymes that attracted such attention among his subscribers.

Now let's shift the scene to the city of New York after Riley and Bill Nye, the humorous philosopher, had discovered their common yearnings to themselves. Nye asked Riley to accompany him to an entertainment given by and for the authors of the nation. All the notables were there at the Academy of Music. Bill Nye appeared and made a hit as usual; then both Nye and Riley responded to the encore with a sketch. More applause, and Riley came back alone. He gave, "When the Frost Is on the Punkin."

Never was a Riley poem recited by Riley in a half-hearted fashion. He was a consummate actor. Always a victim of stage fright before treading the stage, he was master of himself when his feet touched the floor. On this occasion he faced an audience of blasé, surfeited men; harsh, severe critics they were. But they saw the art of his rendition and, heartily welcomed the newcomer who could thrill them; and thrill them the Hoosier did.

"Who is that wonderful young man?" James Russell Lowell eagerly asked of William Dean Howells.

"That," came the reply, "is James Whitcomb Riley, of Indiana."

"Now," Lowell fervently declared, "I know the name of the greatest poet in America."

After that night Riley ceased being a localism. His opportunity had come, and he had taken advantage of it. Then the famous partnership of Nye and Riley toured the country, gave their inimitable readings and dialog sketches and gathered more renown.

Riley's greatest hit on the platform with Nye was the hoariest joke he had ever heard, that of the soldier with his head shot off. The poet, always full of deviltry, told it first to Nye who straightway persuaded the poet to add it to his repertory of jokes.

The chestnut depicts a soldier carrying a wounded comrade to the hospital after the fallen man had requested aid. While returning to the rear a shell decapitates the wounded man, but the carrier remains blissfully unaware. The colonel stops him.

"Where are you going with that?" he asks.

"To the hospital," he informs the officer. "His leg's shot off."

"His leg!" the astounded superior exclaimed. "Man, his head's shot off."

"But he told me it was his leg."

The Hoosier had the natural story-telling gift. He never narrated this particular bit the same way twice. Each time he developed a new angle, and nobody ever grew tired.

In 1877 Riley was versifying and reporting on the Anderson, Indiana, *Democrat*. The rival paper took great pleasure in belittling the alleged amateur writer. Finally the real boy, then 28, conceived a bit of business that would force the editor of the Anderson *Herald* to eat his own words. The poet resolved to show him that familiarity should not necessarily breed contempt.

"Leonainie" was written in the style of Poe. The poet took it to his friend, J. Oscar Henderson, who published the Kokomo *Dispatch*. He plotted with him a plausible story of how the work had been discovered on the flyleaf of an old book brought from Richmond, Virginia. The rival Anderson editor swallowed it without reserve. He praised the piece as Poe's own, and editors all over the country agreed to its genuineness. People came to the *Dispatch* office to see the book. Riley procured a musty volume, imitated Poe's hand and inscribed the lines on the flyleaf.

Henderson and Riley continued the hoax until they heard that the rival editor had got wise; when the *Dispatch* barely had time to prick its own bubble by revealing the plot. But the authorities would not believe Riley's claim to authorship.

"The memory of that time," he said afterward, "still stands out as one of the saddest experiences in my life, and one that I can never outlive. There is nothing for me to do but to acknowledge that I wrote it, as I do; yet that does not stand, as I once denied being the author. I wrote it, but I did not; I did not write it, but I did, and I am a liar any way you put it."

Two years before "Leonainie," Riley was living in Greenfield and supposedly studying law in his father's office. But when the father was away the boy would play; he would pull a manuscript out of a drawer in the desk and work upon it. It was "An Old Sweetheart of Mine" which in various editions brought in a greater total income a word than any poem ever written.

It was a wonderful poem from the depths of the poet's heart. Great works do not come secondhand, and this is certainly a great work; yet Riley insisted that the verses were the result of his fancy and that he had no particular persons in mind. Some few writers, William Allen White, for example, maintained that Riley had a sweetheart; no evidence can be found to support this claim. As you read it you see the "face of lily beauty," "smiling features" and "form of airy grace." You thrill along with the poet "beneath the glances of a pair of azure eyes." You can see the "pink sunbonnet and the little checkered dress she wore when first I kissed her" and you can feel the "pressure of her slender little hand." You know they would be "so happy that when either's lips were dumb they would not smile in Heaven till the other's kiss had come."

"Why," Riley was once asked, "did you never marry?"

"I never felt," he answered, "that I could make a woman happy."

It is entirely likely that the poet was wedded to his art. Full well he knew that art is a jealous mistress; if he had a wife, either she or his art would probably be neglected. His name was coupled with that of Ella Wheeler Wilcox, the poetess; according to the story, he had vowed a life of celibacy when in his early manhood he failed to win her.

"Very interesting," he commented when it was told to him, "but I never saw the lady."

William Allen White pictured him as a "poet come out of Tailholt," but Riley never lived in that village situated seven miles southwest of Greenfield. He knew the place that had "but one post office and a womern keepin' hit." When loss of the post office appeared possible he contributed his bit with, "The Little Town of Tailholt" which seemed "good enough fer me," and he thereby saved it; yet some of the residents scoffed at him and his ways.

Riley spent his last years at the home of Major Charles Holstein on Lockerbie street, Indianapolis. He penned a poem about this block-long street; though I have walked its length most searchingly, I never could see the beauties he saw there. The children of the neighborhood were frequent callers to hear him tell how "the Gobble-uns 'll git you ef you don't watch out." Wherever Riley stopped, children were sure to come.

He would have been great as a story writer even if he had never produced a line of poetry. Have you ever read "The Nest Egg"? It has the clarity of Maupassant, the realism of Stevenson and the sincerity of Dickens.

The twenty-second of July, 1916, marked his passing at the age of 67. I was in "The Little Town o' Tailholt" shortly afterward. The whole town knew.

"Wal, I reckon," one of the old residents said to me, "Jim's up there with the angels now."

"What!" exclaimed a woman who had overheard. "The likes o' him in Heaven! How be it you could ever think so of him? Why, Jim Riley, he chewed and he drank and he swore."

American Gold Standard at British Mercy

Concluded from page 13

it has been established that its current value is inexact, illogical and unscientific?

At some point between nothing an ounce and the present mint value, gold must have a definite economic value. That value remains to be determined by supply and demand, not by Congress or the Bank of England. If the latter institution brings about the free gold market idea, the United States would be helpless in keeping the present mint value. The fall would continue until countless buyers the world over found it profitable to buy it at their prices. Yet who can deny that once England took such a step it would mean that gold would lose the one merit that now makes it so costly?

Thus, unknown to the world at large, Wall Street is preparing for a blow that it is still hoped will not be dealt. This explains why, in accord with England in about everything else, the United States seems so sympathetic toward France's requirements, and why certain newspapers, as organs of the banking world that holds mortgages on them, pretend to see humble justice in the French idea of breaking Germany—and why England is pro-German. American gold supremacy will depend upon France having her own way under the various peace documents drafted in 1919 and 1920, while England's salvation is coupled with Germany's.

If Germany falls, England must fall with Germany.

But to return to the problem of values. Switzerland has been overlooked by the average tourist because Swiss money is not low. A tourist can live in a big Swiss city for less than $3 a day. But because he does not get "thousand-something" bills for a dollar he goes elsewhere to get bills that look valuable. It is not the value of it that appeals to such a tourist, but the looks of it. That "10,000" has a peculiar effect upon him.

Switzerland, of course, can draw such tourists by thousands with new series of bills, reading a hundred times their actual value, marking up everything a hundred and twenty-five times.

I paid much more in Paris for lodgings and food than I paid at Berne, and both my room and my dinners in the French capital left much to be desired in comparison to the latter place. In Holland, for four guilders—$1.50—they gave me a room with three beds in it—and the room was big enough to house, in an emergency, half a dozen persons with little discomfort. Yet Dutch money is at nearly par and a thousand German marks "feel" as if they were more than two-and-half Dutch florins.

Just now the huge army of American tourists in certain European countries is the worst possible advertisement for the common sense of the United States. They may not mean it, but it certainly looks as if they were abroad to get something for almost nothing—and then they squeal if they are unable to cart it away.

England controls the destiny of the world's currencies. The United States has hardly a look-in. And there is a growing disposition in England to dislike cordially certain well-defined groups of what may be termed business men, for the lack of a more exact definition, that have thrived upon British sacrifices.

Some time ago I suggested in these columns the incongruity of demanding of the European allies payment of their debt on an exchange basis that differed from that under which the debts were incurred. A prominent banker a block away from Trinity Church has written to me, in connection with my suggestion, that the debts were "contracted in dollars" and must be repaid accordingly, and that it is none of the business of the United States if dollars cost more (mind, he did not write are worth more) now than when borrowed. The question of who profits by the huge difference is an epic in itself, but it seems that London is solving this problem in another way; to bring down the gold value of the dollar by practically demonetizing gold.

One knows that the English cannot be hurried, for even during the war it was some time before they moved quickly, and I respectfully wish to remind my American readers that the British temper just now is one of profound study, and that the free gold market idea is the object of their greatest attention. Then the professional bankers will sing a different tune.

Curse of Midas Fatal to Mightiest Empires

Concluded from page 10

to the figures of the authoritative International Year Book, the "balance of trade," in gold, was on the other side of the ledger. Five times as much gold left the country as entered it. The following figures tell the story:

Gold exports, 1919	$368,185,248
Gold imports, 1919	76,534,046
Excess of exports	291,651,202

A comparison of these figures shows that our excess of gold imports in 1921 was about SEVEN TIMES that of the preceding year, and the year 1921 (when we had more gold in the country than ever before in our history) was marked by the worst industrial slump on record! Factories were shut down and from five to six million able-bodied men were idle throughout the year, involving an economic waste of BILLIONS through lost wages alone.

THE WAGES LOST THROUGH UNEMPLOYMENT DURING THE PAST TWO YEARS HAVE EQUALED AN AMOUNT SUFFICIENT TO PAY THE SOLDIERS' BONUS SEVERAL TIMES OVER.

In some instances, in the Middle West, industrial cities were practically paralyzed, without a wheel turning in any of the numerous factories. The population of a great rubber and tire center in Ohio, which the writer visited during the prosperous days of 1920 and found a hive of industry, was almost cut in half through the exodus of unemployed workers in the spring of 1921, following the action of the Federal Reserve Board in refusing to permit the banks to continue to discount the "paper" of the automobile accessory dealers throughout the country.

According to Bradstreet's reports, there were 22,000 commercial failures in the United States last year—the largest number of bankruptcies in any one year since the Bankruptcy Act went into effect!

Such was the "prosperity" brought to us by the more than HALF A BILLION DOLLARS excess of gold imports brought into the country by the gold kings, with the permission of a complaisant government, and the putting of our commerce and industry back upon a gold basis by the Federal Reserve Board, in 1921.

It is said that Bismarck, noticing with wonder the phenomenal industrial prosperity of France after she had delivered to Germany the five billions of gold francs exacted as "reparations" after the Franco-Prussian War in 1871, remarked, in a spirit of grim humor, that it might have been better for his country if she, instead of France, had paid the gold indemnity.

Today the situation is reversed. Germany is paying huge "reparations" in gold, and her industries are thriving as never before—German cutlery and other manufactured articles are already competing in our domestic markets—while the countries into which the gold is flowing are suffering from industrial paralysis.

Stephen Graham, an English author, investigating conditions in Germany last year, writes of Berlin:

"Everyone is employed. More are employed than before. The leisured class is smaller. All the workshops and factories and offices are full. The shops display as many wares. There is evidence of an enormous overflowing productivity."

When will the world learn that it is not the amount of gold in a country which determines the degree of its prosperity? The true index of prosperity is the amount of goods and service which the community can offer in trade, and the multiplicity of the economic wants of the people. By the interaction of these two forces production and consumption are equally stimulated, and the equilibrium of supply and demand maintained.

A sudden access of gold upsets this equilibrium, dislocates prices, makes all values unstable, and brings industry to stagnation. It is the old curse of Midas, the trail of the golden serpent, which we have traced down through the long, winding avenue of history.

Our country must be delivered from the menace!

A Vast Treasure House of Rare First Editions

Magnificent Gift to Public Which Opens Way for Great Cultural Center

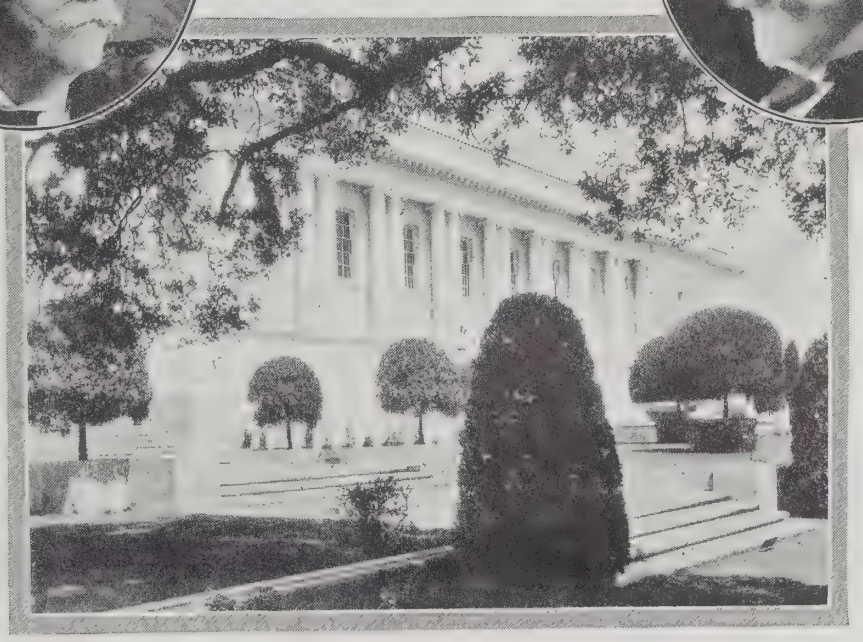
By JOHN B. WALLACE

THERE is being established in Southern California a wonderful treasure house of priceless things. Rare first editions of the great works of literature, paintings by the great masters, historical documents of the highest importance, have been gathered, placed in a setting of unsurpassable beauty, and made the heritage of the public for all time.

The way has been opened for a great center, where American culture, the finest inherited expression of music, poetry, art and literature of all lands and ages, may live forever.

Between the cities of Pasadena and Los Angeles in Southern California lies the great estate of Henry Edwards Huntington, the railway and traction magnate, consisting of 500 acres of fruit, flowers, trees and lawn. Crowning it all at the apex of a sloping green hillside is the beautiful white mansion of the owner, with its famous art collection containing more than 100 works of the great English and American painters.

To the left of the house, just beyond the Grecian gardens, stands the Henry E. Huntington Library and Art Gallery. In this building is housed one of the finest collections of original editions in English literature, American history and literature and early history of California, in the world. Some of its gems are priceless. For those who reckon values in money it may be said that the estate with all it contains is said to be worth nearly $75,000,000.



Henry E. Huntington

Early last spring Mr. Huntington donated this entire property to the public, retaining only a life interest for his wife and himself. There are no strings to the gift. He has provided for the maintenance of the library, galleries and grounds and they will be open to the scholars and art lovers of the world. The property will be in charge of a self-perpetuating board of trustees.

Mr. Huntington, the donor, was born in Oneonta, New York, in 1850. His first venture was in the hardware business. Afterward he became a lumberman, then superintendent of railway construction, superintendent and general manager of eastern railways and finally first vice-president of the Southern Pacific of which his uncle, Collis P. Huntington, was the directing genius. From his uncle Mr. Huntington inherited vast wealth and the directorship of dozens of large corporations. In Los Angeles he owned the street railway system.

Mr. Huntington began collecting about 15 years ago. He devoted himself to this pursuit with ardor. Mr. Huntington has another purpose than the indiscriminate purchase of ancient books, manuscripts and paintings for mere pride of possession. He is deeply interested in the beginnings of English and American history and all of his purchases both in books and paintings have been to provide a complete chain linking the history of the Anglo-Saxon race from its beginnings down to the present.

Front facade of the Huntington Library.

Starting with the earliest English poets and dramatists he brings the student down to the moderns through thousands of originals both in books and manuscripts. In American history and letters the collection begins with four editions in Latin of the letter of Columbus announcing the discovery of the New World.

A full line of the Americus Vespucius letters, as given in the "Mundus Novus" (New World), and the first editions in Spanish and Latin of the four letters of Cortez's "Conquest of Mexico" start the scholar out in American historical research work. The history of the western states has been an especial hobby of Mr. Huntington and his collection in this respect is probably unequaled. Books, pamphlets and documents relating to the history of California are rivaled only by the collection of the University of California. It would be impractical to list the books and manuscripts in this mammoth collection.

Among the gems of the English collection is Caxton's first printed book in English; the Perkin's copy of the Gutenberg Bible, which was the first book printed in movable type and for which Mr. Huntington paid $50,000; a full line of originals in English literature prior to 1641, consisting of nearly 8,000 volumes. This is about as many as are contained in the University library at Cambridge but the Huntington collection is without doubt its superior both in quality of authorship and rarity.

The Shakespeare collection is one of the best known, being better even than that of the British Museum. It contains the first editions of all the poet's plays except one, "Titus Andronicus" which was discovered in Sweden and is now owned by H. C. Folger, of Brooklyn, New York.

The collection of English dramatists is also equal to that of the British Museum for some periods, although, of course, not so extensive in scope. The basis for this collection was the famous Kemble-Devonshire collection purchased by Mr. Huntington from the Duke of Devonshire. An interesting item in the English collection is the Ellesmere copy of Chaucer's "Canterbury Tales," a manuscript written in 1405.

Then there is the Chester cycle of miracle plays, the earliest of five known manuscripts, and the Towneley manuscript of miracle plays, the only copy in existence.

Out of the 387 books (which are recorded in Miss Henrietta C. Bartlett's "Mr. William Shakespeare," a book recently published), written by or attributed to Shakespeare, contemporary notices of his plays or himself and sources from which he drew his material, the Huntington collection has 287.

The library, while not specializing in Bibles, has a fair representation, possessing some 500 of historic interest. Most of these came in collections which Mr. Huntington purchased and were only incidental in his general plan.

Another interesting feature is a collection of some 4,000 original manuscripts of plays submitted to the London inspector of plays, John Sarpent, and his predecessors. Mr. Huntington's collection of English poetry of the Elizabethan period embraces original editions of the fifteenth and sixteenth century poets.

Among the interesting exhibits in early American history are nine tracts of Las Casas, the apostle to the Indians, and a full line of books upon America as known to the Spaniards. In the library are also the original editions of Champlain's voyages and those of Cartier.

Of absorbing concern are the so-called Jesuit Relations, being accounts and reports of the Jesuit priests who came to Canada to Christianize the Indians during the period from 1634 to 1670. These narrations were printed in Paris and were as eagerly read in those days as our best sellers are today.

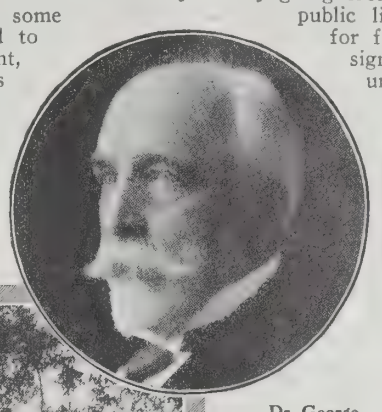
A complete line of pamphlets from the early presses of Cambridge, Boston, New York and Philadelphia relate the exploration and settlement of the United States.

One of the prizes of the collection is a copy of the Bay Psalm book, the first book printed in English-American. Another is the sole copy in existence of the earliest-known Massachusetts laws published in 1648. Dr. Cole, the Huntington librarian, relates with some amusement how when he was visiting the Massachusetts state library, he asked to see a copy of these statutes and with great pride and ceremony the attendant brought forth from a locked safe a photostatic copy made from the Huntington print

There are also two copies in the Huntington library of Bradford's New York laws of 1694.

A full line of Revolutionary War pamphlets, printed both in England and America, is on file, together with a nice collection concerning the history of the naval war of 1812.

Coming down to the Civil War the library possesses thousands of photographs and autograph letters of officers on both sides in the conflict. Mr. Huntington already had a fine collection of Washington letters and a recent purchase places it among the foremost in the country. His Lincoln collection is acknowledged to be one of the finest.



Poets, writers and dramatists of America are well represented and the library is now buying first editions of all British and American authors so as to keep the collection up-to-date.

A feature of the western section is a large collection of the original editions and manuscripts of Brete Harte.

There are only a few of the 125,000 rare and curious books, manuscripts and pamphlets which will be open for study to the scholars of the world. Many thousands of the books are yet in New York; the basement of the library building is filled with immense cases of books yet unpacked and there are at present some 30,000 or 40,000 books and manuscripts cataloged and upon the shelves.

The library building is complete as to the exterior but only one wing of the interior is finished. Steel cases to hold more than 250,000 books are being rapidly installed. These are protected from fire and theft by glass interwoven with wire, the breaking of which sets in motion automatic alarms. However, there is little fear of thieves as practically all of the books and paintings are so well known that no thief could dispose of them.

Mr. Huntington was assisted at the start of his collecting by the late George D. Smith. Later this work has been in charge of Dr. George Watson Cole, a noted bibliographer and librarian, who was graduated from the Columbia library school in 1888. For three years following his graduation Dr. Cole was with the Newberry library going from there to the Jersey City public library where he remained for four years. In 1895 he resigned and traveled abroad until 1901 when he returned to New York and spent seven and one-half years in cataloging the library of the late E. Dwight Church. He finished this work in 1909 and came to California for the first time where he became intensely interested in the study of the old California missions. Mr. Huntington bought the church library and in 1915 engaged Dr. Cole as his librarian, a position he has held ever since.

Dr. George Watson Cole

Dr. Cole has brought together a staff of the most expert catalogers and librarians in the United States who are now at work. It is estimated that it will be at least two years before it will be open to the public. In the meantime, all scholars and students are being given access to the books already upon the shelves for research.

The art collection, with the exception of a few paintings and busts in the private office of Mr. Huntington in the library building, is housed in the Huntington residence where Mr. Huntington wishes it to remain. Perhaps the two most noted paintings in this collection are Gainsborough's famous *Blue Boy* and his portrait of Mrs. Siddons as *The Tragic Muse*. The collection contains approximately 40 of the finest examples from the brushes of Gainsborough, Reynolds, Reyburn, Romney, Lawrence and other of the greatest of English portrait painters. Sixty other famous originals of English and American artists hang on the walls of the Huntington mansion.

Another feature of inestimable benefit to scholars is its photostat plant in which at a nominal cost copies can be made of original manuscripts. This will make the treasures of the Huntington library accessible to those unable to visit California. The wonders of this magnificent gift to the public, however, are not all in the library and home. The 500 acres comprise a park whose beauty can only be expressed in superlatives. Winding driveways nearly 10 miles in length run through a park in which is every variety of tree, shrub and plant that can be made to grow in Southern California.

A fernery contains specimens of every known fern. In the rose garden are thousands of varieties of choice roses, the special hobby of Mrs. Huntington. Leading from this garden to the Japanese garden is a beautiful walk shaded by arbors of vine and grape. The Japanese garden, with its houses, temples, gongs, bridges and ponds, is a section of old Japan.

After emerging from a wooded extent you come upon a typical stretch of desert. This is the famous cactus garden. Then comes a little lake where among the lilies and rare water plants swim beautiful black swans and many other rare waterfowl.

Mr. Huntington is a great lover of birds and his aviary contains hundreds of specimens ranging from huge parrots to the tiny canaries. One of these parrots is reputed to be more than 200 years old, its mate, the only other of its species in captivity, being owned by the Queen of England. Its plumage is of indescribable beauty being white with delicate shadings in pastel of orange and yellow but it talks with a marked cockney accent.

The immense porch of the Huntington residence overlooks 20 acres of velvety lawns dotted with live oaks. Every direction in which the eye turns it encounters some treasure in art or statuary. Nothing could be more effective in its native beauty than the Grecian garden with its border of palms and its background of pines and deodars. Among the thousands of glossy shrubs with which it is fringed are set rows of imported Italian statuary dating back many centuries. Its masterpiece is an ancient fountain antedating the discovery of America by many years.

U OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

The Soviet government has revived exile to Siberia as a method of meting out punishment.

It is just 50 years since America's national park policy was inaugurated. Half a century ago Congress voted that an immense tract of land in Wyoming, since called Yellowstone Park, should be dedicated as a "public pleasure ground and a game preserve." Today there are 19 national park reservations in the United States, covering a total area of considerably more than 10,000 square miles.

Premier Lloyd George will receive 90,000 pounds for his memoirs.

Nearly 14 per cent of the quail's food for the year consists of animal matter, such as insects and their allies. The quail has no superior as a weed destroyer. It is a good ranger and will patrol every day all the fields in its vicinity in search of food.

In order to keep American exchange stable, England is calling in all the gold hoarded by individuals during the war. It is estimated that $15,000,000 worth of gold is held by 2,000,000 persons in England. Gold is being shipped to New York at intervals.

The brass-bound mahogany table desk belonging to Sir Walter Scott recently sold for $132. At this desk, "The Lady of the Lake," "The Lay of the Last Minstrel," and "Marmion" were written. "Walter Scott of Abbotsford" is inscribed on the brass border of the desk.

A Minnesota man has visited the State Fair at St. Paul every year since 1870. It's getting to be a habit with him.

The manufacture of antiques is carried forward on such an extensive scale in Egypt that many collectors are unwilling to risk buying them, and market for the genuine article has become practically ruined.

A locomotive engine recently completed 12 years of service, covering 662,000 miles without extensive repairs.

White huckleberries are being raised by H. A. Weaver, of Cloe, Pennsylvania. The berry bush is large and the berries almost transparent. The berries are large and of excellent flavor. This bush is the only bush bearing white berries, though Mr. Weaver has picked 2,000 quarts this season on his farm.

The major portion of the population of Brazil is Portuguese and Portuguese is the official language of that country.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

It is reported that an inventor after 13 years of experimenting has succeeded in producing unbreakable glass. Some of the tests are throwing plates from a height of 12 feet to the ground, standing a temperature of 750 degrees and driving a nail into wood with a cup. This means the saving of thousands of dollars each year in hotel equipment.

Squirrels are considered a fire menace in some cities and are being killed. They place their nests in remote parts of buildings and the nests are made of materials that have a low kindling point.

A St. Paul man is the owner of a King James Bible, written in old E.glish style, which has been used since 1612.

The largest fish pier in the world is located at Boston where 80 vessels can discharge their cargoes at once. The shiploads of fish are sold at public auction to wholesale dealers.

Loaves of bread are baked in France and Italy up to six feet in length.

Motion pictures showing the processes and steps of manufacture of various American products are to be shown in practically all the important trading centers of the world through the United States Department of Commerce.

An Indian treaty bowl was recently found in British Columbia which was more than 15 feet long and weighed 600 pounds.

German dealers have been able to place Chinese rice in the markets of Columbia, South America, at a lower price than the American dealers.

"Family accommodation" cars, seven rooms to each car, each room accommodating five persons, will be placed in the Chicago-California service of the Santa Fe railway for fall and winter travel, according to recent announcements. There will be 18 cars of the new style. Each room will contain upper and lower double berths, a day lounge and bed, with lavatory and toilet equipment.

Out of 2,608 prisoners at Leavenworth more than 900 are narcotic cases.

A hole 70 feet in diameter and 226 feet deep suddenly appeared in a wheat field of a farmer living near Bland, Missouri. Water to a depth of 112 feet promptly filled the hole. Many scientists have visited the hole. Those who have descended to water level report no apparent inlet or outlet.

The highest point of Mont Blanc, the highest mountain in Europe, is in France. It has an altitude of 15,700 feet.

One hundred children from the American School for the Blind in Kharput arrived in Aleppo, Syria, after a 500-mile hike across Asia Minor. It took them a month to make the journey during which time they passed through mountains and over long deserts. Camels carried food and water for the wanderers. The children were Armenian orphans and their pilgrimage is part of the plan of the Near East Relief to remove several thousand of them from Asiatic Turkey.

Sweden has placed a $2,000,000 contract in the United States for a radio plant of "tremendous power" near Gothenburg, on the west coast.

One hundred thousand pounds must be obtained in the next few years to preserve St. Paul's Cathedral from decay, if not from absolute collapse. St. Paul's is known as "The Parish Church of the British Empire."

In the early eighties at a charity bazaar in Baltimore, patrons were allowed to talk over Mr. Bell's telephone for 10 cents. Only $10 was realized, however, as most people ridiculed the invention.

A discussion over the number of Jews who should be permitted to enter Hungarian colleges recently reached a climax with a challenge for a duel between two educational dignitaries—Dr. Meny, rector of Szegedin and Dr. Barsony, rector of Budapest University.

More than 60 per cent of the population of Glasgow is housed in fewer than two rooms. This, quite irrespective of the size of families.

DEPENDABLE INFORMATION

After reading this copy of THE DEARBORN INDEPENDENT you will have observed that the information it contains is based on fact. There is no room for half-truths and misinformation in this publication. THE DEARBORN INDEPENDENT believes that the people of this country prefer facts to buncombe, substantial information and wholesome ideas rather than sensational appeals to the emotions. If you are not yet a subscriber, become one today. If you are, do a good turn by urging your friends to subscribe and become readers of America's foremost non-fiction weekly. CHRONICLER OF THE NEGLECTED TRUTH

Uncle Sam's Yearly Billions! Where They Go

Debts and Pensions Take More Than Half Annual Government Budget: Ever-increasing Super-overhead Helps Add to the Tax Burden

By AARON HARDY ULM

THE largest single business establishment in the world is a co-operative enterprise. It is owned by more than 105,000,000 persons who are both its supporters and its patrons. The business in question is the United States Government.

It now takes approximately $4,000,000,000 (four billions of dollars!) a year to run that enterprise. That is to say, you and I and all others who make up the country's population have to contribute that much out of what are or might be our earnings in return for what is received by way of services from that business.

Whatever is contributed by anyone of us goes to somebody; whatever is received, via government, comes from somebody either now or in the future—but generally now.

Estimating the national income at $50,000,000,000 a year or about $500 per capita, it takes about eight per cent of all the country's production, or about $50 from the average individual's annual earnings, to run that enterprise. This means that the operation of the National Government entails a direct charge of about $250 a year on the average American family of five. The indirect cost is for many nearly or quite as great. Where, for example, the tariff bill enacted by the present Congress will yield about $330,000,000 a year in revenues, its protective features will levy a toll of between $500,000,000 and $1,000,000,000 which will never see the Treasury. It will be taken from consumers and given to those producers or manufacturers who are held to be in need of "protection." It will be collected through additions to prices made possible by the tariff bill, which in only a secondary sense is a revenue bill. Many other taxes cost the public much more than the Treasury receives.

Dollar a Day a Family

ALL told, the full cost of the Federal Government approximates not less than $1 a day for the average family. State and local governments take a toll nearly or quite as large.

If some agent of government went around to each household every day and collected from $1.50 to $2, or every month and collected $75 to $100, or every autumn and demanded $500 to $1,000, or its value in, say, corn or cotton or wheat produced by members of the household, the average individual would exercise a much livelier interest than is now evident in what is done with the money. An article like this one, dealing with its distribution, would not be dismissed with a glance that showed it to be "statistical." Yet something like those sums are paid by the average family, regardless of what its tax receipts may show. For, at best, only mildly have methods been employed whereby may be truly applied the rule that those shall pay most who have the most to pay with. A wealthy New York publisher had sound warrant for his statement when, in referring to the soldiers' bonus, he said: "Fifty bonuses might be paid to soldiers and it wouldn't affect me personally." Virtually any tax can be evaded, legally and in a way honestly, by big wealth. It can be added to interest charges, as has been done quite extensively in recent years, or to profits, or be escaped by wealth being deflected into tax-free investments, which in late times has been indulged in on a scale amounting to an orgy, both of tax evasion and public debt-making.

Thus it may be assumed that, whatever the books superficially indicate, the public generally pays the taxes as well as the many other burdens imposed through the employment of taxes to help some at the expense of others. The burden no doubt is imposed unevenly—to the extent, in fact, that millions who are conscious of paying least actually pay most in comparison with what they have to pay from.

It may be assumed also that the public generally never "gets something for nothing" out of government.

Savings? Economies?

NOW let's see what it pays for in the case of the Federal Government. During the last year and a half there has been much talk about "savings," "economies" and "reductions" accomplished by the new Budget Bureau and others, including Congress. Some of them no doubt are real, others merely are apparent. Giving to them their fullest possible value, all the "savings" and "economies" to date don't amount to one per cent of the cost of the Federal Government, and "reductions"—that is, cessation or reduced appropriations—do not amount to much more. And unless cuts are made in the very vitals of the government as now permanently conducted, there is no hope that either process for lowering the governmental burden ever will accomplish much more. But the operation of the budget and other forces has tended to clarify and reduce to some measure of intelligent system the spending done by the National Government. It still is so confused, however, that, even though no further appropriations be made, no accountant could tell positively within $200,000,000 what the cost during the present fiscal year will be. But one can now tell how those costs are distributed.

One-third of all is absorbed by one item, which no budgetary or congressional economy can affect. It is the national debt. On it there will be expended during this fiscal year a total of approximately $1,375,000,000, nearly one billion going for interest alone, the balance for retirement of principal. And, though the debt be not increased, the present generation of Americans will see no big reduction in that item of government cost.

Nearly one-half as much goes for what is treated as an additional national debt, that is to say, for pensions, or what is tantamount thereto, for ex-service men. That item is in two parts, one of which is decreasing and the other increasing. Pensions for veterans of wars other than the last one will cost $252,000,000 this year, which is about ten millions less than they cost last year. The Veterans' Bureau, which looks after World War Veterans, has an appropriation of $418,000,000 for the present year. Unless there is a change in policy there will be steady and rapid increase in that item. It is freely predicted that it will call for not less than a billion within less than 10 years.

Two Items=Two Billions

THUS two items of National Government cost—one of which cannot be affected by budgetary or congressional economy and the other isn't likely to be affected—call for a total of $2,045,000,000, or more than one-half of all expenditures on the existing basis of operations. Incidentally, those items, of which all but $252,000,000 going for pensions and a negligible amount of interest are new and the consequence of the last war, now call for twice the expenditures the entire National Government made as recently as six years ago.

With those out of the way there still is nearly $2,000,000,000 to be accounted for. According to the general appropriation bills it is only $1,747,035,382.64. Incidentally it is about $150,000,000 less than it would be had the Budget Bureau's estimates been accepted as presented—but as to that more later.

Since the general appropriation bills were passed, Congress already has added to the sum, notably in the amount of $50,000,000 additional, appropriated to the states for roads construction on a "fifty-fifty" basis of cost. Other appropriations, in addition to deficiency appropriations of the usual kind, undoubtedly will be made before the year ends. Of course, all which is appropriated doesn't have to be spent and some of it won't be spent during the fiscal year. However, the total of the year's expenditures in all likelihood will be close to $4,000,000,000, and *unless radical cut is made in governmental activity they never will be less than that sum during any succeeding year.*

But for safety's sake we'll say that for this fiscal year the Federal Government will cost $1,750,000,000 over and above the $2,045,000,000 that goes to the account of debt and the claims of ex-service men. That is $750,000,000, approximately, more than all the government cost in 1915.

Army and Navy Costs

THE more or less self-sustaining Postal Service accounts for $584,000,000 of it. That still leaves $1,166,000,000, or more than all operations of the National Government cost in 1915, to be accounted for.

The next two largest items are accreditable to the War and Navy departments. The first has appropriations for military activities amounting to $257,500,000. The Navy Department may spend approximately $298,000,000 for like activities. Thus "military activities," at the least, will cost during this fiscal year a total of $555,000,000, or more than three times as much as six years ago.

In addition, the War Department has an appropriation of nearly $75,000,000 for non-military activities, chiefly rivers and harbors improvements. Incidentally, it is worth while noting that Congress boosted the Budget Bureau's estimate for that smelly, "porky" item in the amount of $15,180,401.

Thus, debt, pensions or veterans' welfare, the Postal Service and Army and Navy operations account for all but $550,000,000 of a minimum total of $3,750,000,000 which the Federal Government will expend this year.

Of the balance, more than $100,000,000 will go to the states and for supervision of work carried on on a "fifty-fifty" basis co-operatively with the states—road building, so-called maternal welfare, agriculture and vocational education, and so on.

The remaining balance of about $450,000,000 is widely distributed. The largest single item is accredited to the Shipping Board, which has an appropriation of $100,459,000 for this fiscal year's operations.

One hears much of Congress and the White House, but, comparatively speaking, neither is of consequential direct cost to the taxpayers. All activities, classed as legislative, will cost only $17,000,000. And in that classification there, strangely, is included the Government Printing Office, the Library of Congress and the Botanic Gardens.

The appropriation for the White House, including the Vice-President's as well as President's salary and upkeep of building and grounds, is $331,645.

Many of the departments of which one hears much cost little as compared to the expenses of the Army and Navy organizations. The entire operations of the State Department, including diplomatic and consular agencies abroad and such undertakings as relief and protection of American seamen, will cost this fiscal year only a little more than $10,000,000.

The Treasury Department, once operated at a cost of a few million dollars, has become, largely because of the augmented fiscal affairs of the government, one of the costliest branches of administration. The cost of operating it and the numerous bureaus under it this year will be approximately $119,000,000. It will expend nearly $10,000,000 additional on construction projects, such as new post office buildings. The Interior Department, outside of pensions which it handles, now has an appropriation of nearly $75,000,000, more than $10,000,000 of which is for the Indian Bureau alone. The regular operations of the Agricultural Department, with all of its big and numerous scientific bureaus, are supported by an appropriation of $36,763,868. The Commerce Department will cost $21,345,495.75, if all its appropriation is used during the present fiscal year. The Labor Department will get along on a little less than $8,000,000, while the Department of Justice, which includes the Federal judiciary, is now authorized to spend nearly $20,000,000.

Costs of the Boards

APPROXIMATELY $75,000,000 remains to be accounted for. It is covered by a large number of appropriations to independent and miscellaneous governmental enterprises that operate outside of the regular departments.

The District of Columbia gets an appropriation of about $26,000,000, of which property owners there pay 60 per cent in the form of taxes.

An appropriation of $35,000,000 is required for meeting the high-cost-of-living bonus paid all civil employes of the government.

The Interstate Commerce Commission costs about $5,000,000, and the Federal Trade Commission about $1,000,000. The Civil Service Commission, which merely selects employes for the government, now costs nearly $600,000.

The growing volume and complexity of National Government operations have brought into existence several super-overhead establishments like the Civil Service Commission. Their business is to facilitate the operation of the gigantic governmental machinery. The Bureau of Efficiency, which checks up what other establishments do and how, now has an appropriation of $170,500, and the Budget Bureau, whose appropriation comes through the Treasury Department, is costing around $150,000 a year. The Smithsonian Institution and National Museum get along with not quite $600,000. There are perhaps a dozen other establishments or temporary ventures that have appropriations of from a few to several hundred thousand dollars.

Governmental undertakings have become so numerous that the constant addition of new ones doesn't stand out as in the days when all of them could be named on a few pages of the *Congressional Directory. The country's first budget, submitted to Congress by George Washington, was detailed in about 30 lines of writing. The last one, submitted by General Dawes, fills more than 900 printed pages that weigh about 10 pounds.*

When Cost Proportions Dwindled

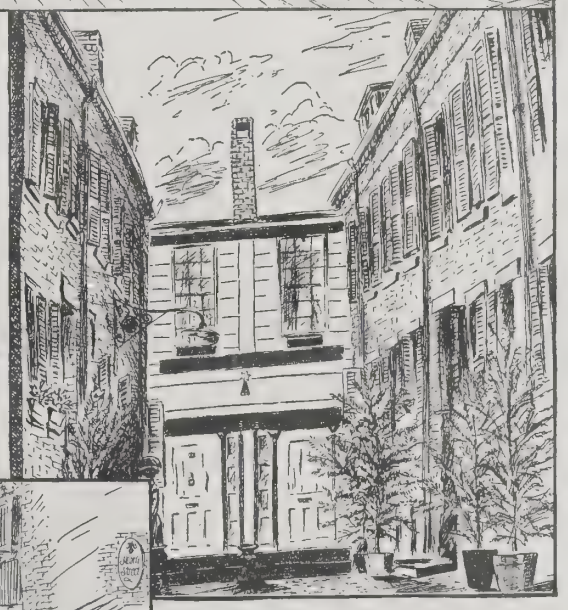
THERE lies a danger not generally recognized in this super-growth of governmental operations and costs. Additions and increases are often thought of in comparative terms. A few thousand more names on a government pay roll already containing, for both civil and military employes, more than 800,000 names doesn't seem nearly so important as when the pay roll contained only a hundred thousand or so. Likewise as to new expenditures. Six years ago a new appropriation of $100,000,000 meant an increase of about 10 per cent in National Government expenditures. It couldn't be taken care of long by artful bookkeeping. Now it means an increase of only two and one-half per cent in total expenditures, which are so huge that such an addition ordinarily can be handled for a year or two without adding to the taxes, that is, by "kiting."

Increase in National Government activities and costs often lead to like increases in state and local governments. Such are made necessary by the "fifty-fifty" appropriations but in any event such usually follows, as has been the case during the last several years. The National Government not only is capable of setting those "model examples" that have led to much of its expansion but it also in great measure "sets the pace" followed by state and other auxiliary governmental units in matters of waste and of hasty and costly adventures into experimental fields.

Where Traditions and Ideals of Another Day Cling

Hurried Stream of Life Passes by Secluded Boston Spots Unheeded, Unmissed

By MAY B. WHITING



WHAT makes a village? Is it narrow lanes and dooryard gardens, a babbling stream and a country store? Or is it a conscious feeling of "home" for a very small area, a certain unconcern about the rest of the world, and a lively interest in the neighbors of that area?

If the spirit is more potent than the place, there is on Beacon Hill, in Boston, a village as authentic as any that clusters along its Main Street and dwindles into scattered houses beside the turnpike. And, when you come to know it well, the village under the gilded dome of the State House has most of the outward signs, too.

Take the matter of narrow lanes. They wind and crisscross into all sorts of unexpected corners. There are Cedarway Lane and Acorn street, with the sign of the three gilded acorns at its start, its toy houses, each with entrance of approved colonial style, and, in the late afternoon, a *Transcript* lying at each door. For Acorn street is a secluded abode for real Bostonians, the slim, erect kind, for its thread of a sidewalk would offer no safety zone should a taxi attempt to pass. It is thrilling enough to watch a roadster get through. You fairly hold your breath lest it take the street with it, and drag it along at the hind wheels.

The Town Room.

Sentry Hill Place.

Acorn Street.

And what village could offer more charming retreats than the courts, the home of artists and writers and all sorts of "intellectuals"? You come up the aristocratic West Cedar street, cross the stately Mount Vernon and the non-committal Pinckney; then the village begins to slide downhill, both literally and figuratively. At Myrtle you can see the change, at Revere you are about to say "how horrid" and turn on your heel, when your glance falls on one of the little courts, say Sentry Hill Place, and you pause in amazement. There are flower boxes in all the windows and potted trees line both sides of the way. If you cross the paved yard and go through the narrow passage to the rear, you will find a whole row of tiny gardens where pansies, radishes, Swiss chard and hollyhocks grow in bewildering cubist design. There is an undeniable "tone" about it all. That, and the good company, make compensation for the more bourgeois comforts of Back Bay. At Christmas the courtyards are ablaze with candles, at Thanksgiving, corn hangs on the doors, and, from the street, the unkempt children of Solomon and Giuseppe peer curiously in and wonder what strange race of people have settled in their midst.

Beyond Revere, the change is most alarming. Go down a little farther and turn into a side street and you might fancy that you were in Paris, on Montmartre. There are hucksters with their wares of every description displayed on carts, and old women crouched on the curbing, selling ladlefuls of beans, all soaking and ready for the fire. But then, there never was a village without its "sprouts" or "flats" or "over the river" places to be ignored or mentioned only in apologetic whispers.

So we turn and climb the Hill again until we find ourselves in Louisburg Square, slumberous in the sunlight. There is too much red brick, you say, and cobblestones, and, while the green is pretty enough, it is fenced in, and, for a village, that is hardly fair. Just cross the little park and look down Mount Vernon. There, just below you, the Charles flows, shimmering and beautiful, with the broad lawns of the Esplanade beside it. Or go up in the other direction a few minutes until you come to Anderson street, and you will find one of the most delightful vistas imaginable. The old Massachusetts General Hospital, with its green and its classic Bulfinch front, seems like a Grecian temple miraculously transported to what was called a modern Athens.

No doubt, after so much tramping, you are ready to dine. Right beside you, on Anderson street, is The Hole in the Wall, a queer little box of a place with shelves scrubbed a creamy white on three sides. At the fourth stands a woman who, with smile and bearing in which there is no trace of the plebian, serves baked beans and brown bread as if she were dispensing ambrosia to the gods.

But if you feel a bit more expansive, climb the Hill toward the State House and stop at the Cupboard on Hancock street. There you will find real comfort. If the day is chilly, a fire burns in the open grate and there are rocking chairs set before it. The tables are spotless with china of quaint design, the candlesticks are stately affairs of brass (one always dines by candlelight on Beacon Hill) and there is an antique sideboard set with luster ware and pewter. In such surroundings it is easy to fancy one's self back a hundred years or so when life held more of dignity and ease.

But if you would like to see something more, say piquant, retrace your steps to Myrtle, even if the prospect does not seem inviting. If you look sharp you will see a sign from Alice in Wonderland. Go down a few steps and you will find yourself in The March Hare. To be sure, there isn't much to see. In fact, there isn't anything, except bare painted walls and chairs that once were painted, too. But soon the habitues begin to drift in, and, through a mist of smoke wreaths and candlelight, you catch a confused picture of long-haired men and short-haired women, of horn glasses, smocks, soft collars and flowing ties. Perhaps you recognize here an etcher, there a playwright, and, in a corner, playing chess with a deadly serious air, a cartoonist and a poet of the *vers libre* order. But who is the little woman in shabby, genteel black, listening so intently to the others? That is a Beacon Hill spinster, shut in the house all day, but who, just for one hour at night, mingles with the world which she loves, to keep her soul from starving. It never occurs to her, or to any one else for that matter, that she is an incongruous, fantastic figure in Bohemia. They are all neighbors on the Hill, and among neighbors one always is at home.

Perhaps you are in more rollicking humor. Then go down toward the river to Cedarway Lane and visit The Green Shutters. That is quite a different story. The windows are hung with draperies of yellow satin, and the walls are gay with batiks in futurist design, very modern and difficult to understand. In a corner sits an enormous white cockatoo in his cage, and, on a perch opposite, a gorgeous red and green macaw, complaining, between his naps, that the customers are slow in coming. But when the tables begin to fill up he really begins to live. From one guest's shoulder to another he flops, graciously accepting titbits from the meal, and joining his clatter in the general din of laughter and conversation.

There is nothing subdued or formal about The Green Shutters. It was started in the friendliest sort of a way and still reflects that spirit. During the war a lad of a Cedar street family became chums with a boy who unexpectedly was without means to continue his education, and, to make it worse, had no experience in earning his living. When released from service, he was made welcome at the Cedar street home, but could find no work to pay for his schooling. So the two put their heads together. A few hundred dollars was borrowed from the family treasury and the venture launched. From the first it prospered. It put the young man through college, established him in a useful business career, and at the same time made itself a host of friends who would not hear of The Green Shutters being definitely closed.

Like all villages, Beacon Hill has its show places. There are the fine Bulfinch houses on Beacon and Mount Vernon streets, Ford Hall, which saw the beginning of the Forum movement and whose audiences are reputed the most wonderful in the world, the Athenaeum, that most unusual of libraries, besides a wealth of literary landmarks. But if you want to see the village spirit at its best, you must go to number 4 Joy street and visit the Town Room.

This unique institution was established by Joseph Lee, of one of Boston's oldest families. Mr. Lee is called "the father of the playground

(Concluded on page 15)

If Not the Bonus, Why the Subsidy?

PRESIDENT HARDING is reported to be considering calling a special session of Congress to pass a ship subsidy bill. In the face of the reason given for the veto of the bonus act, it is difficult to find an excuse for urging legislation of this kind even were the measure defensible on its merits. It is subject to attack as graft, pure and simple, of no value to the public which bears the burden of expense.

J. J. Hill, in his day a great financier and rail king, said of a similar effort to pass a subsidy: *"A ship which cannot run profitably without a subsidy will make a mighty lean run with one."*

Robert Dollar, economist, in an article in *Nation's Business* for June, said: "I have always felt that a shipowner who must have 'pay' from the government does not deserve to be in the business. We do not need any advantage over the other fellow; we can take care of ourselves."

In view of the condition of the nation's finances, what excuse can be made for the proposed step?

Overdoing It on the Ocean

A BLOW was struck at the influences which have permitted the sale of liquor on United States Shipping Board vessels, when a high official of the British-owned White Star Line announced a pronounced falling off in bar sales.

The ocean-going public has shown a clear change of attitude on the liquor problem. Formerly the tourists adopted a continental tolerance of the use of wines and spirits. Since the adoption of prohibition, however, ocean liners have been inflicted with a small but noisy clientele of bibulous persons whose conduct has been as offensive as their mouthing of "personal liberty" protests. The natural result has been a falling off of the popularity of the bar among the more contained travelers.

English shipping men report that since the enactment of the Volstead Act, bar receipts have sharply declined, despite the fact that the bulk of the passengers are Americans, supposedly eager to make the most of their rare opportunities to obtain prohibited beverages.

There are, of course, a few tourists to whom liquor is the chief motive of travel. The disgust which these tourists have caused is producing a reaction which should have a strong influence in compelling the United States Shipping Board to do something the Constitution seems powerless to effectuate, stop the illegal traffic on government ships.

Immigration

AS SO often happens, it has been necessary for the government to adopt negative measures as a prelude to positive measures in the problem of Immigration. The only justification for placing restrictions on immigration was that the restrictions should lead up to a selective process. This country needs immigrants; it needs the hardy pioneer stock which aided in building up the country. But it does not need the riffraff, and it will no longer take the riffraff of Europe and the Orient. The instance is well-known of a certain European community, unable financially to build an addition to its prison, deciding that it would be more feasible to present the criminal population with tickets to America—which was done. That is the sort of thing which has been in some degree stopped, though not entirely. The dead load of mental incompetents, physical wrecks and criminal parasites, which this country is already carrying, has overreached the limits of absorption. Not only must this kind of immigration be entirely restricted, but a deportation movement should be commenced in possibly 200,000 instances of persons now in the country illegally. And then, by wise selective means, let us invite the good people of all lands, the workers and producers of all races, to come here and learn Americanism and help build up here the vision of life which visited our fathers. Good people, willing workers, those who passionately desire industrial opportunity and civic freedom—to these people America will never permanently refuse a welcome. Let selection, under the wisest methods and checks, follow upon restriction.

Germany Has Credit

THE future historian will be compelled to disregard much of the wisdom exhibited in this and other countries regarding the financial record being made by Germany. Much has been made of "the falling mark," but business seems to be going on where the mark circulates, while poor Czecho-Slovakia and other countries are experiencing the natural distress all countries do under a forced resumption of the gold basis.

Wiseacres tell of the danger of "cheap money," the crime of semi-repudiation, the sanctity of the dollar. They forget the inequity of increasing the purchasing power of the dollar. They seem to think a debt contracted when a dollar was worth only a half bushel of wheat has increased if at maturity it is worth a bushel. If they would appreciate the fact that money s not a measure of value, but an index of relative values, they would see the necessity for maintaining the dollar at as near a stable proportion of all values as possible.

But is Germany bankrupt? Need we shed tears for her, when her industries flourish while the factories of the world are idle? She is burdened, of course, but in production of values, of real wealth, and so far as her productive resources are concerned she is leading the world. Only her money is quoted as almost worthless in the world's exchange. But it is good in Germany, and is freely spent there, because rising prices make it a loss to hoard it.

But Germany has credit. She recently succeeded in arranging with the Bank of England, in conjunction with the Bank of Holland, to back an issue of treasury notes in lieu of paying out the gold marks demanded by Belgium in settlement of reparations interest to a total of 100,000,000 marks on a gold basis—in other words, securing bank endorsement for a note issue equaling in value at present exchange rates more than ten billions of the paper marks which have furnished Germany the means of keeping alive her industries since the war.

There is food for thought in this bit of diplomacy on the part of the English and Dutch bankers in aiding Germany, for it was good diplomacy as well as safe business.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE DEARBORN INDEPENDENT, The Ford International Weekly, published weekly at Dearborn, Michigan, for October 1, 1922, State of Michigan, County of Wayne, ss.

Before me, a Notary Public, in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company, Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, W. J. Cameron, Dearborn, Michigan; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware, Henry Ford, Dearborn, Michigan; C. J. Ford, Dearborn, Michigan; E. B. Ford, Detroit, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 2nd day of October, 1922.

[SEAL] J. EMMET HALL,
(My Commission expires September 29, 1924)

Prodigies and Dullards

THE head of Dartmouth College is reported as being of opinion that there is a great waste in attempting to educate dull students, and that institutions of higher learning should aim to receive only the most promising applicants for admission. He believes in mental quality rather than great numbers as the goal for college work. There is a sense in which this attitude is wise, but another aspect is in danger of being overlooked.

Of course, in the stress for athletic supremacy many are admitted to first year work who are not fitted by taste or training for intellectual pursuits. Collegiate rivalry in beef and brawn works disastrously on entrance regulations where a crack center, a fleet runner or a miracle pitcher is the matriculant. But it is not with these that the head of Dartmouth deals.

The rejection of dullards would spell the doom of many colleges. Any man of experience knows that the "bright" student rarely rises above his fellows in business life or public career. On the contrary, the dullard, who must study hard to learn, acquires an intellectual discipline and a permanent knowledge which serves him well in practical life. Of the many illustrious sons who constitute Dartmouth's justifiable boast, it is safe to say nine-tenths were of the plodding kind, while a majority of those who seemed most promising settled into prosaic lives where success depended on retentiveness rather than on creative acquisitiveness.

The fellow, whose lessons are learned without digging, has in consequence a leisure which is excessive, while his slower classmate finds it necessary to forego everything but the grind of study. The one learns his lessons; the other learns the secret of persistent labor, which is the best lesson of all. The teacher who wants only "bright" students under him lacks somewhat in perception.

The First Woman Senator

THE president of the United States Senate must hereafter, for a time at least, have heed in his recognition of a Senator seeking an audience, and the members of that body must also be ready to use some variation of the conventional reference to colleagues. "The gentleman from" hereafter cannot always apply. Whether the new style will be "the lady" or "the Senator from" has not been decided, but a woman will sit in place of the late Tom Watson, representing the state of Georgia. Governor Hardwick has appointed Mrs. W. H. Felton, the "grand old woman of Georgia," to fill the vacancy caused by Senator Watson's death. In response to a popular sentiment the position was proffered the widow of the deceased Senator, but she declined, and the decision was quickly made to send Mrs. Felton. This gives the lady the distinction of being the first woman to be United States Senator.

The new Senator from Georgia is a native of the state and has always resided there. Her family, the Latimers, have always been prominent. She herself has been identified with philanthropic and other public welfare work, served as a commissioner from her state at the Chicago Columbian Exposition, and was one of the leaders among the women opposed to the suffrage movement. In her letter accepting the appointment, Mrs. Felton spoke highly of her predecessor, and thanked the governor for having offered the place to Mrs. Watson.

The appointment is but a temporary one, however, as a successor to Senator Watson must be elected in November for the unexpired term, who will of necessity assume the toga next March. Governor Hardwick himself is a candidate for nomination to the position.

A Congressman's Verdict

"CONTRARY to popular belief, Congress has ceased to be a legislative body. Bills are brought in under special rule, which altogether shuts off debate and the right of amendment, or confines such action to those selected by the 'leaders.'"

The statement above is not the attack of partisans eager to change the majority of Congress. It is merely the judgment of Charles L. Knight, member of Congress from the Fourteenth Ohio District who recently quit the national legislative body because he declared he was out of harmony with the spirit and purpose at Washington.

Mr. Knight declared that "a half a dozen politicians do the legislating for the nation."

Mr. Knight's indictment of the course of legislation in the national house would not be a severe one if it was *leadership* he charged. Since the days of Clay, Webster and Calhoun, each Congress has furnished only a small quota of outstanding figures. But former congresses were notable for the strength of leadership these few members furnished. Recent ones have been notable for the efficiency with which a few men control the machinery of legislation.

Mr. Ford's Page

THE overthrow of Money from the place it now holds in our system of life is so certain that it is amazing that more intelligent men do not see it. Class hatred among the so-called "radicals," ignorance of the complexity of modern economic requirements, and sheer greed to divide what appears to be "the wealth of the world" have been so apparent in all the discussions of the matter, that people of common sense have taken the easy-going attitude that it is all talk. Talk about money is hard to understand anyway; figures are "dry reading"; and so a large section of the people, who ought to be awake, are wholly unconscious of the change which is coming just as surely as winter is coming.

This does not mean that money is to be abolished. Nor does it mean that the soundness of money is to be tampered with. Money is a wonderful piece of machinery for facilitating the business of the world. To tamper with it would be to destroy its great usefulness as a part of the machinery of life. Nothing is justified except that which would make money still sounder. Just now money is not so sound as many think it is. Public confidence and public ignorance—the ignorance no less than the confidence—are the principal bases of our money today. The United States dollar is no more a dollar than the German mark is a mark—so far as its buying power goes. In buying power the dollar is now about 50 cents in some lines of trade. It is not so bad for those who deal merely in coin, but it is rather bad for those who deal in wealth, that is, goods.

The overthrow of money will consist in this, that people will see what has been done to them by exalting money to the place of rulership, and when they see this they will reduce it to a place of servantship. That will constitute the most drastic overthrow of money since its evil cult began.

Of course, there have been many idealistic attempts toward this end ever since the beginning of the Christian Era. Not very long ago the country was saturated with a kind of preaching that put money down in the servant class. Men were exhorted to use their money for good, to use it to help the unfortunate. Very good and eloquent men preached what was called "idealism in life." It was very pretty, and true enough, but it never bit very deep. The men who preached it were exalting an emotion, they were talking out of the sheltered corners of their own literary lives, and while everyone recognized that there was something in what they said, the instinct of the people told them that there was also something omitted. What the individual may do with his wages, in the sense of using them unselfishly and idealistically, may have a very profound affect on his own character and may support certain activities without which the community would be very sordid, indeed, but all his individual idealism would not be sufficient to affect in the slightest degree the system which makes him its victim.

For example, and it is a very simple example: Go out into the country and see the great apple crop largely going to waste. And then go into the city of Washington, say, and see apples selling for 10 cents each. If you are a normal person, and have the means, your first impulse would be to get Nature's apple bounty to the cities. You would say to yourself, "Why all that is needed to supply every child with all the health-giving apples it can eat is just to get this wonderful apple crop sent to the cities!" That would be your impulse. It would probably be the impulse of the majority of the plain people. (This statement is important to remember, that it would probably be the impulse of a majority of the plain people.)

But suppose you try to move the apple crop into the cities. You encounter a close association of business men, engaged in that business, who don't want their city to have all the apples it could use. A city plentifully supplied with apples would mean a lower price for apples. These men, in association, would rather sell a few apples at 10 cents each than many carloads of apples at 10 cents a peck. The work is less and the profit is greater. That is to say, in your innocent assumption that the only thing to be done is to offer the apple supply to the city, you would meet with an utterly sordid arrangement which cares neither for apples nor public but for "the price level."

And if in righteous anger you try to break this state of affairs, you will find that your cars of apples are shunted about on the tracks interminably (if you have been able to get cars at all) and that you are utterly unable to get a single one of the distribution agencies to take your supply and make it available to the city. There is no treason to the "association" that is considered so vile as the increase of supply and the consequent decrease of price to the people. Supply and service are secondary, price is paramount.

Now, it doesn't matter how idealistic the apple-eating families may be with their money. Indeed, they may gladly pay their 10 cents apiece for apples just for old-time sentiment's sake. But that makes no impact whatever on the system that balks nature, robs the people, enthrones money as the greatest good, and subtly plants within the public mind the constant thought of scarcity—scarcity. That system which is impoverishing the life and the thought of the people still flourishes. Apples are still left scarce and costly, and millions of people are being daily trained in the thought of scarcity—scarcity.

The overthrow of money as the chief objective in business will occur just as soon as the people learn the tricks that are being played upon them in the name of business. Because the majority of the plain people are so constructed, are yet so wholesome and well-intentioned, that when they see that the only scarce thing in the world is the scarcity of the idea of service in our public service activities, the effect of their seeing will be quick and radical. Not destructive—why, it is the present system that is destructive! Nine-tenths of our economic trouble is due to the fact that we are busy thwarting the natural supply, in the interest of money! The true economic practice is to utilize money in the interest of a full supply.

One could wish that business were not so fascinated by the glitter of coin, that it might see this. For it is the most unbusinesslike thing about business that it takes the very course which stifles its development. As well might a manufacturer contemplate the wheels of his machinery, and consider those wheels to be the main object for which the industry is operated, as for him to consider money, and only money, and always money, blind to the truth that money is but a sign of something else. It is absolutely demonstrable that if the "association" gathered up all the apples of all the orchards and made the cities redolent with the smell of apples and sold barrels and barrels of apples where they now sell a pitiful few, their profits would be larger because their service has been larger, and more than that, the people would lose their pinched view of "scarcity" and would buy and buy of everything, until the stream of busy prosperity had reached all round the circle and benefited everybody and then had started round again to benefit everybody some more. It is a moral, a social and an economic crime to thwart natural circulation anywhere, and this is what is always done when Money is made the chief objective.

IT IS a most unbusinesslike thing to strangle business, as many business practices do. The manipulation of supply to maintain an artificial price level is strangulation which affects the whole economic body. Specific instances may illustrate the practice, but do not show the cause. The cause is the exaltation of money as the objective of business, instead of its proper valuation as one of the tools of business. The overthrow of money as the be-all and end-all of business is absolutely essential to the continuance of business. That is the point that is missed in all the talk on the subject: this reform is essential for the salvation of business. It is business that is suffering from stupidity. The people suffer, too, but they can out-suffer business.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Why Canada Turned Down Waterway Plan

Facts Propagandists Do Not Print; an Illustration of Neglected Truth

By HECTOR CHARLESWORTH

THE plan for an international ship canal on the Upper St. Lawrence, which would provide deep waterways for ocean vessels from far-away Lake Superior ports, like Duluth, Minnesota and Port Arthur, Canada—not to mention intermediate cities—is indefinitely postponed. There is reason to hope that at some distant day Canadians and Americans alike may see such a canal in active and flourishing operation; but by that time a majority of its present advocates in both countries will be in their graves. To some this may seem an over-candid expression of opinion, but it is just as well to look the facts in the face. Canada's national debt is approximately two billions, four hundred millions of dollars ($2,400,000,000), a heavy burden for a country so sparsely populated in comparison with her vast domain; and there is a large body of conservative opinion which is resolved that no more enterprises shall be embarked upon which will increase Canada's financial obligations. But back of the whole question lies the warfare of opinion as to the merits and demerits of public ownership of public utilities which is being waged in many parts of this continent.

It should be understood that Canada has not definitely rejected the plan. Its prime minister, Honorable William Lyon Mackenzie King, has merely refused to commit himself and taken refuge in the statement that "the time is not opportune." But the private political reasons which have actuated him and his colleagues in taking a non-committal position are well-known to those acquainted with the curious ramifications of Canadian politics. His course, if not a reversal of, is a retreat from, the Canadian official position of last year. The Union-Conservative government of Honorable Arthur Meighen, which was defeated at the polls last December, favored the project, nominally at least. But unfortunately even the Conservative party which first set the project afloat (as far as Canada is concerned) is not unanimous on the subject. The dominating elements of the Liberal party, which on a very narrow tenure holds power at Ottawa, are strongly opposed to it. The Progressive or Farmers' party, numerically strong enough to hold the balance of power at Ottawa, is almost exclusively a prairie delegation in the House of Commons. Unlike the farmers of the American West they are indifferent, and in some instances opposed. With them the argument that all the expenditures of public money involved would be spent in the East has even aroused a certain measure of antagonism. Thus there is little to spur the government to a candid declaration of policy.

Prime Minister Noncommittal

ON MAY 28, Rodolphe Boudeau, clerk of the privy council of Canada, forwarded to Sir Auckland Geddes, British ambassador at Washington, a minute of that body expressing acquiescence in publication of a statement as desired by the President and the following paragraph was appended explaining the official attitude of the Canadian Government:

"His Excellency's advisers have not thus far had opportunity to give to the report of the International Joint Commission and the accompanying report of the board of engineers appointed to examine the subject, the careful consideration which their importance merits, and, moreover, having regard to the magnitude of the project and the very large outlay of public money involved, the government is of opinion that it would not appear to be expedient to deal with this matter at the present time."

Beyond that statement, Honorable W. L. M. King has refused to go. On June 1, Mr. T. L. Church, M. P., who represents one of the Toronto constituencies in the House of Commons and is a prominent member of the harbor commission of that city, tried to elicit a fuller statement from the prime minister.

"Do I understand rightly," asked Mr. Church, "in view of the reply given to the Government of the United States, that no further action on the findings of this report is contemplated by the Canadian Government?"

To which the prime minister responded: "I think my honorable friend is as well able to read the reply already given as I am to interpret it. That reply stated that the government did not think it advisable to take up the matter at this time; it did not go beyond that."

Supporters of the St. Lawrence improvement scheme may take a little satisfaction from the fact that Canada, as Mr. King's words show, has not absolutely slammed the door in the face of the United States' advocates of the project.

Canadian parliamentary practice in some degree reverses that which prevails at Washington. There the Senate is the more important body; but in Canada initiative on matters demanding financial outlay lies exclusively with the House of Commons. The prime minister is also leader of the House of Commons during his tenure of office and his refusal to countenance a measure puts it beyond hope of practical accomplishment, for that session at least. The Canadian Senate on the other hand, though it cannot initiate measures involving public expenditures, has certain powers of criticism and revision and frequently constitutes itself a debating society for the untrammelled expression of opinion on public issues. Thus, there has been much more candid and illuminating discussion on the St. Lawrence improvements in the "upper chamber" than in the Commons; and the cleavage between the supporters of public and private ownership has been made clear.

For the sake of clarity the details of the plan as recommended by the International Commission and embodied in Secretary Charles E. Hughes' memorandum to Sir Auckland Geddes, may be briefly summarized. They call for an arrangement by treaty to carry out a scheme of improvement of the St. Lawrence River between Montreal and Lake Ontario under the direction of an International Board, such improvements to consist of "navigation" works and "power" works. The cost of "navigation" works is to be apportioned between the two countries on the basis of the benefits each will receive from the new waterway, to be determined by certain known factors which need not be enlarged upon here. The "power" works are to be built, installed and operated by and at the expense of the country in which they are located. Secretary Hughes made no reference to total costs; but these are estimated in the report of the engineers as $252,000,000. Another important proviso in the Hughes memo is that the new Welland ship canal across the Niagara peninsula shall be proceeded with by Canada, and "embodied in said scheme and treated as part thereof." This is of significance since it is taken to mean that the United States will participate in the cost of this work, to which Canada is already committed. Therefore, opponents of the general plan are trying to minimize this concession and represent that the United States has not definitely recognized the Welland improvements as part of the project. The suggested treaty would also call for a slight readjustment of the international boundary; and there have been and will continue to be appeals to prejudice on this point; but the triviality of such carping is clear from the text of the memorandum dealing with boundaries.

To make clear where the strength of the opposition lies it is necessary to elucidate some of the complexities of the Canadian political situation. The International Commission during its sittings in Canada, in the 23 months which elapsed between its creation in January, 1920, and the submission of its report and recommendations in December, 1921, took evidence from public bodies as far west as Calgary, Alberta, and as far east as the Atlantic ports. In the three great grain-growing provinces of Alberta, Saskatchewan and Manitoba, it encountered complete indifference. The prairie farmer at present pins his faith to a scheme of transportation by the Hudson Bay route. Undoubtedly this latter route is much shorter, but weather conditions make it hazardous and insurance charges would make transportation costs prohibitive.

Eastern Canada is the only section of the country where the St. Lawrence improvements are a live issue as yet, and even from this statement we must exclude the maritime provinces which have their own ports on the seaboard. These are not affected by the plan, one way or another; but are not likely to give a very warm support to any project involving large expenditures in the interior. In fact, it is a standing grievance down by the sea that their interests are ignored by the great populous and wealthy provinces of Ontario and Quebec which continue to dominate Canadian politics.

The real cleavage lies between Ontario and Quebec opinion, and in the alignment of interests the subject of water power plays a more important part than the navigation phase. Geographically, Ontario covers the entire lake region and the part of the St. Lawrence Valley where the proposed improvements would take place. It is whole-heartedly friendly to the plan. Its government, which is at present in control of the Farmers' party, has declared itself in favor of the project, and in this it has the support of the Liberal, the Conservative and the Labor parties alike. Boards of trade in nearly all the leading towns and cities have also put themselves on record, and the only vestige of opposition comes from certain private power interests who carry no weight with public opinion.

Public Ownership in Ontario

ONE of the reasons Ontario so strongly favors the St. Lawrence improvements is that for nearly two decades the province has been engaged in the development and distribution of electrical power, on the Niagara River and latterly on less important waterways in various parts of the province, as a public enterprise. The Ontario Hydro-Electric Commission, with its subsidiary municipal commissions, constitutes by far the largest electrical development enterprise in the world. Under the Federal constitution, and by provincial enactment, the Hydro Commission has control over the power rights in all navigable waters within the boundaries of Ontario. If the St. Lawrence project were carried out, this commission would automatically be in charge of the entire power development on the Canadian side of the canal. When the work was completed Ontario would have additional resources in electrical energy totaling 1,464,000 horse power, according to present estimates. Provided a market could be found for this vast accretion of power resources, this would mean an immense additional revenue.

The total cost of the proposed developments, part of which would be borne by the United States, is estimated at $252,000,000. Leaving out of consideration the stimulus to navigation and taking into consideration the equally vast power development that could be obtained on the American side of the canal, it will be seen that the project offers a development of electrical energy at amazingly low cost that would in time revolutionize industry on both sides of the boundary, and solve any anxieties on the subject of soft coal supplies for manufacturing purposes. But it should be borne in mind that this is all a matter for the future. The Ontario Hydro-Electric Commission has recently completed at enormous expense the Chippewa power canal on the Niagara peninsula, and has as yet found no markets for the greater part of the power that is available from that source, although it proposes to sell very extensively to the United States.

If the St. Lawrence improvements are ever carried out it will be necessary for financial reasons to pool the Canadian development at this point with the Niagara development, else the one would cut the throat of the other. For these reasons even the strongest Ontario supporters of the St. Lawrence plan are in no hurry.

Though Ontario is definitely wedded to power development under the public ownership system, the province of Quebec—or at any rate the interests which control her destinies—are as strongly wedded to power development by private capital. According to information in the hands of the Ontario Hydro-Electric Commission, the interests which exercise most power in New York State are almost as strongly in favor of private ownership as those of Quebec. Periodically for the past 10 years, the establishment of a New York State Hydro-Electric Commission on the lines of the Ontario enterprise has been advocated at Albany but has been defeated. The vast power resources of the province of Quebec—particularly those adjacent to Montreal—are in the hands of a group of capitalists who have very sympathetic relations with the New York interests opposed to the construction of the St. Lawrence canal. From the outset of the agitation the bourses of Montreal and New York have acted in common in opposing the scheme. At the present time the Montreal group is able to exercise far more political power than their New York friends.

The opponents of the St. Lawrence plan do not talk to the public at large about the menace of cheap power. But they have seriously alarmed the cities of Montreal and Quebec with the idea that deep-sea navigation from Lake Superior to Liverpool would mean commercial disaster. Montreal is the present head of ocean navigation in Canada, and Quebec is a tidewater port. Quebec fears that it would become almost negligible and Montreal assumes that it would lose all the business that arises from the transshipment of grain during the seven months—nominally May 1 to December 1—when navigation is open on the lower St. Lawrence. The city of Montreal, during the recent session of Parliament, sent out a great deal of literature protesting against the St. Lawrence project in which that city's present pre-eminence as a grain-shipping port was presented. The figures show that during 1921, despite the fact that navigation was but of seven months duration, Montreal shipped 138,453,980 bushels of grain; Galveston, Texas, 94,000,000 bushels; New York City, 84,698,000 bushels; New Orleans, 73,689,000 bushels and Baltimore, 55,314,000 bushels. This pre-eminence is due to distance. It is 2,773 miles from Montreal to Liverpool; 2,810 miles from Boston to the same port and 3,010 miles from New York. This argument was urged:

Montreal's Shipping Problem

"THE port of Montreal, being nearer Europe than any other large Atlantic seaport, offers superior advantages not only to her immediate hinterland, but also to American states bordering on the Great Lakes"; and it was prophesied that St. Lawrence development would rob her of this advantage.

Senator Reid takes the view that Montreal is needlessly alarmed as to the future of her harbor interests. He believes that vessels of large tonnage will travel between Port Arthur and Montreal where they will transship to ocean vessels. This could be done at very small expense—from one-quarter to one-third of a cent a bushel—and instead of hurting Montreal the St. Lawrence improvements would bring more traffic to its harbor. Since an ocean-going vessel costs about five times the sum to build as a lake freighter of similar dimensions this argument seems reasonable.

During the sittings of the International Commission the fact that the Canadian canal route is open only from about May 1 until, approximately, December 1, was taken under consideration; but I have reason to believe that this condition is not fully grasped in some parts of the United States. It is a demerit of the project from certain standpoints, but as has been demonstrated by the Montreal statistics, quoted above, it has not prevented Montreal taking a first position among the grain-shipping ports of North America.

To come back to the political aspect of the case; Honorable Mr. King, the Canadian prime minister, is helpless under the present alignment of parties in the House of Commons. He is carrying on government with a bare semblance of a majority. His Liberal followers number less than 120 in a total membership of 235. More than half of his supporters, 65 in all, represent the Province of Quebec and are to a man opposed to the project. There is also a solid delegation of 16 from Nova Scotia, who are indifferent, if not hostile. To have come out in support of the St. Lawrence improvements would have meant Mr. King's political destruction, for the time being, at least. The most powerful member of his cabinet is Sir Lomer Gouin, who holds the entire Quebec delegation in the hollow of his hand, and is identified with the Montreal power group which is determined to defeat St. Lawrence improvements, as far as they involve power development, at all costs. To imagine an analogous situation, suppose the support of the Republican party at Washington came exclusively from Atlantic seaboard states which imagined they would be detrimentally affected by the construction of the canal. How far would the proposal have got under those circumstances?

Restoring What Man Destroyed—Silver Foxes

Great Industry in Breeding of Animals Trappers Once Slaughtered

The incorporated city of the silver black fox. Left—Snow Flake, first prize winner, Boston, 1920. Right—Major, first prize winner at Montreal and Muskegon, 1920.

By R. D. COLQUHOUN

THE fact that Nature will preserve her more perfect species, against all handicaps, is exemplified in the case of the silver black fox. This animal at one time roamed the forests of America in considerable numbers, and constituted a true species, superior in size, coloring and quality of fur to the common red fox of that day and this. Indeed, it was the wondrous beauty of the silver black fox fur that became the principal obstacle to its existence, for we may suppose that even primitive man recognized the superior beauty of this pelt. Consequently, the animal was diligently hunted to the point of extinction as a separate and distinct species.

It was at this point apparently that Nature intervened and by causing the silver black to mate with his humbler cousin of the red coat prevented the breed being entirely wiped out. The strain has persisted through unknown generations and *to this day in the wild state silver black whelps are found in litters of the red fox.*

The earliest fur traders in America knew and valued above all others the pelts of this wonderful little animal. Trappers and hunters were ever keen to obtain even a single specimen. To do so gave a mark of distinction. A single black pelt would give him sufficient credit at the fur post to render work unnecessary for many months thereafter. Little wonder, then, that the taking of silver black fox pelts was looked upon in that circumscribed world as the event of a lifetime.

Some 35 years ago, in Prince Edward Island, a trapper discovered a den containing silver black whelps. He conceived the idea of raising and mating these and thereby insuring himself a steady income from the sale of pelts. With two of his closest friends he determined to keep the secret, even from members of their immediate families. They intended to use this secret source for supplying the pelt market, and did not realize the fact that by giving the news to the world they would reap a much greater reward through the sale of the animals for breeding purposes.

The secret finally leaked out. This one was disclosed by the sudden abnormal prosperity of the three friends. The drafts received from the London fur brokers became too large to be handled by the local banker, a fact which aroused a lively curiosity. Their struggle to guard their hidden source of wealth from possible competitors makes a story by itself, of long journeys to distant points to mail small packets of furs, and various wily stratagems to defeat the curiosity and suspicion of their native community. Finally, the knowledge was shared and three backwoodsmen became millionaires, fathers of a new industry. The demand for foxes as breeders became acute. Prices went from $5,000 to as high as $40,000 for one pair of breeding animals.

These were boom days when owners of one pair of foxes could form a company, capitalizing the pair for $200,000 or more and have the stock oversubscribed in a few hours. Many such companies were launched, some survived, but others smashed when the prices suddenly declined.

Following the break in the original combine the business of breeding grew steadily on Prince Edward Island. At present there are more than 300 ranches in the province. Persons employed number about 9,000. During 1921 pelts sold for the aggregate sum of $1,240,000. This is in addition to the value of the animals sold for breeding stock for which the figures are not available. The industry spread until "fox ranching" exists in nearly all the provinces of Canada, and in the United States is found in practically every state north of the Mason and Dixon Line.

The fox-breeding industry at the present time is at the point of becoming of general interest rather than being confined to localities. Closer co-ordination of the larger producing ranches in the opening of new producing points will within the next few years so increase the producing facilities that the enormous demand for these pelts can be met from the yearly increase without the danger of depleting the breeding stock. At the present time there are not enough ranch-bred foxes in the country to supply a fraction of one year's demand. Raw pelts of high grade sell in the fur auctions at from $500 to $600 dollars each, with extra fine specimens commanding still higher prices, and high-grade registered stock can be purchased at approximately $2,000 a pair.

The most significant angle of the story of the rise of fox farming to the position of a profitable industry of national scope is that it heralds the return to this country of one of America's chief sources of wealth, furs. Furs were wealth. Furs were money. Furs were credit. Furs were commerce. But ruthless exploitation combined with the rapid settlement of the country practically eliminated the wild fur bearer, and now comes a newer generation to foster and restore another of America's natural resources.

Instead of the picturesque frontiersman in fringed buckskin whose pitfall, trap and gun, respected neither time nor season, but killed when opportunity offered, we now have mating on scientific lines, trained veterinarians and attendants, feeding schedules, stud books, and careful registration. Instead of pelts taken during mating season or when a denned litter of sucklings were sacrificed with the death of the parent animals we now have furs taken at the very prime condition from animals killed quickly and painlessly.

The ranch fox is a likeable little chap. His conduct of family affairs and social relationships might well serve an example to the human family. Added to the ordinary fox psychology, developed in wild environment, the ranch-bred animal has a new set of impulses resulting from association with man. He still distrusts and fears mankind in general but is quick to respond to care and attention from the individual.

Foxes are mated in pairs. Mating usually endures for the lifetime of the animals. Each pair occupies a space about 30 feet square inclosed by a special woven wire fence. The inclosure has a woven wire partition, shutting off about one-third the area of the pen when occasion demands. A concrete foundation for the pen walls is sunk to about 30 inches below the ground to circumvent the fox's desire to dig himself out. Where the soil demands, a piece of woven wire about 18 inches wide is laid flat below the surface of the pen floor just inside the walls as an added precaution. The fox starts operations close to the obstruction. His engineering does not quite run to starting a few feet back.

The mating season is in January, and 51 days later the young are born. During this time the fox and his mate, particularly the latter, exhibit those traits of character which in human beings are placed under the head of temperament. Tempers are short, and trifling annoyances become causes of prolonged irritableness, while fear may easily become panic. Visitors are excluded from January until early summer.

As their main residence, the pair select the largest den. This is a two-roomed affair, the inner sleeping chamber being double-walled with a packing of sawdust or ground cork between the walls to insure the litter against cold. The outer or living room has a single wall only but is weather-tight, as are all the dens. Some ingenuity is required to devise ingress and exit. The fox idea requires that the real entrance to his living quarters be placed as far as possible from the dwelling itself and with no apparent relationship between the front door and the dwelling. To humor this idiosyncrasy, ranchers have reproduced as nearly as possible the hollow log which the wild fox finds so convenient for disguising the entrance to his den.

Once settled, the fox and vixen find it ample for a home. The other two dens are used only for lounging. Near the time of maternity, the nervousness and anxiety of the parents is evidenced by quarrels of high frequency and tension. It is frequently necessary to isolate the fox. He is driven into the partitioned-off space. All openings are closed and father fox spends several weeks of enforced bachelorhood. The vixen left alone finds solitude more or less sedative. She is constantly under observation by the caretaker guardian in the watch tower, and when she emerges from the den exhibiting nervous excitement he knows that a new family has arrived. He knows, too, just what will serve to calm her excitement and as quickly as possible he gets a live chicken or pigeon, wrings its neck and tosses it to the vixen. The rending of warm flesh affords an outlet for the vixen's irritableness and quiets the nervous condition, so that she can give attention to the puppies. In a few days the closed runways are opened and the fox family circle restored. From then on the fox and vixen find their time fully and joyfully occupied.

After the birth of the litter, the need for the third den becomes apparent. As soon as possible, the caretaker lifts the top of the large den to count the litter and to put the den in a sanitary condition. This act arouses the suspicion of the vixen. She seems to feel that the entire world has been let in on the secret of the location of her wonderful new family and decides to hide them anew. The third den offers a convenient hiding place. Without it, the vixen would undoubtedly attempt to dig out a den for hiding her puppies which might result in the death of some from exposure.

Foxes are fed chiefly with cereals and milk, the old ones receiving meat twice daily. The meat, chiefly beef, with occasional allowances of poultry, is fed clean and sweet though mostly a little tough, and at no time are scraps and remnants allowed to remain about the pen. The eating and drinking vessels for the foxes are kept immaculately clean and every precaution taken to keep the living quarters sanitary. The silver black will eat almost anything and thrive under any conditions but modern ranchers whose stock consists of pure bred animals take every precaution.

American Lights Gleam on London's Hungry

It's Broadway's Glitter, But There's a Different Kind of Britisher

By an American Observer

TWENTY-FOUR hours of London; it is a job if one attempts to "do" the city à la Cook's tourist style, but not much to pick out the high lights of this centuries-old capital whose name figures in the news of the day more often, probably, than any other name. This city is the capital of Europe, and within a short distance from where these lines are written, that place often referred to as Downing Street is endeavoring to solve the riddles of the world.

Within an hour after arriving at Waterloo Station the writer stood on that corner of the Strand and Trafalgar Square, City of Westminster, upon which stands the building of the Union of South Africa, which in turn, on the Strand side, houses a busy postal station.

Not many years ago a popular melodrama was entitled, "When London Sleeps." The writer was awake last night when most of London was asleep. London sleeps, but it sleeps differently. And if the sleep is different it must be because London is awake in a manner that bears no comparison to the waking hours of a decade ago. One cannot call every passer-by who speaks the English language a Londoner but each and all make the city what we see it.

It used to be the fashion of writers to say of every Englishman that he was phlegmatic and bored. Some writers persist in characterizing them thus unto this day. But he who knows an Englishman when he sees one, and has seen him at his bored best, could not say the same thing of him today. Piccadilly, Oxford, The Strand, Whitechapel—on the streets, in the buses, afoot, or leaning against a friendly cane—there is little of the phlegmatic in him now. It is no longer too much trouble to look round and about, and there are fewer monocles to adjust in nervous eyes.

Much may be lost to the glance during the few moments required to put the single glass into position, and as these are days when things move quickly, the time-losing optical adornment has been laid aside. The Englishman wants to see, and he wants to see quickly. He is an adept at it even though he shows traces of being a graduate, but when he has learned how to look quickly and see things—see the very things that he is looking at—then he will understand better his brothers in North America, from Hudson Bay to the Rio Grande.

We will just take the month of August, and summer is supposed to be doing its best, or its worst, so far as life in a great city goes, but is summer in London now what it used to be? No, it is not. It is not so "dead" as it used to be, nor is this from an amusement standpoint in particular. There are shows going on whose titles are gracing or may grace New York City electric signs sooner or later—titles that are suggestive, such as Husbands are a Problem, The Naughty Wife, Decameron Nights, If Four Walls Told, and even such an old friend as The Second Mrs. Tanqueray. Sally is trying to steal a march on Broadway by being advertised in multicolored lights symbolizing a dancing girl pirouetting some 70 feet on a roof sign near Trafalgar Square, while Charles Hawtrey's successful Ambrose Applejohn's Adventure has been repeated several hundred times successively.

Bus Ride Best Amusement

THERE are kinema theaters—the British names for our "movie houses"—advertising local productions and a few ancient American ones; then there are the Midnight Follies, at the Metropole, for one-pound admission, except on gala nights with its extension "until 2 a. m.," tickets for which cost 30 shillings. Yet the best amusement is a sixpenny ride atop a bus, and by careful selection of routes for four or five shillings one may see something of real London.

The real Londoner is not attending these theaters and amusements. The over-advertised ones are for the rich visitor, the person with nothing to do, and the latter description does not apply to the Londonese, not just now. Later on, in a Lyon's restaurant, which is quite an improvement over certain American chain lunch rooms, both for better food and lower prices, the discussion was continued with four taking part; a manager from Manchester, a "clark" of Bond Street and one who did not identify his status, but very likely was a mercantile man. The three agreed that they did not attend the London theaters, although their reasons differed. Amusement in the heart of London, when paid for at box-office prices, is quite too costly for the average Londonese purse. Its slimness is another thing that keeps the Britons awake.

There are a few flighty ones who make a brave attempt at being wide-openly amused. The grills are well filled, and so are a host of other similar places, where music is an important part of the pastime, but the proportion of Londonese is very small. The managers say so. Faces and mannerisms and dress rather supports this view. What of London is laughing is not London, but its crust.

Along the darkened passage known as Northumberland street, within a stone's throw either way of Nelson's Column and the Savoy Hotel, young men indulge in personal horseplay or are in eloquent and not always silent confabs with flirtatious young women. Two of them were good-naturedly struggling for her smile, while an even more smiling taxi driver was counting the clicks of the meter. The usual type of unattended women, young or old or ageless, seen about boulevards like The Strand, are there, but few and far between, not easy to detect unless one actually looks for them, and outwardly they offer no problem. If they do, it is not in the bright-light district.

There are, according to official statistics, more women than men in this city, but in the streets one sees more men than women. One sees fewer silk stockings than in New York, and imitation silk almost not at all. Young women will reveal ankles clad in cotton, lisle or wool without concern, and this is in their favor. They are the young women that are a part of the population. They are not the women who loaf about places like the Strand Grand grill, where they smoke excessively, to the point, it is said, that small pipes of rich briar and meerschaum have been fashioned for their especial benefit, as has tobacco flavored with exotic perfumes.

One sees many such women unaccompanied by men, because it is quite obvious that the London man is not minded to become frivolous, even though he may have the Paris habit, so-called. He has given up his monocle, to repeat, but he has not oscillated to the other extreme. And to prove this there is something else. Only recently permission was granted by the authorities whereby sports are allowed on Sunday in London parks. It was expected that there would be a rush to take advantage of this new opportunity. Tennis, boating and bowling attracted a few players, but quoits, net ball and Badminton did not.

If it is borne in mind that the Britisher was the sportsman of Europe only a decade ago, he who set the fashions and the pace, one may better understand what this negative attitude means. It is a key attitude because it was to operate the collective attitude of male London, and his did not respond. Nor is the Britisher flabbier or lazier, hardly. He is exercising his mind more than ever. He needs that more than his muscles just now. And there are too many, many too many, who have been eliminated from all muscular activities by the war.

The streets are full of men who limp, who walk with difficulty, who are ruddy of countenance but cough, of men who are maimed or otherwise invalided. To engage in sports implies having a well-filled stomach, good clothing, and few cares. In other words, it means having a job.

The Poor They Have Always

IT IS incompatible with British sensitiveness to play about, especially out in the open, when the percentage of spectators would be in favor of war veterans with nothing excepting medals to show for their sacrifice. And the truth to tell, it is not possible to yield to the vanity of a superficial sportsmanship, granting that there are those who would like to engage in it, under the scrutiny of maimed and hungry men. For poverty is increasing; even the latest official figures show that the number of persons receiving poor relief in England and Wales is now about double the number of those who received such aid in 1914, and 124 per cent above the number last year. Yet, fortunately, the people are not declining; excepting that divorces are increasing alarmingly, there continues a high birth rate and a low death rate—the lowest since 1862.

This time it was another eating place, a few doors away, known as Lockhart's. It is an inexpensive eating place. The writer idled a bit before entering, studied the menu pasted against the plate glass window minutely, watched the patrons that came and went in the course of a few minutes.

A three-quarter mutton chop, grilled, chips (fried potatoes likewise grilled) 20 cents, bread two cents, milk four cents, a sugared bun, two cents. A chop that at any American hotel could not be had at any price and at the leading London hotels for probably "three and six"—roughly 85 cents—forming the *pièce de rèsistance* of virtually the cheapest dinner to be purchased in London city.

Yet it was not until later that it became painfully obvious that this was quite a course dinner, as dinners at the adjoining tables went. Imagine a middle-aged man, with a frock coat whose braided edges were frowzy, whose worn striped worsted trousers were carefully brushed, whose well-worn shoes, topped by a thick pair of socks, were dully polished, feasting upon a cup of cocoa, two slices of buttered bread and a piece of cake—the whole amounting to about nine cents! Yet he was oblivious to the fact that it was meager, and as he made the best of his bread and cake he perused a lengthy and evidently ancient letter that to him must have meant a great deal. There was tragedy sitting at the table behind—tragedy personified in a man whose facial delineaments were of the well-bred individual, bravely hanging on to the last shreds—shreds in more ways than literally—of gentility and convention, whose luncheons and breakfasts could hardly be any more opulent.

But what is a single specimen of tragedy? The unknown aged one could not demand much of one's thoughts when others were coming in. For next to the table sat a one-legged veteran, carrying what looked like a shoe box containing matches that he was peddling. Matches, he was selling, he whose three medals of valor and distinction occupied a place over his heart, pinned over his waistcoat, where they would not be too obvious, too intrusive, reminders of flames and fire of another kind. He, too, ordered a sumptuous dinner.

"Tea, unbuttered bread, more unbuttered bread." About four cents' worth. So the hero of yesteryear was now having the time of his life, chatting with another fellow across the table, until a woman came in and sat by his side. She arranged the boxes of matches for him, talked to him awhile, and then they went out together. His sister? His wife? Who knows?

Opposite to me came a man in uniform. He was a fireman. But to make conversation the meaning of a ribbon representing four orders or decorations was inquired after, with not much success. "It's a mystery," he said, with a dry voice, "and it means lots o' things."

He was substituted by a young fellow, 26 or 28 years of age, very rosy cheeks, a clean-cut profile, a strong and lithe body, a bright eye—all that goes to make a real man. Coughing occasionally he sat down waiting for his order. He pretended to read a newspaper, whose soiled edges and raggedy folds showed its probable origin, and looked at his vis-a-vis (this being the observer) trying to do justice to the chop, that was, judging by American standards, about the size of a small club steak, and this is only a slight exaggeration.

There are ways and ways of looking around and about, and I believe I have tested all of them, and so I became conscious of a peculiar scrutiny in turn. What could it mean? If such a young man, drinking coffee and eating bread and butter—less than a nickel's worth—looked at you, diffidently, nervously, anxiously, and you were aware that he was all that has been said of him, and in addition that he coughed incessantly, that a service pin adorned a lapel that was as old as the rest of his suit, that his collar was quite dirty, that his face and hands revealed ablutions probably at a public drinking fountain—what would be your answer? There are hoboes and idlers and bums, under appropriate names in the several languages, in any country, and as for the United States, they look just about what this chap seemed to look like. Yet his eyes were disconcerting.

A copious draft of hot coffee, a brave resolution, and he said:

"That feels good; it's the first thing I have had to drink or eat since last night."

The situation was delicate.

"Out of work?" It was the best question, after all, I could submit.

"Six months, and the worst is yet to come." Then he added, upon further questioning, that he was a mechanic, that he had worked in a high-class automobile factory that is suffering from slack business, that he lost a brother in the war who had been working an allotment of Canadian land which he lost by abandoning it for over-sea duty with no one to leave it to, that he was merely one of thousands of other service men, most of them invalids in one way or another—his own cough was due to being gassed—who refused to stand together after a few "parades of unemployed" and all of them without aid, he said, from the government at this time.

This chap was a genuinely hungry man, for upon being invited to order something to keep me company, he called for a chop, bread, hot tea and stopped there.

Too Weak to Eat

"MY STOMACH is weak because fed too irregularly," he said, "and I don't want any more just now than is good for me."

One might add to the picture, because Lockhart's, in the heart of London, almost in sight of Parliament buildings and Buckingham Palace, is the refuge of just such men, either itinerant street merchants or unemployed or, undoubtedly, a few grafters, but the grafters cannot be too many when the city is so full of men who are in the throes of hard luck.

These men, and perhaps their women, too, because not all are orphans like the dinner companion, are everywhere. They watch you as you meander along if you bear any evidence of time-killing, like a camera, for instance. It is not a glance of disapproval, but it seems to some to be a reminder, and very likely it is a reminder of better days.

It is just these men and these women who are down, but not quite out, who live on from day to day, thinking and causing others to think, except perhaps the government, and all this thought is leading to the change of London's psychology.

This very moment three ragged little girls are peering at me through the iron fence that guards the basement across what is virtually a moat and call to me for change. They smile; a tot of about three years of age is sending me a smile that ought to be worth millions to any father or mother, and the tots that can smile like that are solid children of solid people. It may be that the grown-ups of the present generation may not care to smile much or again in this London town, but it is essential that young London smiles shall be preserved for the future.

The kodak has been called into aid to carry a sample of this smile to the United States, a smile owned by two boys that look like ragamuffins and would have been so scarcely a decade ago, but just now it is dangerous to make such distinctions because more likely than not they are apt to be wrong.

London is full of the new poor, the white-collared class. But they are more thrifty and less self-conscious about it. Men wear suits of three different patterns and think nothing of showing to an indifferent world that they are last remnants of as many suits or that separate garments have been purchased as need arose. Some odd color combinations are met with, but withal there is always the sense of orderliness, of propriety, of convention. The cane is ever present. Spats are frequently seen. Toppers—two gallon and two and-a-half-gallon—are commonplace, except that they look ludicrous over a tuxedo coat.

Another thing one sees is a vast number of what are known as attaché cases, leather affairs that resemble a suit case range in size from a woman's large pocket book to a miniature trunk. One wonders where so many "attachés" are going, and what they are attached to. They cannot all be diplomatists of junior rank, and the best explanation I can think of is that the "clark" of other days are now dubbing themselves by the new name. There is a similar disease in the

(Concluded on page 10)

Blind—But She Can Read Human Character

Remarkable Faculties of Girl Stenographer of Sightless Eyes; Voice, Touch, Handshake, Assist in Her Analysis of Persons

By GEORGE C. HENDERSON

"THAT man is dishonest!"
Although the speaker was blind, she did not hesitate to pronounce her judgment.

"But you cannot see him," I protested. "What makes you think he is crooked?"

As a matter of fact the man to whom I had introduced her had been a yeggman and was then a lecturer on criminology at the university.

"I can see," she said, raising her sightless eyes. "My ears and fingers see. My whole body sees. One does not need the eyes to read character."

The little blond girl was Miss Mathilda Allison, blind stenographer, commercial college lecturer on "Business Opportunities," a graduate of high school and two technical colleges and at present history clerk and dictaphone operator at the Sonoma, California, State Home.

Although physically in total darkness, her mind reaches out toward the sun. She can see opportunities, not only for business but for big humanitarian achievements. By passing the highest in civil service examination, she caused the commission to abolish blindness as a disability and opened up the field to other sightless unfortunates. Thus she performed a service for that portion of humanity.

Miss Allison is the first blind person in America to pass a state civil service examination.

Each week this girl makes a journey at her own expense to the State Veterans' Home and teaches blind soldiers to read with their fingers in big books of raised letters.

"The voice is the chief index of character after all," said she of the long shapely fingers and the sightless eyes as she sat at her desk and rapidly thumbed through manuscripts. In some miraculous way she found the letters that she desired and handed them to her assistant.

"That man's voice was repellent, shifty. It had an insincere timbre," she continued as she rapidly typed a card and put it away in a labeled filing cabinet.

How could this woman see to pound the keys of a typewriter when she was blind? How could she sort papers and bring order out of a chaotic mess? There was something bewildering about the way those long fingers traveled unerringly over her desk and through the cases filled with correspondence.

"When the fellow shook hands with me, this sense of untrustworthiness increased," said Miss Allison.

"It is a bit difficult to analyze my sensations. You, who can see, often have met persons whose voices sounded insincere. I cannot see. I must rely upon my sense of hearing 10 times more than you. Therefore, I have trained my ears to do the work of a pair of eyes. You *see* a sneering or dishonest light in a man's eyes. I *hear* it in his voice.

"The successful man has a crisp, decisive tone that is pleasant to hear. The failure is betrayed by a wavering, vacillating tone."

The most marvelous achievement of the blind girl stenographer was that of saving a chum from marrying a crook. It was not until then that she recognized her own powers. When introduced to the young fellow she immediately pronounced him a crook. Her antipathy increased so with each meeting that her chum finally put off a marriage on the strength of it. Two months later the youth was apprehended as an embezzler and it was found that he had a penitentiary record.

"In analyzing my own feelings, I found that my character reading is made up of nine parts of observation and one part intuition. By intuition I mean that sense which causes us to dislike or like a person instinctively.

"The young man whom I condemned so quickly had a firm handshake," she admitted, "but even that was not wholesome. He was too caressing, shifty. I cannot convey the subtle distinction to you. One must be blind to understand.

"And then there was his manner of walking. I did not like the sound of his footsteps."

Here was a strange creature indeed! What possible bearing could a man's footsteps have upon his character.

"One man shuffles his feet," she explained. "Another steps out with a sharp quick tread. Weak character and loose morals go with a shuffling gait. This fellow did not walk honestly. He dragged his feet. His voice alternated between the domineering and servile.

"I have trained myself to read men's minds for self-protection. I could not do business unless I understood them."

Miss Allison has classified voices not only as to character but as to stature as well. She says there are short voices and tall voices that go with short and tall men and that there are fat, lean and medium tones. She recognized the sloppy voice of the careless person, the whine of the failure and the singsong monotone of the shiftless and lazy.

"Weak persons inevitably finish up a statement in an uncertain diffident manner," said the sightless stenographer. "They may begin quite vigorously and deceive you for a minute but they trail off into indecision before completing what they set out to do or say. This shows an incapability of sustained effort.

"A handshake speaks volumes. The warm-muscled grip of a person who is well and strong is in strange contrast to the cold, clammy touch of one who is ill or weak. The flabby hand indicates to me a flabbiness of character and physique. When I feel the grip of long, strong fingers I am inspired with an added sense of confidence.

"The general demeanor of a person is a good criterion. You wonder how I can distinguish demeanor?

"Well your crook friend kept moving around. He was shifting first one way and another. I could hear him putting his hands in his pockets, sighing, jingling keys, snapping his fingers, scuffing with his feet."

The blind girl contends that breathing also is a character index. "Seeing" people rely upon it as well as do the sightless. A puffing, wheezy person leaves a disagreeable impression. She is conscious that such a one is not physically well, and, of course, physical disability is a drain on character.

The blind girl explained the mystery of her use of the filing system by showing how she marked each folio with a Braille machine which writes in raised letters. Thus with a couple punches on the Braille she marks letters so that she can find them by the feel in going through her files.

We were going along one of the graveled walks of the Sonoma Home. Directly in the path stood an automobile. No noise was issuing from it. I waited to see how this girl would avoid it. I expected her to reach out her hands and touch it before passing, as other blind people do. But she went around it as easily as a "seeing" person.

MISS MATHILDA ALLISON

"How did you do that?" I asked. "You didn't touch the car. How did you know it was there?"

"Simplest thing in the world," she explained. "My nose warned me. It was the smell of oil, rubber and gasoline. I try not to feel my way through life."

Miss Allison makes very close "guesses" as to the size and appearance of people whom she meets but cannot see. I asked her about one stranger who had been introduced and had transacted some business.

"I thought of him as short, slight of build, about 5 feet 6 inches tall, clean-shaven, brunette and of a strong but not a dominant personality," she told me. "Now how far did I miss it?"

"Wrong as to complexion," I said. "He was a blond, not a brunette. How did you do it?"

"Well," she began slowly, "he had what I call a short man's voice. He did not talk down to me. The sound of his voice came from a point directly on a line with my own face. This indicated that he was not much taller than myself. When he shook hands I knew positively that he was not a big man. His hand was small and slender and from the angle at which he extended his arm to me, I knew he was not reaching down.

"The matter of complexion and clean-shavenness was purely an impression, conjecture. When one hears a man discussed, one immediately forms a mental vision of him. I did that."

"But what was the key to his character?" I asked.

"First the way he knocked at the door," she answered. "There was no hesitancy about it. Then his step as he entered the room; he did not mince along or shuffle his feet but walked firmly, quickly.

"Then his voice, of course. While there was nothing dominant about his tones, he addressed me by name after the introduction, showing that he had the faculty of giving attention.

"Do you know why so many people forget names after they are introduced to persons? Simply because they become confused. In reality they do not hear even the name spoken. They are thinking of their own embarrassment, about the impression they are going to make or they are forming some complimentary or uncomplimentary opinion of you. Such inability to concentrate indicates a character weakness.

"This young man shook hands easily. His fingers were long, strong and warm. He launched into his business without hesitation.

"As to knowing that his character was not dominant, this was a matter of instinctive feeling. When you meet a strong character you feel the subtle, magnetic quality which is called personality."

On one occasion Miss Allison had an opportunity to demonstrate her ability to find her way about. Her friends tried to lose her while out walking in a meadow. Then they challenged her to find her way back to the institution alone.

Without hesitancy she followed a path that led her back to the state home. The laugh was on the jokesters who insisted that she explain how she did it.

First, she had located the highway that ran past the home by the noise of the heavy traffic that distinguished it from other roads. This gave her the general direction. She walked across the meadow until she hit a path. As she proceeded she listened for the familiar noises that came from the various buildings. The blind girl had long been accustomed to identifying the various structures on the big farm by the sounds that emanated from them. She could tell even the time of day by the nature of these sounds and by the character of the traffic passing on the boulevard.

Some have eyes and see not.

This blind girl stenographer has no eyes, yet she sees all.

It was from the old blind soldiers at the Veterans' Home in Sonoma County that I first heard of the sightless girl who came to visit them weekly, like an invisible fairy, bringing laughter, happiness and cheer.

Mathilda Allison! The name caused their faces to light up and their sightless eyes probed the eternal darkness futilely to locate the speaker.

"She is a wonderful girl," they said. "She comes and reads to us each week."

There are 20 of them, blind soldiers of American wars. They cannot see the strongest light of the sun. The honeysuckle vine trailing over the hospital wall to them is but a beautiful odor.

They turn their faces up to the blue sky but they do not see. A beneficent solar glow enfolds the broad prairie land and daubs verdant masterpieces over nature's landscape canvas. Polychromatic wonders spring from the soil, filling the world with a symphony of marvelous tints. Even at night the scintillant firmament cannot be entirely obscured by darkness.

But to the 20 blind soldiers, all is black. They hear the tolling of the cowbells but they cannot see the cattle lowing on the hillside, outlined against the ruins of an adobe house. They sense the laughter in the voices of fortunate people with good eyes but the smiles are invisible to them.

But Mathilda Allison, she is the miracle worker. She brings the light and sparkle of girlish youth into their lives. Her deft fingers trail over the raised letters of the blind books and she reads to them rapidly from the tomes of all times and ages.

So say the blind soldiers of the Veterans' Home. She came out of the nowhere, it seemed. She had just been certified by the United States Army to teach blind soldiers in France and was awaiting the call to go overseas. Miss Allison was blinded when seven years old by a splinter which flew into the left eye. Her father was chopping wood. She lost the sight in both eyes.

By dint of hard work she graduated from a high school for the blind, working her way through. She then took a year's college course and attended two different business colleges, getting a diploma of graduation from each. She found that she was receiving less pay than a "seeing" person for doing the same work and this so goaded her pride that she insisted on taking the civil service examination. A special ruling was made in her favor and she passed with such a high grade that she was immediately certified by the Civil Service Commission and made history clerk of the Sonoma Home. It is from this place that she makes her regular visits to the Veterans' Home.

"Most blind people fail because they let others belittle them into thinking that they are disabled," says Miss Allison. "I refuse to believe that blindness is a disability at all.

"I refuse to feel my way through life."

A Plan for the Rehabilitation of Agriculture

Co-operative Marketing and Revitalization of U. S. Bureaus Suggested

By GEORGE H. STEVENSON

THE question, "What has modern civilization done to the American farmer?" was answered to the best of my ability in the article appearing in the May 27th issue of THE DEARBORN INDEPENDENT. A friend remarked, "Everything you state is absolutely true, but terribly destructive." If telling the truth is destructive of that erroneous impression which many people still hold concerning the status of agriculture, then it was intended that that article should be destructive. In this article, however, it is my desire to present a constructive plan for the rehabilitation of agriculture. Agriculture is the basic industry, and if civilization is to endure agriculture must prosper.

In the first place, the field of agriculture falls logically into three divisions: first, economic; second, social; and third, political. I am convinced, however, that the social and political life of the rural community is determined by its economic success. Therefore, the problem of agriculture is essentially a matter of earnings and profits. The improved and modern schools, churches and social organizations of the average rural community, may be considered an accurate index of the "dollars and cents" *borrowing* capacity of the community. Rural pride, however, cannot thrive on husks alone. Far too many rural communities find themselves today mere shells of their former selves, disheartened and impotent.

It is not within the scope of this article to discuss in any detail the intricacies of the organization of the Department of Agriculture, nor of the state institutions. It is my intention, however, to emphasize the recognized fact that the Department of Agriculture has become top-heavy in the administration of regulatory functions; and that it has made available more material along scientific and investigational lines pertaining to the production of farm crops than agriculture, in its present economic plight, is able to make use of.

The Demonstration or Extension organization, consisting of some four thousand county agents, men and women, is the great constructive force, which will prove a vital factor in the readjustment and reconstruction of agriculture. The county agent has the opportunity to become the adviser, confidant and friend of his constituents. He should and does know the problems of the farmer. *Today, however, the county agent, instead of being looked upon as the emissary of the farmer, has become, because of pressure of his superiors, primarily the emissary of a multiplicity of scientific and semi-scientific bureaus desiring to exploit the results of their research, and ofttimes their theories, at the expense of the farmer.*

Too much stress is laid upon increased production, but the alert county agent knows, as does the farmer, that the problem of agriculture is not now a question of increased production, but rather a question of marketing at a profit the crops now being produced; likewise, that too often the application of science to farming is not practicable. Science generally increases cost of production, and the market value of an increased quantity does not justify the increased cost.

Too Much Specialist

SCIENCE dictates that liberal applications of phosphate rock shall be applied to the soil. No one will dispute that increased production follows, but to make the application requires an expenditure of from $10 to $20 an acre. The average farmer is not in position, being already heavily burdened with debt, to assume this new obligation. The Demonstration or Extension Service is the medium through which the Department of Agriculture and state institutions are dishing out to the farmer large quantities of rich dessert, when, as a matter of fact, the "average farmer" is starving for substantial food. It is a case of "too much" specialist, and not enough constructive, practical, nation-wide vision.

An analysis of the last annual appropriation for the Extension Service will show that the Department of Agriculture is spending more on overhead and specialists than it is on county agents, both men and women. The total allotment of all extension funds for the current year was $18,497,360, including appropriations from the Federal Government, state governments and from county authorities. When the county wants an agent it is required to put up at least half the money. The salaries and the expenses of the more than 4,000 county agents total $11,740,657, of which one-half is provided by the Federal and state governments.

When the Bureau of Markets of the Department of Agriculture was established nine years ago, it was hoped that the bureau would work out a constructive national marketing policy. But no comprehensive program has been evolved.

The farmers' isolation, the necessity for independent or family unit production, the wide variety of products grown upon the average farm, the seasonable production and marketing of staple crops, resulting in market gluts, and the uncertainty of income, are the factors, taken together, which constitute the inherent weakness of agriculture.

Generally speaking, I do not advocate the entrance of government into private business. In agriculture, I believe that the time has come when the government should provide machinery on a nation-wide scale, through which farmer co-operative marketing associations may organize and function.

Taken through a series of years, the American farmer does not, and need not fear the normal functioning of the law of supply and demand, but for many years this law has not been permitted to function normally. The more compact and cohesive tendencies of urban peoples has made possible a system of middlemen, so thoroughly intrenched that they now maintain themselves in open defiance of the laws of supply and demand.

It would seem on its face, that the carrying out of a program of sufficient magnitude to effect the results I suggest would prove a tremendous undertaking. It would impose the test of sincerity and statesmanship upon Congress. However, I am convinced that the most drastic action is justified.

The principal points of my plan involve:

1. A reorganization of the Federal and state co-operative demonstration service, affecting principally the character of work expected of the county agent. (The Extension Service should in its entirety be administered directly by an assistant secretary of agriculture.)

2. A reorganization of the Bureau of Economics (formerly the Bureau of Markets), leaving a portion of the work in the present organization under the Department of Agriculture, placing the balance under the control and direction of an independent board to be known as the "Federal Board of Co-operative Farm Marketing and Finance."

The reorganization suggested will be more particularly a matter of revitalizing the organization, and directing its course back into the channels originally outlined by its founder, the late Dr. Seaman A. Knapp, to wit:

(a) Economic production.
(b) Standardization of products.
(c) Stimulating of co-operative effort among farmers.
(d) Application of demonstration principles to rural homes.
(e) And of vital importance, encouraging the production upon the farm of as much as may be possible of the food consumed thereon.

Following the above general outline, assuming that it would be administered with due regard to varying conditions, the personnel of this organization, if once more imbued with the idealism and inspiration of the original workers when headed by Dr. Knapp, will accomplish their full part.

County Agents Hampered

IT SHOULD be said for the Co-operative Demonstration Service, as now constituted, that it is doing much in an unofficial way to aid the farmers in their attempts at organization along co-operative marketing lines. The county agent in extending this aid, however, is placed in a class with the "lawbreaker," for he is under instructions from headquarters not to participate actively in this work, as it is contrary to the interpretation given the organic law establishing the Demonstration Service. I would recommend the establishment of this new agency under the name of the "Federal Board of Co-operative Farm Marketing and Finance," under a board of practical men, representing the marketing interests of co-operative associations, organized along commodity lines, two representatives for each group, namely: grains, cotton, tobacco, live stock, dairy products and perishables, with the Secretaries of Agriculture and Commerce members ex officio of the board.

I would suggest that all market work, together with the administration of the Warehouse Act be transferred to the board as above outlined, leaving in the present Bureau of Economics all economic investigations, and crop and live stock statistical work. A part of the regulatory work since the first of July of this year has been placed directly under the Secretary of Agriculture, and should remain there.

The Bureau of Economics would remain under the administration of the Department of Agriculture, classed as a scientific division or bureau, continuing its economic studies into the subject of marketing, farm finance, and general agricultural statistics. The highest standard should be maintained in the personnel of this organization.

The functions of the Federal Board of Co-operative Farm Marketing and Finance should be separated into two divisions—first, the Division of Co-operative Farm Organizations, and second, the Division of Finance. The Division of Co-operative Farm Organizations would be that constructive force in the organization and operation of farm organizations.

The Financing Plan

UNDER the Finance Division would be established a corporation, the operating capital to be provided from the Federal Treasury, through the issuance of long-term government bonds, these bonds to be sold, in so far as may be practical, in the rural sections. The sale of these bonds should be made through national farm loan associations, country banks and farm organizations. This corporation should be empowered with the authority to purchase, build, lease or license warehouses, elevators and cold storage plants in all primary and export centers where available facilities are either inadequate or controlled by interests which operate same on a basis discriminatory to the co-operative commodity associations seeking to do business with them. Warehouse receipts should be issued for produce stored as provided for under the Warehouse Act, said certificates to be acceptable as collateral security for advances to the co-operative association controlling the product for which the certificate is issued. It is contemplated that a large part of the capital of the finance corporation would be available as a revolving fund which may be supplemented by collateral loans from the Federal Reserve System. In fact, the finance corporation should be a member of the Reserve System, authorized by law to do business direct with any one of the 12 Reserve banks Be it understood, that the finance corporation should seek in every way possible, through cash advances and the providing of storage facilities, to bring about an orderly marketing of crops, seeking by these means to maintain prices against the serious and ofttimes ruinous breaks resulting under the present system from the periodical market gluts and from market manipulation.

The country as a whole has come to recognize that the complexities of the present-day civilization, considering the interdependent relationship existing as between industries, render it unthinkable for our government to permit the disintegration and failure of any fundamental industry. I insist that the plight of agriculture is the concern of the whole nation, and that action along fundamental lines is justified and imperative.

American Lights Gleam on London's Hungry Concluded from page 8

United States where brief cases are now carried by everybody except the iceman.

The old faithful stick is doing overtime, in every conceivable manner of carrying, from the debonair to the measured pounding with each step. It is carried under the armpit and it is held across one's shoulder blades or held tightly in the hand. They are generally old sticks—boon company of other days—and often the only relic remaining of past prosperity, because in such cases the stick reveals costliness and elegance that belies the present state of its owner.

But these owners, one and all, may be poor but they are not miserable. They are sitting tight. They are self-centered. For this reason editorials in newspapers, finding fault with stolid ones who do not uncover their heads as they pass the Whitehall Cenotaph, or when the band plays "God Save the King," fail to realize that the Britisher who a few years ago had nothing to think about except how to be extremely conventional is now suffering from absent-mindedness, and in the whole for a good purpose. It is better that he should be thinking to the point of self-effacement than to have nothing to think about except to be overpolite.

Thus there is little to London of the old London, regarded from its human equation. A false note was struck in Kingsway, along that spot that might seem a bit of the United States, for one meets such names as the General Electric Company, Kodak, Dictaphone, Ingersoll, International Correspondence Schools, Armour and Woolworth's. At that corner, illuminated in emerald green that houses the Ford agency, there passed a drunken elderly woman who was waving and gabbing at the passers-by.

This is London today. It is a city—

Through the open window of my Upper Bedford place, Russell Square, hotel, strains of music reach my ears. It is dusk and there are intermittent showers. I hear an excellent baritone voice singing Gounod's Ave Maria, to the accompaniment of an organ and a violin. They are three itinerant musicians giving forth a music the like of which I have never heard before in any streets, not even Piedigrotta during the song festivals, because this is much deeper than anything the Neapolitan town stands for. I shut my eyes, my typewriter is stilled, and I think of a church service; this is the best compliment I can think of. For the street is very quiet, although it is twilight in the heart of London, and such music is carried to working chaps like me, to solitary individuals inhabiting the countless rooms hereabouts, perchance to welcome it . . . . And now starts Mendelssohn's Spring Song, which in turn is followed by Raff's Cavatina. They are old friends, and such a concert is worth two dollars of anybody's money. We pay more for much less.

I have just returned from a chat with one of them. The singer, who excused himself for hoarseness, is an ex-service man, English through and through; so are his two companions, he told me. It is the best way out of their economic difficulty, and to be frank they collect liberally, but this means that their auditors are pleased. That is an unusual compliment in the case of street music.

But music of this kind, and of variety, seems to be gripping London. For this morning a group of brass players, four of them, I believe, were playing beautifully, and cornets and trombones synchronized so well is no mean feat. Later a duet, an ex-service man playing a one-string fiddle, and his wife singing while playing a melodeon, came along and gave me a picture of himself as a memento.

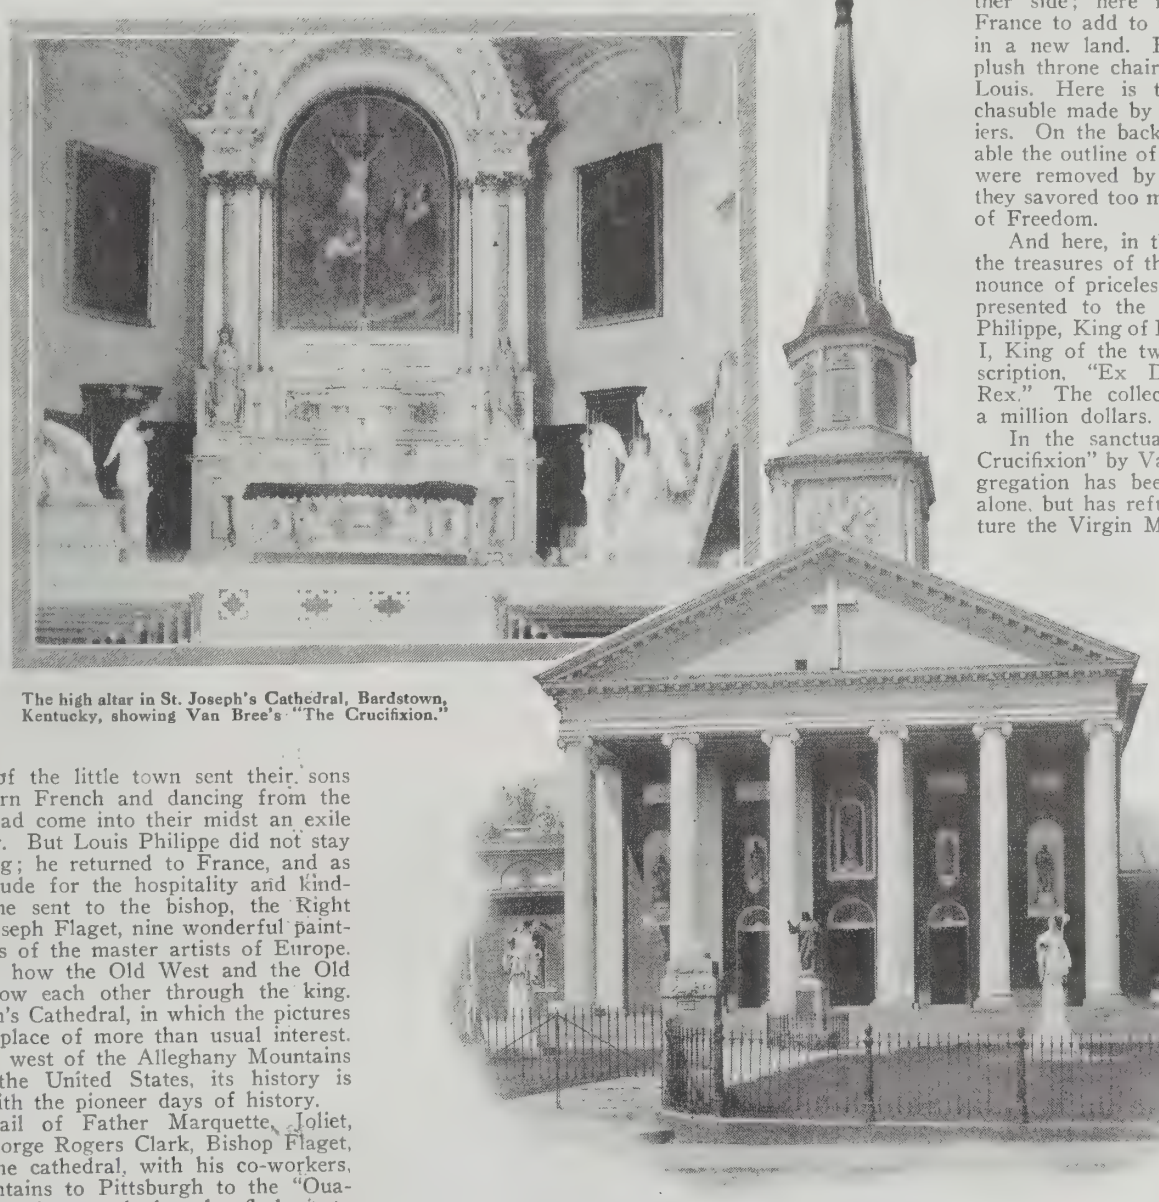
Three teams, as it were, that would grace any vaudeville theater now overburdened with jazz and related atrocities, and, mark you, real London—the London away from the rich foreigners' habitats—enjoying it. Then there are the church bells, mostly chiming Westminster quarters, or scattered clocks in houses hereabouts striking to the accompaniment of varied melodies on tubes, rods and bells.

As long as London has and can enjoy this music, in the streets, England is all right. As long as England is all right all will be well with the world.

The Royal Gift of a Royal Dancing Master

"Old Masters" Testify to Louis Philippe's Gratitude to Kentucky City

By ROBBIE TRENT



THIS is the true story of the Old West, a King and the Old Masters. The king is mentioned second because it was through him that the Old West and the Old Masters came together.

The Old West! What a name it is for conjuring. Under its magic spell, one can hear, if he listens carefully, the tramp, tramp of the adventuring footsteps of the pioneer settlers over mountains and untrod hills to valleys rich in the promise of fruitage and the music of falling waters.

There were men of many minds in these expeditions; men who came lured by the call of a new land, and men who came to escape the problems and obligations of life in their own land. There were men who sought the wealth of the soil and others who found in the vast reaches of the great forests a hope which filled them with joyous abandon.

"Once upon a time" is the proper way to begin, so, "Once upon a time, long, long ago," so the story goes, "a king came riding by," a ragged, hungry and discouraged monarch, but a king nevertheless. From across the seas he came, through the cities of the East and over the mountains, into the hills of Kentucky, to the little village of Bardstown.

And because the king was hungry, and the good bishop of Bardstown had admonished his flock that they must "be not forgetful to entertain strangers," the pioneer settlers of the little town sent their sons and daughters to learn French and dancing from the youthful ruler who had come into their midst an exile from his own country. But Louis Philippe did not stay in the little town long; he returned to France, and as a token of his gratitude for the hospitality and kindnesses shown him, he sent to the bishop, the Right Reverend Benedict Joseph Flaget, nine wonderful paintings from the brushes of the master artists of Europe. That is the story of how the Old West and the Old Masters came to know each other through the king.

The high altar in St. Joseph's Cathedral, Bardstown, Kentucky, showing Van Bree's "The Crucifixion."

The old St. Joseph's Cathedral, in which the pictures are hung, is itself a place of more than usual interest. As the first cathedral west of the Alleghany Mountains and the second in the United States, its history is closely interwoven with the pioneer days of history.

Following the trail of Father Marquette, Joliet, Daniel Boone and George Rogers Clark, Bishop Flaget, the first pastor of the cathedral, with his co-workers, journeyed over mountains to Pittsburgh to the "Ouabouskigin," the Ohio River, and then by flatboat to Louisville, which was reached on June 4, 1811. From Louisville to Bardstown the journey must be made by land, and the new bishop labored part of the way on foot. Some of the extracts from an account of the journey give a glimpse of a few of the frontiersman's difficulties of travel.

In a letter of July 2, 1817, Bishop Flaget says: "While we were there (in Louisville), the faithful of my episcopal city put themselves in motion to receive me in a manner conformable to my dignity. They dispatched for my use a fine equipage drawn by two horses; and a son of one among the principal inhabitants considered himself honored in being the driver. Horses were furnished to all those who accompanied me, and four wagons transported our baggage . . . . The roads were so detestable, that, in spite of my beautiful chargers and my excellent driver, I was obliged to perform part of the journey on foot; and I should have so traveled the entire way, had not one of my young seminarians dismounted and presented me his horse."

In this manner the first bishop of the West came unto his diocese, which at that time was three times larger than all of France, embracing what is now included in the states of Michigan, Ohio, Indiana, Illinois, Missouri, Kentucky, Tennessee, Arkansas, Wisconsin and Iowa. With a parish whose area extended over 10 states and included frontiersmen, Negroes and Indians, the bishop indeed had a wide scope for his work.

The "episcopal palace" of this diocese consisted of two log huts, 16 feet square, and there the bishop and his companions lived, carried on the services of the church and conducted a seminary for the young men who had come with them. It was this crude seminary which became the cradle of the old College of St. Joseph which opened her doors in 1819 as one of the pioneer educational institutions of the frontier.

The original brick building is still in use today, the old walls standing as solid and strong as ever. The concrete dormitory dates back to the days of the Jesuits. On the campus is a weather-stained handball wall, a silent testimony to the fact that the educators of 1819 believed in vigorous outdoor recreation for the youth under their care.

It is interesting to note, in the entrance hall, a time-yellowed paper which gives the expense of the college course of a century ago:

"Tuition alone in higher branches $40 in Kentucky paper.

"Tuition alone in common branches $28 in Kentucky paper. Board and tuition, including washing and mending $125 specie."

(C) Caufield & Shook, Inc.

St. Joseph's Cathedral, Bardstown, Kentucky.

At the entrance of the grounds is a great iron gate with heavy knocker. On either side of the gate is a small brick lodge house, where the watchful porter waited to answer the calls of long ago. The porters are gone now and the lodge houses are empty, but the old St. Joseph's College still opens its doors to the youths who come to learn of its wisdom.

It was early in the heart of Bishop Flaget to build a house of worship, and on June 16, 1816, the corner stone of St. Joseph's Cathedral was laid.

Amid the lofty trees of the forests, then practically untouched, there arose another temple in the wilderness, a temple which is today considered, by those capable of judging, one of the most beautiful examples of religious architecture in this part of the world.

Outside, the Greek style predominates. The walls which are three feet thick are made of brick manufactured in the inclosed yard. The building is 150 feet long, 74 feet wide and 60 feet high. Across the front is a portico with six great Ionic columns. Each of these columns is a monument to the patience and painstaking genius of the pioneer builders who hewed, sawed and shaped the massive supports without the aid of modern machinery. They are tributes also to the one-time grandeur of the forests of the Old West, for each pillar, "shining and tall and fair and straight," is the trunk of a great walnut tree from the wooded hills of Kentucky.

A most unusual feature of the exterior of the building is the row of 10 white tablets, one above each window. On each of the gleaming stones is inscribed one of the commandments from the tablets of Sinai.

The slender spire, crowned by a cross, rests upon a square tower in which there was for nearly a century a wooden clock brought from Ninove, Belgium. This clock was used until 1915, when the silver-toned bells ceased to ring and a new timepiece replaced the old one.

The old bell is one of the most prized possessions of the cathedral. Made at Alost, in Belgium, for the Monastery of Ninove, it for years called pious monks to prayers. From France it was sent by Louis Philippe as a gift to Bishop Flaget, and for almost a century now, it has been sounding forth to the little town the message of the Old Cathedral. The original bell was cracked some years ago, but it was recast and is still in use today.

The woodwork of the interior of the cathedral is of solid walnut. The arrangement and decorations are such as to give the impression of Roman architecture. Here again are great columns flanking the nave on either side; here is the deep-toned organ sent from France to add to the beauty and dignity of the church in a new land. Here is the bishop's throne and the plush throne chair presented to Bishop Flaget by King Louis. Here is the wondrously wrought red velvet chasuble made by the Queen of France and her courtiers. On the back of this vestment there is still traceable the outline of the French royal coat of arms, which were removed by Bishop Flaget because he felt that they savored too much of autocracy for use in the Land of Freedom.

And here, in the dim light of hallowed tapers, are the treasures of the East, treasures that art critics pronounce of priceless value. These are the nine paintings presented to the first bishop of Bardstown by Louis Philippe, King of France, and his brother-in-law, Francis I, King of the two Sicilies. On each frame is the inscription, "Ex Dono Franciscus Lutriusque Sicilae Rex." The collection has been valued at more than a million dollars.

In the sanctuary over the high altar hangs "The Crucifixion" by Van Brée, the Flemish artist. The congregation has been offered $100,000 for this painting alone, but has refused to sell at any price. In this picture the Virgin Mother and John, the beloved disciple, are standing gazing at the figure on the Cross, while the weeping Magdalene clasps the feet of the dying Christ.

On the wall of the right aisle nearest the altar is Rubens' "The Flaying of St. Bartholomew." This is considered the most valuable painting of the collection. The shadows on the picture are heavy, and only when the western sun lights up the rich colorings of the artist's brush can the vividness of the scene be to any degree comprehended. But it is worth waiting for the light to get a glimpse of the figures.

On the left is Murillo's "Crowning of the Blessed Virgin." This is a more pleasing picture, resembling to a marked degree the "Immaculate Conception." The cherub faces are very similar, and the soft clouds and subdued radiance are the same. The other paintings are: "The Winged St. Mark" by Van Dyck, "St. Peter in Chains" by Van Dyck, "St. John the Baptist" by Van Dyck; "The Annunciation of the Blessed Virgin" and "The Descent of the Holy Ghost at Pentecost," thought to have been painted by Van Eyck, and "St. Aloysius Teaching the Youths" by an unknown artist.

These are the treasures of the Old Cathedral, and it is a treasure house indeed. It is a wonderful thing to find a gem of such symmetry and beauty in the crude setting of a little town not far from the Kentucky mountain district.

* * * * * * * * * * *

Outside a soft snow had fallen, wrapping the last barren twig in a garment of whiteness and splendor. The wind was silent and the stars were shining as brightly as they did a century ago on the unbroken forests. Inside, the deep-toned organ was pealing forth notes of challenge, of strength and of hope. And the song was the song of strong men who fight and weak men who win, the song of those who see visions and dream dreams—the song of the Pioneers.

"We, detachments steady throwing
Down the edges through the passes up the mountains steep;
Conquering, holding, daring,
Venturing as we go the unknown ways,
Pioneers—O Pioneers!"

And the song was a song of gladness because of the Old West, a King and the Old Masters.

Where Motor Stages Are Superseding Railroads

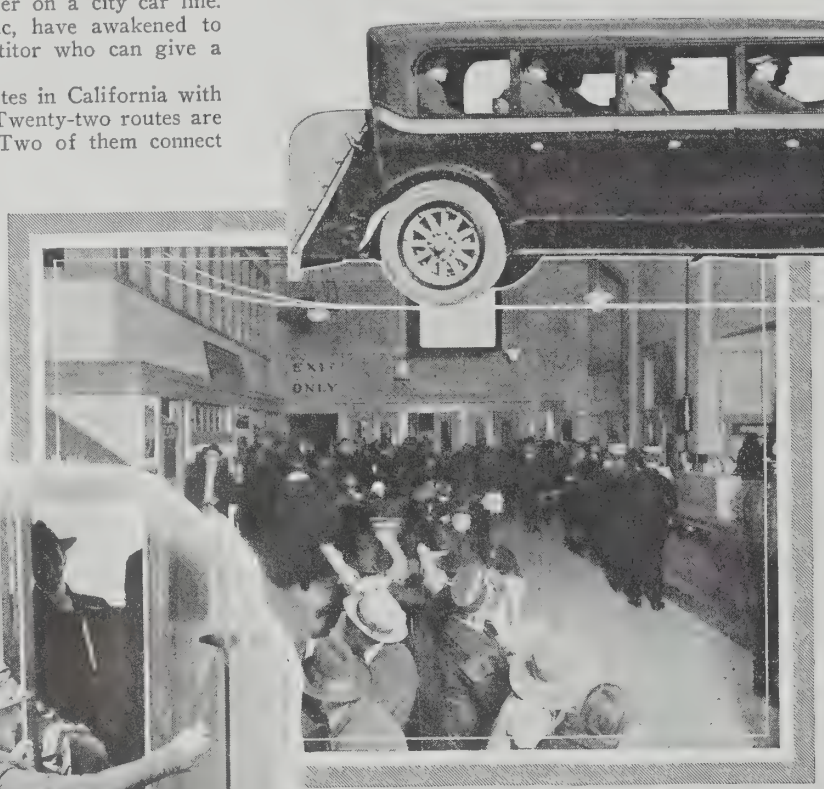
A Transportation War in Which the People Win Better Service

By JOHN ANSON FORD

ONE of the most significant revolutions in transportation is taking place on the Pacific Coast, particularly in California, as a result of the introduction of the "motor stage" as a competitor of the steam and electric lines. During the past year more than 13,000,000 passengers traveled in these gasoline-driven, rubber-tired common carriers in California. The social and economic results from this change are marked. Communities that were considered forever off "the beaten track" have found new life. The motor buses have made every farmer's gateway a stopping point comparable to a street corner on a city car line. The rail lines, steam and electric, have awakened to the fact that they face a competitor who can give a service they cannot give.

There are 260 motor stage routes in California with a total mileage of 11,162 miles. Twenty-two routes are more than 100 miles in length. Two of them connect Los Angeles and San Francisco, serving different territory, each over 450 miles long. Over these two latter routes passengers travel daily, making the trip in 16 to 17½ hours, without change of cars. The buses, or stages, as westerners prefer to call them, are provided with especially built bodies. The fares average less than the railway fares and the time is comparable to that of interurban lines. The two long runs furnish successful competition to steam trains. In mountainous regions, inaccessible to the railways, the buses necessarily make slower time and the fare rates are higher. The total income last year from motor transport lines, including freight carriers in California, was $14,831,895. About $1,000,000 was derived from handling mail.

Most of the stages are of pay-as-you-enter type.



But the whole story is not of receipts and passengers. A thousand remote communities and thousands upon thousands of ranches and farms have been given daily contact with the outside world. Out on the Mohave Desert, for example, a few miles from the town of Victorville is an orchard settlement called Adelanto. There men are reclaiming the desert. Next to the automobile and the telephone is the motor stage as a factor in keeping this settlement in touch with the rest of the world. No railway or electric line could afford to build a branch to Adelanto, but a motor line, for freight and passengers, is wholly practical.

In Northern California there have been vast sections that had no common-carrier service until the motor stages entered the field.

The complete equipment which these stages now possess is a matter of astonishment to visitors. Every large city in the state has its stage depot, many of them being "union depots," maintained jointly by several stage lines. The Union Stage Depot in Los Angeles is conveniently located with respect to the retail district. This stage depot handles more than 3,000,000 passengers annually.

It has been contended that stage lines are practicable only in a mild climate where there is no snow and little severe temperature. This argument has been shown incorrect. From Los Angeles to Bakersfield, a distance of 113 miles, is a road paved with concrete, popularly known as the "Ridge Route" which was one of the most difficult roads in point of engineering to be found in this country. For more than half its length it follows the ridge of a mountain range, rising to elevations of more than 4,000 feet. The winter climate on this "Ridge" is as severe as in Wisconsin, Michigan, or New York. But despite cold and snow, motor buses running over this route maintain their schedules winter as well as summer.

Each year sees improvement in the design of these motor stages. The seating capacity varies from 8 and 12 to 20 and even 30, depending on the density of traffic. In traveling something more than 1,000 miles on various lines in the state the writer found that the stages did not exceed 35 miles an hour, the legal limit. And yet so consistently do the trained drivers keep a steady near-maximum of speed that they pass more than 95 per cent of the vehicles on the road. Like trolley cars, the buses always come to a dead stop at all rail crossings.

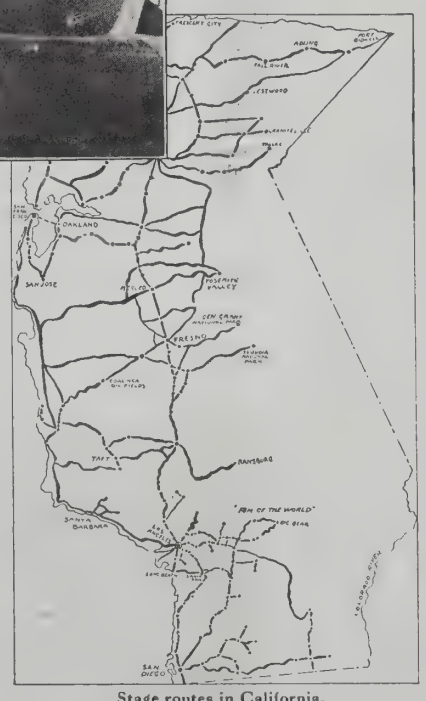
View of the Los Angeles Union Stage Depot which handled 3,000,000 persons last year.

Interior view of typical motor stage showing commodious seating arrangement.

Most of the stages are of the pay-as-you-enter type, the driver taking care of tickets and change except at the large stations where gatemen are provided. The seats in the buses are placed crosswise and usually there is an aisle running down the center. As little glass as possible is used in the special bodies, but the curtains at each seat end, which are of the tight-fitting, windproof kind, are provided with celluloid "windows."

This big transportation service was inaugurated less than a decade ago with the widespread introduction of "jitneys." Through lack of regulation and fixed responsibility many of the "jitneys" went out of business, but the idea survived. Like the early history of steam roads and electric roads, many short lines competed and overlapped in motor-stage development. Indeed, the fact that there are 260 stage lines in California at the present time, shows that this period has not yet passed. However, considerable consolidation has already taken place but there remains enough competition among the stage lines themselves as well as with the rail lines to give that "spice" which is said to be the life of trade. A large proportion of this stage business is now controlled by four concerns, whose financial resources are such that they can keep a large number of vehicles on the road and can maintain suitable stations.

Steam and electric railways feel that the millions of dollars taken in by the stages have been taken away from them. The stage men are emphatic in their declaration that fully half of their business is patronage which the rail lines never did get and which, by reason of less frequent stops, they never can get. For example, stage lines, trolley lines and steam lines run between Riverside and Los Angeles, a distance of slightly more than 50 miles. The bulk of the travel between these points is by trolley. Steam rates are too high and trains too infrequent. Stage lines have built up a very profitable Los Angeles-Riverside business, 14 round trips being made daily.



One of the smaller stages which make daily trips from Los Angeles to San Francisco.

But a study of this traffic shows that an average of only two or three persons in each stage load are "through passengers." The majority are bound for intermediate points—and these intermediate stops are not merely the half-dozen towns in between but every crossroad and ranch gate. Therein lies the secret of stages—they give a roadside service. It may be remarked that city service and service to suburban communities immediately adjoining such cities as Los Angeles and Oakland is practically monopolized by the interurban lines, due to their franchises. But for these factors the stage lines undoubtedly would have invaded and successfully served much residential territory contiguous to the principal centers of population.

There are other cities which find in the motor stages a better long-distance service than that given by the trains and it is that fact which makes the rail lines particularly hostile to the new competitors. Bakersfield at the southern end of the San Joaquin Valley, and 122 miles from Los Angeles, is an example. Connecting the two cities are the Southern Pacific Railway and the Motor Transit Company, one of the largest of the stage concerns.

The stages travel over the "Ridge Route." The stages, it is estimated, carry twice as many passengers as does the steam line. The Southern Pacific Railway has five trains daily from Los Angeles to Bakersfield, some of them of the slow traveling "local" type, and the average running time is seven hours. The bus, or stage line has seven cars running to Bakersfield, making the trip in five hours and charging only $5.50 for a one-way ticket and $9 for the round trip. The steam line charges $6.68, one way, and no reduction for a round trip.

"Volume" is the key to the common-carrier business. Heavy rails, big locomotives and heavy passenger and Pullman cars are profitable only where thousands are traveling a given route each month. Lighter rails, one and two-car trolley trains and electric power houses are profitable where hundreds are carried in place of thousands. But the stage lines, with still smaller investment and no right of way to maintain, can operate with profit where there are tens instead of hundreds of passengers. The older transportation agencies are face to face with an immutable economic law. They have a competitor who enjoys greater simplicity of organization, lower operating costs and greater adaptability.

Stage routes in California.

It is on this point of difference in investment that the present controversy in California hinges. "Of course, the stages can beat us," declare rail officials in effect, "they use the public rights of way which our taxes help to maintain."

However, that statement, while true, does not cover the case, which is rather complicated. Technically, the stage lines of California pay no taxes. They do pay taxes to counties and municipalities, however. On the other hand, the rail lines, together with other public utilities like light and power companies, pay a direct tax to the state in lieu of all other taxes. Even the automobiles of these concerns are exempt from license fees. The steam railways are now required to pay to the state seven per cent of their gross receipts. The electric lines pay five and one-fourth per cent of their gross receipts.

It is claimed that the percentage of gross receipts is a mathematical convenience for levying the tax. It cannot rightly be called the *basis* of the tax. Computed on recent earnings and valuations, the taxes paid by some of the leading California steam roads are *less than two per cent* of the investment. (*Concluded on page 15*)

How a Cable End Ended Cable Monopolies

Single Shot Fired at Miami Bids Fair to Have Far-reaching Consequences; The Complications That Arose From Government Interest in Business

By THEODORE M. KNAPPEN

THE shot that was fired at Miami didn't resound round the world, but it did reverberate as far as London and clean around the whole continent of South America and back to New York and Washington. It was some shot as single shots go; it was just a sort of a popgun, blank-cartridge affair fired by a drab little sub-chaser, but it revolutionized communications between the North and South American continents.

Said shot off Miami in late 1919 was in the nature of a command to a Western Union cable ship to stop, desist and otherwise cease from trying to tie a cable to the United States. Scores of cables had been dragged out of the oceans and attached to North America with no more fuss than when a fishline is pulled in. The Western Union, being a corporation that pays its taxes on time, was dumbfounded. The stolid British Western Telegraph Company was apopleptic. The All-America Cable Company, which by means of a flea introduced into an official Washington ear, had procured the firing of the shot, was not exactly downhearted; and the Postal Telegraph and Cable Company felt better than it had for some time.

Newcomb Carlton, president of the Western Union, broadcast a series of hot press releases and hastened to Washington to protest. Washington was greatly disconcerted—for it feared that it had done something without a precedent; the Wilson Administration on its State Department side disliked being caught without a precedent. After some days a precedent was found that fitted like a glove.

Back in President Grant's time the French Cable Company wanted to land a cable in the United States. Now, in France you never do anything without a permit, and so it never occurred to this French company that it was the free-and-easy custom to land cables anywhere in the United States without asking permission. Its representatives respectfully solicited permission. Nobody in the State Department knew how to issue such a permit, or thought one necessary. But the Frenchmen insisted that it was patently impossible to land a cable without a permit, and that if they couldn't get one they would have to take their cable to Canada or Mexico or somewhere. So the unprecedented request was referred to President Grant, who being disinclined to disappoint the polite and considerate Frenchmen referred the matter in the interrogative affirmative to the Attorney-General of that day. The Attorney-General looked in the Constitution and under it and also in the amendments but couldn't find anything about cables. He rendered an opinion, however, that this was manifestly a question of foreign relations, which were the prerogative of the President, whenever the Senate wasn't interfering.

They Were So Polite

ACCORDINGLY, President Grant instructed the State Department to issue a beautiful permit, ribbons, seals, engrossment and all.

Then the meticulous Frenchmen produced their charter from France to prove their identity, right to be on the premises, bona fides and general good character. Nobody in the State Department wanted to read the document, the same being in French anyway; but the Frenchmen were so obviously hurt by this indifference to their fundamental document that some underling was finally instructed to read it so carefully that he could remember it backward, in case the Frenchmen should casually mention Paragraph 6 of Section VII, for instance. He went to his appointed task with great conscientiousness and discovered that the French company was vouchsafed a monopoly of all cable landings in France. Here was a great to-do. The French company wanted to connect up a cable with the United States, but no American company could get within three miles of French soil with its cable! Gallic propriety had overreached itself. The determination of the Frenchmen to have a permit made it necessary for the company to denounce its French territory monopoly. So there was the precedent.

The Western Union said the foregoing constituted not much of a precedent. The British Western Telegraph Company was laying a cable from Brazil to connect at Barbadoes with the Western Union's cable. So the W. U. betook itself to the courts, pointing out that all kinds of cables had been landed in the United States since the French cable without permits.

The retort was that nobody but the Frenchmen had ever asked for a permit, and the government hadn't officially had its attention directed to other cable landings until the intended one at Miami—and history bristles with proof that no self-respecting, correct government ever knows anything unless it knows it officially. The courts decided that the whole affair was none of their business. In the meantime, Senator Kellogg, of Minnesota, introduced and procured the passage by Congress of a bill requiring cable companies to obtain permission from the President before landing cables. Incidentally, it was retroactive, and all cable companies were directed to obtain permits for all cable landings since submarine cables began.

Cable prospects at Miami now began to look up, and the Western Union, with the Western Telegraph Company hovering in the offing, applied for its permit as made and provided by law—but the Navy still remained on guard at Miami and the Barbadoes cable lay impotently on the bottom of the ocean, with nothing but a buoy to betray its presence.

In the meantime, the Wilson Administration had gone out and the Harding Administration had come in with its penchant for taking the government out of business, which supposedly included the cable business. Of course, it was only a matter of formality now—getting the permit. But the unexpected always happens. Harding O. K.'d Wilson. The State Department officials had been looking into the whole question of South American cables, not entirely without the aid and consent of the All-America Cable Company, and these are some of the things they discovered:

The Western Cable Company of England had a 60-year cable concession from Brazil with seven or eight years yet to run, giving it what amounted to a monopoly of all Brazilian intra-coastal cable rights. The All-America Company has one cable from Buenos Aires to Santos, in Brazil, and another from Buenos Aires to Rio de Janeiro. The Western's monopoly kept the American company from laying a cable between Santos and Rio, so that it had to lay two cables of great length, where one with a comparatively short extension would have done. It could, at that, handle nothing but terminal business in Brazil.

Competitive Cross-currents

THE Western had also monopolistic rights in Uruguay and the lion's share of rights in Argentine, including a monopoly of all cable business originating on land wires. The All-America Company was in Buenos Aires by means of a telegraph connection across the continent from its west coast cable terminal at Valparaiso, but it had to content itself with Argentine business originating at Buenos Aires except what the Western suffered it to have to non-competitive points on the west coast. But when it came to cablegrams to the United States there was nothing stirring unless the message was handed in at the All-America's Buenos Aires office, as the Western could route such business via Brazil and England.

However, Santos and Rio de Janeiro are most of Brazil in a foreign cabling business way and Buenos Aires is about 90 per cent of the Argentine in the same sense. The All-America cables could shoot messages across South America, up the west coast to Panama and across the Caribbean and the Gulf to the United States points about twice as rapidly as the Western Telegraph Company could relay them via England—and it was getting about two-thirds of the cable business.

In these circumstances the Western Cable Company decided that it must have a direct line to the United States. It proceeded to lay a cable from Brazil to the British Island of Barbadoes, in the Antilles, and arranged with the Western Union Telegraph Company, which had long longed for a piece of the South American business, to lay a connecting cable from Barbadoes to Miami. This greatly aggrieved the All-America Company, which complained that it had been baffled by the Western Cable's monopoly in an attempt of its own to lay a cable to the United States from some point in Brazil where, it contended, the Western's concession did not apply. The All-America Company protested the granting of a permit for the Miami landing, on the ground that it would be playing into the hands of a British cable monopoly that had the whole eastern coast of South America tied up more or less tightly. On the other hand, the State Department found that in effect the All-America cables had a good working monopoly, taking all its concessions together of all the cable business down the western coast of South America in Colombia, Ecuador and Peru; Chile being free to all comers. Of course, an American company, with foreign concessions, doesn't look just the same as a British company with foreign concessions, especially when the latter is trying to get into American business; so the All-America people had a good deal of sympathy around the State Department whenever they bawled piteously about the designing and monopolistic Western Cable Company and the deep dark meaning of the Miami contact.

But the Western Union kept on shaking its tax receipts and demanding its permit according to law. Finally it got it, but it was a conditional permit with U. S. A. blown in the bottle, in accordance with the policy of Charles Evans Hughes to put into foreign business all the government had taken out of domestic business. This permit without naming names stipulated in effect that the Western Union could land its cable at Miami, provided a certain circumlocutionarily described British cable company surrendered all its privileges and concessions as against all other American and British cable companies, and, also, provided that the All-America Company divested itself of all its octopian tentacles, in so far as they interfered with cable freedom of other American or British companies. Having done this the State Department let the two competing companies settle their differences in any way they saw fit, not mentioning the fact that there was only one way. Both companies are led by able men with good eyesight. Accordingly, they shook off their business bellicosity and agreed to renounce all their respective special cable privileges up and down the coasts of South America, east and west. So once again the Western Union reached out for the permit.

"But wait," says the State Department, "it is not enough for you two companies to say that your respective contracts with South American governments are no longer binding. It takes two to make a contract and also two to unmake one. You must get the South American governments to give up their ends of the documents."

Snags in Argentine

BUT by this time, the permit having begun to look like an inevitable cinch, the Western Union had sent a cable steamer down to grapple the Miami cable end, and it had been picked up. Picking up a cable from the bottom of the deep sea, blue or otherwise, even when buoyed, is not like picking up a fallen telegraph wire; and once again the Western Union had a cable up with no place to put it, and a mean-looking United States fighting craft sticking around just the same as if the permit weren't a cinch. The All-America Company quickly lined up its west coast governments and the Western Cable Company soon made satisfactory self-denying pacts with Brazil and Uruguay, but it struck a time-killing snag in the Argentine. The principle is all right there and the outcome is certain but the concession tangle has to be untangled in a slow and devious procedure that may delight international lawyers and professional diplomats but that causes business men to look favorably upon expletives.

All this time the Western Union cable layer was hanging on to the Miami end of the Barbadoes-Brazil cable and doing nothing else but hanging. Then came a hurry-up call for a cable job at Halifax. "Have a heart," said the Western Union in meaning, if not in words, to the State Department. "Don't compel us to throw this darned cable end overboard again and come back fishing for it."

And the State Department had a heart.

If you will go down to Miami you can see that famous cable end on shore; but there is a big gob sitting on it, equipped with all the personal armament that any one American gob has when cleared for action. One of these days when the final formal diplomatic deliverance shall be delivered from Buenos Aires, the gob will hop off.

When he does you will see the ripe fruit of the new American diplomacy in foreign business, as instanced in South American cables. There will be no more British monopoly in those parts—nor even American monopoly—and American business men will have a double and competitive service to all points south. It is even in the gossip that the Western Union will soon festoon the western coast of the southern continent with loops of cable at the same time that the All-America cables are likewise decorating the coasts of Argentina, Uruguay and Brazil and laying an Atlantic cable to Miami or some other convenient home town.

From the Veranda of "The Hermitage"

Albert H. Abernathy, who reads The Dearborn Independent, recently enjoyed the story and photographs having to do with the construction of the highway that passes before "The Hermitage," the historic home of "Old Hickory," Gen. Andrew Jackson. He forwarded a view of the grounds stretching from the veranda and it is here reproduced.

70 Miles of Books Are Placed at Your Disposal

Congressional Library, Beautiful Home of Uncle Sam's 3,000,000 Volumes

By GEORGE H. DACY

IF A veritable bookworm essayed the stupendous assignment of reading all the books in the Congressional Library—the most beautiful edifice of its kind and the third largest—it would take him 2,000 years to finish the job if he read three books a week. Uncle Sam's huge reference library is replete in practically everything that is readable. Its hundreds of thousands of volumes—it takes 102 miles of bookshelves to accommodate them—represent 80 different languages and more than 100 distinct and separate dialects. No matter what question may arise, be it an intricate engineering enigma or a simple problem of household management, some of the reference books in the spacious Federal book plant will contain the answer.

If the reference books were placed in a pile flat side up—the average thickness of the volumes is one and one-half inches—they would tower to a height of 71 miles. There are several little books of the Tom Thumb type which are about the size of a silver nickel. An edition of the New Testament published by a book firm of Scotland is one such, while a translation of Omar Khayyam's Rubaiyat is another. The giant among the government reference books is an American bird book by Audubon. It consists of four volumes of 100 centimeters. And interspersed between these are several million medium-sized books which contain complete information about everything that the human mind can comprehend. The oldest volume in the library was published in 1459.

In addition to the multitudinous stacks of books, the Congressional Library is also a clearing house for all sorts of rare and valuable prints and maps. At present, there are more than 2,000,000 articles of this description in the big building located directly opposite the National Capitol. During the last decade more than 1,185,000 copyrights have been issued. The newspaper and periodical division of the National Library is extremely interesting because it is a rendezvous for government employes and tourists who are regular visitors to scan the news in the latest editions of their home town papers. Files are kept of all the leading newspapers, magazines, trade papers, technical publications and scientific treatises, and constitute the most popular reading material available. At present, 629 American and 117 foreign papers are received daily.

The Congressional Library covers three and one-half acres, houses 3,000,000 books on 102 miles of shelves. It is the third largest and the most beautiful building of its type in the world.

Our national lawmakers depend on the Congressional Library for reference material. Every week during the sessions of Congress thousands of books are speeded on the underground electric railroad from the Federal Library to the House Office and Senate Office buildings several blocks away. The little electric car carries 25 books to a trip and makes about 50 trips a day. When a Senator or Congressman wants a reference book all he does is to telephone the library and four minutes later the desired volume is delivered at his desk. This remarkable system of dispatching books to the Federal legislators speeds up the preparation of important bills and measures. It is only because of the truly marvelous system of indexing and cataloging the books at Uncle Sam's mammoth library that such expedition in locating and circulating the books is possible. Library experts have repeatedly complimented the card indexing method of book identification installed at the Congressional Library as the best of its kind in use.

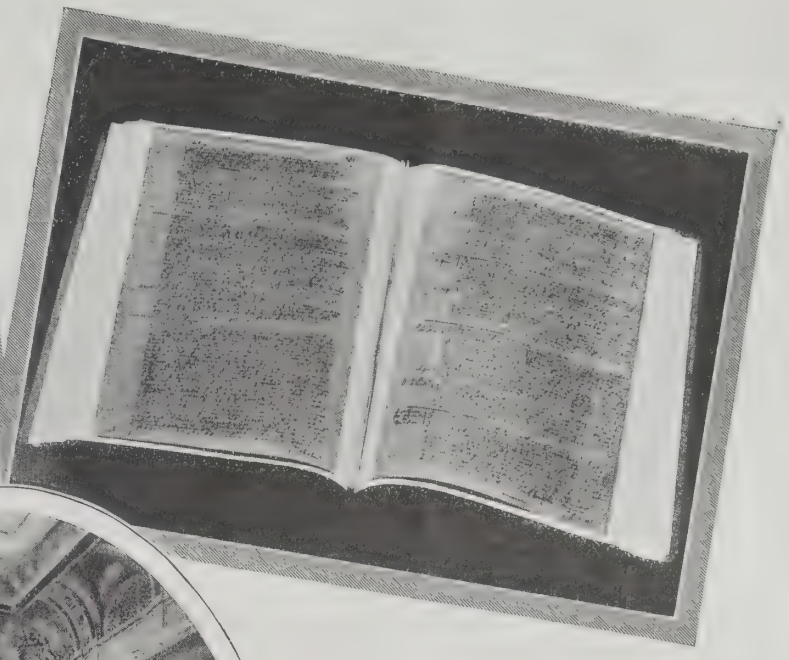
Several million persons a year visit the Congressional Library to admire its architecture and to exclaim over its matchless resources in the book line. No tourist ever visits Washington without making a tour of this resplendent building. To inspect the library building thoroughly is considerable of a trip, for it covers three and one-half acres, being 470 feet long and 340 feet wide. The structure is somewhat like a wheel with its central rotunda as the hub and the radiating galleries as the spokes. The walls are built of New Hampshire granite. The rotunda dome is made of black copper with an ornamental overcoating of gold leaf. This roof has proved very practical and economical aside from the high initial cost. Artists say it is the most beautiful dome in creation. At the peak of the dome almost 200 feet from the floor is a lantern which typifies the sempiternal torch of science. A famous bronze fountain called "The Court of Neptune" is one of the exterior artistic features. The building is one of the best lighted that has been built. It has 2,100 large windows and is illuminated at night by 11,500 incandescent lamps.

The bronze doors in the library represent Printing, Writing and Tradition. Nine colossal portraits in granite are memorials to leading men of art and literature, including Macaulay, Hawthorne, Irving, Scott, Emerson, Goethe and Dante. Gutenberg, the inventor of printing, is also eulogized in bronze. The Italian marble of the entrance hall is beautiful, the ornamental pillars extending 72 feet above the floor. Twenty-six small marble figures venerate sculpture and the various arts and sciences. Comedy, Tragedy, Poetry, Music, Medicine, Electricity, Telephony and Astronomy also are represented among the ornamental scrolls. The balustrade figures are Painting, Architecture and Sculpture. History, Mythology, Art, Science and Literature have all contributed their share toward making the interior ornamental decorations of the Library of Congress most impressive and beautiful.

The traveler who plans on visiting the gigantic book headquarters of Uncle Sam should train by going to the circus and trying to watch all that goes on simultaneously in the six rings. One must be gifted with the eyes of a pathfinder to appreciate the fractional part of what there is to see. If a visitor attempted to inspect all the old prints and art treasures in the many arcades and galleries, he would have to double up on his annual vacation and spend all the time—night and day—looking at the pictures. Just to see the long rows of cabinets which accommodate the index cards—each of the 3,000,000 volumes has a special card—is the best mental measure which one can find to estimate the vast amounts of printed matter which are stored in the Library of Congress archives.

Babel and confusion are as foreign to the rooms and corridors of this huge book depository as are ice cream cones to the jungles of Guiana. Large signs throughout the building command "Silence" and everybody—over-awed, perhaps, by the magnitude and splendor of our champion library—walks about on tiptoe and speaks in faint whispers. It is one of the last places in the world where lovers or honeymooning couples should go. Investigation has developed the fact that they are about the only ones who do not temporarily lose the use of their tongues when looking at the wonders of the Congressional Library. This building is one of the few government structures which does not observe the "blue laws" of the District of Columbia and close on the Sabbath. The National Library is open from 9 a. m. until 10 p. m. every day in the year except Christmas and the Fourth of July. On Sundays the building opens its doors at 2 p. m. and admits visitors until 10. This divergence from the customary hours results because patrons of the library like to read Sundays and evenings while many are able to visit the building only on those occasions.

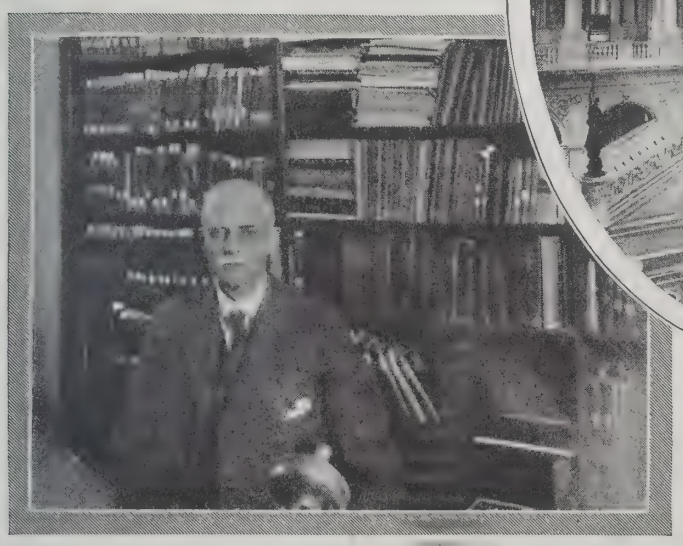
Practically all the Presidents are represented at the Federal Library by important pamphlets, treatises, bulletins or books which they wrote. With the exception of the two Adams—John and John Quincy—the chief executives have left manuscript collections at the big bookery. Such leaders as Cleveland, Wilson, Roosevelt and Taft, were productive in handling pen and manuscript, and have written many magazine articles, books and political treatises, copies of which are kept on file in the Library of Congress. It is difficult to estimate the value of this big book depository and its contents. The building itself cost more than $6,000,000, while the books are worth at least double or even treble that figure.



The division for the blind is an extremely interesting feature of the Library of Congress. Books and magazines for those who cannot see are circulated to all parts of the United States from the Washington headquarters. There are 1,400 blind persons who are regular patrons of this novel service and between 2,000 and 2,500 books are circulated every month. The books are sent out and returned under government frank. The person to whom the books are loaned can keep them two months with the privilege of renewing the loan for a third month. Altogether there are 9,547 books for the blind in the Congressional Library. They are set up in English and American Braille and moon type. Braille is a system of dots and dashes embossed on paper which the blind read with the fingertips.

Fiction books are most popular among the blind who borrow books from Uncle Sam with biographies, history, geography and mythology ranking next in order of importance. Many of the fiction stories and popular novels are reproduced by embossing the subject matter on brass plates from which paper impressions are made subsequently with a printing press. It costs $5 a thousand words to stereotype the metal plates with additional costs for embossing the paper sheets and binding them together in book form. "Penrod" by Booth Tarkington was Brailled at an expense of $300. The cost of embossing "Love Stories" by Mary Roberts Rhinehart was about $400. In both cases the authors themselves financed the work. A large number of hand-copy Braille books are also made each year by volunteer Red Cross workers and presented to the Library of Congress for circulation among the blind. Generally the books for the blind last about 20 years. The paper ordinarily gives out before the dots wear down. Usually the books have to be rebound after about 10 years of service.

Probably the most curious feature of the Library of Congress is the book hospital where multilated, damaged and worn-out volumes are repaired and restored. Mr. A. R. Kimball, chief of the bookbinding and salvage division, reports that during his 23 years of service as a government book doctor he has reclaimed and made over more than 1,250,000 books. The bookbinding and printing section of the Congressional Library is really a branch station of the Government Printing Office. Thousands of missing pages of multilated books are printed at the library printing shop, sewed into place and rebound in their original position. Last year, in addition to the book repair work, in excess of 2,000 volumes of newspapers and 3,900 volumes of other periodicals were bound. George Suter, the chief carpenter and cabinetmaker who runs the woodworking shop in the basement of the government library is 88 years old yet he still insists on putting in a full day's work 300 days in the year. He has been on the pay roll of the Library of Congress for 60 years but refuses to be pensioned.



This valuable and rare old deed book was received at the Library of Congress in a badly mutilated condition. It was consigned to the book hospital for repairs.

This is the way the mutilated deed book at the left looked after the government experts had reclaimed it. The bookbindery and repair shop of the Congressional Library is a branch of the Government Printing Office. It works near-miracles in salvaging old books.

The Library of Congress is the most beautiful structure of its kind. The dome which is made of black copper coated with gold is 200 feet above the floor at its peak.

Two copies of every copyrighted book in the United States must be filed at the Library of Congress. The 3,000,000 books there cover 80 different languages and more than 100 different dialects.

Sewing room in the Congressional Library where books are stripped of their worn and injured covers preparatory to providing them with new bindings.

Where Traditions and Ideals of Another Day Cling

Concluded from page 3

movement in America," but no name has been found to symbolize his vision in supplying a clearing house for all sorts of village problems.

The Town Room is situated in the upper story of the old Alpheus Hardy mansion. The attic floor has been removed, leaving bare the rafters and great beams with their wooden pegs. There is a high wainscoting of cypress and above that, the undressed brick, so that the whole is very much in the style of an ancient guildhall. On one side is a great fireplace, and opposite, a narrow stair leads up to the gallery where the more bulky part of the library is kept. For the library of the Town Room is not a mere collection of books, but it contains maps, photographs, lantern slides, designs for costumes for amateur theatricals, anything that can meet a village need.

Suppose, for instance, that you live in Pine Hollow, and the village, by careful planning, has set aside money for new lamp posts. Now the chairman of the village improvement society has a notion—though where in tunket she got it the First Selectman is at a loss to know—that there are lamp posts and lamp posts. To be sure, her ideas are vague, and she hasn't much to go by except a picture of the Great White Way in the Sunday supplement and she feels sure that the assessor wouldn't consider that an instant. But if she will call at the Town Room, she will find a whole array of monographs on lamp posts, with drawings and approximate cost, and everything complete. Result, the First Selectman is put in his proper place, and Pine Hollow is beautified, not disfigured, by its outlay.

Of course, all the villages you ever knew had a country store and so does Beacon Hill, on Saturdays, at number 3 Joy street. There are bedspreads and pickles, pine cones and driftwood for the fireplace. There are bayberry candles, honey, and toasting forks with long handles, wrought by some rural artist at his blacksmith forge. There are vegetables in season, spruce gum and slippery elm, and rarest of all, linen woven by the women of Saint Albans, as beautiful and fine as any that Italy can produce.

There is a ready sale, too, for the treasures of the old-fashioned garden, cockscomb, sweet William, and mignonette, for Beacon Hill is a flower-loving village and in all seasons its windows are gay with blossoms. It is a lovely, mellow, peaceful neighborhood, free from street cars and department stores, and, by its traditions and ideals, holding fast to much of the good in life.

Where Motor Stages Are Superseding Railroads

Concluded from page 12

The Motor Transit Company's total tax bill for 1920 was $11,932.56 and was made up of real and personal property tax of $1,733.89; franchise fees, $2,019; city and county licenses, $8,179.67. In addition there was a Federal tax of $1,806. The tax total (exclusive of Federal taxes) is 34 per cent of the assessed value of the company's property.

California has spent millions on its highways and now, 10 years after the beginning of the movement for paved thoroughfares, many of the roads are giving way under the heavy traffic. In the minds of a good many people the ever-busy stages are held largely responsible for this and so the sentiment in favor of taxing the stage lines is being reinforced. But what really is taking place in California has been repeated elsewhere or will be, within a few years, namely, on the one hand, motor traffic in general has increased vastly, there now being one motor vehicle for every 4.61 persons in the state. At the same time the science of road building has made important advance in the last decade, revealing the deficiencies of earlier construction.

The problem of highway maintenance is fast assuming a character totally different from what it was in the old days when each man worked out his poll tax with a pick and shovel and kept the dirt and gravel roads passable 10 months in the year. New methods must be devised for financing these vital public improvements and if possible a way must be found to tax in proportion to the use made by individual citizens.

But in spite of the many perplexing problems that remain to be solved the motor stages have won a secure place in our system of land transportation. The steam and electric lines may temporarily curb or handicap these vigorous young competitors but the latter have on their side the unfailing economic law that he who serves best and most economically will survive. They also have a large measure of public support, for hundreds of communities and rural districts which have grown dependent on the stage lines could not now afford to do without them.

BRIEFLY TOLD

Military maneuvers of the largest army in Europe, conducted on a huge scale, recently included a three-day sham battle with artillery, airplanes and tanks in the rocky, broken country near Rennes, France.

Seventy-nine per cent of the growing cotton in the United States last year was destroyed by the boll weevil.

Lunacy all around was really responsible for the World War, according to Dean W. R. Inge, of St. Paul's Cathedral. "The Germans were more or less honestly persuaded that similar abstractions, called Russia, France and England, were the criminals. Now it seems to most of us that we were all stark mad together," says Dean Inge.

In Manheim, Pennsylvania, there is a church known as the Red Rose Church. It is leased to the community on the annual payment of one "red rose" to the family of William Henry Speigel by each member of the church's congregation.

The high school graduating class of Bledsoe County, Tennessee, was awarded certificates of excellence in Bible study at the recent commencement.

Indians of the Acoma pueblo, near Albuquerque, have consented to the filming of a religious ceremonial dance.

Laminated baseball bats built up of short pieces of ash joined with the waterproof glue used in airplane propellers are said to be as resilient, durable and satisfactory as the one-piece kind.

A new device, consisting of conductor wires submerged in the channels of New York Harbor, enables liners to guide themselves safely through to port. Sensitive wires slung over the vessel's side and trailed below the surface, serve to communicate a buzzing sound to the bridge when the vessel is safely in mid-channel.

Motion picture men were denied permission to film the interior of the Canadian House of Commons because it was felt that such a procedure would not be in keeping with the dignity of the Parliament.

More than $15,000,000 is collected annually by professional alms-seekers in Greater New York.

Horses work up to their necks in the waters of the lower Columbia River, Oregon, drawing the great seines with the catches of tons of salmon. Many of the animals have little hair left. Immersion in salt water seems to kill it.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

The body of Enos A. Mills, widely known naturalist and author, lies in the shadow of Long's Peak, where he spent 36 years of his life. Funeral services were conducted by Judge Ben B. Lindsey. Mills worked unceasingly in the interests of the Rocky Mountain National Park. He was a friend of John Muir, the famous naturalist of California.

A hydroelectric plant with a capacity of 84,000 kilowatts, operating a 200-mile line will be constructed on the Shinano River in Japan.

Governor McCray, of Indiana, proposes to honor Paul Dresser, writer of the Indiana State song, "On the Banks of the Wabash, Far Away," by establishing a Dresser state park somewhere along the Wabash, with a monument to the memory of Dresser. The governor learned that Dresser's body lies in a neglected grave in St. Boniface Roman Catholic Cemetery, Chicago, and proposed that it be reinterred in the new park.

Hindus are vegetarians and regard the cow as a sacred animal; in their eyes to kill a cow is a greater sin than to kill a man.

In 1916 the total daily attendance at motion picture shows in the United States was 20,000,000. This year the daily attendance has dropped to 10,000,000 to the great alarm of the motion picture controllers.

There are from 100,000 to 300,000 aliens in the country who were smuggled in, according to the Secretary of Labor. The Department of Labor also believes there are 60,000 Chinese in Cuba, watching their chance to reach the Gulf Coast. It is argued that registration of aliens would halt smuggling.

The wood duck, threatened with extinction, is now protected by the Federal migratory bird act. These birds may not be killed anywhere in the United States.

"The League of Nations is a Jewish idea, and Jerusalem some day will become the capital of the world's peace," says Dr. Nahum Sokolow, the Zionist Jew. The statement is interesting in view of the fervid denials of last year.

The first scientific information on agriculture to Russia from America since 1914 was literature recently sent by the United States Department of Agriculture.

General Grant, more than 40 years ago, regarded as a grave danger the heavy immigration of foreigners into this country. He stated that he feared the time would come when the South, with its Anglo-Saxonism, could alone be depended upon to save the nation from ruin by the influence of an alien population. North Carolina, with only seven-tenths of one per cent of foreign stock, is spending $20,000,000 in a building campaign. It is putting $50,000,000 into highway improvements and is expanding its hydroelectric development and cotton mill interests.

More than 60 per cent of the population of New England is of foreign stock.

Germany is now a country of extremes. There are those who nearly starve and there are others living in luxury. The German government has now decreed that high taxes shall be paid by those who partake of the revelries in the Berlin restaurants. The revenues proceeding from this tax will be turned over to the committee for the feeding of the needy.

It is estimated that 20,000 natives of India are killed each year by cobras, one of the deadliest of snakes.

A tunnel more than six miles long will be built through the Continental Divide in Colorado. This will shorten the distance between Salt Lake City and Denver 173 miles and shorten time on passenger trains between the two points six hours.

There are only 180 whites on the Samoa Islands. The entire population is 8,058. The purchase of land by whites is forbidden.

The Jews of Toronto, Canada, combined in a movement to prevent Paderewski giving a recital in that city. When Paderewski was president of Poland he took certain defensive measures which his enemies label "anti-Semitic" but which were only the plain common sense of a difficult situation.

CHRONICLER OF THE NEGLECTED TRUTH

Uncle Sam's Billions! Whence They Come

Where the "Taxpayer" Is Really the Tax-Gatherer, and at a Profit; Income and Profits Taxes Raise One-half of Government Revenue

By AARON HARDY ULM

HOW many persons know from whence comes the $3,885,000,000 of receipts which the Federal Government handles during a fiscal year? This estimate of the revenues is that of the United States Treasury Department.

The story of the sources of government revenues is, on the whole, a long one; yet for the greater part of them a short one. In its short form the story is told in one word, *taxes*. For from taxes, the government realizes during this fiscal year revenues approximating $3,000,000,000. Of the balance, about $555,000,000 is covered by postal revenues. The remainder, about $330,000,000, comes from numerous sources, many being of a mere bookkeeping nature.

A brief narration of the sources from which comes that balance not derived from taxes or postal charges may be worth while, because of the insight it will give into the expanding tendencies of the national governmental establishment. For to that $330,000,000 will come contributions incident to activities which include almost every kind known to modern society. Aside from public land dealings, the National Government, for example, is a big operator in real estate, as buyer, seller and rentee. It operates hotels. It manufactures several different products. It conducts the world's biggest fur seal farm, realizing therefrom a gross income of about one million dollars a year. It sells as well as buys a wide variety and a large number of things.

In fact, while the Treasury Department is the revenues-raising branch of the government and does collect all the taxes, every department of the government, and most of the bureaus, contribute to the total of government receipts.

The State Department, for instance, will take in in a year almost as much as required for its operations, its estimated receipts being nearly $10,000,000. These come chiefly from consular and passport fees. But about $100,000 comes from miscellaneous sources, such as gain by exchange, itself a $20,000 item, return of relief money furnished American citizens abroad and the sale of property it no longer needs, like office material.

The Treasury Department raises considerable revenue outside of taxes. Its collections in various forms of interest are expected to total $27,407,325, and in fees, fines and penalties not less than $35,000,000. Its sales of government property are expected to yield not less than a million. Profits on coinage (the making of metal money is one of Uncle Sam's most profitable manufacturing enterprises) and bullion deposits will total twelve and a half million dollars. Even the War and Navy departments take in as well as expend considerable money.

The receipts of the first are expected to be this year not less than $113,000,000. Much of it will be mere reimbursements, such as the cost of maintaining American troops in Germany, and $100,000,000 of it is expected to come from the sale of war materials. But the War Department collects more than $3,000,000 from revenues-producing enterprises. They are operated mostly for the army itself, as in the case of its laundry and dry-cleaning establishments. But some are used by the public, as with certain telegraph lines it operates.

Sources of Revenue

THE Panama Canal is expected to yield revenues in the amount of $13,315,000, which will be nearly double the appropriation made for its operation.

The Navy Department will turn into the Treasury more than $5,000,000, outside of what may be derived from the scrapping of vessels on account of reduction of armament. It will come from numerous sources.

The Department of the Interior, because of its control of public lands and Indian funds, handles big receipts. They will total this year nearly $37,000,000, of which the public domain, by way of sales, leases, fees, and so on, will account for nearly $10,000,000. The Department of Agriculture will take in nearly $7,000,000, the biggest part of which will come from the operations of the Forest Service.

The Department of Commerce is expected to take in not less than $5,500,000, nearly a million of which will come from the sale of sealskins harvested on the government's big fur seal farm on the Pribilof Islands, Alaska. The Department of Labor will collect more than $5,000,000, the bulk of which will be yielded by the immigration head tax and naturalization fees. The United States courts will collect in the form of fees, fines, costs, and so on, not less than $7,700,000.

The government's Housing Corporation, a product of the war, is expected to realize about three and one-half millions from sales and operation of property consisting of general real estate.

Governmental revenues from sources like those described above, while in the aggregate large, are small in comparison to the total of funds used in maintaining the national establishment. Even those revenues, in greater part, come ultimately from the general public.

Of the other and larger revenues the public generally supplies all, though they are raised, in the main, by such indirect methods, that most persons who make up the public are conscious of supplying either none or very little.

The tax burden for this year will be considerably less than for last, and, of course, very far below the peak period of war taxes. However, it is several times its pre-war size.

Reductions claimed by the present Congress total $818,000,000. They were achieved through the elimination of some taxes, like the so-called "nuisance" and the transportation taxes, and by the reduction of others, as in the case of some of the income taxes.

Fewer Taxpayers This Year

THESE facts, however, should not be overlooked: *There was a much greater reduction in the number of direct taxpayers than in taxes.* Thus the elimination of the "nuisance" taxes, which caused everyone when buying a soft drink or any one of numerous articles of merchandise to be reminded of the fact that the National Government took money from his or her pocket, relieved several million persons of all consciousness of paying Federal taxes. Yet the total burden was thus reduced by only $72,000,000.

Slight increase in the exemptions allowed persons who pay on incomes of $5,000 or less bring about an apparent reduction of several dollars in the taxes paid directly by each of a million or more persons. Yet those persons, though constituting nearly 90 per cent of those who pay taxes on personal incomes, actually pay, directly, less than 10 per cent of the funds derived from that source.

"A large class of people—a very large class—seems to assume that if the Government does it or builds it or buys it or pays for it that it costs nothing. They seem to think that Government money grows on bushes, to be gathered at will or is provided by the good Lord in the shape of manna from heaven."

—Representative Guy U. Hardy, of Colorado.

The repeal of the transportation taxes reduced the total tax burden about $350,000,000. While this is substantial, there is little doubt that the motive which moved Congress was more the desire to remove the annoying reminder of the tremendous cost of government, than to cut the tax burden for repealing those taxes.

Thus taxpayers have been relieved of small and annoying reminders to a much greater extent than taxes actually have been reduced. To a greater extent than it has been reduced, the tax burden has been made to appear that it lies less heavily on the many and heavier, or at least not materially lightened, on the few. This applies both as to individuals and communities.

It is well to go back and see just how the $3,000,000,000 coming from taxes is raised. Tariff duties, which certainly are paid by consumers, yield about $330,000,000. But the money will be paid over and the receipts taken from importers who will add the tax—and in many cases more—to the prices charged for the products thus taxed. The remainder will come from internal revenue taxes. They broadly are of two kinds, income and profits taxes and miscellaneous. The last will yield, it is estimated, about $900,000,000.

Fifty Millions From Spirits

A FAIR conception of the sources of the miscellaneous internal revenue taxes may be given by reviewing collections under that heading in July last.

First comes the estates, or inheritance taxes. They yielded for that month a little more than $4,000,000. It is one of only a very few taxes which tax authorities say cannot be passed on to others than those who get the receipts.

Next comes distilled spirits, from which, despite prohibition, Uncle Sam still collects $50,000,000 or more a year. In July they yielded nearly $3,000,000.

From tobacco in various forms there was collected more than $26,000,000, primarily from the manufactures but ultimately from the consumers of tobacco products.

From various kinds of excise taxes, such as stamps on real estate deeds, levies on telegraph and telephone messages, sales of jewelry, corporation capital stock tax, admissions to theaters, and a 10 per cent toll on dues paid by members of clubs, there was collected about $43,500,000. Then from such things as adulterated flour and oleomargarine the Treasury procured nearly $1,000,000.

The taxes on automobiles and parts, cameras, candy, firearms and various other goods presumably within the luxury class—the taxes being paid in some cases by consumers directly and in others by dealers—brought in more than $8,500,000.

Various beverages, still permissible and taxable, yielded more than $1,000,000.

Though the $330,000,000 customs taxes and the nearly $900,000,000 miscellaneous internal revenue taxes are paid admittedly by consumers, only a very small proportion of all is so levied that the consumer at best is more than vaguely conscious of paying them. Inasmuch as they are added to the prices charged for things sold, it is made to *seem* that others pay the bulk of them. On the contrary, the consumer pays not only the taxes but the cost to the manufacturer or retailer of collecting many of them—and often with a profit added.

More than one-half of the tax revenues to be raised this year will come from income and profits taxes. That the bulk of them are passed on to others than those who get the receipts is now admitted by most sound students of economics. But the contrary *seems* to be the fact.

Though millions make income tax returns, the bulk of revenues realized from that source come, nominally, from a comparative few. In 1919 when more than 5,000,000 individuals made personal income tax returns, 18,741 persons, who paid on incomes of $50,000 or more, took receipts for 54.82 per cent of the $1,269,630,104 collected from that source that year. Did their returns show that this small number of the more than 5,000,000 who made returns had more than 50 per cent of all income reported? Not at all. They had only 7.86 per cent of all. There is nothing to indicate that, with the average of them, what they had left after all taxes were paid was any less than usually enjoyed before the taxes were levied. In fact, there is much to indicate that it was considerably more—not because of the taxes but in no respect in despite of them. As a rule they were mere tax-gatherers and paid themselves handsomely for the trouble. If they found it unprofitable to be tax-gatherers they sought refuge in tax-free securities.

An analysis of income and profits taxes paid by corporations yield results similar to that of personal income taxes; that is to say, the bulk of them were paid by large corporations, which, so far as noticeable, were still able to pay the usual or higher dividends.

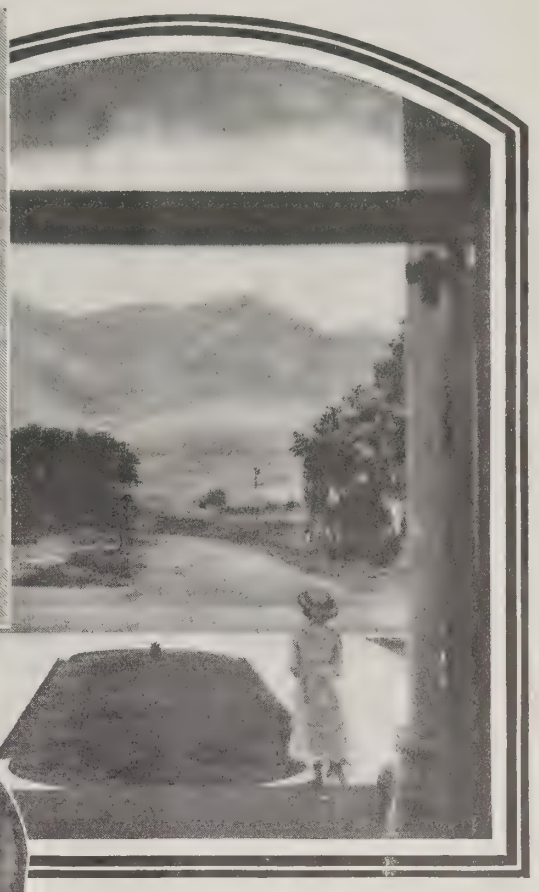
Analyzed as to communities and sections, even more surprising facts stand out. For example, more than 50 per cent of all personal and corporation income and profits taxes are collected in four states of the Union—New York, Illinois, Pennsylvania and Massachusetts. From citizens of and corporations resident in New York State alone are more than one-fourth of them collected. Likewise the bulk of tariff duties on imports are collected in New York.

The Taxation Center

IT IS probable that at least one-half of all Federal taxes are collected in the half-dozen largest cities of the country. That those cities actually and truly pay such a proportion of Federal taxes isn't and can't be a fact. It is equally true that the fewer than 50,000 persons and corporations who get receipts for probably more than one-half of all Federal taxes paid do not actually contribute those taxes, excepting, of course, the exceptional instance.

But it *seems* that they do, which is the most important factor in the situation. Inasmuch as it is made to *seem* that the bulk of government money comes from a small portion of territory and also a comparatively small number of persons and organizations, there naturally follows the *seeming* truth that the more the government collects and spends the better it is for most of the country's territory and population.

Machiavelli long ago pointed out that it was much more expedient for a ruler to seem to be generous, economical or just than actually to possess and apply those virtues.



Because it is made to seem that most of the country, measured by both territory and population, gets "something for nothing" out of the United States Treasury, taxes, on the whole, increase; the cost of government goes up; and, perhaps worst of all, government steadily expands and increases its activities.

Such is the vicious result of indirect taxation.

A Debtless County and a Paid-for Courthouse

In Which California Becomes Famous for Something Besides Climate

In the upper left-hand corner is Inyo County's paid-for courthouse, while at the right is a view from the courthouse steps. In striking contrast to the courthouse is Uncle Sam's post office in the lower left-hand corner. The other photograph is the official siren of the county seat, the pet coyote that makes Independence sound like an industrial center.

By JOHN L. VON BLON

AN UNMORTGAGED, debtless California county, Inyo, has just erected a $250,000 courthouse—*and paid for it.* It is patterned somewhat after the White House at Washington and is well-nigh faultless in its lines, quite unlike the average public building of "original" design. *And, wonder of wonders, it was put up without a bond issue,* so it will not be a devouring white elephant to be fed by the community with endless interest. Surplus money and a special tax levy of but 10 cents per $100 made the achievement possible, and this in a county of only $10,000,000 assessed valuation and about 7,000 inhabitants in its 10,156 square miles. Here is the exception to the rule of flagrant financial mismanagement in political offices. Nobody can deny that it is refreshing and encouraging.

From Sacramento came $100,000 as reimbursement for loss of revenue from 1910 to 1918 on account of the state taking over the taxing of operative public service properties, and the board of supervisors provided the remainder of the building fund. These supervisors are business men. Their names deserve record: George W. Naylor (chairman), Charles A. Partridge, Thomas Thomson, Jr., Amos P. Hancock and W. V. Butler. Instead of letting the county's money lie in vaults or lending it to banks at a paltry two per cent, perhaps to be reloaned to its real owners, the taxpayers, at 8 or 10, they put it out at the very best rate obtainable. Most of it has been bringing four and one-half and four and three-quarters per cent on government certificates and other securities, netting $42,000 in the past two years. That's why Inyo has a handsome new courthouse, no bonded indebtedness, the fourth lowest tax rate of any California county, pays everything the day it is due, and has not in 30 years registered a single warrant for lack of funds. To the credit of the Golden State are 14 other unbonded counties but none has made such a showing.

Picturesque and historic Independence, population 300 or thereabout, is the county seat, so it happens that the magnificent classical edifice stands in a village much too small to be incorporated, though undoubtedly the finest structure of its kind in the country so located. Almost at its front door towers Mt. Williamson, 14,384 feet, fourth highest peak in the continental United States. The building is colossal—considered in relation to the few occupants and the comparatively light volume of business—a hall of silence. None enters or leaves for hours at a time. The promising future was kept in mind. On the night of dedication, when everybody who could get there turned out, a ball was scheduled on the walk and lawn. The weather suddenly turned cold, the band was taken inside, and the entire assemblage found ample dancing space in the corridors. The building is of concrete and steel with pure white exterior, massive bronze doors, and much of the same metal conspicuous within. Flood lights bring it out in bold relief by night.

By way of contrast, on the opposite side of the road, in the next block, is the post office, so tiny that the biggest citizen always sends in a boy to get his mail, declaring he's afraid of getting stuck, should he enter. There is a false front projecting above the single story to make it look more imposing. Uncle Sam's business has the place of honor and the capable postmistress and her family live in the rear. In the back yard is kept a playful but snarling coyote.

There are two ancient little hotels, one of which has been under the same proprietorship more than 50 years. At mealtime the manager dashes out in the highway and vigorously rings a handbell. When this tocsin clangs its clarion call under the energetic manipulation of mine host, something else breaks loose—a wild, weird, screeching uproar like a dozen cracked sirens. I heard it unexpectedly, imagined myself in an industrial center, and looked about for the factories and whistles. None in sight. Only the burg's champion noisemaker, the post office coyote, was getting busy. It never fails when the bellman starts his gyrations, and so regular is he that the baying is accepted as official time. Everybody within miles knows when it's 7 or 12 or 6 o'clock. It would make a startling curfew should Independence need one. Steam's always up.

Unique interest attaches to the diminutive county seat because in it were stationed the only soldiers of the United States Army who ever mutinied and got away with it—Company E, Second California Cavalry, composed of Tuolumne County volunteers for the Civil War. Like other similar organizations it had been allowed to select its own officers and had chosen D. B. Akey, miner and Mexican War veteran, as captain. Instead of being sent to the battlefields of the South the company was kept in Northern California to subjugate hostile Indians. Discontent ensued.

Akey proved a veritable tyrant and finally, in the summer of 1862, the entire unit agreed that on a certain date not a man should obey any order given by him, though all were willing to serve under any other officer. He learned of this decision and went to San Francisco, presumably to consider it. The company was removed from Fort Humboldt to Red Bluff, whither Akey followed. When he appeared, the orderly sergeant drew the company up in line. Then came a tense, dramatic scene, of which American history records no parallel.

Standing before his men the captain said: "All those who intend to refuse to obey my commands as their superior officer step two paces to the front."

Though sworn to ignore his orders, they obeyed this command with alacrity, every man, save two who had been attached subsequent to the compact, taking two steps forward.

Captain Akey stood in silence a full minute, glanced up and down the row of stern faces, then turned on his heel and walked from the presence of his company forever. He resigned his commission some months later.

Under the Articles of War the men were amenable to the death penalty but the department, after weighing the case for months, decided to muster them out without pay and in dishonor. Governor Stanford, of California, interceded, the finding was revoked, and the organization retained and sent under a new leader to Fort Independence, where a permanent military camp already had been established, to fight the warring Piutes. Company E was held there for years, virtually forgotten. Historians overlooked this odd chapter, too, until the recent publication of "The Story of Inyo" by W. A. Chalfant, of Bishop.

The motion picture companies go from Hollywood to Inyo County because in the Sierra Nevadas they can find Alaskan winter; along the countryside, typical New England homes and scenes, and at Independence real early California settings. At that particular spot the Old West,

A Friendly Word to the Legion

THE American Legion, throughout its young and vigorous life, has been the objective of designing men and movements who have sought the influence and carrying power of its name to "put across" matters foreign to its purpose. Of course, the number of such attempts that are thwarted is rather large, and the public seldom hears about them, but a sufficient number has reached public attention to give a very definite impression that one of the Legion's problems just now is to prevent itself being used for unscrupulous public purposes.

The name of the Legion is everywhere, and what the most obscure Post does is considered worthy of public notice. These facts have not escaped the "publicity hounds" and the "resolution ranters." Thus we see the American Legion advertised as denouncing or approving a bewildering assortment of things, when as a matter of fact some local Post, out of good nature to the proposer of a resolution, has simply permitted him to get it off his chest. Of late, however, a certain element in the Legion, which will never be of any use to the Legion, which will commit the Legion on every possible angle of a certain question, and which in the end will leave the Legion to care for the unwelcome consequences, has been more than active in a scheme which can hardly be characterized as American and which involves the denunciation of persons who are rather entitled to approval, and of movements which perhaps have not been studied sufficiently to warrant an expression of opinion. The unfortunate result is that in some quarters the Legion has been misjudged as being immature and misinformed, when, as a matter of fact, it has only been too good-natured in allowing the "resolution ranters" to use the Legion's name to gain them a hearing and to give the public the impression that they are speaking the mind of the American Legion, which in many cases they are not.

When this good nature of the local Post is abused to publish a piece of personal prejudice, or to give the impression that the Legion has pronounced judgment against certain efforts to arouse the American people to a realization of the influences that are operating among them, the result is lamentable, mostly for the Legion.

This is a friendly word to call wider attention within the Legion to a fact which has already become apparent to thousands of Legionnaires, and which will doubtless be corrected by the common sense and fairness of the majority.

The Alien Assault

WHAT the few Americans thought and said would be worth knowing. English, however, must have been lost in the strident screeching of an alien gutter invective.

The reference, of course, is to the treatment accorded Kenesaw Mountain Landis, styled by some the "Czar of Baseball," and brought into the professional game to save it from disgrace and (of more importance to the owners) from complete financial disaster. It was at the conclusion of the second game of the World Series, an American institution now tarnished, that 5,000 thoroughly un-American and completely unsportsmanlike creatures swirled around the box, in which the white-haired American jurist and his wife sat at the Polo Grounds in New York, and screamed their East Side street-filth into the ears of the venerable couple. William Slavens McNutt says that for clean courage in the face of a dangerous mob, Judge Landis' march across the field was a splendid exhibition of character, and that the action of the mob was the most vicious exhibition of hoodlumism he had seen in a wide reportorial experience.

The whole incident once more calls attention to the fact that we have in America a violent alien element capable of acting together without provocation, and selecting as their target the most representative things in American civilization. Is professional baseball worth saving, either from or for the persons who composed that mob?

It Doesn't Mean Anything

SENATOR SMOOT, of Utah, made a splendid start toward the purification of the *Congressional Record* the other day, in announcing that henceforward he would refuse unanimous consent for the printing of political speeches made outside the Senate. Mr. Smoot is in charge of the *Congressional Record* and, as such, custodian of the *Record*.

The Senator wisely refrained from stating that he would refuse consent to political speeches *in the Senate*. Such refusal would, of course, have compelled the discontinuance of large sections of the *Congressional Record*.

The adjournment of Congress shortly after Senator Smoot's epoch-making stand insures members of Congress against any practical loss from it this year, and they hope that two years hence he will have forgotten his decision.

Bond Prices and the Money Market

JOE K. BILLINGSLEY, financial expert of Boston, describes conditions affecting the market value of government bonds. Asked whether to hold the Liberty issues, he declines to decide as an authority, but says if he had any he would sell; that present market conditions indicate they have reached the highest point possible before maturity; that a tightening money market must surely depreciate their market value.

As to the causes of fluctuating market prices, his article may be summarized as follows: What determines the price of Liberty bonds? (1) The financial condition of government; (2) the trend of the public debt; (3) condition of the budget; (4) government's revenues as compared with expenditures; (5) social, political and economic conditions; (6) the money market.

Mr. Billingsley casts aside the first five reasons as unimportant, and places the money market as the sole arbiter of the price of a bond for which its face price was paid as a patriotic duty and which of a certainty will be redeemed in full.

It would be interesting to know what would have been the price in the market of Liberty bonds but for the manipulation of the issue and the market by those who control both. Back of all the conditions he mentions is the manipulation of the country's fiscal policies which renders the natural laws of business inoperative.

Two per cent consols of 1930, netting a half of one per cent less when used as a basis of bank circulation, have never been affected by market conditions. They have stood above par since issue and until recently have led even the four per cents as to premium offered. The circulation privilege is expressly denied the Liberty issues. Why? Netting more than twice the interest return of the consols forming a circulation base, they fell to a discount of 15 cents on the dollar, when the Money Trust had forced their holders to sacrifice their savings by closing opportunity for employment and shutting off the incomes of the classes who had been induced to invest. Is it reasonable, then, or not, to insist that the restriction was part of a plan to manipulate the market and make speculation profitable?

With the experiment of these same consols, our fiscal masters have the example of a means of refunding every maturing obligation, yet they do not apply it. Instead, the refunding operations are conducted by reissues bearing more than twice the interest cost of the consols.

Even the deposits in the postal system are used for direct official business, favored banks paying a small rate on balances, and lending the money back to the government for high-priced temporary loans.

Mr. Billingsley will forgive us for the remark that all of his basic conditions are of vast importance; that private business conducted in the same manner would soon exhaust its own credit; and that the emancipation of legitimate market values from trust control is more imperative than watching the market for indications of securities prices.

Whatever Steps Are Needed

"NONSENSORSHIP" is a volume in which are published the opinions of some 12 or 15 of our younger so-called literati on a suggestion put forth in New York that a committee be named to examine such manuscripts that might conceivably be sufficiently of the mold of "Jurgen" and "Gargoyles" to warrant the deletions considered necessary to maintain standards of common decency.

There has been no effort made to sustain "Puritanism" in the sense which those in the "show business" and the "film game" would have us believe is being attempted. The entire controversy, in books, in drama, in pictures, in art, does not hinge upon Puritanism. It simply revolves upon the desire of the white people who inhabit this country to protect their own against the alien, roundhead infiltration.

Among those who say their say in "Nonsensorship" is Ben Hecht, a late addition to the ranks of the young intellectuals, who, in "Gargoyles," his publishers say, has written a "devastating novel."

"Puritanism," contributes Mr. Hecht, "beaten to a pulp by an ever-increasing herd of first, second, third and fourth-rate iconoclasts, has triumphed completely in the legislatures of the country."

And from the Chicago *Tribune* the following is clipped:

> Ben Hecht, a reporter, and Wallace Smith, an illustrator, were named in Federal warrants charging them with conspiracy to circulate obscene matter by means of interstate common carriers.
>
> Charges against the two men are an outgrowth of the publication and distribution of "Fantazius Mallare," written by Hecht and illustrated by Smith . . . .
>
> "'Fantazius Mallare' is one of the most filthy, inexcusable assortments of rubbish that has come to the attention of government officials in 10 years," said First Assistant United States District Attorney Robert A. Milroy, who with Inspector D. F. Angier conducted the inquiry which resulted in action against the book producers."

Reports that the tide of erotic slop was receding and that the flapper "novelists" were on the wane are not confirmed if the fall printings are examined closely. The bulk of the fiction and the plays on which the American public of today is supposed to feed is being produced by a strange "he-flapper" type of creature which a sterner civilization would have ruthlessly eliminated or suppressed. It cannot be, however, that healthy men and women would be any more capable of reading habitually the line of pornography that is being merchandised today in the name of literature than normal man would be capable of writing it.

But let this be understood. If non-censorship is to mean the pruriency of the alien roundhead, by all means let us have whatever "Puritanism" we may need to keep this country fit to live in.

Adulterating Union Principles

THERE is going on in Union Labor a contest for control of the organization that does not alone interest those who are doing the fighting. The entire country should know what the situation is. That those outside the American Federation of Labor may have the same grasp of what threatens in the country, THE DEARBORN INDEPENDENT in this issue presents a review of the "Boring-from-within" tactics of William Z. Foster, the syndicalist, who is proponent of the Industrial Union idea, or Sovietism, or Dictatorship of the Proletariat, or whatever you may desire to call that which he seeks to bring about. The article is written by E. J. Costello, who is conversant with his subject.

This paragraph in Mr. Costello's treatment of the situation that exists in the fight between Gomperism and Fosterism is significant:

"Let me repeat. Whether we like it or not, the fact stands out that this (Foster's) propaganda has sunk deep into the very vitals of the whole labor movement."

On October 5, in Detroit, at the triennial convention of the United Brotherhood of Maintenance of Way Employes and Railway Shop Laborers, one of the conservative group stated on the convention floor:

"Emissaries of Soviet Russia or of the I. W. W. are secretly sitting in this hall, disguised as loyal union men, and this convention needs no further proof that the affairs of this body, for the time being at least, are under the influence of William Z. Foster, known wherever labor is organized, as ultra-radical."

The gentleman in question is the same William Z. Foster who came into notoriety during the days of the steel strike, at which time it was charged that revolution by the steel workers of the Pennsylvania and Ohio districts was the objective sought.

Mr. Ford's Page

SOME people are only discovering that there is a race question in this country. Of course they are making a fuss about it, indulging in hysterics and oratory to a large extent, and calling committee meetings to see what can be done about it. The professional "reformers" already sniff soft jobs with organizations that are sure to spring up as the self-constituted saviors of the country. All the accessories of the question are certain to receive more attention than the question itself. People will become very much concerned with their own emotions and fears; prophets and seers will foretell disaster or decent settlement. Everything will be done save look the question in the face.

A race question bears some resemblance to a strike, in that it is usually agitated for profit. Most of the agitation today, except for constructive ends, is paid for. There is a definite organized business of destructive agitation. Much of it sounds like the voice of righteous indignation; most of it is really the voice of a larger income than honest work could bring. Ask who is profiting by the agitation, then what methods they use, and you will learn something about the race question. The worst form which any race question can assume is where one race stimulates another race to violent resentment, for the sake of the use the inciting race may make of the other's indignation.

Here in the United States people are becoming agitated because of what they call a rising Negro question. Now it is true that people of color have been giving strong indications of a revival of race consciousness. But race consciousness is not to be deplored. Why should it be? Mankind was cast into various races with distinct qualities and natural bounds; the races were visibly marked and distinguished in every possible way to keep mankind aware of racial differences; so that there is not, there cannot be anything necessarily alarming in race consciousness. But there may be something alarming in the method which is used to stimulate it. There is the educational, developmental method, and there is the incendiary method. The difficulty with the incendiary method is that it does not rouse race consciousness, but race hatred.

There are certain broad principles which ought to be inculcated by the leaders of all races, and as regards the white and colored races in America one of the principles is this: The history of the colored race would indicate that its future is to be closely connected with the white man. Some destiny seems to have bound them together. Though it appears that the institution of slavery was the device by which this swarming of the colored race began to the lands of the white people, and though measured by the standards of today chattel slavery has nothing to recommend it, still it is a fact which the Anglo-Saxon-Celtic peoples have to their credit, that the emancipation of the Negro from slavery all over the world was the act of the white man, at great cost of blood and treasure.

It is a fact not sufficiently measured. It has not been allowed its full weight. The emphasis has been placed upon the fact that once the white man enslaved the Negro. But here is a greater fact than that: the white man emancipated himself from his error and the Negro from his bondage. One political party has lived on that fact for a long time, and lived unworthily, but that does not alter the value of the fact for those who seek to understand the strange weaving of the loom of destiny. The races are now together in what seems to be a providential arrangement, and the one thing lacking seems to be a knowledge of their duty one to another.

When one stops to think that the migrations of the Negro were not toward the other colored peoples of the East, but toward the lands dominated by British and American civilization, the insistent sense of a meaning in it all is hard to dismiss. And when one considers that slavery at least proved the ability of both these races to live in the same community on understanding terms, it is hard to believe that this ability to live in the same community is devoid of meaning for the future.

There is leadership growing up among the Negroes, as it does in every race, and it is to be hoped that through this leadership race consciousness will lead to race understanding, and not to race boastfulness, to false dreams of race domination and to outbursts of race hatred.

If one were asked what to say to the Negro on this matter, one would advise the Negro to beware of those who pretend to be his friends for the sake of arousing his ire against others. There is an influence in America which has insidiously worked with the Negro to stir him against the majority in America. Indeed, this has been done by a minority which ranks in numbers below the Negro population of the United States. Let the man of color distrust those false friends who mingle with him to get his money, who seek an alliance with him on the alleged common ground of "oppression," and who expose their whole hand when they urge him to that kind of Bolshevism found only in Moscow and on the East Side of New York. The Negro has a better right in America and a deeper stake in the welfare of the country than have many of those who have appointed themselves his friends and guardians. It is a great pity that some of the best and most sincere Negro writers have been unknowingly poisoned by this subtle thing which hates America.

There is something to say to the white man, too. The race that calls itself superior can only prove its superiority by superior ability to help the others, and can only retain its superiority by actually fulfilling its racial destiny as helper of the others. The Negro is a human being, capable of integrity, loyalty and domestic peace and prosperity, and as a human being he is entitled to opportunities to develop and exhibit those qualities and to enjoy his natural human rights. Where the Negro has been given opportunity he has proved a community asset; his labor and his contribution to the development of the country are capable of being increased. Race correction by education is always the superior way, and not coercion. The Negro should be given a chance, and should be regarded with full humanity and treated with entire justice.

To both may be repeated what was said above, that both are here by an apparently purposeful destiny, and the thing to do is to identify and nullify the common enemies of both, and tackle the question upon the principal basis offered this generation, namely, the industrial basis.

When there are enough jobs to go around in this country, when every man shall have opportunity to go forth in the morning to perform the work he is best fitted to do, and to receive a wage which means a secure family life, there will be no race question. The Negro question is largely one of unemployment and of inexperience in handling the rewards of labor. The Negro needs a job, he needs a sense of industrially "belonging," and this it ought to be the desire of our industrial engineers to supply. In the South where the Negro is most at home, where he is best understood and most intelligently appreciated, there ought to be an industrial development that will absorb the Negro population, render it self-sustaining and hold before it the promise of a contented future. Indeed, if the South were given her share in the industrial opportunity of this generation, if Money were not so sectional in its favor, the life of this nation, economically and racially, would be much better balanced. The root of the race question may be found in duty ignored and in public-spirited enterprise suppressed. In duty done and opportunity developed, many difficulties will simply vanish.

THERE is no need of race hatred in America, even though there is a race question. A race question is primarily a question for the race that is being complained against. The complainant has no way of settling it, else it would not have stopped to complain. The question between the white and the colored races in our country is primarily a question for the white race. It is a question for the Negro, too, in so far as he ought to identify the enemy of both the colored man and the white man, the common enemy that is trying to stir hatred between them. Destiny has placed these two races together. Our modern industrialism, changed to motives of public service, will provide means to remove every injustice that gives soil for prejudice.

The Lost Army of the Russian Revolution

Kappel's 10,000 Peasants Forced Across 6,000 Miles of Snow and Waste

By H. G. SMITH and WYMAN SMITH

Japanese tanks in Vladivostok.

WHEN the revolution of October, 1917, overthrew the government of Czar Nicholas, Russia and Siberia were reckoned by the world as only immense and vague generalities. But who could have prophesied that an army of 10,000 men would roam through that great region, homeless and friendless, for nearly three years? Even today those 10,000 are 6,000 miles from home, dare not return, and through anxious days are awaiting the time when they may cease strife and resume the tillage of their little farms in the valley of the Volga. And, sorry but true, they are the victims not so much of the revolutionary spirit as they are of a great love for their homeland. They can only wait and wait—constructive action is denied them.

Were Russia and Siberia less vast, and did they not include one-seventh of the land area of the world or 9,000,000 square miles and a population of 150,000,000, perhaps the revolution had been ended earlier. Had that empire been smaller, however, it is undoubtedly true that an army would not have been lost for nearly three years; it would have been either exterminated or captured. In any other country of the globe an independent army of 10,000 could not exist, but when the Kappel army, one of the queer outgrowths of the revolution, started under its banner of a "peasant democracy" in 1919, it faced only the possibilities and opportunities of Russia and Siberia. It marched through a multitude of peasants who have been land hungry for years, who have lived in poverty and misery in straw-thatched huts where a single window beckoned to the daylight, and who tilled land which they did not own but tilled as members of a *commune* or *mir*.

A country, suddenly plunged into revolutionary strife, heard the news that it had been freed, and that all Russia and Siberia were to become a great commonwealth, a world-nation under a rule of the people with the talisman of "Democracy." From such a great seething mass of humanity then came the dreamers, the idealists, the thinkers, many of them wise with a true knowledge of freedom many of them unwise and failing to comprehend the task they were undertaking. From Northern Russia arose the forces and with them the doctrine of the Bolsheviki, across the line in Southern Siberia moved another doctrinist, Kolchak, with his definition of freedom, and between the two in the valley of the Volga appeared yet a smaller group in the autumn of 1919 under the leadership of Kappel, a colonel of the old régime, with his theory and his promise of a peasant government.

It is with this army that we shall travel through nearly three years of Russian history, through bloodshed, pillage, victory, defeat, and new victory in tragedy which has driven that small army across Siberia, or more than twice the distance from New York to San Francisco. Perhaps Kappel's dream was wild, perhaps it might have come true, for, after all, he proposed nothing so very new or so very radical to any except the people of Russia; he hoped to adopt in Russia a constitutional monarchy patterned after that of England, and upon that dream he expected to establish a calm and successful government for his beloved country. He wanted to solve the ever-present land problem of the peasants, release them from their economic servitude by constitutional assembly and by ownership of the land. Through such means he promised the peasants he would solve their difficulties, and expected in return that they would join his army in ever-increasing numbers until the small stone (his 10,000 men who themselves had been peasants) rolling onward would accumulate a momentum which nothing could stop and would thereby become powerful enough to control the destiny of Russia and obtain for the people their earnest desire. But then occurred the first of a long series of distressing events. Pushed east by the Bolsheviki who controlled European Russia and crowded northward by the forces of Kolchak who held the territory along the Trans-Siberian Railroad, this army wandered into Siberia expecting to receive help and rallying regiments from the peasantry. However, the peasants had already experienced the promises of Kolchak. Kolchak had promised a constituent assembly and fair treatment, but the assembly had never been called and the government of Kolchak had pillaged their villages, killed their people, taken their property, and had given them not a single ruble in return. Thus when Kappel came with this new appeal, the peasants merely watched his movements calmly and said: "You promise only what Kolchak has promised. Why should we have faith in you; you will give us nothing. Surely, the Bolsheviki can treat us no worse than you or Kolchak do." Onward then along the old routes traveled by the exiles of the old régime, marched the army of Kappel, still hopeful, still ambitious, still trusting that the people would understand and eventually follow its standard.

Nor was it a dream so wild but that it should have obtained more support than it did. It was the third attempt in Russian history to obtain freedom in like manner—a small army pressing toward an indefinite goal and enlisting the distressed workers as it marched forward. In 1725, Stenkaraszin, the Cossack chieftain, started in the Volga Valley and captured nearly all that territory of Southern Russia (his name still rings throughout the folklore and the songs of the realm); in 1825, Pugachev, another general, set up his banner in like manner and won a partial success. Their defeats were due, not so much to the passivity of the peasants, as to the overwhelming forces of the empire sent against them. Why then should not Kappel have right to expect a victory at so propitious a time?

Kappel, however, obtained even less support than his two predecessors, for, harrassed as he was on both sides by enemies, and compelled to seek refuge toward the east, he was forced to commandeer even the food he required for his troops. Thus he experienced not only the passive resistance of the peasants but the secret, hidden antagonism to his work which eventually forced him into the vicinity of Irkutsk in February, 1920, nearly five months after his army had departed from the Volga. Nor was it through any especial desire of his own that he sought refuge in that interior city, for it was within the territory which Kolchak presumed to control, being a segment along the line of the Trans-Siberian Railroad.

Part of the Kappel army entering Vladivostok in 1921.

Kolchak forces drilling in Irkutsk.

Kolchak forces attacking the railroad station in the Geida revolution

Over the snow-clad roofs of Vladivostok.

No better place, however, could have been chosen for the base of operations than Irkutsk. At one time it had been a city of more than 60,000 population; it was the center of the stage routes which before the railroad had connected the Pacific provinces with European Russia; in its markets was transacted the great fur business of Siberia; through it flows the rapid Angara and on the east shines the crystal blue waters of Lake Baikal. Calm and peaceful is the Angara with its swift 16-mile an hour current scarcely perceptible; serene and rarely tinged is the basin of Lake Baikal which has its source 600 miles northward at the melting, breaking terminus of a glacier. Those who lived in Irkutsk before the revolution spent their summers in country homes on the shores of Lake Baikal, and their winters in the city where the social life was interspersed by plays, musical entertainments and operas. Whether he breakfasts on bread and tea in the morning, or on eggs, meat cakes, bread, jam and tea in the evening, the Russian never neglects the art of living gracefully. In earlier days students were sent to the gymnasiums to learn appreciation for music, painting, sculpture, architecture, and when they finished at the age of 19 years, they had read 1,000 books of the world's best literature.

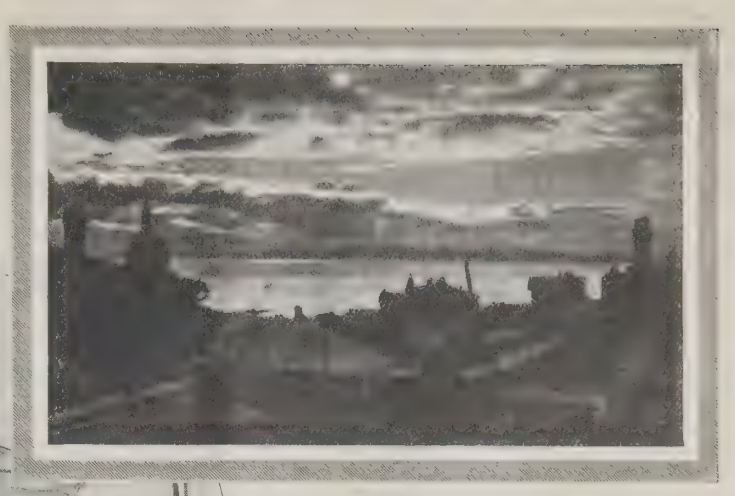
Towering above the walls and dwellings of the inland city rose the glittering domes of 19 Greek churches; evening basked their western sides in the vivid colors of a Siberian sunset, and set their long globular shadows majestically across the quiet city below.

Thus was Irkutsk in former days, but when Kappel's army arrived, peacefulness had been replaced by tumult and upheaval. Kolchak's power had crumbled, he was being held prisoner even then by his own troops and additional revolutionists from the surrounding country. The new revolutionists, working as another branch of the Bolsheviki, held him prisoner from January 25 until instructions from the eastern headquarters could arrive. Orders placed Kolchak's fate in the hands of a military tribunal, he was tried for treason, not against the Bolsheviki, but against Russia, convicted and shot by a firing squad.

Even during the trial, Kappel was forcing his way into the city, but before he could obtain complete control, reinforcements came to the revolutionists which

enabled them to drive him out and retain possession. Again Kappel's army was forced eastward, from the city which had only a few weeks before appeared as a refuge for the winter, and with only one possible destination remaining—Vladivostok, 1,500 miles away. To insure safety, the army was compelled to march the 60 miles across Lake Baikal, then covered with ice to the depth of several feet, but far too clean a playground for the storms of winter. All the sufferings that an army has ever endured had been summarized in those brief terrible months which succeeded the march from the Volga, and experienced by that moneyless, starving, drifting army.

And the crossing of Lake Baikal proved the supreme test of endurance. On foot, on horseback, scantily clad and weary, they stopped once to rest until they could brew their cups of tea, and then marched on lest pursuit annihilate them. Among the wounded and sick who were being carried along on sledges was Kappel himself. When he was taken ill with pneumonia in Irkutsk he had no other hospital than a sledge and on the march he remained in the sledge until he died while crossing the lake. With a temperature of 60 degrees below zero, it became necessary to leave him, just as others of the sick and wounded were left, buried in the ice and with the cold snow for a winding sheet, while the forlorn, aimless march continued.



That army could not stop, for to do so would mean death from the Bolsheviki, its leader remained only a corpse on Lake Baikal; its claim to a wise knowledge of freedom for Russia had been denied. Insurmountable obstacles lay before.

One incident will partially typify the tragedy of the lost army, an interview with a Russian officer who eventually reached Vladivostok.

"We had enlisted together," he told me, "a friend of mine whom I had known in the Volga. We came with the army, of course, all those intolerable miles of tramping. Our clothes were negligible, food was scarce. At times we were near to starvation, and it was only through the hospitality and friendliness which one Russian has for another that we were enabled to live. We might have won at Irkutsk had it not been for the revolution. Even when we began the march on Lake Baikal I thought we were safe at last, but then Leoniff, my long and faithful friend, was taken sick. I could not stay to watch him, I could not help him, the sledges were more than full—we had to leave him there on the ice and snow."

That was one incident, but in the faces of other men, I read many another like it or even worse, but of which they in their reluctance did not speak or only vaguely suggested. They did not care to relive such intense and long-continued suffering.

Crippled and disillusioned, the troops arrived at Vladivostok, some earlier than others, but all by May 1, 1921. Not more than 8,000 remained after the 6,000-mile march, but that remnant seemed for a time contented. On foot, horseback, on trains, when they could obtain them, or by any other means of conveyance or travel, the army reached the city and for a time at least was assured of bodily warmth and food.

Kolchak's prison at Irkutsk.

At left—He waits for peace.

Below—A peasant home in Siberia.

Celebrating the Bolshevik revolution of March, 1918, in Vladivostok.

At the time, indeed, Vladivostok was under the régime of the Far Eastern Republic, which had been established at Chita, and although in partial alliance with the Bolsheviki, was still very young and unstable. Its main opposition had originated in Vladivostok, and had it been an older government it might have watched more closely the army of Kappel. But it was too busy establishing a permanent form of government which was based upon five fundamental principles:

1. Rights of private property.
2. Freedom of the press.
3. Suffrage for both sexes of 18 years or over.
4. Control of natural resources by the government.
5. A government conducted by the people.

The republic retained a small army but was not so much interested in fighting as in returning to such a definite economic status that Eastern Siberia at least could re-establish its industry and commerce. Antoneff (named in Siberia, Krasnochekoff), who had been a lawyer in Chicago for 15 years, was elected first president by the delegates to the first congress chosen at popular election by the provinces of the Far Eastern Republic. Concessions on natural resources were being made and industry promised to recontinue; the peasants believed at last in the established government, and that spring began the planting of crops and the tillage of their farms with a new vigor and a fresh hope.

"It is the first time since the revolution of 1917, the first time in four years," said a mujik, "that we have faith in a government. We are ready to stop fighting, we want a peaceful condition of the country, we want to stop the banditry which has been going on among the villages and on the railroads. If you come into our village now, even though you are a stranger, you will be welcomed as a friend for we believe the time for fighting is over. Before this we have not worked, for our crops would have been taken from us, but now we have returned to our fields again. We are ready for peace."

In the city, bankers, merchants, business men of all sorts were also beginning the restoration. "It is the first time in five years," they said, "that we note improvement in our business because people are buying again." It was the first time that the railroads had paid expenses, and thus in the short four months which had elapsed since the meeting of the first congress, Eastern Siberia experienced a new faith and began the work of reconstruction. In the schools also the courses were being arranged to teach not only cultural studies, but to supply training in various vocations. Dressmaking, hat-making, shoemaking, modern methods of farming, and many other subjects which would help future citizens to learn a useful trade and become of greater service to the community, were being taught. All included, it was a large and extensive program, but if time had been given it might have made the necessary adaptations.

The government which everyone had feared would be Bolshevik at its beginning was showing itself very democratic.

Vladivostok awoke as from a horrible dream, for peace had come and with it the glorious month of May.

Let us climb the 500-foot Viokie Gorie (High Hill) to observe better the scene and the surroundings of this terminal of the Trans-Siberian Railroad. Below the hill cluster the homes of 200,000 people interrupted by lumber mills, car shops, manufacturing establishments, several engineering and technical schools, a naval school, high schools and a university of 2,000 students. The city is admirably situated, for less than 40 miles away are the richest coal mines of the East and only four miles away is the ocean opening to Golden Horn Bay, through which ocean vessels may come to anchor at the very wharves. This is the second best natural harbor in the world, and although it is crowded with ice in the winter, ice-breakers keep the channel open.

Beyond the bay is an archipelago formed by Russian Island, Sckaploff Island and three or four smaller land points. On Russian Island one may go to picnic on fine days, and although the ocean washes its sides, the billows have already been subdued by Peter the Great and Amur bays which are the more formal entrances to Golden Horn Bay. Just as one may observe remnants of the fortifications which were to make Vladivostok second only to Gibraltar in impregnability, so may these deserted structures be found also on Russian Island; but all about is an abundance of flowering plants and grasses, so varied and so numerous that a story has originated regarding the island. "When God had completed the planting of the earth, he discovered that Russian Island had been neglected. Accordingly, he took seeds from all the plants of the torrid and temperate zones and endowed Russian Island as the botanical garden of the world."

As the eye wanders entranced over the criss-crossing streets and avenues of the hill slopes, it senses the kindly hospitality and friendliness of the Siberian city. Vladivostok is certainly young as cities are known, for even its great limestone cathedral was built only 50 years ago. It was founded slightly more than 70 years ago, and old residents still relate incidents of the time when tigers were caught just outside the city; today an occasional unfortunate peasant will come in with a story of a tiger which has killed one of his best horses. Vladivostok is still a young and eager city and its great period of accomplishment lies in the future.

But with the passing of the May month came the approach of another Doomsday. For several weeks rumors regarding a new revolution were about in the city, yet folks refused to believe that a city which had already undergone five revolutions could have another. Five revolutions there had been; the first followed the death of the Czar in 1917, the second came during the Bolshevik upheaval, the third was the revolution directed by General Geida (former general with Kolchak but a rebel because of the farmers' poor management and methods) against Kolchak which had failed; fourth, the overthrow of Kolchak by the revolutionists who had assisted Geida and waited until they could become stronger; fifth, the taking of the city by the Japanese in 1920 which, turned back to the provisional government, was eventually to become a part of the Far Eastern Republic.

After all that, Vladivostok was not to rest. On May 26, 1921, came another revolution, this time by the remnants of the old régime who proposed to re-establish monarchistic government in Russia. Under the leadership of the Markuloff brothers, two men who had been members of the Black Hundred (secret organization of the Czar), one an editor of a monarchistic paper, the other a commercial man, the revolution was hurried on its way. On that morning soldiers of the Far Eastern Republic were conducting a group of Kappel officers under guard through the streets of the city. Permission was given one of the men to telephone from a Japanese headquarters, on personal matters, but instead he sounded the alarm and in a short time men were rushing from their stations to take part in a new fight. All those who were in any way discontented with the Far Eastern Republic joined the ranks; they had scarcely any reason except that revolt would bring them change. With this group were also the remnants of the Kappel army who were supplied with ammunition, grenades, rifles, under no particular effort at concealment, by the Japanese forces still in the city. Thus a new army paraded the streets of Vladivostok and a new government was thrust upon the people.

This government did nothing except hold its ground and maintain smugly: "We oppose Bolshevism and we want the old monarchy again." If the Japanese forces were withdrawn, the government would have crumbled before the power of the Far Eastern Republic, and its strength was maintained only in those areas where Japanese forces hold the ground.

Meanwhile at Chita, 1,500 miles away, the Far Eastern Republic struggled to obtain an agreement with the Japanese for evacuation, and with the Markuloff brothers for reinstatement of the republic. While waiting, the lost, homeless Kappel army, for want of other occupation, acted as the militia and police force of the Markuloff government. They served only because they must live, because they believed in Russia and because they are still 6,000 miles from a home to which they dare not return. They marched to seek freedom and democracy, and their search has thus far been fruitless. The service rendered by the Kappel army, unrecorded and little understood, has had its purpose, no doubt, and marks the end of the third and last dream of a "peasant democracy."

Bees Make Him Known All Over the Land

"Grand Old Man" of Medina, Ohio, Has Led Active and Purposeful Life

By FRANK HILL

A. I. ROOT, "grand old man" of Medina, Ohio, is still quite a youth at 82. His intellect is keen and alert, and his gaze is constantly fixed on the advancing frontiers of knowledge, science and invention. He is continually peering to discover what is going to happen next. If he ever thinks of death he does not allow it to disturb him in the least. He lives just as if he expected to go right on living on this earth for another 82 years.

Although not rugged physically, he is in good health, and is very active. He gets around easily and is always eager to "go somewhere and investigate something."

The writer was with him and some friends when he visited a great factory where he saw "acres of men and machinery" at work. He noted the processes of manufacture carefully, observed that the men were not discontented, and that none were "loafing on the job."

Later, while inspecting the grounds of our host, we discovered that Mr. Root had disappeared.

"You probably will find him in the automobile taking a nap," suggested a member of the party.

Sure enough that is exactly where we found him. He had made a pillow out of a blanket, and curled up on the back seat, where he was sleeping peacefully and soundly. Our steps must have aroused him. He awakened as we approached, rubbed his eyes, and crawled out of the machine very much refreshed.

"That's the way I keep ahead of the undertaker," he explained. "My fountain of youth is to eat sparingly and take a nap whenever I feel like it. Years ago a doctor told me a great deal about the value of sleep, and I attribute my long life and vigor to the fact that I keep slept up to date. If you expect to live long and retain your strength of mind and body you must keep your battery charged all the time. The brain constitutes the battery of the human machine, and nature recharges it while you are asleep. Many nervous breakdowns in middle age result from late hours as much as any other one thing. If a man is prematurely old you can generally trace it back to loss of sleep and dissipation. Proper diet, sleep and exercise are the essentials of health and strength, and they are within reach of everybody."

A. I. Root is known in 15 languages as "Root, the Bee Man." He has built up the largest concern in the world for handling bees and making bee equipment. His activities cover the earth, and his foreign correspondence is so extensive that he is obliged to maintain a special translating department so each correspondent can be answered in his own tongue.

In his youthful days Mr. Root was looked upon as a "joke" by the neighbors in Medina because he was constantly making experiments. Now at 82 he still bubbles with enthusiasm and new ideas and an insatiable desire to "see the wheels go round."

As a youth he was much like Edison in one respect at least. He loved to tinker with electricity and chemistry. Before electric motors came into use Root operated a small motor which he had built out of crude materials with a file, a wire cutter, a drill and a jackknife. One day he developed a great idea, and invited other members of the household to see him try out his discovery. He announced that he was going to explode gas with an electric spark. Nobody objected and he went on with the show. He put gas into a bottle, ran electric wires in through a cork, and turned on the juice. The resulting explosion blew the bottle into fragments, and one of the pieces hit a girl on the arm. Thereafter young Root's contraptions were excluded from the family circle, and whenever he announced that he had developed a new invention he was advised to keep it in the woodshed, and not bring it into the parlor. When he set off the gas with an electric spark and shattered the bottle, Root used the basic principle by which all gasoline motors are operated today in running airplanes and automobiles.

At 25 he was in business as a manufacturing jeweler. A swarm of bees flew over the town one day and attracted his attention. Just as a challange he offered an employe a dollar if he would catch the bees. The proposition was accepted and in due time the bees were delivered. Root began to study them. He read books, questioned farmers, made experiments, learned how to handle bees, and in a few years gave up making jewelry, and devoted all of his time to raising bees, and making equipment for bee raisers.

He began with a silver dollar and has developed a business rated at a million.

When he erected his first brick factory, Mr. Root put over the main entrance the words, "In God We Trust," carved in stone. It is there to this day and always attracts attention. That slogan is the keynote to the life, activities and character of this unusual old man.

He discusses religion just as naturally as other folks talk about the weather. In his younger days he was a "follower of Bob Ingersoll," but he finally became a Christian, and at once started in to tell the world all about his new faith. He has contributed considerable money in the last 25 years to promote various religious and humanitarian undertakings.

His world-wide business resulted from a bit of generosity that most "hard-boiled" business men would have considered the height of folly. And yet in the last analysis what he did proved to be the very best kind of business sagacity.

One Sunday Mr. Root went to his church to listen to a sermon, but a stranger was in the pulpit. He told about the heathen and their need of Bibles and teachers, and wound up by asking for donations. Mr. Root was deeply impressed, and much disturbed. He felt that he ought to do something, but he did not see how he could spare any money. Finally a bright idea shot into his mind. Going up to the speaker after the service Mr. Root exclaimed:

"That was a great talk you gave us, and everybody ought to help. I want to do something, but I have little to give. But I tell you what I'll do. Mail me a list of missionaries in foreign countries, and I'll send them my little magazine, *Gleanings in Bee Culture*, free."

"All right, I'll do it," responded the speaker.

In due time Mr. Root received a long list of men and women who were preaching and teaching in foreign lands.

He slowly scanned the names, estimated the number and computed the postage he would have to pay. The grand total was rather forbidding, much larger than he expected.

"I didn't know there were so many missionaries in the whole world," he commented, shaking his head. "But I'll have to go through with it in some way."

Again he was laughed at by his associates, but that did not stop him. When the first mailing time came his secretary exclaimed in dismay:

"Why, Mr. Root, it will cost 24 cents for postage on a lot of these names, and some will take even 48 cents. Where are we going to get the money for the stamps?" Mr. Root could not say much just then but he did not flinch. "Don't worry," he calmly replied. "The Great Father above will furnish the stamps to send *Gleanings* to the missionaries."

Somehow the cash was always in hand for stamps when needed and the magazines were sent out regularly. It did not enter Mr. Root's mind that he would ever get any business from the missionaries or their people. He was not sending *Gleanings* to them for that purpose. But here is what happened:

The missionaries in the list given to Mr. Root were located in South Africa, the northern part of South America and points in the Orient, where the climate is warm and nectar-producing flowers and blossoms are abundant. In short, the heathen occupied an ideal bee country, where bees lived in hollow trees and were hard to reach. The missionaries saw an opportunity to use Mr. Root's beehives, smokers and honey extractors to both win and help the natives. First, they wanted to demonstrate that the white man's religion was the best in the world by putting bees in hives so they could be controlled, and by showing the people how to do it themselves. Furthermore, they needed the honey for food. In a few months Mr. Root began to get orders from the missionaries. The foreign market thus started grew until it became a very important part of the business.

For a long time Mr. Root exhibited a large collection of envelopes addressed to him bearing foreign stamps and postmarks to show that his trade extended to the ends of the earth. These envelopes were mounted on a piece of cardboard two by three feet in size, and hung on the wall near the front door of his office.

This foreign trade could not have been obtained in any other way. It is a strange story which can be explained only in the language of Mr. Root: "It was the Lord's doings. I cast my bread upon the waters and it returned to me after many days with a hundredfold increase."

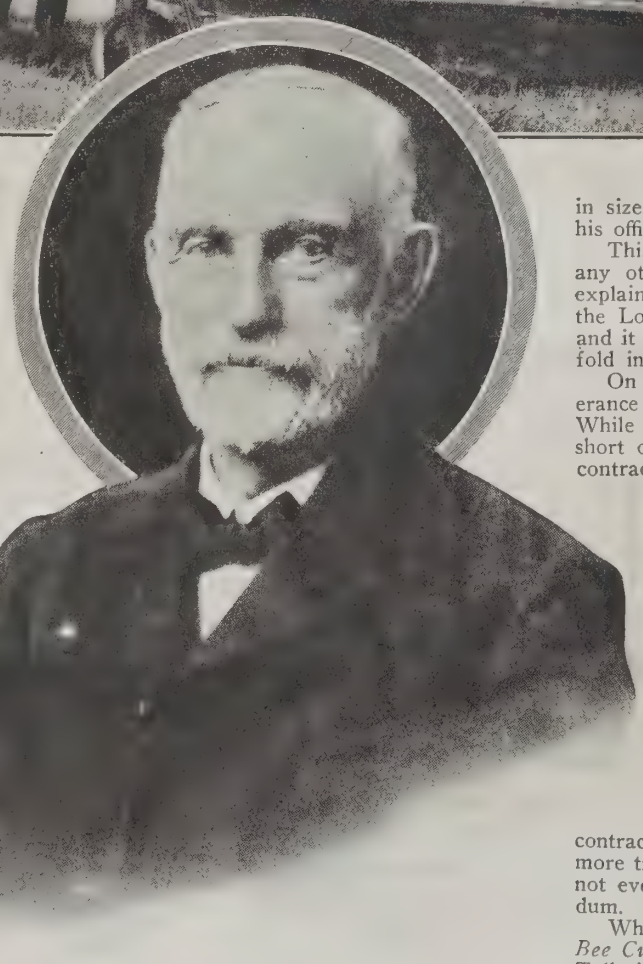
On another occasion Mr. Root had a singular deliverance from a business difficulty that is worth relating. While he was erecting his first factory building, he ran short of cash and became seriously embarrassed. The contractor wanted his money and Mr. Root did not know which way to turn to get it. In telling the story Mr. Root says:

> "I could not see my way so I took the matter to the Lord. After I had prayed a while I got an assurance in my heart that the money would come all right. Several days later a stranger called and asked me to show him how to transfer bees from one hive to another. He was very friendly and during his visit he asked if I was in difficulty of any kind. So I told him about the demands of the brick contractor, and to my surprise and relief he said he had some money that I could have if I would take it. A few days after he left, a draft came from Quebec for $500, and with that I paid the contractor. My credit was re-established and I had no more trouble. The man was an utter stranger. He did not even want to take my note except as a memorandum. Of course, the Lord sent him."

When Mr. Root started his magazine, *Gleanings in Bee Culture*, he established a department called "Home Talks," in which he discussed religion in a matter-of-fact way just as others talk about the weather, crops and the price of hogs. It was an unheard-of thing for an industrial journal to have a department devoted to that subject. Several subscribers quit when it was first started, but for every one who quit for that reason dozens subscribed. Mr. Root's "Home Talks" have become so popular that they have a vital bearing on the circulation of the magazine. In view of his advancing years, Mr. Root has prepared material for his "Home Talks" that will last for five years after he is no longer able to write.

In the ordinary course of business Mr. Root ordered a supply of small tin pans and pails from an eastern concern for use in handling honey. He wanted *dozen* lots, but the order was filled in *gross* lots. There was a lively exchange of letters thereafter, and at length the manufacturer agreed to have the excess shipped back at their expense.

Then Mr. Root had a brilliant idea. Why not take the surplus tinware to the approaching county fair and dispose of it at a special sale that would net a little profit? That would save the situation for all concerned.



Of course, the manufacturer consented. Mr. Root set up a booth at the fairgrounds, put the tin pans on sale and had a happy time disposing of them personally. He offered them at bargain prices and soon cleaned out the entire stock. When he forwarded a check to the concern for the bill he received a very unusual letter from the manager:

"We have heard that you were a crank on religion, but we are very much pleased with the way in which you show it. We sincerely hope a lot of other people will do likewise."

Prohibitionists probably do not know how much

Mexico Claims 11 Isles Under American Flag

Famous Catalina Among Those Sought by Southern Neighbor

By HARRY H. DUNN

THE United States of Mexico is claimant indirectly, as a result of a war waged three-quarters of a century ago, to 11 islands, now flying the Stars and Stripes. The islands stretch from the Mexican border to the Golden Gate and include a valuable, as well as popular, summer resort. There are 13 or 14 islands, but only 11 are habitable, the remainder being merely rocks. They include also the famous Farallon Islands, guardians of the Golden Gate, whose lofty lighthouse has pointed the way home to thousands of American vessels. In the diplomatic claim which has been drawn up by the attorneys for the Mexican Government, Santa Catalina, San Miguel, Santa Rosa, Santa Cruz, San Nicolas, San Clemente, Santa Barbara, Anacapa and the Farallones are mentioned. There being two Farallon islands, this accounts for 10, while a large rock projecting from the sea northeast of San Miguel Island, and known by several names, is the eleventh. There are a number of other such projections, but they are not included. The Mexican Government first turned its attention to these islands early in the administration of Alvaro Obregon. Attempts had been made to bring up the matter as far back as 1909, when Porfirio Diaz was president, and the writer of this article was living in Mexico City. Diaz refused to present the claim to the United States because of the effort he was making to induce the Washington Government to prevent the fomenting along the Texas-Mexico border of revolutions against the Mexican Government. Ramon Corral, then vice-president of Mexico, was an active mover for the claim. When Francisco I. Madero came into power, succeeding Diaz, he pledged himself to press the claim for these islands, but was overthrown and killed. The claim and its proponents then slumbered through the administrations of Victoriano Huerta and Venustiano Carranza, but shortly after the inauguration of President Obregon, he commissioned General Amado Aguirre, then sub-secretary of agriculture, as the head of a committee to investigate and present a report.

The hotel and bathing beach on Catalina Island, which, if the Mexican Government makes good its claims, will be flying the red, white and green *bandera* of Mexico.

The beautiful arch on Santa Cruz Island, one of the most rugged, and the finest scenically, of all the Channel Islands. Several spots on this island have been used extensively for motion picture stage settings and the island is very popular with vacationists and campers who know how to live away from the telephone.

The lighthouse and the United States Government Lighthouse Service Station on one of the Farallon Islands, the rocky group which stands some 30 miles out in the Pacific Ocean, almost directly in front of the Golden Gate entrance to San Francisco Harbor.

Islands off the California coast at one time owned by Mexico, now American possessions, are claimed by our Southern neighbors.

The report presented, President Obregon has decided to forward it diplomatically to Washington, and the writer has been privileged to see its text. In part, it says:

"Those pieces of land known as 'the Channel Islands,' and the other and smaller group, known as 'the Farallones,' lying farther north along the coast of California, of right belong to the United States of Mexico. The United States of America is not occupying them by right of discovery, because they were discovered—with the exception of the Farallones—in the sixteenth century, by the Spanish navigator Cabrillo, who gave them the names they now bear. They were well known as the property of Mexico when the United States took possession of the territory ceded to it by Mexico in the treaty of Guadalupe Hidalgo.

"These islands are not occupied by right of purchase, since Mexico never has sold them to any state or nation.

"They are not occupied by right of conquest, since they never have been conquered, other than the peaceful conquest of the Indians, then occupying them, by Cabrillo, more than three centuries ago.

"They are not occupied by right of territorial jurisdiction, because the international code to which the United States of America adheres sets the principle that the territorial jurisdiction of a nation cannot extend farther than a league from shore, and the islands in question are at a greater distance from the coast line of the United States.

"The international code to which the United States adheres rejects the right of conquest by stating that not all territory conquered belongs to the conqueror, but only that part assigned by definite stipulations of duly authorized treaties. No mention of these islands, or of any of them, is made in any of the treaties between Mexico and the United States of America, including the treaty of Guadalupe Hidalgo.

"Further proof of the justice of the claim of Mexico to the islands is given in the decree of the Queen of Spain, issued in 1836, declaring that, in the future, all possessions of the kingdom of New Spain belong to the Republic of Mexico, thereby recognizing Mexico as a sovereign nation. For many years Mexico exercised control and government over these islands and the Indians then living on them, without dispute from any other power.

"In substantiation of this occupation, control and government, reference is made to a decree issued by General Anastasio Bustamente, then president of Mexico, on June 20, 1838, authorizing the then governor of California to make grants of any parts of these islands to settlers, but limiting the grantees by stating that such gifts of land should be made to Mexicans only and for purposes of actual settlement and development of the islands.

"Titles to parts of these islands, granted to Castillero and Carriol, in 1839 and 1841, respectively, were afterward nullified by decree of President Santa Anna, in November, 1853; by President Alvarez in July, 1854, and by President Comonfort, March 10, 1857, all three of these latter dates having been since the signing of the treaty of Guadalupe Hidalgo."

It is further contended in this report, which follows a personal visit to all the islands, search of old records in California, in Mexico City and in Spain by General Aguirre, that when the Republic of Mexico surrendered the vast empire of the west of the United States of America, no mention whatever was made of these islands, nor of their inhabitants, then estimated to number several thousand Indians, many of whom had fled to the islands from the mainland because they did not wish to work on the mission farms. Though the islands are beyond the three-mile limit of the coast of the United States, they are under the government of California.

Attorneys who are interested on the California side have gone over the original draft, in Spanish, of the treaty of Guadalupe Hidalgo, dated February 2, 1846, and under which Mexico ceded California, with other territory, to the United States. These attorneys say that Mexico in that treaty relinquished all right and title to "all territory west of the present boundary line between the two countries at San Diego, California," and that Mexico has no ground for her claim.

These attorneys add that "if Mexico had made her claim immediately after the signing of the treaty of Guadalupe Hidalgo, she, probably, could have established a valid claim," but that 70 years' delay, with the consequent long period of uninterrupted occupation of these islands by citizens of the United States, practically conceded present ownership—whatever may have been the status in the past—to the United States.

The intrinsic value of the islands, with the exception of three of them, is not great. Santa Catalina, better known merely as "Catalina Island," contains one of the largest, best known and most popular summer resorts on both shores of the Pacific Ocean. There is a considerable town, Avalon, and thousands have their summer homes on the island. The island was purchased a few years ago by an eastern millionaire from the Banning Brothers, who, in turn, got it from the original Spanish grantees, by the simple process of marrying into the family. Considerable money has been expended by the new owner on the development of the island, and Los Angeles real estate experts estimate its value at about $7,000,000. Allowing for the excess of enthusiasm and imagination possessed by the average owners of Southern California real estate, it would seem reasonable to say that the island is actually worth about $2,000,000. As a piece of property, it is undoubtedly more valuable than all the other southern islands put together, but in utility and real value to mankind, it is worth far less than one of the Farallones which bears the light pointing the way for Pacific shipping to the Golden Gate entrance of San Francisco Harbor.

Should the Farallones fall to the hands of Mexico, the certainty with which mariners have been guided by this light for many years would be endangered, if not lost, for the lighthouses on the Mexican coasts function when the keepers are disposed to operate them, rather than certainly and continuously. San Clemente Island also is occupied, being leased by a sheep-raising

North and South Florida Drifting Apart?

Separate Governments for Sections Is Held as Solution of Grievances

By FRANK B. STONEMAN

Editor-in-chief of the Miami *Herald*.

THERE are two distinct Floridas, North Florida and South Florida, quite evenly divided as to territory, population, but widely divided by interest, occupation, soil conditions, industry, and ideas of progressiveness.

A line drawn across the state at about latitude 29 degrees north, at the narrowest part of the peninsula, approximately divides the two sections. To the north of this line lies old Florida with all its ancient traditions. To the south, is that portion of the state, the new Florida, bursting with energy, enterprising and progressive and with a great vision of the splendid empire it is rapidly creating.

Agitation for state division of Florida has been more or less sporadic for a number of years, but it has only been within the last two or three years that there has been any serious consideration of the subject.

One has only to turn the map of Florida upside down to notice its close resemblance to an old-fashioned boot. Away out, in the western end of the boot, there is that section of the state that joins on to Alabama. In that section there has been from time to time demands for state division, a division that would permit the people of that West Florida to attach their territory to the state of Alabama.

The urge has occasionally come from the state of Alabama itself, for that state would very much like to have a section that would give it a few more towns and cities and more gulf coast. The legislature of that state is said at one time to have made an appropriation to purchase the coveted territory from Florida, but nothing has ever come of the movement.

Railroads Develop South

SOUTH Florida was practically an unknown land previous to the beginnings of the development undertaken by Henry B. Plant and Henry M. Flagler, the one creating a railroad system that reached down into the southwest section of the state to Tampa and farther on, and the other building down the east coast of the state to Miami and finally to Key West. When it is said that Florida was an unknown section of the country before the great empire builders began their work, it is not meant that state history had not been made. Immigration from the northern states had begun long before the admission of the state in 1845, and there were many good, old-time towns and cities in North Florida before the Civil War.

But Florida began to be widely known when railroads pushed their enterprising way into South Florida. Then it was that the tide of tourists set in, first in driblets and then in the mighty flood that now marks every Florida winter. Northern capital was chary of entering Florida until the railroads showed the way, and then northern men with money, attracted by the possibilities of profit in citrous fruit culture, began to flock into that section.

Progress was slow; the fateful years of 1894-5 seemed to end it forever in disastrous freezes that wiped out the entire citrous fruit industry and ruined thousands who had put their all of years, money and life into their ventures.

But the "great freeze," as it is still referred to by old-time residents, was a blessing, although heavily disguised. Men sought other sections where frost and cold could not come, and they found it or thought they found it in the extreme southern end of the state. With the gradual recovery from the freeze there came a most wonderful development of the entire southern section of the state, and with it a new birth to the section that had been so badly used by the frost.

After the year 1900, the people of the North discovered that there were great possibilities in the soil of South Florida and from that time to this there has been a steadily increasing stream of immigrants who have settled on the rich lands of the southern portion of the state. They have built up magnificent towns and cities, they have covered the section with hard-surfaced roads, they have acquired groves and gardens and ranches; in brief, they have created an empire.

How It Would Be Cut Up

IF GENERAL consent should ultimately be given to the division of the state at about the line suggested, North Florida would retain 35 counties, with a population of about 550,000; while South Florida would have a state composed, as at present, of 26 counties with a population approximating 400,000. Both states would have about the same area after such a division as is suggested.

The present assessed valuation of North Florida is somewhat in excess of the valuation of the other part of the state, but the difference is rapidly being made up by the growth of South Florida. There are in North Florida 26 national banks, with $80,000,000 of resources; while in South Florida there are 28 national banks, with resources of $70,000,000 in round numbers. In North Florida there are 86 state banks and trust companies, with resources of $35,209,867; in South Florida one hundred and twenty-seven such institutions with resources of $78,295,728.

In North Florida there are nine daily newspapers, with a combined circulation of 75,000. In South Florida there are 20 daily newspapers, with a circulation of nearly 100,000. In North Florida there are 80 publications of all kinds including dailies; while in South Florida there are 99.

The growing demands for state division may be attributed to the uneven political development of the state and the consequent retention of power by a few of the northern countries over the rest.

Paired with Iowa, as a slave state, Florida was admitted to the Union in 1845. There were 42 counties, 29 of which were in the section which in this article has been designated as North Florida, while there were 16 counties in the southern portion of the state. The latter were all very much larger than the counties in the north and were practically unsettled.

Under the constitution adopted in 1885 the 29 northern counties had a representation, in the house of representatives of the legislature, of 48. The other 16 counties were given a representation of 23. In the senate the 29 northern counties had 22 senators; and the other 16 had 10.

The constitution of 1885 provided, among other things, that "The legislature that shall meet in 1887, and those that shall meet every 10 years thereafter, shall apportion their representation in the senate, the whole number of senators not to exceed 32 members; and at the same time shall apportion the representation in the house of representatives, the whole number not to exceed 68. The representation in the house of representatives shall be apportioned among the several counties as nearly as possible according to the population; provided each county shall have one representative at large in the house of representatives, and no county shall have more than three representatives."

This provision was amended in 1900 to permit new counties to have one representative, despite the prohibition as to the number that should compose the house.

That provision in the constitution provided a reasonably fair and equitable apportionment of the representation of the state, and everybody was satisfied, for the time being.

The legislature that met in 1897 quietly ignored the mandate of the constitution and adjourned without obeying its injunction to reapportion representation in the legislature. This neglect caused some talk and much dissatisfaction was expressed at the failure of the legislature to perform its plain duty.

When that body met in 1899, again there was talk of reapportionment, but it was urged that the constitution provided that reapportionment should only take place every 10 years after 1887. This argument was sufficient to postpone any action.

And then came other 10-year periods in 1907 and 1917, but the legislatures positively refused to take any steps toward reapportioning the state as required by the constitution.

Southern Districts Growing

MEANTIME, the southern portion of Florida had been growing. The vast majority of people from other states who went into Florida settled in South Florida. Despite its political handicaps, that section of the state developed marvelously.

The effects of the constant refusal of the legislature to re-apportion the state has been to center the political power in the few counties in the extreme northern and western parts of the state. With the 32 members of the senate, 17 senators coming from counties lying in the northern part of the state and despite the creation of new counties in the southern part of the state, each one having one representative, the north still holds a majority in the house.

Hence, South Florida's claim is that it does not enjoy equal political rights with the north, and it points to the fact that in the distribution of state institutions North Florida has received all the benefits while South Florida is compelled to pay the greater part of the taxes for their maintenance. The state capital is located at Tallahassee, in the northern part of the state. The state asylum for the insane is in the same section as are the state college for women, the state university, the state normal school for Negroes, the industrial school for boys, the state prison farm, the school for delinquent girls, the school for the blind and deaf, while in South Florida there is not a state institution except a small laboratory at West Palm Beach and a small agricultural experiment station in the same county.

Another cause for complaint has been that the southern counties have always been advocates of good roads and they have constructed hundreds of miles of hard-surfaced highways comparable with any in the whole country, and have paid for them by taxing themselves. The northern counties, until quite recently, have been very backward in respecting good roads. They have very generally refused to bond themselves for the construction of highways and even to this day many of them are content with the dirt roads of last century.

Statistics Are Brought In

BUT within recent years, there has been something of a change of view and there have come movements through which the state, by levying a tax on gasoline, on automobiles and other sources of income has raised a fund for road building. This is being augmented by funds from counties that consent to bond themselves and from Federal aid.

Developments show, it is strenuously claimed by South Florida people, that while the southern portion of the state pays 75 per cent of these and other taxes, 90 per cent of the resulting fund is being expended in the northern portion of the state and in exactly those counties, according to the contention, that have always refused to join in the good-roads movement, until they were assured of state aid, which aid, so South Florida claims, comes from South Florida.

This, according to the southern view, furnishes argument for state division.

The attitude of many of the people in the northern section of the state toward state division is one of good-natured tolerance. They do not see how division can be put over and they are not much agitated over it.

Opposition is invariably expressed on the sentimental ground that the "good old state ought not to be divided; that things are going on all right as they are and that, anyhow, it can't be done."

It must not be understood that there is in Florida any great agitation on the question of state division. Just at this time it is more an academic subject of conversation than a deliberate political plan. But it may be said that if the legislature does not show some disposition to obey the constitution and give the southern portion of the state its fair and just proportion of political rights and power, the question of state division will become acute with every prospect that South Florida will ultimately succeed in creating a state for itself.

Bees Make Him Known All Over the Land

Concluded from page 8

they owe to A. I. Root for helping to start the Anti-Saloon League, the fighting organization which dug the grave of John Barleycorn. Dr. Howard Russell, a young preacher, who had also studied and practiced law, conceived the idea that the saloon could be driven out under local option, and took steps to form an organization for that purpose. Churches were so conservative in those days that Russell was obliged to rehearse his speech to the church boards before he was permitted to occupy the pulpits. He was doing pioneer work, and naturally suffered all the hardships of a pioneer. He was out of money most of the time and financed his work with great difficulty. A. I. Root and a man by the name of Metcalf in Oberlin became deeply interested, and during the early years of the Anti-Saloon League these two men furnished most of the money to keep Dr. Russell going. Thus the Roots and the Metcalfs builded better than they knew. Russell led in a movement which later became nation-wide, gripped every voting precinct in the United States, and is now a terror to "wet" evildoers everywhere. Ever since that time the Roots have been active in the fight against booze, cigarets and vice.

After A. I. Root had turned the active management of his bee business over to his sons and sons-in-law, he began to experiment with chickens, and is now having a jolly time raising fancy chickens and garden truck. If he had another life to live he would probably become the greatest hen raiser in the world. He knows all about hens, and it is amusing to hear him talk about bees, hens, war, religion, garden truck, flowers and windmills all in the same breath.

In his youth he was the first person in Medina to own and ride a velocipede, and when the automobile came on the market he soon bought one. When the Wrights were experimenting with their airplane at Dayton, Mr. Root went down to see how it worked. He got there just in time to witness a successful try-out. He rode around the course in an automobile with Miss Wright, sister of the Wright Brothers, congratulated them on their success, and was among the first to recognize what they had achieved.

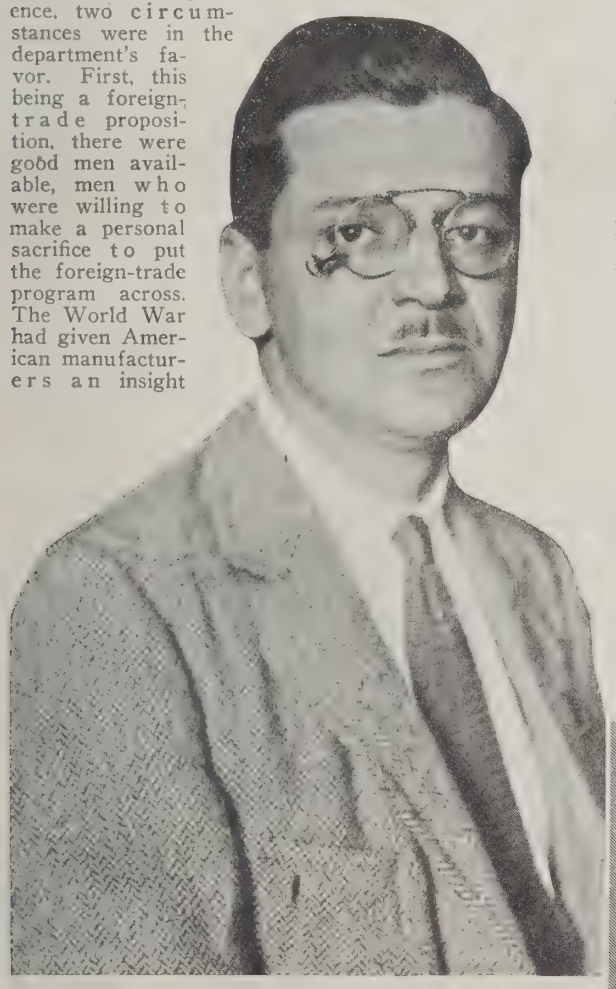
Just now Mr. Root's big hobby is to harness the wind for the benefit of mankind. At his winter home near Bradentown, Florida, Mr. Root has put up a windmill with which he generates electricity for lighting the house, operating small machines and charging his automobile. This wind motor is of metal, 14 feet across, and is hung on delicately adjusted roller bearings. A belt around the outer rim of the wheel turns a dynamo four inches in diameter! The generator is so attached that it swings with the wheels when it turns to face the wind. Wires carry the electricity to storage batteries in a room below. A very slight breeze will cause the motor to revolve, and yet a heavy storm will not drive it faster than 20 revolutions a minute.

Mr. Root is quite unconventional. He wears an ordinary suit, with a cap on his head, and half the time the cap is down over one ear. On one occasion he got caught in Columbus without baggage and when he went to a hotel and registered he was required to pay in advance for a 50-cent room. He merely laughed when a friend in the lobby came forward, and introduced him to the embarrassed clerk.

When I asked him what would be the next great industrial development he replied:

"Wind power," he replied promptly. "We are going to harness wind and generate electricity for all power purposes. Fuel is becoming a serious problem. Our coal will eventually become exhausted, and natural gas will be no more. Of course, water can be used, but water-power sites are not always within reach. But we can always find wind. I put up my wind motor in Florida more to show what could be done than for any other purpose. For a few hundred dollars a man can erect a windmill that will generate electricity to charge automobiles, grind corn, run a churn, a washing machine, or a shop, light the house and furnish heat. By using a storage battery a fairly steady supply can be maintained for all purposes."

The Nation's Automotive Salesman at Large



A Story of Gordon Lee Who Manipulates the Lever of Foreign Trade

By J. H. WALTON

This is one of a series of several articles dealing with important United States officials who are unknown to the general public.

WHEN, in the spring of 1921, the Department of Commerce reorganized the Bureau of Foreign and Domestic Commerce, instituting 12 commodity divisions, the finding of just the right men to be chiefs of these divisions was an especially difficult task.

In selecting these men there were two problems to face—one, the inadequacy of government salaries as an inducement to men of special fitness and training, and, second, the general feeling that there is no opportunity for initiative in the government service; things must be done in the same old way and bound up in red tape. It was, therefore, clearly a case of the job hunting the man and not the man hunting the job, as is too often the case. In the quest of business experts who had some foreign-trade experience, two circumstances were in the department's favor. First, this being a foreign-trade proposition, there were good men available, men who were willing to make a personal sacrifice to put the foreign-trade program across. The World War had given American manufacturers an insight into world markets. Second, some of the best experts in the country were eager to have a part in getting a big thing done. The men who finally came to the department were chosen from large groups of possibilities, and selected for their fitness for the work.

GORDON LEE,

Chief of the Automotive Division of the Department of Commerce. At the right, he is shown on his own two-wheeled "automobile."

Naturally, because of the great strides already made in the international field by the American automobile, one of the new divisions concerns itself with automotive products.

Out of 66 candidates under consideration for the position of Chief of the Automotive Division, Gordon Lee was chosen by a committee named by the National Automobile Chamber of Commerce. Mr. Lee has been associated with the automotive industry since the earliest days, having worked upon experimental models of the "horseless carriage."

Aside from an extensive domestic experience in the manufacture, distribution and sale of motor cars, trucks and farm tractors, he has spent considerable time in over-sea markets as automotive trade analyst in Europe and the Far East.

Mr. Lee graduated from East High School, Rochester, New York, in 1907; entered Union University, Department of Law, and graduated in 1910. This was followed by one year of private tuition and travel, as secretary to the late W. H. Brady, of New York.

Contact with the manufacturers of auto trucks, and their problems, coupled with his experience as an actual distributor, both wholesale and retail, of cars, trucks and tractors, gives Mr. Lee a viewpoint and insight into the problems of these divisions of the industry, so that he has a knowledge of both foreign and domestic markets as manufacturer, dealer and distributor.

Since his appointment to the Automotive Division, in July, 1921, Mr. Lee has made various trips to the automotive centers, and is keeping in close touch with developments in the domestic field as well as making an exhaustive survey of the international markets.

When I called on Mr. Lee he was engaged in conversation.

"You want a tractor," said Mr. Lee. "Naturally you want one which will stand up under the hard usage to which it will be subjected over the rough roads of your country, Poland. The war has set your country back many years, unfortunately, and you have not been able to improve your roads. Your country will find it worth while to take advantage of the production facilities which have been so highly developed in this country during the last 10 years.

"Here we have listed the various kinds of tractors manufactured in America. You can see that the majority are of light construction, a necessary requisite for travel over your mud roads. Here is one that sells for—(quoting price) one-third the price of the German tractor you spoke of. You can buy three of these and have more hauling power, your weight distributed—an important factor on soft ground—and further, if one should become mired in the mud you can attach a log chain to one of the others and pull it out. If you buy the *one* big tractor and it gets stuck, what can you do?

"You cannot buy a tractor as light as these American-made ones, that have anywhere near the power they have, in any other country. Nowhere else are produced the automobiles, trucks and tractors, regardless of price, class, quality, durability or finish, that will compare favorably with the American output, and these American-made products are called upon to fill the transportation needs of practically every territory."

Mr. Lee then gave instructions to his stenographer to write letters of introduction to dealers in tractors. I had heard one of the most important selling talks ever given: Selling America to Europe! for that is practically what it amounts to. Every good salesman knows that he must sell his house before he can sell his goods.

Mr. Lee may not be the "Division" but he is certainly a large portion of it. He puts life and vitality into it. He is just bubbling over with exuberance. His enthusiasm when talking "shop" is contagious, and before he had talked five minutes I was sold on the fact that America must control the World's Automotive Trade.

"The question is not so much as to the value of international trade but as to how it may be obtained," continued Mr. Lee. "That is the real purpose of the Bureau of Foreign and Domestic Commerce, organized under the Department of Commerce to aid in the enlargement of international sales of American-made products.

"The object of the bureau is to collect and disseminate information on the various markets and to lend every hand in the promoting of commercial relations between this and other countries. Previously, the bureau consisted only of regional, technical and service divisions, but, in 1921, to these older divisions were added an additional 12, this division being one of that number.

"Under this division fall passenger cars, motor trucks, motorcycles, marine engines and motor boats, airplanes and aircraft, with, of course, the parts, units, accessories and service equipment that go with them. These products constitute the automotive industry and it is the development of their use for which the Automotive Division is working.

"Much of the information collected by us is distributed to the various manufacturers through the associations of which they are members, and by the automotive business papers. We receive a vast amount of material from unofficial sources, such as business publications and daily newspapers published in foreign countries, and from travelers and visitors who come in contact with our representatives, either at home or abroad.

"Statistical information is supplied regarding registration, importation, exportation; and other reports, frequently by cablegram, are regularly received regarding current market conditions, significant developments and trade opportunities. This material is transmitted to us either automatically and at stated intervals or upon special occasions.

"When a tender is offered, for instance, for motor trucks in Brazil, Spain or Japan, or for motorized fire-fighting equipment or airplanes in Bombay, Buenos Aires or Capetown, full information concerning it is sent here, either by mail, or, if the time is short, by cable and is then supplied at once to manufacturers and distributors in this country. We receive dozens of such inquiries each week from numerous countries covering all automotive products, ranging from aircraft to accessories and service equipment.

"America has a duty and an opportunity. It is her commercial destiny not merely to export American-made automotive vehicles and equipment, but to bring to the entire world the benefits of efficient transportation on the road, in the water and through the air. The world is in great need of American automotive equipment. The passenger car and motor truck and other equipment that has negotiated the roads of Kansas, Missouri, Oklahoma, Iowa or Nebraska, is likewise the vehicle best suited to overcome similar conditions and to give the maximum of service in Mexico, Patagonia, South Africa, India and other countries.

"Each company and each firm, no matter how large or small, should investigate the possibilities for the use and sale of its products in these other countries. Some companies, it may be found, have products unsuitable for export trade and will do well to make a thorough investigation before undertaking any extensive sales campaigns. But to numerous others a definite volume of international sales seems assured if they will but make an honest and careful campaign to obtain it."

Money in Circulation

A READER of The Dearborn Independent calls attention to a summary of the report of the United States Treasury, in which the total stock of money in the country is put at $8,303,549,241, usually accompanied by no explanation as to its disposition, leaving the reader to the natural conclusion that there is a larger quantity in circulation than is really available.

Beginning July 1 of the present year the form of Treasury statement was changed and analysis of its items is different than before. It was explained at the time that the change was for the purpose of making the statement more intelligible to the layman, but in summarizing it is as easy to hide a fact as formerly, while the same difficulty in arriving at an estimate of the idle money remains in the detailed figures. Evidently our correspondent has seen only the summary.

Of the above total of money, $3,858,543,202 is in gold coin and bullion. The two items are united, and as bullion is not money at all, and as none of the bullion or gold is government owned, it is difficult to see what part it has in a financial statement of the country's resources. It is known that much of the gold coinage has been decoined by its holders in the past, and it is doubtful if even the government has any means of arriving at the exact or an approximate value of the gold in the country. It can tell the coinage value of the metal in the treasury, represented in circulation by gold certificates, and the amount held by the Federal Reserve banks as cash reserve, and that may be presumed to be the amount reported.

Of Standard Silver Dollars $394,444,404 are given as the total, but no indication is given as to whether any of these are in active circulation. These, as well as gold certificates and various other forms of currency, being available for reserve use, it is safe to say the actual circulation is confined to the Federal Reserve notes, the general notes aggregating $2,603,730,960, and the Federal Reserve Bank issues $69,737,400, or less than three billions of dollars. The subsidary coinage amounts to $270,701,710, greenbacks to $346,681,016, and the National Bank notes to $739,705,549.

According to the report, $3,591,881,552 is held in the Treasury, leaving $5,720,316,896 held outside. From this latter amount, $1,326,809,969 held by Federal Reserve banks and agents must be taken, leaving the circulation statement standing at $4,393,506,927. And there the report leaves us.

Each of the more than 30,000 banks in the United States carries its own reserves to an amount at least of 15 per cent of its deposits, while many industries keep on hand large items of cash. Hoarders are many, and much of this estimated free money available for business is inert. To estimate the amount is only guesswork and serves no useful purpose, but one would be safe in asserting that if everything were accounted for the circulation would shrink.

The criticism due any statistics of the kind is that they are really not informative. It would be impossible to learn the cash balances or the distribution of money in circulation. If held by a few, and wage earners are idle, a circulation 10 times as large would not make prosperity. Idle money earns nothing.

"Boring" From Within: Foster's "Fosterism"

Syndicalist's Propaganda Widely Distributed Among Organized Labor

By E. J. COSTELLO

Mr. Costello is the founder of The Federated Press, the trade union news agency, and, until September 1, was its managing editor. This article presents an interesting and informative study of union labor as viewed by one thoroughly in touch with all the activities of the government.

THE late Theodore Roosevelt used to tell a story about a bootblacking experience that came to him while living on a ranch in the old-time cattle country, where everybody worked. One day, during a lull in outdoor tasks, with an enthusiasm which outran his judgment, he blacked the boots of all the cowpunchers and other occupants of the ranch house. He coated them with a thick paste which afterward left its mark on everything they touched, and as a result he lost not merely the respect but the affection of the wearers. This was not, however, because Mr. Roosevelt had blacked the boots, but because he had blacked them badly.

The strike of the railway shopmen is over. It has been settled on a compromise basis. The men on the majority of the roads are returning to their jobs, or such jobs as they can obtain, there to think on the events of the weeks since they walked out with such unanimity. And particularly they are going to think about those individuals who brought about the events—the men who led them into collective idleness upon the promise that all demands would certainly be conceded by the railway executives before they went back to repairing locomotives and rolling stock so that the transportation systems of the United States could operate with customary efficiency.

And then, in another year, perhaps, or months, they are going out again. But they will be under a new leadership, and a stronger purpose will dominate them—will point the goal. They are blaming their present leaders already, not so much for having induced them to quit their jobs, but for having made what to them actually amounts to a bungle of the walkout just ended. Those leaders are going to lose not merely the respect but the affection of the rank and file of railroad workers, not because they called the strike, but because they handled the strike badly. The executive paste these leaders have used is likely to leave its mark on the lives of the rail workers for a long time to come.

From the standpoint of the general public it is, indeed, fortunate that a truce has been patched up, but the public ought to understand that it is only a truce. The public ought to realize that the general conditions which prompted the recent strike have in nowise been changed, and particularly it ought to take cognizance of certain factors in the industrial situation, as it affects the railroads, which point to that now seemingly improbable development—the general strike of all railroad employes, from the locomotive engineers and conductors on down to the humblest section hand and trackwalker.

Students of American manifestations of industrial unrest are convinced of that one outstanding fact. It is the knowledge of what is actually happening behind the scenes which convinces them. They have laid aside their personal prejudices for or against those who constitute the factors, in order to understand. So must the public lay aside its prejudices in order to understand.

Over the State Line

THE noonday sun beat down upon a highway a few miles out of Torrington, Wyoming, recently, as a chauffeur brought a big automobile to a sudden stop in a cloud of dust, finishing a ride of more than a hundred miles that had started at Denver. A sheriff, wiping the perspiration from his face, turned to a prisoner at his side.

"This is where you get out," he commanded.

The prisoner was dazed. "What does this mean?" he demanded.

"It means that we are at the boundary line and you are in tough luck. You've got to walk the rest of the way. You were deported by the Denver authorities, and we don't want you in our state. The station in Nebraska is down the road. Get out!"

The prisoner got out, and his baggage followed. In another moment the car had turned and was speeding back in the direction whence it came.

William Z. Foster, head of the Trade Union Educational League of America, idol of thousands of trade unionists, and hated and feared alike by regular union officialdom and Organized Industry, stood in the middle of the road with a heavy suitcase in each hand and watched the automobile until it disappeared. Then he trudged into town and caught a train for Chicago. A few days later he was arrested for alleged violation of the anti-syndicalism law of the state of Michigan.

It is not the purpose of the present writer to discuss the merits or demerits of the philosophy of Foster, nor to comment upon the justice or injustice of the legal procedure against him. But it is the intent to portray as clearly as possible just what he has accomplished to date in the American labor movement, and particularly among railroad workers, to the end that it may be understood why the general strike of railway workers is forecast.

"Fosterism" is without doubt the greatest issue in the American organized labor movement today. By "Fosterism" is meant the carefully developed program for the amalgamation of existing craft unions into industrial units. Nothing in the history of trades unionism in this country has ever brought about so fierce a controversy. The man and his movement are being attacked from several quarters, with a vindictiveness unparalleled.

In the boldness of Foster's speech and the menace of his program for intrenched labor officialdom may be found the reason for the bitter antagonism of Samuel Gompers, president of the American Federation of Labor. For Foster says the purpose of his League is "to develop trade unions from the present antiquated and stagnant condition into modern and powerful labor organizations capable of waging successful warfare against Capital. To this end it is working to revamp and remodel from top to bottom their theories, tactics, structure and leadership."

It is not strange that Gompers, the ardent exponent of craft unionism in America, should oppose Foster, because, if the "boring from within" program prevails, all the great Gompers machine is bound to crumble to earth. It is the probability that it will prevail that causes the veteran leader to fight with his back to the wall.

The opposition of Organized Industry has a slightly different, but none the less important, basis. It comes as the result of such statements as these:

His Program Takes Hold

"INSTEAD of advocating the prevailing shameful and demoralizing nonsense about harmonizing the interests of Capital and Labor," says Foster, "it (the League) is firing the workers' imaginations and releasing their wonderful idealism and energy by propagating the inspiring goal of the abolition of Capitalism and the establishment of a Workers' Republic. The League aggressively favors organization by industry instead of by crafts. Although the craft form of union served a useful purpose in the early days of Capitalism, it is now entirely out of date. In the face of the great consolidation of the employers, the workers must also close up their ranks or be crushed. The multitude of craft unions must be amalgamated into a series of industrial unions—one each for the metal trades, railroad trades, clothing trades, building trades, and so on, even as they have been in other countries. The League also aims to put the workers of America in co-operation with the fighting trade unionists of the rest of the world. It is flatly opposed to our present pitiful policy of isolation, and it advocates affiliation with the militant international trade union movement, known as the Red Trade Union International."

Fundamentally Foster may be all wrong, and in the estimation of many capable orthodox economists he is, but the fact remains that his program has already taken a powerful hold on the imaginations of the rank and file of the workers. When he began developing his League a little more than a year ago, he was careful to select trustworthy lieutenants in all the principal industrial centers throughout the country, and to concentrate upon a single industry at a time.

Foster began with the railroad workers, and here is what he told them:

"In every important railroad center there will be educational groups of railroad men, not of single crafts, but of the whole 16 in the industry. These local groups will co-operate nationally through a secretary. (Foster is the secretary.) A national program will be adopted, and a great drive instituted to combine the 16 squabbling groups into one solid body. Amalgamation will be made the burning issue all over the country, wherever railroad men meet and talk. From the live wire section man in San Diego, California, to the rebel engineer in Portland, Maine, the whole body of railroad militants will move unitedly and irresistibly to the accomplishment of their task, the erection of a great and powerful industrial union of railroad workers, by the amalgamation and invigoration of the sixteen craft unions. The union leaders refuse to carry out this absolutely indispensable project, so it is up to the rank and file militants to do it themselves."

Foster's movement is still young, but the shopmen's strike was in itself an exemplification of the success so far achieved. Of course, amalgamation had not yet been effected, but there were ample surface indications of Trade Union Educational League activity. The sporadic strikes of Brotherhood men at Joliet, Illinois, and at other points throughout the country, had their origin in the Foster propaganda.

It was no secret that the radicals were a difficult problem for the leaders in charge of the strike to handle. It was the radicals as organized in the Foster groups who were directly responsible for the action of the Brotherhood chiefs in their attempt to bring about the strike settlement. So many of the Brotherhood men themselves had come under the influence of Foster that the officials speedily saw that a shopmen's strike of long duration could have but one result—a general strike. And they were not prepared for that. The statements from the White House, and the injunction program of the Attorney-General were immediately capitalized against the officials by the League agents.

Just how active these agents were everywhere during the strike, and are now, has been developed in the last few weeks. The recent conference of the League in Chicago, which was broken up by a police raid, disclosed the information that there are literally thousands of these militant groups in all the principal industrial centers of the country.

Perhaps one of the most illuminating proofs of the general trend toward amalgamation and consolidation in the labor movement is the fact that the shopmen's strike was conducted by the Federated Shops Crafts of the American Federation of Labor. The department is the embodiment of the recognition of the common industrial interests of the crafts forming it. True, its present conservative leadership is in the nature of a drag on the impulses of those who respond readily to revolutionary propaganda, but the department is a decided step in the direction of Foster's goal, which he and his militants are quick to take advantage of in their campaign.

Foster Program Appeals

FOSTER is in trouble with the authorities, but his pamphlets have already been circulated by the tens of thousands. He has thoroughly planted the idea of amalgamation within the American Federation of Labor, and the opposition of orthodox leaders is only helping the growth of that idea. Foster has told the rank and file that one of the latest and greatest achievements of working-class thinking is a clear understanding of the fundamental proposition that the fate of all labor organization in every country depends primarily upon the activities of a minute minority of clear-sighted, enthusiastic militants scattered throughout the "great organized mass of sluggish workers."

These live spirits, he tells them, are the natural leaders of the working class, the driving force of the labor movement.

Let me repeat. Whether we like it or not, the fact stands out that this propaganda has sunk deep into the very vitals of the whole labor movement. It has already done much to destroy the dual unionism that has tended to break the ranks of the workers, Foster and his lieutenants being bitterly opposed to dual unionism. That's why the League finds vicious enemies in the I. W. W. and the Canadian One Big Union, both of which for years have been fighting craft unionism as represented in the American Federation of Labor.

The men who have gone back to work in the railroad shops are not going to find conditions anywhere near what they were led to expect. It is merely a truce that has been patched up. The seniority and other problems are a long way from being settled, the promises of Bert Jewell and the other leaders to the contrary notwithstanding. Resentment of the men over the loss of good time and good money, in what many of them are already calling the recent fiasco, is going to make for the Foster movement, the present aim of which, as far as the railroads are concerned, is the general strike. And, of course, the ultimate aim of Foster is the Workers' Republic, but that is a long time off.

Mexico Claims 11 Isles Under American Flag

Concluded from page 9

company which has introduced the Karakul sheep from Afghanistan, a breed noted for the fineness and value of the wool of the young lambs. Success has followed its efforts and now the island is well covered with the herds of these valuable animals. Anacapa, one of the smallest of the islands, is beloved of fishermen, because of the deep water off its shores, the presence of fresh water on the island, and the level banks in the ocean floor, which attract both food and game fishes. Next to Catalina Island, it offers the best fishing, both for sport and for the market, of any of the islands.

Santa Cruz is the most beautiful with a number of tidal caves, a high arch cut in the solid rock by erosion and rolling hills. It has been used extensively in filming motion pictures, especially those involving pirate lairs, fugitives from justice, Indian scenes, and naval battles. Probably more boys have thrilled to the scenes enacted for the screen on Santa Cruz and in its adjacent waters than to those from any other island in the world. San Nicolas is the most valuable ethnologically of all these islands for it contains the oldest Indian burial mounds, kitchen middens, caves once inhabited by Indians who occupied it long before the Spaniards came, and who were of a different tribe from those on the mainland. The other islands, for the most part, are merely blocks of land some 30 or 40 miles off the California coast, seldom visited save by ornithologists or ethnologists, or fishermen blown from their usual fishing grounds.

While California contests the claim of Mexico on these islands, there is a growing feeling that the move has a motive not revealed. Legal circles familiar with Latin-American methods feel that Mexico will drop her claim, if through its presentation, she can open an easier path to financial assistance. Recognition would solve both problems, it is hinted, for it would open money in Mexico, and, thereby, would accomplish what Mexico seeks to accomplish by demanding the lowering of the American flag over these islands.

The Coronado Islands, which lie just across the international boundary, south of San Diego, California, belong to Mexico, which also owns several small islands farther south, both on the Pacific Coast and in the Gulf of California, among the latter the famous Tiburon Island, long reputed to be the haunt of the last cannibals of the New World, but, as a matter of fact, inhabited by a handful of miserable aborigines, still living in the Stone Age, or not far removed from it. It is 60 or 70 miles north and west from the Coronado Islands, Mexico's most northerly island possessions, to San Clemente Island, the most southerly of the islands on the Pacific Coast of the United States. Grouped near San Clemente are San Nicolas, Santa Barbara and Santa Catalina islands, lying off the coast of Los Angeles, Orange and San Diego counties. From 50 to 60 miles farther northwest lie San Miguel, Santa Rosa, Santa Cruz and Anacapa islands, off Santa Barbara and Ventura counties.

Wall Street's Dictatorship of Rails Is Absolute

Analysis of Directorships of 70 Per Cent of Mileage Reveals Financial Rule

By CHARLES ALBERT COLLMAN

IT IS one of the truisms of railroad history that all of America's trunk lines have been built. The days of railroad pioneering have passed forever. With few exceptions, the master builders of our great transportation lines have vanished from the stage. This transition has taken place quietly, and almost without comment.

It might be said that the era of great railroad builders ended with the death of James J. Hill. Hill was a man of wonderful persuasive power, and this rugged son of the Northwest had few peers as a railroad economist, financier and constructor. Edward H. Harriman, Hill's rival in his later years, was less of a railroad builder than a financier. However, he was also active in vast extensions of the Southern Pacific system, especially in California, and down along the west coast of Mexico.

George J. Gould, 18 years ago, bore the promise of becoming the greatest railroad man in American history in heading a real transcontinental system, large portions of which he built in the face of tremendous obstacles and opposition. It was old Jim Hill's theory that a transcontinental line in this country was an impossibility. "Traffic changes ownership at Chicago," was his saying. At one time Gould threatened to disprove this theory. Beginning with the Western Maryland, on the Atlantic Coast, linking it up with the Wabash and Missouri Pacific, he planned to reach the Pacific Coast over the lines of the Denver & Rio Grande and Western Pacific, and gaining an entrance into Mexico over the International & Great Northern and affiliated lines. But the great Gould transcontinental crumpled up on the Atlantic long before the Western Pacific reached California. Hill's prediction came true. Gould's railroad career has ended, he has made his home abroad, leaving the impression that he may never return.

Hoover's Secret Meeting

BENJAMIN F. YOAKUM, creator of the Brownsville road, and pioneer railroad builder of the Southwest, for years has no longer been actively identified with railway construction. Neither has Edward T. Jeffery, builder of the Western Pacific, the last of American trunk lines. Joseph Ramsey, Jr., who carried the Wabash system into Pittsburgh, after one of the hardest-fought railroad battles in American history, during which he built the Wabash-Pittsburgh Terminal at a cost of a million dollars a mile, is no more. One might also mention the late Henry H. Rogers, who won distinction by constructing his Virginian Railway entirely at his own expense, and without borrowing a dollar.

The pioneers of American railroad life, the men who planned or built the great transportation arteries, are either vanished or retired. The ownership of the country's railroads has passed into the hands of men other than those who built them. This ownership is vested in financiers, bankers and underwriters. It is one of the misfortunes of the country that, with some notable exceptions, most of the great railroads are in control of those who have little sympathy with public interest and public needs.

Quite recently this question of American railroad ownership came very prominently to the fore.

> Last August, the country being threatened with a railroad strike, Herbert C. Hoover, Secretary of Commerce, went to New York, where he had summoned a group of Wall Street financiers to meet him at the Equitable Building. *The call for this secret meeting was issued to approximately 15 heads of national banks, private banks and trust companies in the financial district.* Among the latter were the National City Bank, J. P. Morgan & Company, Kuhn, Loeb & Company, the National Bank of Commerce, Seligman & Company, the Bankers' Trust Company, the First National Bank and the Chase National Bank.
>
> Mr. Hoover, speaking on behalf of the Administration, stated that *as railroad presidents were compelled to look to their bankers for advice and counsel,* he urged the assembled financiers to use their influence to have the railway executives meet their striking employes halfway.

The bankers received this suggestion with an outburst of indignation. The proposal, they said, was one that they could not listen to. Labor readjustment was a problem for railroad presidents, and they never interfered with railway heads! Indeed, for them to do so would only spread abroad an impression that most of the country's railroads were controlled by Wall Street! Nothing, they added, was further from the truth than that Wall Street banks controlled America's railways.

As a matter of fact, the monthly circulars of most of the above-mentioned banking institutions, had for more than a year previous, been preaching the necessity for *liquidating labor—which is the financial phrase for cutting wages.*

Now it was quite human for the bankers to wish to avoid having responsibility for the railroad strike placed upon their shoulders. But it is an undeniable fact in Wall Street's history, since its earliest days, that its bankers have always controlled American transportation lines, and that the railroad president who would dare oppose the dictates of his finance committee, or his executive committee, would soon be out of his job. For generations, important groups of railroads truthfully have been known in the Street as the "Vanderbilt," the "Morgan," the "Gould," the "Kuhn-Loeb," and the "Speyer" roads.

A railroad company, like any other corporation, is managed, dominated and controlled by its board of directors. The board, in turn, is ruled by its own executive or finance committee, as the case may be. The president is an executive official, who is bound to obey the orders of his board. There have been presidents, such as Hill or Harriman, who managed independently the properties of which they were the heads, but their day has long since passed.

The general run of stockholders in a railroad have very little to say in its management. The directors and financiers must have "majority control," or it would be in the power of a dissatisfied minority at any time to oust them from the management. Majority control, however, means, as a rule, possession of only 35 to 40 per cent of the stock. For in the case of a contest, it is then always possible for the financiers to buy up in the market sufficient stock to give them the necessary 51 per cent to outvote their opponents.

Such being the case, it would appear that Wall Street's disclaimer to the charge of controlling the country's railroads could easily be proved or disproved by a scrutiny of the interests represented on the railway board.

The Erie Railroad, once known in financial history as the "Scarlet Woman of Wall Street," has for at least two generations been recognized as a Morgan road. From that period to the present day, J. P. Morgan & Company have financed the needs of the company, and the banking house is the road's official transfer office. Morgan bankers have always managed the Erie. As was shown in a previous article, the elder Morgan located five to six floors of Erie offices in the Hudson Terminal buildings, at an expensive rental, against the plans of its president, and without the knowledge of its stockholders. Again, it was the elder Morgan who personally bought the inflated Cincinnati, Hamilton & Dayton Railway combination, and loaded it upon the Erie against the advice of its president. It was the same financier who, some years ago, decided that the Erie should be thrown into bankruptcy. This calamity was averted by E. H. Harriman, then a member of the board, who came to the rescue of the road with a personal loan of more than $5,000,000. "The Erie can't afford a receivership," said Harriman. This was his fling against the Morgan firm, which had charged the road $1,000,000 as the cost of a previous receivership and reorganization. At the present time eight of the Erie directors are prominent Wall Street men, officers, partners or directors of banking institutions. Among them may be mentioned Edward J. Berwind, of the Guaranty Trust; George F. Baker, chairman of the First National Bank; Arthur M. Anderson, of J. P. Morgan & Company; Grenville Kane, of the banking house of Tailer & Company; George G. Mason, of the Southern Utilities Company; Julius Kruttschnitt, of the Harriman National Bank, and Leonor F. Loree, of the Mechanics & Metals National Bank.

Let Independents Try

LET some group of independent stockholders combine to seek representation on the Erie board, and they will soon be made to realize the impossibility of breaking through the banking ring that commands this property.

The two former Harriman systems, Union Pacific and Southern Pacific, which are financed by Kuhn, Loeb & Company, are both dominated in their boards of directors and executive committees by Wall Street bankers. Nine of the managing directors of the Union Pacific are either members of large banks or directors of Wall Street banking institutions. Among them are Paul M. Warburg, of the National Acceptance Bank, who, with Newcomb Carlton, was recently elected to succeed respectively Mortimer L. Schiff and Otto H. Kahn, of Kuhn, Loeb & Company; Robert Walton Goelet, Frank A. Vanderlip, Charles A. Peabody and others. Of these, two are directors of the Guaranty Trust Company, two of the National City Bank, the others being directors or trustees of similar banks.

The managing directors on the board or executive committee of the Southern Pacific include 10 well-known Wall Street bankers, of whom two are directors of the Central Union Trust, two of the Equitable Trust, two of the United States Trust and one of the National City Bank. These include Robert Goelet, James N. Jarvie, E. P. Swenson, Ogden Mills, J. Horace Harding and Henry W. De Forest.

Not by the wildest stretch of the imagination can anyone assert that the two one-time Harriman systems are not controlled by Wall Street bankers.

Eight Wall Street financiers are the managing directors of the Chicago & Eastern Illinois Railroad. They include John W. Platten, who is chairman of the board, and president of the United States Mortgage & Trust Company; Henry Evans, of the Central Union Trust; Edward Shearson, of the Chatham & Phenix National Bank; John J. Pulleyn, of the Irving National; F. J. Lisman, of the banking house of F. J. Lisman & Company and George W. Murray, of the Equitable Trust.

The Chicago, Rock Island & Pacific Railway is dominated by three Wall Street bankers on its finance committee. These are Charles Hayden, of Hayden, Stone & Company; James Speyer, of Speyer & Company and Henry V. Bruere, of the Franklin Trust.

Eight Wall Street bankers control the affairs of the Missouri, Kansas & Texas Railway, the chairman of whose board is Henry Ruhlender, formerly of Speyer & Company, now a director of the Central Savings Bank. Other directors are De Witt Milhauser, of Speyer & Company; Alvin W. Krech, president of the Equitable Trust; Stuyvesant Fish, of the National Park Bank; Edward R. Tinker, of the Chase National Bank and Andrew J. Miller, of Boissevain & Company. The financial affairs of this road are completely in the hands of Speyer & Company, Seligman & Company and Hallgarten & Company.

It has been previously related how several trust companies in the financial district of New York threw the Denver & Rio Grande Railroad into bankruptcy, wiped out the equities of the stockholders and of a large proportion of the bondholders, and linked up the property with the Western Pacific. These trust companies represented two groups of Wall Street financiers, the Rockefellers and Blair & Company. It is this Rockefeller-Blair group of financiers which now controls and manages the Western Pacific-Denver & Rio Grande Western system. Five members of the board represent the controlling interest, and of these, three are directors of the Equitable Trust Company, a Rockefeller institution. The managing directors are Alvin W. Krech, president of the Equitable Trust; John B. Dennis, of Blair & Company; Richard B. Young, of E. H. Rollins & Company; George W. Murray, of the Equitable Trust and Lyman Rhoades, of the Equitable Trust. The Western Pacific is one of the most eloquent examples of a Wall Street controlled railway.

The New York Central system is a Vanderbilt property, being completely under the management of eight prominent financiers: George F. Baker, of the First National Bank; Robert S. Lovett, of the National City Bank; William K. Vanderbilt, Frederick W. Vanderbilt, Ogden Mills, of the United States Trust Company; Edward S. Harkness, Chauncey M. Depew and Bertram Cutler, of the Equitable Trust.

70 Per Cent of Mileage

THE Chicago, Milwaukee & St. Paul Railway is under the management of seven Wall Street financiers; the Baltimore & Ohio under five financiers; the St. Louis & San Francisco under five financiers; the Illinois Central system under seven such financiers; the Atchison under six financiers, and the Northern Pacific under six financiers, all of these gentlemen being prominent in New York's financial district.

On the board of directors of the New Haven are four Wall Street bankers; on that of the Pennsylvania Railroad, three; on that of the International & Great Northern, three, the financial affairs of this road also being under the control of Speyer & Company and J. & W. Seligman & Company. Wall Street control manifests itself also in the Great Northern Railroad, the Chicago Great Western Railroad and the Chicago & Northwestern Railway, which is another Vanderbilt property, whose directorate is dominated by Chauncey M. Depew, William K. Vanderbilt and Frederick W. Vanderbilt.

Above has been given a list of 20 American railroads, including the largest transportation companies in the country. They represent a mileage of 174,690, which is 70 per cent of the total railroad mileage of the United States, the total being 253,152.

On the directorates of these 20 railroads, there are to be found 114 Wall Street financiers, who, as said before, are either partners in large banking houses, or directors or trustees of powerful financial institutions, most of whom issue and underwrite the securities of these properties. It might be added that the railways of Mexico are similarly dominated and controlled by Wall Street bankers, the affairs of the National Railways of Mexico, the Mexican International, the Pan American and the Mexican Central being in the hands of Kuhn, Loeb & Company, the Central Union Trust Company, Speyer & Company, Hallgarten & Company, the National City Bank, Ladenburg, Thalmann & Company, the Guaranty Trust Company and the Chase National Bank.

It would seem that the foregoing analysis of American railroad directorates gives proof positive and incontrovertible that the transportation system of the country is completely in the power of Wall Street bankers. It is difficult to conceive any reason for a denial of this fact. Yet for some reason, best known to themselves, the bankers of the financial district, for the last year and more, have been protesting the truth of the matter in a most vehement fashion. Only recently, on their authority, Robert S. Binkerd, assistant to the chairman of the Association of Railway Executives, challenged a public statement made that the railroads of the country are under Wall Street banking control.

There certainly is no harm in an acknowledgment of the truth. A large number of the directors whose names have just been mentioned, have every possible right to direct the management of properties in which their fortunes are invested. Some of them have devoted their entire lives to railroad operation and railroad finance, and they have shown themselves to be thorough, capable and conscientious railway managers. With such men, certainly, the American public has no quarrel.

What Wall Street never seems to understand is the public attitude. It has no criticism to make of the fact that men in the financial district are active factors in railroad life, but it bitterly resents the mismanagement, the rapacity, the absolute disregard to national interest that Wall Street bankers and operators display.

Wall Street cannot escape its responsibility by evasions, but its attempt to disclaim dominance over the railroads is being propagated for some specific reason. It has often been said, more or less jestingly, that speech was given bankers to conceal their thoughts.

The Land of the Rich Port Is One of Contrasts

Streets of San Juan Present Strange Sights to Visitors to Tropic Island

By CARL SCHURZ LOWDEN

COME and go with me through the streets of San Juan. You will see the stone homes of the wealthy, and you will see tenements. An imported motor car flashes past a bullock cart. Ragged mendicants beg at the street corners, while pampered sons with twirling canes stage an impromptu style show. You will see wealth and poverty, health, disease and death. A man walks along with a rude coffin balanced on his head; really, it is a common sight in our richest possession.

The very name of Porto Rico means "Rich Port." For many years it was possessed by the capital; then it was applied to the whole island and the city became San Juan. Columbus discovered the island on the sixteenth of November, 1493. It was rich and fertile then, but if the explorer could come back now he would be utterly amazed at the extent of its products, which include sugar, tobacco, coffee, pineapples, oranges, cotton and hats.

Poverty should have no place in Porto Rico, but it is there in its most hideous form. This garden spot of the Great Antilles, sometimes referred to as the garden spot of the world, is a paradox. It will grow virtually anything indigenous to the tropics; yet not enough food is produced on the island for its inhabitants. In 1920 the total imports reached a value of nearly $100,000,000, while the exports exceeded this amount by 50 per cent. Apparently I am not proving my case. But, listen: the bulk of the exports consists of sugar, tobacco and coffee. Neither the natives nor we can live on these products which are not truly foods.

One of the richest spots in the world is Porto Rico; likewise it is one of the poorest places for a day laborer supporting a family. There are too many mouths, too many appetites, too much of the land given over to the production of luxuries, not enough to necessities. Try living on sugar, coffee and tobacco with oranges and pineapples thrown in. They do not build up the human body; they are mighty nice to have for those that like them but they should not be depended upon as substantials.

"Kick a bush," it is said of the island, "and a Porto Rican will jump out." The truth of this statement outweighs any fictive element. Consider the size, 95 miles long by 35 wide. Consider the population, nearly one and a third millions, of which a large majority dwell in the country. The area of Porto Rico is one-thousandth of the United States, the population one-hundredth. We now average 33 persons to the square mile, but if we had Porto Rico's 330 we would be almost one solid town from the Atlantic to the Pacific and from the Gulf to the Canadian border. Only one country in the world, little Belgium, has a denser population; but there intensive methods of agriculture are used and the land is not devoted to the production of non-substantials as in Porto Rico.

Limitation of families is utterly unknown; those of largest sizes may be found among the peons, the smallest among the wealthy. Overpopulation continues, wages remain down, more mouths to feed, less to feed them, because the earning power and the buying power of the head of the family has not kept pace with the needs.

At the present time the little island is a veritable tempest in a teapot. Perhaps the agitation in the Philippines for independence has had much to do with this movement in our West Indian garden spot, but certainly it has sprung primarily from the wretched economic conditions prevailing there. The natives have never been truly satisfied with our government. Only recently grand jury charges were preferred against the governor-general. In fact, neither house of the Porto Rican legislature has indorsed or sympathized with our policy there. It is a case of the Anglo-Saxon branch of the white race trying to enforce laws on those of Latin blood. Oil and water do not mix better than the racial elements I have just mentioned.

"The Porto Ricans are not capable of governing themselves," a missionary told me, "but I wonder what can be their mental state when we are continually dinging that fact into their ears. They think they can. We know they cannot. There will be no satisfaction, however, until they have tried."

How would you like to work on a sugar plantation for $1 a day? You would feel rather hopeless and decidedly down in the mouth. You would not be able to see much of a future. With the burden of a large family depending on you for support you would realize how poverty can grind. The old philosophy of "grin and bear it" would serve as a sop for a time, but sooner or later you would wake up and begin to ask what can be done to alleviate the conditions. The peons are asking that now.

The big sugar companies could raise the wage if they would. They refuse to pay more, insisting the natives will not work if they have money ahead; so these corporations ingenuously manage to have an army of day laborers in virtual slavery. There is a story going the rounds of the vaudeville stage now which mirrors the specious assumption of these employers; according to it, a Negro was offered a quarter to do an errand but declined it by saying, "No, sir, boss, I'se got a quarter."

Docks at the Porto Rican capital.

Thus it is that the laborers are kept despicably low. There is no future, nothing to look forward to but death. They live from day to day in miserable hovels of one or two rooms for the entire family. There is no privacy. They cannot acquire a competence. They cannot meet the proverbial rainy day. Sickness finds them utterly unprepared. They do not live; they merely exist as beasts of burden, machines and slaves.

Before we acquired Porto Rico the land was largely owned by small farmers who tilled it themselves. The settlement of the Spanish-American War gave us the island. Soon American-owned companies invaded the garden spot, bought up the most fertile of the acres, formed huge plantations, and employed the quondam owners, practically all of whom had squandered the money they had received. The owners were thus dispossessed and forced into the slavery that $1 a day means. The land was changed from a producer of foods to a producer of luxuries. The remainder of the land is far less fertile and incapable of growing enough to keep hunger out of the over-populated huts. In this garden spot the merciless efficiency of big business is demonstrated every hour and minute.

More than half of the population or approximately 800,000 suffer from under-nourishment. Most of these are seriously affected. Many have the hookworm disease caused by a parasite which enters through the bare feet of the workers on the sugar plantations. If there were sanitary facilities the hookworm would not play the part it does. The Presbyterian hospital, built at a cost of $200,000, is doing much to alleviate suffering and diminish disease on the island.

Tuberculosis is rampant. When you see a man carrying a coffin from the maker's shop to a home, you can safely guess the victim's death to have been caused by the white plague or the hookworm. The people sleep with the windows tightly closed and the house unventilated because they think the night air will give them colds. The open sewage, mosquitoes and utter lack of screens combine to introduce malaria, another ogre of disease.

Two-thirds of all Porto Ricans are illiterate. This lack of education accounts largely for the prevalence of disease which goes hand-in-hand with ignorance. Only 41 per cent of the children of school age are in school. This condition seems bad enough now, but under Spanish rule it was worse yet, with 83 per cent of illiteracy throughout the island. The Spanish influence remains a potent factor, for most of the people have Spanish blood in their veins. The language is spoken everywhere and taught in the schools along with English; store clerks must be able to converse in either.

Ignorance cuts the income of the peon and small tradesman or peddler class. For example, an egg-vender from the country came into town with a basket of eggs, but like his fellows he could not qualify as a mathematical expert—far from it he was. He had a scale of prices: one egg for a nickel, 11 for 50 cents and a dozen for 60 cents. The man who told me the story laughed at the way he had beaten the peddler by buying 11 eggs, then one, thus saving five cents from the dozen price.

Thoroughbred hogs were sent to a high school class studying agriculture and animal husbandry. The students and their parents lacked interest in the project of establishing better breeds on the island. They had always raised the "razorback" type, sometimes adjacent to the house but often under it; when marketing time came, the animals were caught, roped and carried away under the arms of the owners. Now roast pig happens to be a favorite dish, even more so on feast days; so the hogs were butchered and served up at a fiesta. They had cost a lot of money, but the Porto Ricans did not care.

Hand labor is considered despicable; every person that can avoids it. When the educated Spanish or Latin-American buys a hat, paper of pins, tennis balls, cigars or anything whatsoever, he will have them delivered or carried home by his own servant. According to his philosophy he would be lowering himself if he carried his purchases. This reluctance for hand labor is shared by other classes; it may have been largely responsible for the butchering of the imported hogs by the high school students of agriculture.

The University of Porto Rico at Rio Pedras, eight miles southeast of San Juan, affords a vivid contrast to the woeful state of illiteracy. It is now drawing many young men from the Latin countries of South America. It has a great growth before it as it will very likely become the great Latin-American educational institution of the Western Hemisphere. The establishment in the United States of such a university failed. Porto Rico, however, seems ideal as a bridging point where the American and Latin civilizations may meet and the best of each be thus made obtainable.

The rich have fine homes in San Juan, Ponce and others of the leading cities. They are built of stone with elegant roofs of red tile, or they may be fashioned in stucco. Inside may be found the patio or courtyard redolent with luxurious flowers and providing a cool retreat from the sun's rays.

The homes of the peons are one or two-room affairs that squat on posts above the damp ground. Most of the population dwells in these miserable hovels. From the artist's viewpoint they must be rated as picturesque; but close inspection will prove to the usual tourist the greater pleasure of seeing them from a distance, in perspective, as it were. They really do seem charming in a setting of mountains or pretty landscapes.

Casinos, dance or club halls provide amuse-

ment for the wealthy. The poor see Bill Hart at the movies or watch a cockfight; if the latter they bet everything on the result, then go home ridiculously happy or utterly miserable. Our government has officially abolished this amusement because the gambling fever demoralizes the men to such an extent that the families suffer from the general recklessness. However, it is abolished only in name; thus a person wishing to see a cockfight can always see one.

Chickens are invariably sold alive, as ice can be obtained only in the big cities. A fish vender carries his catch strung on a pole over his shoulders. The bread man walks from house to house with an open basket on his head. The milkman brings his goat or cow around to his customers so they can see that he delivers the food strictly fresh. In many parts of the country cows or oxen placidly draw old-fashioned plows made of wood.

Taking pigs to the market.

Though Porto Rico has a thousand rivers, many of the poor people do not have wells or live near a stream; so the tourist may see them carrying water in five-gallon cans that once contained motor oil. Incidentally, there are many good auto roads on the island. The old Spanish military road bisecting our possession from San Juan to Ponce has a fine hard surface, is rather too narrow and too full of curves. If you ask the why of the curves you will be told that the Spanish government so shaped the road that none of the beautiful mountain vistas will be missed by the traveler.

Royal palms are everywhere. The natives make crude tubs from the bark and wash clothes in them. There are other picturesque means of cleansing garments. Sometimes an entire community forms a washing center in the shallow parts of a river. They wet the clothes, spread them on the rocks and beat them; this treatment is probably no worse than that accorded by our laundries.

The women are quite proficient in crocheting, embroidering, knitting and making lace. They work a whole day to make a yard of lace and receive 10 or 15 cents for it. In New York it sells at a profit of 500 or 1,000 per cent. Why? This is just another sample of the way Porto Rico has been and still is exploited for gain, but not the gain of the residents.

The tobacco fields make a delightful picture when a vast area of cheesecloth protects the tender plants and gives the appearance of snow on the ground though one knows well it is far too hot for snow there. The cloth stands six feet above the plants so the laborers will not have to stoop when they cultivate them with hoes.

The pineapple plantations please the eye, but the long rows of the growing fruit are treacherous. Try to walk through them without wearing leather leggings if you dare to risk leaving your suit on the thorns and emerging in dishabille. Strolling in a coffee plantation does not entail any such disagreeable features.

Ponce, second city in importance in Porto Rico, ranks first in population. To it also belongs the distinction of being the chief port for the exportation of sugar. This fact does not impinge itself upon the traveler inasmuch as the docks are two miles outside the city and linked to it by a railroad. Many of the streets are too narrow for comfort, likewise the sidewalks on which a person carrying an open umbrella cannot meet another similarly equipped unless one of them closes his rain protector.

The island contains more than 1,000 miles of railroad but only one interurban or trolley line. It runs from San Juan to Rio Pedras and thence south to Caguas. A sense of the violent contrasts characterizing the island comes to a passenger when he looks out of the car window and possibly sees a sick man or woman in an improvised ambulance of a blanket fastened to poles and carried across the shoulders of natives.

In San Juan, the capital, a babel of noise greets the tourist. Venders, jangling bells of street cars and the unrestricted mufflers of automobiles make a sonorous mixture of ancient and modern. The snowy walls of the house Ponce de Leon built gleam in the sunlight. The skyscrapers cast long shadows. Through it all, however, one wonders when the tempest now merely bubbling in the teapot will boil over.

A Debtless County and a Paid-for Courthouse

Concluded from page 3

making its last stand, is slowly, surely succumbing to the new order. Sometimes, while a film is in the making, almost the whole town, from staid county officials to Piute papooses, is on the pay roll for weeks. Last summer a director wanted to make an improvised episode more exciting and offered $5 to anyone who would fall into the creek—ice water direct from the snowy heights. So many tumbled in at once that most of the water was splashed out on the banks. That director, so the story goes, hasn't yet squared himself with the treasurer of his outfit.

Just across the way from the courthouse is a weekly paper still printed on one of the first Washington hand presses, though set up on a modern linotype. Bishop, Eastern California's only city, has this press.

The somnolent village has no police force and no need of any, but a proposed volunteer fire department is the topic of the hour. Old Piute squaws, "mahalas" in their language and so called by all the whites, squat on the benches outside the stores. Not always radiantly immaculate, they are picturesque. The Indians of today are dangerous only to those who get in the path of their high-powered automobiles. Dogs and pet sheep and cows dispute pedestrians' right-of-way on the dusty, locust-lined "main street" but make room for motor vehicles. The people can afford their cars, too. There is $175,000 on deposit in the bank. Authentic records show that in this ten-million-dollar county more than one million dollars a year is expended for automobiles, accessories, gasoline and oil—in excess of $3,000 a day—indicating the affluence of the comparatively few inhabitants. The low total assessment is due to the fact that while the county is nearly one-fifth the size of Michigan and larger than Massachusetts, New Hampshire or Maryland, it contains but several hundred thousand acres of agricultural land, lying in the fertile Owen's River Valley. The remainder consists of rugged mountains and desert, including Death Valley, rich in potential mineral wealth.

Independence suddenly finds itself imbued with the spirit of progress. The village is growing, but it will have to hustle to catch up with that courthouse.

BRIEFLY TOLD

Creeping Bent Grass in pure strains makes the best golf green, according to experiments made by the United States Department of Agriculture. This variety of grass is uniform in color and texture and stands wear well.

Oat stalks, six feet one inch in height, were grown by a rancher near Port Arthur, Canada.

Ruins identified as those of Nendrum Monastery, one of the earliest Christian monasteries in Ireland, have been found at Mahee Island, Strangford Lough, near Belfast. Extensive excavations have revealed valuable material. Writings, believed to be of Danish origin, have been unearthed.

A 12-year-old girl of Salem, Oregon, recently climbed Mount Rainier. She is the youngest person recorded as having reached the summit of the mountain.

Buffaloes at the Canadian federal game park at Wainwright, Alberta, have increased in such numbers that government officials state the vast tract of land set aside for them is insufficient to accommodate them. A number of the older animals are to be slaughtered, the carcasses to be sold to northern trading companies to be made into pemmican. The government will retain the hides.

Medical treatment in Germany costs 20 times as much as before the war.

Citizens of Harrah, Oklahoma, protest the ringing of the 9 o'clock curfew, because it interrupts their slumbers. Every night after the village has settled down for a good rest and the lights are turned out, the clanging of the curfew rouses the citizenry from its slumbers and the situation is becoming well-nigh unbearable, according to the delegation that registered a complaint with the county attorney.

Fully one-eighth of all the inhabitants of the world live along the banks of the Yangtze River, or its tributaries.

A small, uninhabited island off the South American coast has been purchased from Ecuador by a dozen students of Loughborough College, England. They raised $25,000 and purchased a 90-ton boat and their island, on which they hope to make a good living growing fruit and raising cattle.

A chemical, colorless, odorless and one which can be absorbed by wool in small amounts giving it the property of being uneatable by the moth worm without injuring the wool, has been invented by a German.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

All property in Fiji is owned in common. No man there labors as an individual but the work is done in common and the result divided equally among all. If a man's home is destroyed he reports to his chief that he needs a new one, and a certain number of men are assigned to build it.

More wood is used for shipbuilding today than when wooden vessels were the only ones afloat.

During the fiscal year ended June 30, 1922, exports from this country totaled in value $3,770,000,000, as against the $6,516,000,000 value of exports in the previous fiscal year. During the same period imports totaled in value $2,608,000,000, as against the $3,654,000,000 value of imports in the previous fiscal year.

A process has been developed in Hungary for treating corn straw in such a manner that it will produce 40 pounds of cellulose, 40 pounds of molasses and 5 pounds of artificial fertilizer from every 100 pounds of straw.

Seventy-five years ago, a New Hampshire-born man, Horace Greeley, gave the advice, "Go West, young man." Today, New Hampshire is saying to young westerners, "Come East, young man." A board of publicity, serving without pay, is endeavoring to place before young western farmers, of American type, the advantages of New Hampshire. This attempt to reverse the course of American emigration is almost revolutionary and is confined wholly to those already farmers and to those of the Nordic stock.

The game of polo originated in Persia, and from that country it spread over the East, taking root in India and in Constantinople under the Byzantine emperors.

Chile has decided to electrify her railroads by means of the abundant water power to be derived from the mountain streams.

A road, a quarter of a mile long laid down in the shape of a race track at Pittsburg, California, is constructed of 13 sections, each section of a different type of concrete pavement. Forty motor trucks travel continuously over its surface. The problem is to find out which type will last the longest. It is hoped that the information obtained will more than offset the cost of the experiment.

Pure-bred live stock will replace the scrub stock of South Africa soon, if plans of the secretary of agriculture of Rhodesia mature.

The inhabitants of the island of Marken in the Zuider Zee wear the quaintest of Dutch costumes. Girls and boys up to the age of seven years are all dressed exactly alike, in girl's attire. Not till the boys reach the age of 10 do they blossom forth into full masculine clothing. The change is gradual.

The average woman of means in Burma wears about 50 pounds of brass jewelry.

The American embassy, at Buenos Aires, is to be moved from over the old mattress shop, which quarters it has occupied for years, and will be installed in the new headquarters consisting of an entire house comparing favorably with the embassies and legations of eight other nations.

The old-time cowboy used the handkerchief which encircled his neck, but not as an ornament. As the cowboy rode behind a bunch of moving cattle, the still knotted handkerchief's broadest part was drawn up over the wearer's mouth and nose excluding the suffocating dust and making breathing possible.

As a result of a crop failure in Japan last year, that country imported 59,213,900 pounds of rice from California alone during the first five months of 1922.

Two motor truck loads of human bones, the remains of several hundred early settlers of New York, were unceremoniously dumped into the ocean recently in New York City from a rubbish scow, according to a news dispatch from that city. Workmen dug up an ancient churchyard with old brownstone tombstones containing names and dates, the latest of which was 1820. Records indicate the old graveyard was undoubtedly connected with two prominent Manhattan churches of the early nineteenth century, and no doubt contained the bodies of heroes of the American Revolution and the War of 1812.
